Index of Applications

Engineering and Physical Sciences

Acceleration, 128, 132, 160, 162, 180, 257, 910
Air pressure, 440
Air traffic control, 158, 750, 854
Aircraft glide path, 197
Angle of elevation, 155, 159, 160
Angular rate of change, 381
Angular speed, 38, 381
Apparent temperature, 903
Archimedes' Principle, 514
Architecture, 698
Asteroid Apollo, 742
Atmospheric pressure and altitude, 323, 349, 955
Automobile aerodynamics, 30
Average speed, 44, 93
Average temperature, 988, 1039
Average velocity, 116
Beam deflection, 697
Beam strength, 226
Boyle's Law, 493, 512
Braking load, 778
Breaking strength of a steel cable, 360
Bridge design, 698
Building design, 453, 571, 1012, 1040, 1068
Cable tension, 761, 769
Carbon dating, 421
Center of mass, 504
Centripetal acceleration, 854
Centripetal force, 854
Centroid, 502, 503, 527
Charles's Law, 78
Chemical mixture problem, 435, 437
Chemical reaction, 430, 558, 967
Circular motion, 844, 852
Comet Hale-Bopp, 745
Construction, 158, 769
Cooling superconducting magnets with liquid helium, 78
Cycloidal motion, 844, 853
Dissolving chlorine, 85
Doppler effect, 142
Einstein's Special Theory of Relativity and Newton's First Law of Motion, 207
Electric circuit, 371, 414, 434, 437
Electric force, 492
Electric force fields, 1045
Electric potential, 882
Electrical resistance, 189, 910
Electricity, 159, 307
Electromagnetic theory, 581
Electronically controlled thermostat, 29
Emptying a tank of oil, 489
Engine design, 1067
Engine efficiency, 207
Escape velocity, 98, 257
Explorer 1, 698
Explorer 18, 745
Explorer 55, 698
Falling object, 312, 434, 437
Ferris wheel, 870
Field strength, 548
Flight control, 159
Flow rate, 290, 294, 307, 351, 1109
Fluid force, 506, 507, 508, 509, 510, 513, 514, 546, 549
Force, 293, 509, 774, 775, 785, 786
Free-falling object, 72, 96
Frictional force, 862, 866
Fuel efficiency, 581
Gauss's Law, 1107, 1109
Geography, 807, 817
Gravitational fields, 1045
Gravitational force, 581
Halley's Comet, 698, 741
Hanging power cables, 393, 397
Harmonic motion, 142, 163, 349
Heat equation, 901
Heat flux, 1128
Heat transfer, 332
Heat-seeking particle, 925, 930
Height
  of a Ferris wheel, 40
  of a man, 581
  rate of change of, 157
Highway design, 173, 197, 870
Honeycomb, 173
Hooke's Law, 487, 491, 512
Hydraulics, 1005
Hyperbolic detection system, 695
Hyperbolic mirror, 699
Ideal Gas Law, 883, 903, 918
Illumination, 226, 246
Inductance, 910
Kepler's Laws, 741, 742, 866
Kinetic and potential energy, 1075, 1078
Law of Conservation of Energy, 1075
Length
  of a cable, 477, 481
  of Gateway Arch, 482
  of pursuit, 484
  of a stream, 483
  of warblers, 585
Linear vs. angular speed, 160, 163
Load supports, 769
Lunar gravity, 257
Machine design, 159
Machine part, 471
Magnetic field of Earth, 1054
Mass, 1059, 1065, 1066
  on the surface of Earth, 494
Mechanical design, 453, 797
Meteorology, 883
Motion
  of a liquid, 1122, 1123, 1127
  of a spring, 531
Moving ladder, 93, 158
Moving shadow, 159, 160, 162, 163
Muzzle velocity, 761
Navigation, 699, 761
Newton's Law of Cooling, 419, 422
Newton's Law of Gravitation, 1045
Newton's Law of Universal Gravitation, 487, 492, 854
Oblateness of Saturn, 473
Ohm's Law, 241
Oil leak, 294
Orbit
  of Earth, 698
  of the moon, 690
  of a satellite, 698, 731, 870
Orbital speed, 854
Parabolic reflector, 688
Particle motion, 132, 291, 294, 295, 698, 717, 827, 835, 837, 844, 853, 854, 865
Path
  of a ball, 706, 842
  of a baseball, 709, 841, 842, 843, 864
  of a football, 843
  of a projectile, 186, 716, 842, 843
  of a shot, 843
Pendulum, 142, 241, 910
Planetary motion, 745
Planetary orbits, 691
Power, 173, 910
Producing a machine part, 463
Projectile motion, 164, 241, 679, 709, 761, 840, 842, 843, 851, 853, 854, 864, 868, 870, 917
Psychrometer, 844
Radioactive decay, 352, 417, 421, 430, 440
Rectilinear motion, 257
Refraction of light, 963
Resultant force, 758, 760, 761
Resultant velocity, 758
Ripples in a pond, 29, 153
Rotary engine, 747
Satellite antenna, 747
Satellites, 131
Sending a space module into orbit, 488, 575
Solar collector, 697
Sound intensity, 323, 422
Specific gravity of water, 198
Speed of sound, 286
Surveying, 241, 565
Suspension bridge, 484
Temperature, 18, 180, 208, 322, 340, 413, 963
  normal daily maximum in Chicago, 142
  at which water boils, 323
Temperature distribution, 882, 902, 925, 930, 968
Theory of Relativity, 93
Topography, 875, 929, 930

Tear out Formula Cards for Homework Success.

DERIVATIVES AND INTEGRALS

Basic Differentiation Rules

1. $\frac{d}{dx}[cu] = cu'$
2. $\frac{d}{dx}[u \pm v] = u' \pm v'$
3. $\frac{d}{dx}[uv] = uv' + vu'$
4. $\frac{d}{dx}\left[\frac{u}{v}\right] = \frac{vu' - uv'}{v^2}$
5. $\frac{d}{dx}[c] = 0$
6. $\frac{d}{dx}[u^n] = nu^{n-1}u'$
7. $\frac{d}{dx}[x] = 1$
8. $\frac{d}{dx}[|u|] = \frac{u}{|u|}(u'), \quad u \neq 0$
9. $\frac{d}{dx}[\ln u] = \frac{u'}{u}$
10. $\frac{d}{dx}[e^u] = e^u u'$
11. $\frac{d}{dx}[\log_a u] = \frac{u'}{(\ln a)u}$
12. $\frac{d}{dx}[a^u] = (\ln a)a^u u'$
13. $\frac{d}{dx}[\sin u] = (\cos u)u'$
14. $\frac{d}{dx}[\cos u] = -(\sin u)u'$
15. $\frac{d}{dx}[\tan u] = (\sec^2 u)u'$
16. $\frac{d}{dx}[\cot u] = -(\csc^2 u)u'$
17. $\frac{d}{dx}[\sec u] = (\sec u \tan u)u'$
18. $\frac{d}{dx}[\csc u] = -(\csc u \cot u)u'$
19. $\frac{d}{dx}[\arcsin u] = \frac{u'}{\sqrt{1 - u^2}}$
20. $\frac{d}{dx}[\arccos u] = \frac{-u'}{\sqrt{1 - u^2}}$
21. $\frac{d}{dx}[\arctan u] = \frac{u'}{1 + u^2}$
22. $\frac{d}{dx}[\operatorname{arccot} u] = \frac{-u'}{1 + u^2}$
23. $\frac{d}{dx}[\operatorname{arcsec} u] = \frac{u'}{|u|\sqrt{u^2 - 1}}$
24. $\frac{d}{dx}[\operatorname{arccsc} u] = \frac{-u'}{|u|\sqrt{u^2 - 1}}$
25. $\frac{d}{dx}[\sinh u] = (\cosh u)u'$
26. $\frac{d}{dx}[\cosh u] = (\sinh u)u'$
27. $\frac{d}{dx}[\tanh u] = (\operatorname{sech}^2 u)u'$
28. $\frac{d}{dx}[\coth u] = -(\operatorname{csch}^2 u)u'$
29. $\frac{d}{dx}[\operatorname{sech} u] = -(\operatorname{sech} u \tanh u)u'$
30. $\frac{d}{dx}[\operatorname{csch} u] = -(\operatorname{csch} u \coth u)u'$
31. $\frac{d}{dx}[\sinh^{-1} u] = \frac{u'}{\sqrt{u^2 + 1}}$
32. $\frac{d}{dx}[\cosh^{-1} u] = \frac{u'}{\sqrt{u^2 - 1}}$
33. $\frac{d}{dx}[\tanh^{-1} u] = \frac{u'}{1 - u^2}$
34. $\frac{d}{dx}[\coth^{-1} u] = \frac{u'}{1 - u^2}$
35. $\frac{d}{dx}[\operatorname{sech}^{-1} u] = \frac{-u'}{u\sqrt{1 - u^2}}$
36. $\frac{d}{dx}[\operatorname{csch}^{-1} u] = \frac{-u'}{|u|\sqrt{1 + u^2}}$

Basic Integration Formulas

1. $\int kf(u)\,du = k\int f(u)\,du$
2. $\int [f(u) \pm g(u)]\,du = \int f(u)\,du \pm \int g(u)\,du$
3. $\int du = u + C$
4. $\int u^n\,du = \frac{u^{n+1}}{n+1} + C, \quad n \neq -1$
5. $\int \frac{du}{u} = \ln|u| + C$
6. $\int e^u\,du = e^u + C$
7. $\int a^u\,du = \left(\frac{1}{\ln a}\right)a^u + C$
8. $\int \sin u\,du = -\cos u + C$
9. $\int \cos u\,du = \sin u + C$
10. $\int \tan u\,du = -\ln|\cos u| + C$
11. $\int \cot u\,du = \ln|\sin u| + C$
12. $\int \sec u\,du = \ln|\sec u + \tan u| + C$
13. $\int \csc u\,du = -\ln|\csc u + \cot u| + C$
14. $\int \sec^2 u\,du = \tan u + C$
15. $\int \csc^2 u\,du = -\cot u + C$
16. $\int \sec u \tan u\,du = \sec u + C$
17. $\int \csc u \cot u\,du = -\csc u + C$
18. $\int \frac{du}{\sqrt{a^2 - u^2}} = \arcsin\frac{u}{a} + C$
19. $\int \frac{du}{a^2 + u^2} = \frac{1}{a}\arctan\frac{u}{a} + C$
20. $\int \frac{du}{u\sqrt{u^2 - a^2}} = \frac{1}{a}\operatorname{arcsec}\frac{|u|}{a} + C$

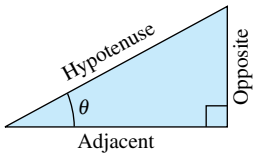
TRIGONOMETRY

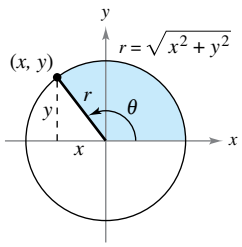
Definition of the Six Trigonometric Functions

Right triangle definitions, where $0 < \theta < \pi/2$.

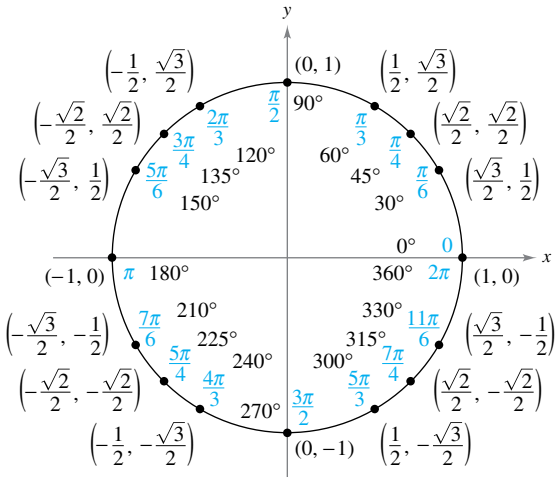


$$\sin\theta = \frac{\text{opp}}{\text{hyp}} \quad \csc\theta = \frac{\text{hyp}}{\text{opp}}$$
$$\cos\theta = \frac{\text{adj}}{\text{hyp}} \quad \sec\theta = \frac{\text{hyp}}{\text{adj}}$$
$$\tan\theta = \frac{\text{opp}}{\text{adj}} \quad \cot\theta = \frac{\text{adj}}{\text{opp}}$$

Circular function definitions, where θ is any angle.



$$\sin\theta = \frac{y}{r} \quad \csc\theta = \frac{r}{y}$$
$$\cos\theta = \frac{x}{r} \quad \sec\theta = \frac{r}{x}$$
$$\tan\theta = \frac{y}{x} \quad \cot\theta = \frac{x}{y}$$



Reciprocal Identities

$$\sin x = \frac{1}{\csc x} \quad \cos x = \frac{1}{\sec x} \quad \tan x = \frac{1}{\cot x}$$
$$\csc x = \frac{1}{\sin x} \quad \sec x = \frac{1}{\cos x} \quad \cot x = \frac{1}{\tan x}$$

Quotient Identities

$$\tan x = \frac{\sin x}{\cos x} \quad \cot x = \frac{\cos x}{\sin x}$$

Pythagorean Identities

$$\sin^2 x + \cos^2 x = 1$$
$$1 + \tan^2 x = \sec^2 x \qquad 1 + \cot^2 x = \csc^2 x$$

Cofunction Identities

$$\sin\left(\frac{\pi}{2} - x\right) = \cos x \qquad \cos\left(\frac{\pi}{2} - x\right) = \sin x$$
$$\csc\left(\frac{\pi}{2} - x\right) = \sec x \qquad \tan\left(\frac{\pi}{2} - x\right) = \cot x$$
$$\sec\left(\frac{\pi}{2} - x\right) = \csc x \qquad \cot\left(\frac{\pi}{2} - x\right) = \tan x$$

Even/Odd Identities

$$\sin(-x) = -\sin x \qquad \cos(-x) = \cos x$$
$$\csc(-x) = -\csc x \qquad \tan(-x) = -\tan x$$
$$\sec(-x) = \sec x \qquad \cot(-x) = -\cot x$$

Sum and Difference Formulas

$$\sin(u \pm v) = \sin u \cos v \pm \cos u \sin v$$
$$\cos(u \pm v) = \cos u \cos v \mp \sin u \sin v$$
$$\tan(u \pm v) = \frac{\tan u \pm \tan v}{1 \mp \tan u \tan v}$$

Double-Angle Formulas

$$\sin 2u = 2 \sin u \cos u$$
$$\cos 2u = \cos^2 u - \sin^2 u = 2\cos^2 u - 1 = 1 - 2\sin^2 u$$
$$\tan 2u = \frac{2\tan u}{1 - \tan^2 u}$$

Power-Reducing Formulas

$$\sin^2 u = \frac{1 - \cos 2u}{2}$$
$$\cos^2 u = \frac{1 + \cos 2u}{2}$$
$$\tan^2 u = \frac{1 - \cos 2u}{1 + \cos 2u}$$

Sum-to-Product Formulas

$$\sin u + \sin v = 2\sin\left(\frac{u+v}{2}\right)\cos\left(\frac{u-v}{2}\right)$$
$$\sin u - \sin v = 2\cos\left(\frac{u+v}{2}\right)\sin\left(\frac{u-v}{2}\right)$$
$$\cos u + \cos v = 2\cos\left(\frac{u+v}{2}\right)\cos\left(\frac{u-v}{2}\right)$$
$$\cos u - \cos v = -2\sin\left(\frac{u+v}{2}\right)\sin\left(\frac{u-v}{2}\right)$$

Product-to-Sum Formulas

$$\sin u \sin v = \frac{1}{2}[\cos(u - v) - \cos(u + v)]$$
$$\cos u \cos v = \frac{1}{2}[\cos(u - v) + \cos(u + v)]$$
$$\sin u \cos v = \frac{1}{2}[\sin(u + v) + \sin(u - v)]$$
$$\cos u \sin v = \frac{1}{2}[\sin(u + v) - \sin(u - v)]$$

Contents

P Preparation for Calculus 1

P.1 Graphs and Models 2
P.2 Linear Models and Rates of Change 10
P.3 Functions and Their Graphs 19
P.4 Review of Trigonometric Functions 31
Review Exercises 41
P.S. Problem Solving 44

1 Limits and Their Properties 45

1.1 A Preview of Calculus 46
1.2 Finding Limits Graphically and Numerically 52
1.3 Evaluating Limits Analytically 63
1.4 Continuity and One-Sided Limits 74
1.5 Infinite Limits 87
Section Project: Graphs and Limits of Trigonometric Functions 94
Review Exercises 95
P.S. Problem Solving 98

2 Differentiation 99

2.1 The Derivative and the Tangent Line Problem 100
2.2 Basic Differentiation Rules and Rates of Change 110
2.3 Product and Quotient Rules and Higher-Order Derivatives 122
2.4 The Chain Rule 133
2.5 Implicit Differentiation 144
Section Project: Optical Illusions 151
2.6 Related Rates 152
Review Exercises 161
P.S. Problem Solving 164

3 Applications of Differentiation 165

3.1 Extrema on an Interval 166
3.2 Rolle's Theorem and the Mean Value Theorem 174
3.3 Increasing and Decreasing Functions and the First Derivative Test 181
Section Project: Even Polynomial Functions of Fourth Degree 190
3.4 Concavity and the Second Derivative Test 191
3.5 Limits at Infinity 199
3.6 A Summary of Curve Sketching 209
3.7 Optimization Problems 219
Section Project: Minimum Time 228
3.8 Newton's Method 229
3.9 Differentials 235
Review Exercises 242
P.S. Problem Solving 246

4 Integration **247**

4.1 Antiderivatives and Indefinite Integration 248
4.2 Area 258
4.3 Riemann Sums and Definite Integrals 270
4.4 The Fundamental Theorem of Calculus 281
4.5 Integration by Substitution 296
Section Project: Probability 308
Review Exercises 309
P.S. Problem Solving 312

5 Logarithmic, Exponential, and Other Transcendental Functions **313**

5.1 The Natural Logarithmic Function: Differentiation 314
5.2 The Natural Logarithmic Function: Integration 324
5.3 Inverse Functions 333
5.4 Exponential Functions: Differentiation and Integration 342
5.5 Bases Other than *e* and Applications 352
Section Project: Using a Graphing Utility to Estimate Slope 361
5.6 Indeterminate Forms and L'Hôpital's Rule 362
5.7 Inverse Trigonometric Functions: Differentiation 373
5.8 Inverse Trigonometric Functions: Integration 382
5.9 Hyperbolic Functions 390
Section Project: Mercator Map 399
Review Exercises 400
P.S. Problem Solving 404

6 Differential Equations **405**

6.1 Slope Fields and Euler's Method 406
6.2 Growth and Decay 415
6.3 Separation of Variables and the Logistic Equation 423
6.4 First-Order Linear Differential Equations 432
Section Project: Weight Loss 438
Review Exercises 439
P.S. Problem Solving 442

7 Applications of Integration **443**

7.1 Area of a Region Between Two Curves 444
7.2 Volume: The Disk Method 454
7.3 Volume: The Shell Method 465
Section Project: Saturn 473
7.4 Arc Length and Surfaces of Revolution 474
7.5 Work 485
Section Project: Pyramid of Khufu 493
7.6 Moments, Centers of Mass, and Centroids 494
7.7 Fluid Pressure and Fluid Force 505
Review Exercises 511

Preface

Welcome to *Calculus* with CalcChat® and CalcView®, Twelfth Edition. We are excited to offer you a new edition with more resources then ever that will help you understand and master calculus. This text includes features and resources that continue to make *Calculus* a valuable learning tool for students and a trustworthy teaching tool for instructors.

Calculus provides the clear instruction, precise mathematics, and thorough coverage that you expect for your course. Additionally, this new edition provides you with **free** access to a variety of digital resources.

- **GO DIGITAL**—direct access to digital content on your mobile device or computer
- **CalcView.com**—video solutions to selected exercises
- **CalcChat.com**—worked-out solutions to odd-numbered exercises and access to online tutors
- **LarsonCalculus.com**—companion website with resources to supplement your learning

These digital resources will help enhance and reinforce your understanding of the material presented in this text and prepare you for future mathematics courses. CalcView® and CalcChat® are also available as free mobile apps.

Features

NEW GO DIGITAL

Scan the on-page codes of this text to *GO DIGITAL* on your mobile device. This will give you easy access to

- instructional and proof videos,
- interactive examples,
- solutions to exercises,
- free online tutoring,

and many other resources.

UPDATED CalcView®

The website *CalcView.com* provides video solutions of selected exercises. Watch instructors progress step-by-step through solutions, providing guidance to help you solve the exercises. The CalcView mobile app is available for free at the Apple® App Store® or Google Play™ store. You can access the video solutions by scanning the on-page codes at the beginning of the section exercises or visiting the *CalcView.com* website.

UPDATED CalcChat®

Solutions to all odd-numbered exercises are provided for free at *CalcChat.com.* Additionally, you can chat with a tutor, at no charge, during the hours posted at the site. **For over 20 years, millions of students have visited our site for help!** The CalcChat mobile app is also available as a free download at the Apple® App Store® or Google Play™ store.

UPDATED LarsonCalculus.com

All companion website features have been updated based on this revision. Watch videos explaining concepts or proofs from the text, explore examples, view three-dimensional graphs, download articles from math journals, and much more.

App Store is a service mark of Apple Inc. Google Play is a trademark of Google Inc.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

NEW Big Ideas of Calculus

We have added a new feature to help you discover and understand the Big Ideas of Calculus. This feature, which is denoted by , has four parts.

- The **Big Ideas of Calculus** notes give you an overview of the major concepts of a chapter and how they relate to the earlier concepts you have studied. These notes appear near the beginning of a chapter and in the chapter review.
- In each section and in the chapter review, make sure you do the **Concept Check** exercises and the **Exploring Concepts** exercises. These exercises will help you develop a deeper and clearer knowledge of calculus. Work through these exercises to build and strengthen your understanding of the concepts.
- To continue exploring calculus, do the **Building on Concepts** exercises at the end of the chapter review. Not only will these exercises help you expand your knowledge and use of calculus, they will prepare you to learn concepts in later chapters.

Big Ideas of Calculus

In this chapter, you will study integration. Integration, like differentiation, is a major theme of calculus. Interestingly, as you will learn in the Fundamental Theorem of Calculus, these two major themes have an inverse relationship. As part of your study of integration, you will examine the areas of plane regions.

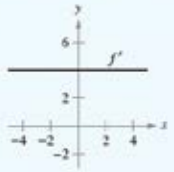
Concept Check

1. Explain what it means for a function F to be an antiderivative of a function f on an interval I.
2. Can two different functions both be antiderivatives of the same function? Explain.
3. Explain how to find a particular solution of a differential equation.
4. Describe the difference between the general solution and a particular solution of a differential equation.

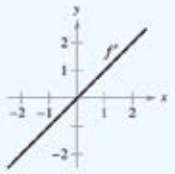
Exploring Concepts

In Exercises 49 and 50, the graph of the derivative of a function is given. Sketch the graphs of *two* functions that have the given derivative. (There is more than one correct answer.) To print an enlarged copy of the graph, go to *MathGraphs.com*.

49.



50.



Building on Concepts

75. Consider the function

$$F(x) = \int_0^x \sin^2 t\, dt.$$

(a) Evaluate F at $x = 0, \pi/6, \pi/3, \pi/2, 2\pi/3, 5\pi/6$, and π. Are the values of F increasing or decreasing? Explain.

(b) Use the integration capabilities of a graphing utility to graph F and $y_1 = \sin^2 t$ on the interval $0 \le t \le \pi$.

(c) Use the differentiation capabilities of a graphing utility to graph F'. How is this graph related to the graph in part (b)?

(d) Verify that $\sin^2 t$ is the derivative of

$$y = \frac{1}{2}t - \frac{1}{4}\sin 2t.$$

Graph y and write a short paragraph about how this graph is related to those in parts (b) and (c).

UPDATED Exercise Sets

The exercise sets have been carefully and extensively examined to ensure they are rigorous and relevant and to include topics our users have suggested. The exercises are organized and titled so you can better see the connections between examples and exercises. Multi-step, real-life exercises reinforce problem-solving skills and mastery of concepts by giving you the opportunity to apply the concepts in real-life situations.

Section Projects

Projects appear in selected sections and encourage you to explore applications related to the topics you are studying. All of these projects provide an interesting and engaging way for you and other students to work and investigate ideas collaboratively.

UPDATED Chapter Opener

Each Chapter Opener highlights real-life applications used in the examples and exercises. For this edition, we also highlight the online resources at *CalcView.com* and *CalcChat.com*.

SECTION PROJECT

Graphs and Limits of Trigonometric Functions

Recall from Theorem 1.9 that the limit of

$$f(x) = \frac{\sin x}{x}$$

as x approaches 0 is 1.

(a) Use a graphing utility to graph the function f on the interval $-\pi \le x \le \pi$. Explain how the graph helps confirm this theorem.

(b) Explain how you could use a table of values to confirm the value of this limit numerically.

(c) Graph $g(x) = \sin x$ by hand. Sketch a tangent line at the point $(0, 0)$ and visually estimate the slope of this tangent line.

(d) Let $(x, \sin x)$ be a point on the graph of g near $(0, 0)$, and write a formula for the slope of the secant line joining $(x, \sin x)$ and $(0, 0)$. Evaluate this formula at $x = 0.1$ and $x = 0.01$. Then find the exact slope of the tangent line to g at the point $(0, 0)$.

(e) Sketch the graph of the cosine function $h(x) = \cos x$. What is the slope of the tangent line at the point $(0, 1)$? Use limits to find this slope analytically.

(f) Find the slope of the tangent line to $k(x) = \tan x$ at $(0, 0)$.

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

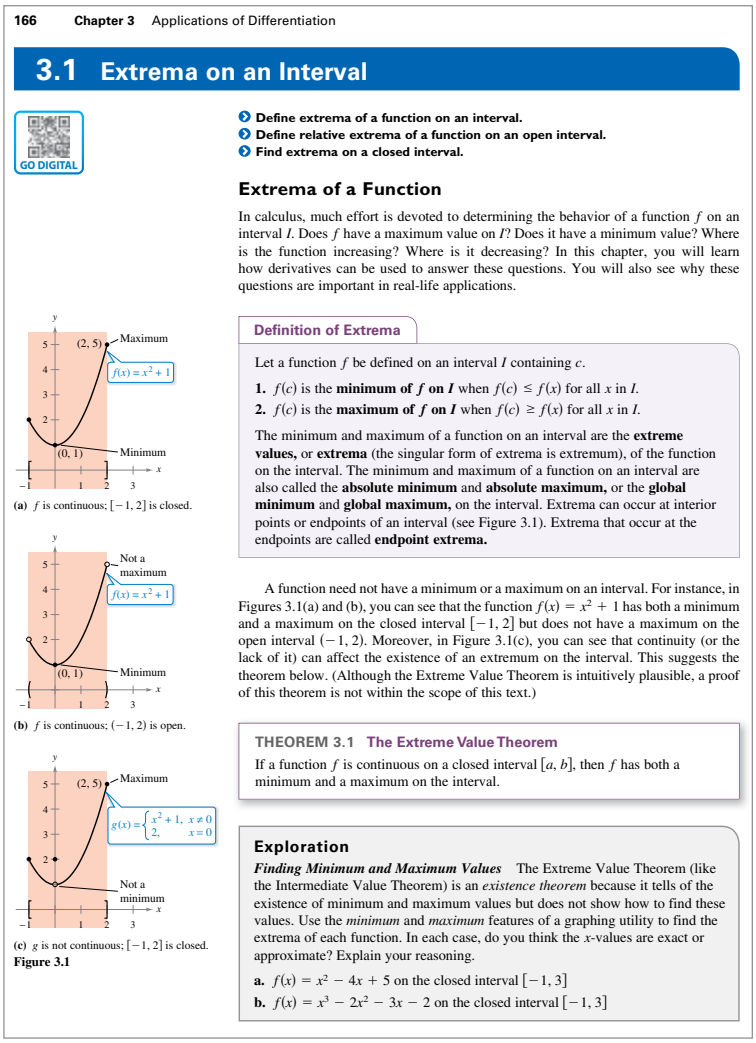
Section Objectives
A bulleted list of learning objectives provides you with the opportunity to preview what will be presented in the upcoming section.

Theorems
Theorems provide the conceptual framework for calculus. Theorems are clearly stated and separated from the rest of the text by boxes for quick visual reference. Key proofs often follow the theorem and can be found at *LarsonCalculus.com.*

Definitions
As with theorems, definitions are clearly stated using precise, formal wording and are separated from the text by boxes for quick visual reference.

Explorations
Explorations provide unique challenges to study concepts that have not yet been formally covered in the text. They allow you to learn by discovery and introduce topics related to ones presently being studied. Exploring topics in this way encourages you to think outside the box.

UPDATED Remarks
These hints and tips reinforce or expand upon concepts, help you learn how to study mathematics, caution you about common errors, address special cases, or show an alternative solution to an example. We have added several new Remarks to help students who need more in-depth algebra support.



166 Chapter 3 Applications of Differentiation

3.1 Extrema on an Interval

GO DIGITAL

- Define extrema of a function on an interval.
- Define relative extrema of a function on an open interval.
- Find extrema on a closed interval.

Extrema of a Function

In calculus, much effort is devoted to determining the behavior of a function f on an interval I. Does f have a maximum value on I? Does it have a minimum value? Where is the function increasing? Where is it decreasing? In this chapter, you will learn how derivatives can be used to answer these questions. You will also see why these questions are important in real-life applications.

Definition of Extrema

Let a function f be defined on an interval I containing c.

1. $f(c)$ is the **minimum of f on I** when $f(c) \leq f(x)$ for all x in I.
2. $f(c)$ is the **maximum of f on I** when $f(c) \geq f(x)$ for all x in I.

The minimum and maximum of a function on an interval are the **extreme values,** or **extrema** (the singular form of extrema is extremum), of the function on the interval. The minimum and maximum of a function on an interval are also called the **absolute minimum** and **absolute maximum,** or the **global minimum** and **global maximum,** on the interval. Extrema can occur at interior points or endpoints of an interval (see Figure 3.1). Extrema that occur at the endpoints are called **endpoint extrema.**

A function need not have a minimum or a maximum on an interval. For instance, in Figures 3.1(a) and (b), you can see that the function $f(x) = x^2 + 1$ has both a minimum and a maximum on the closed interval $[-1, 2]$ but does not have a maximum on the open interval $(-1, 2)$. Moreover, in Figure 3.1(c), you can see that continuity (or the lack of it) can affect the existence of an extremum on the interval. This suggests the theorem below. (Although the Extreme Value Theorem is intuitively plausible, a proof of this theorem is not within the scope of this text.)

THEOREM 3.1 The Extreme Value Theorem

If a function f is continuous on a closed interval $[a, b]$, then f has both a minimum and a maximum on the interval.

Exploration

Finding Minimum and Maximum Values The Extreme Value Theorem (like the Intermediate Value Theorem) is an *existence theorem* because it tells of the existence of minimum and maximum values but does not show how to find these values. Use the *minimum* and *maximum* features of a graphing utility to find the extrema of each function. In each case, do you think the x-values are exact or approximate? Explain your reasoning.

a. $f(x) = x^2 - 4x + 5$ on the closed interval $[-1, 3]$

b. $f(x) = x^3 - 2x^2 - 3x - 2$ on the closed interval $[-1, 3]$

(a) f is continuous; $[-1, 2]$ is closed.

(b) f is continuous; $(-1, 2)$ is open.

(c) g is not continuous; $[-1, 2]$ is closed.

Figure 3.1

UPDATED Historical Notes and Biographies
Historical Notes provide you with background information on the foundations of calculus. The Biographies introduce you to the people who created and contributed to calculus. We have added several new biographies, and more biographies are available at *LarsonCalculus.com*.

Technology
Throughout the book, technology boxes show you how to use technology to solve problems and explore concepts of calculus. These tips also point out some pitfalls of using technology.

How Do You See It? Exercise
The How Do You See It? exercise in each section presents a problem that you will solve by visual inspection using the concepts learned in the lesson.

UPDATED Applications
Carefully chosen applied exercises and examples are included throughout to address the question, "When will I use this?" These applications are pulled from diverse sources, such as current events, world data, industry trends, and more, and relate to a wide range of interests. Understanding where calculus is (or can be) used promotes fuller understanding of the material.

Putnam Exam Challenges
Putnam Exam questions appear in selected sections. These actual Putnam Exam questions will challenge you and push the limits of your understanding of calculus.

Student Resources

CENGAGE | WEBASSIGN

Prepare for class with confidence using WebAssign from Cengage. This online learning platform, which includes an interactive eBook, fuels practice so that you truly absorb what you learn and prepare better for tests. Videos and tutorials walk you through concepts and deliver instant feedback and grading, so you always know where you stand in class. Focus your study time and get extra practice where you need it most. Study smarter with WebAssign! Ask your instructor today how you can get access to WebAssign, or learn about self-study options at *cengage.com/webassign*.

Student Solutions Manual

Student Solutions Manual for Calculus of a Single Variable, 12e
(ISBN-13: 978-0-357-74919-7)
Student Solutions Manual for Multivariable Calculus, 12e
(ISBN-13: 978-0-357-74920-3)
These manuals provide step-by-step solutions for all odd-numbered exercises, including Review Exercises and P.S. Problem Solving. The manual for *Calculus of a Single Variable* contains solutions for Chapters P–10, and the manual for *Multivariable Calculus* contains solutions for Chapters 11–16.

Cengage.com

Additional student resources for this product are available online. Sign up or sign in at *cengage.com* to search for and access this product and its online resources.

LarsonCalculus.com

Of the many features at this website, students have told us that the videos are the most helpful. Watch instructional videos presented by Dana Mosely, as he explains various calculus concepts. Watch proof videos presented by Bruce Edwards, as he explains various calculus theorems and their proofs. Other helpful features are the data downloads (editable spreadsheets so you do not have to enter the data), algebra help videos, interactive examples, and much more. You can access these features by going to *LarsonCalculus.com* or by scanning the on-page code .

CalcChat.com

This website provides free step-by-step solutions to all odd-numbered exercises and tests. Additionally, you can chat with a tutor, at no charge, during the hours posted at the site. You can access the solutions by going to *CalcChat.com* or by scanning the on-page code on the first page of any exercise set.

CalcView.com

This website has free video solutions of selected exercises. Watch instructors progress step-by-step through solutions, providing guidance to help you solve the exercises. You can access the videos by going to *CalcView.com* or by scanning the on-page code on the first page of the section exercises.

MathGraphs.com

For exercises that ask you to draw on the graph, we have provided free, printable graphs at *MathGraphs.com*. You can access the printable graphs by going to *MathGraphs.com* or by scanning the on-page code on the first page of any exercise set.

Instructor Resources

CENGAGE | WEBASSIGN

Built by educators, WebAssign from Cengage is a fully customizable online solution for STEM disciplines. WebAssign includes the flexibility, tools, and content you need to create engaging learning experiences for your students. The patented grading engine provides unparalleled answer evaluation, giving students instant feedback, and insightful analytics highlight exactly where students are struggling. For more information, visit *cengage.com/webassign*.

Cengage.com

Additional instructor resources for this product are available online. Instructor assets include an Instructor's Manual, Educator's Guide, PowerPoint® slides, a Solution and Answer Guide, and a test bank powered by Cognero®. Sign up or sign in at *cengage.com* to search for and access this product and its online resources. The Cengage Instructor Center is an all-in-one resource for class preparation, presentation, and testing. The instructor resources available for download include:

Instructor's Manual Includes activities and assessments correlated by learning objectives, chapter and section outline, key formulas and terms with definitions, ideas for student collaboration and class discussions, and more.

Solution and Answer Guide Provides answers and solutions to all exercises, including Review Exercises, P.S. Problem Solving, and Putnam Exam Challenge.

Cengage Testing Powered by Cognero® A flexible online system that allows you to author, edit, and manage test bank content online. You can create multiple tests in an instant and deliver them from your LMS, or export to printable PDF or Word format for in-class assessment.

PowerPoint® Slides The PowerPoint® slides are ready-to-use, visual outlines of each section that can be easily customized for your lectures. Presentations include activities, examples, and ample opportunities for student engagement and interaction.

Transition Guide Highlights the content changes from the previous edition to the new edition, including exercise correlations.

Guide to Online Teaching Provides technological and pedagogical considerations and tips for teaching a calculus course online.

Educator's Guide Offers suggested content and activities for Cengage WebAssign —like videos and assignments—that you can integrate into your course to help boost engagement and outcomes.

LarsonCalculus.com

In addition to its student resources, *LarsonCalculus.com* also has resources to help instructors. For students who need algebra help, we have provided instructional videos to explain various algebra and precalculus concepts. Students can assess their knowledge of these concepts through self-grading progress checks. You can also give your students experience using an online graphing utility with the Interactive Examples. You can access these features by going to *LarsonCalculus.com* or by scanning the on-page code .

MathArticles.com

This text contains over 50 references to articles from mathematics journals noted in the For Further Information feature. To make the articles easily accessible to instructors and students, they are available at *MathArticles.com* or by scanning the on-page code .

P.1 Graphs and Models

GO DIGITAL

- **Sketch the graph of an equation.**
- **Find the intercepts of a graph.**
- **Test a graph for symmetry with respect to an axis and the origin.**
- **Find the points of intersection of two graphs.**
- **Interpret mathematical models for real-life data.**

RENÉ DESCARTES (1596–1650)

Descartes made many contributions to philosophy, science, and mathematics. The idea of representing points in the plane by pairs of real numbers and representing curves in the plane by equations was described by Descartes in his book *La Géométrie*, published in 1637.

See LarsonCalculus.com to read more of this biography.

The Graph of an Equation

In 1637, the French mathematician René Descartes revolutionized the study of mathematics by combining its two major fields—algebra and geometry. With Descartes's coordinate plane, geometric concepts could be formulated analytically and algebraic concepts could be viewed graphically. The power of this approach was such that within a century of its introduction, much of calculus had been developed.

The same approach can be followed in your study of calculus. That is, by viewing calculus from multiple perspectives—*graphically*, *analytically*, and *numerically*—you will increase your understanding of core concepts.

Consider the equation $3x + y = 7$. The point $(2, 1)$ is a **solution point** of the equation because the equation is satisfied (is true) when 2 is substituted for x and 1 is substituted for y. This equation has many other solutions, such as $(1, 4)$ and $(0, 7)$. To find other solutions systematically, solve the original equation for y.

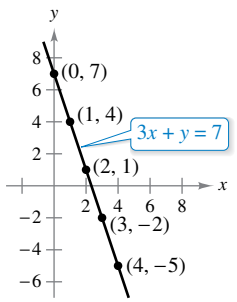
$y = 7 - 3x$ Analytic approach

Then construct a **table of values** by substituting several values of x.

x	0	1	2	3	4
y	7	4	1	-2	-5

Numerical approach

From the table, note that $(0, 7)$, $(1, 4)$, $(2, 1)$, $(3, -2)$, and $(4, -5)$ are solutions of the original equation $3x + y = 7$. Like many equations, this equation has an infinite number of solutions. The set of all solution points is the **graph** of the equation, as shown in Figure P.1. Note that the sketch shown in Figure P.1 is referred to as the graph of $3x + y = 7$, even though it really represents only a *portion* of the graph. The entire graph would extend beyond the page.



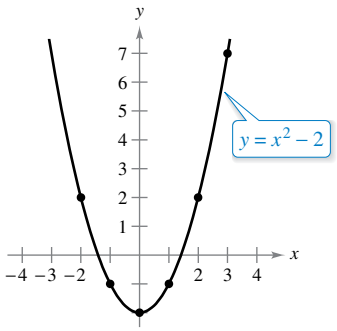
Graphical approach: $3x + y = 7$
Figure P.1

In this course, you will study many sketching techniques. The simplest is point plotting—that is, you plot points until the basic shape of the graph seems apparent.

EXAMPLE 1 Sketching a Graph by Point Plotting

To sketch the graph of $y = x^2 - 2$, first construct a table of values. Next, plot the points shown in the table. Then connect the points with a smooth curve, as shown in Figure P.2. This graph is a **parabola.** It is one of the conics you will study in Chapter 10.

x	-2	-1	0	1	2	3
y	2	-1	-2	-1	2	7



The parabola $y = x^2 - 2$
Figure P.2

GO DIGITAL

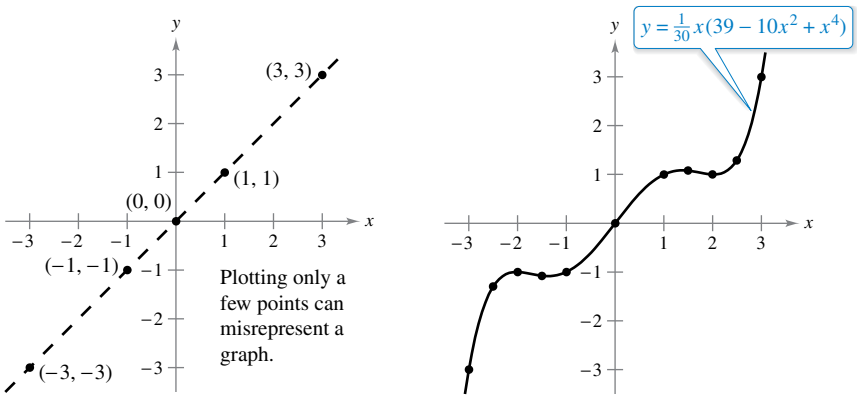
One disadvantage of point plotting is that to get a good idea about the shape of a graph, you may need to plot many points. With only a few points, you could badly misrepresent the graph. For instance, to sketch the graph of

$$y = \frac{1}{30}x(39 - 10x^2 + x^4)$$

you plot five points:

$$(-3, -3), \quad (-1, -1), \quad (0, 0), \quad (1, 1), \quad \text{and} \quad (3, 3)$$

as shown in Figure P.3(a). From these five points, you might conclude that the graph is a line. This, however, is not correct. By plotting several more points, you can see that the graph is more complicated, as shown in Figure P.3(b).



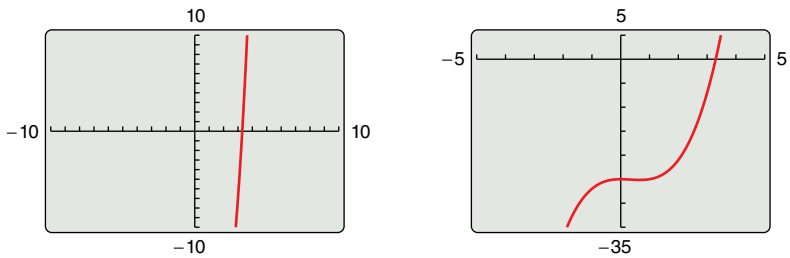
(a) (b)

Figure P.3

TECHNOLOGY Graphing an equation has been made easier by technology. Even with technology, however, it is possible to misrepresent a graph badly. For instance, each graphing utility* screen in Figure P.4 shows a portion of the graph of

$$y = x^3 - x^2 - 25.$$

From Figure P.4(a), you might assume that the graph is a line. From Figure P.4(b), however, you can see that the graph is not a line. So, when you are graphing an equation, either with or without a graphing utility, you must realize that different "viewing windows" can produce very different views of a graph. In choosing a viewing window, your goal is to show a view of the graph that fits well in the context of the problem.



(a) (b)

Graphing utility screens of $y = x^3 - x^2 - 25$

Figure P.4

Exploration

Comparing Graphical and Analytic Approaches

Use a graphing utility to graph each equation. In each case, find a viewing window that shows the important characteristics of the graph.

a. $y = x^3 - 3x^2 + 2x + 5$

b. $y = x^3 - 3x^2 + 2x + 25$

c. $y = -x^3 - 3x^2 + 20x + 5$

d. $y = 3x^3 - 40x^2 + 50x - 45$

e. $y = -(x + 12)^3$

f. $y = (x - 2)(x - 4)(x - 6)$

A purely graphical approach to this problem would involve a simple "guess, check, and revise" strategy. What types of things do you think an analytic approach might involve? For instance, does the graph have symmetry? Does the graph have turns? If so, where are they? Later, in Chapters 1, 2, and 3, you will study many new analytic tools that will help you analyze graphs of equations.

*In this text, the term *graphing utility* refers to graphing calculators (such as the *TI-Nspire* and *Desmos*) and mathematical software (such as *Maple* and *Mathematica*).

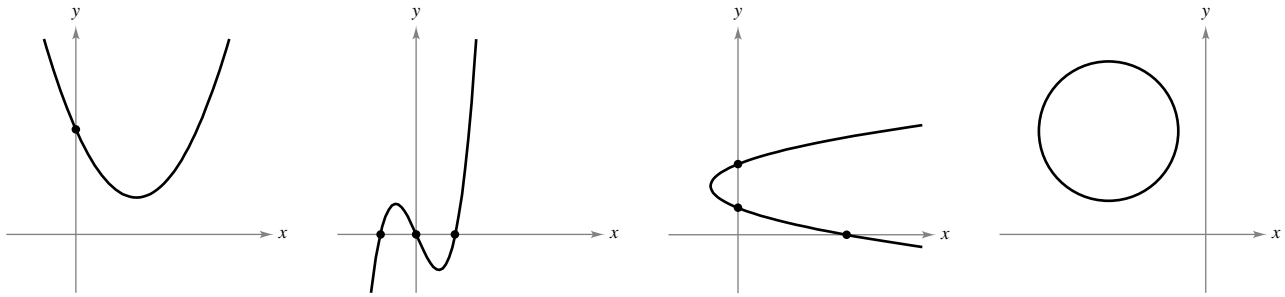
REMARK Some texts denote the x-intercept as the x-coordinate of the point $(a, 0)$ rather than the point itself. Unless it is necessary to make a distinction, when the term *intercept* is used in this text, it will mean either the point or the coordinate.

Intercepts of a Graph

Two types of solution points that are especially useful in graphing an equation are those having zero as their x- or y-coordinate. Such points are called **intercepts** because they are the points at which the graph intersects the x- or y-axis. The point $(a, 0)$ is an ***x*-intercept** of the graph of an equation when it is a solution point of the equation. To find the x-intercepts of a graph, let y be zero and solve the equation for x. The point $(0, b)$ is a ***y*-intercept** of the graph of an equation when it is a solution point of the equation. To find the y-intercepts of a graph, let x be zero and solve the equation for y.

It is possible for a graph to have no intercepts, or it might have several. For instance, consider the four graphs shown in Figure P.5.



No x-intercepts
One y-intercept

Three x-intercepts
One y-intercept

One x-intercept
Two y-intercepts

No intercepts

Figure P.5

EXAMPLE 2 Finding *x*- and *y*-Intercepts

Find the x- and y-intercepts of the graph of $y = x^3 - 4x$.

Solution To find the x-intercepts, let y be zero and solve for x.

$$x^3 - 4x = 0 \qquad \text{Let } y \text{ be zero.}$$
$$x(x^2 - 4) = 0 \qquad \text{Factor out common monomial factor.}$$
$$x(x - 2)(x + 2) = 0 \qquad \text{Factor difference of two squares.}$$
$$x = 0, 2, \text{ or } -2 \qquad \text{Solve for } x.$$

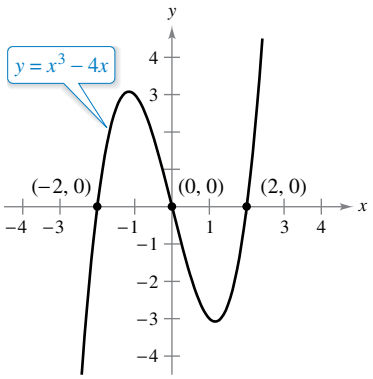
This equation has three solutions, so the graph has three x-intercepts:

$$(0, 0), \quad (2, 0), \quad \text{and} \quad (-2, 0). \qquad x\text{-intercepts}$$

To find the y-intercepts, let x be zero. Doing this produces $y = 0$. So, the y-intercept is

$$(0, 0). \qquad y\text{-intercept}$$

(See Figure P.6.)



Intercepts of a graph
Figure P.6

GO DIGITAL

TECHNOLOGY

Example 2 uses an analytic approach to find the intercepts. When an analytic approach is not possible, use a graphical approach to find the points at which the graph intersects the axes. Use the *trace* feature of a graphing utility to approximate the intercepts of the graph of the equation in Example 2. Note that the utility may have a *root* or *zero* feature that can find the x-intercepts of a graph. If so, use this feature to find the x-intercepts of the graph of the equation in Example 2.

Figure P.7

Symmetry of a Graph

Knowing the symmetry of a graph before attempting to sketch it is useful because you need only half as many points to sketch the graph. The three types of symmetry listed below can be used to help sketch the graphs of equations (see Figure P.7).

1. A graph is **symmetric with respect to the *y*-axis** if, whenever (x, y) is a point on the graph, then $(-x, y)$ is also a point on the graph. This means that the portion of the graph to the left of the y-axis is a mirror image of the portion to the right of the y-axis.
2. A graph is **symmetric with respect to the *x*-axis** if, whenever (x, y) is a point on the graph, then $(x, -y)$ is also a point on the graph. This means that the portion of the graph below the x-axis is a mirror image of the portion above the x-axis.
3. A graph is **symmetric with respect to the origin** if, whenever (x, y) is a point on the graph, then $(-x, -y)$ is also a point on the graph. This means that the graph is unchanged by a rotation of 180° about the origin.

Tests for Symmetry

1. The graph of an equation in x and y is symmetric with respect to the y-axis when replacing x by $-x$ yields an equivalent equation.
2. The graph of an equation in x and y is symmetric with respect to the x-axis when replacing y by $-y$ yields an equivalent equation.
3. The graph of an equation in x and y is symmetric with respect to the origin when replacing x by $-x$ and y by $-y$ yields an equivalent equation.

The graph of a polynomial has symmetry with respect to the y-axis when each term has an even exponent (or is a constant). For instance, the graph of

$$y = 2x^4 - x^2 + 2$$

has symmetry with respect to the y-axis. Similarly, the graph of a polynomial has symmetry with respect to the origin when each term has an odd exponent, as illustrated in Example 3.

EXAMPLE 3 Testing for Symmetry

Test the graph of $y = 2x^3 - x$ for symmetry with respect to (a) the y-axis and (b) the origin.

Solution

a. $y = 2x^3 - x$ Write original equation.

$y = 2(-x)^3 - (-x)$ Replace x by $-x$.

$y = -2x^3 + x$ Simplify. The result is *not* an equivalent equation.

Replacing x by $-x$ does *not* yield an equivalent equation, so the graph of $y = 2x^3 - x$ is *not* symmetric with respect to the y-axis.

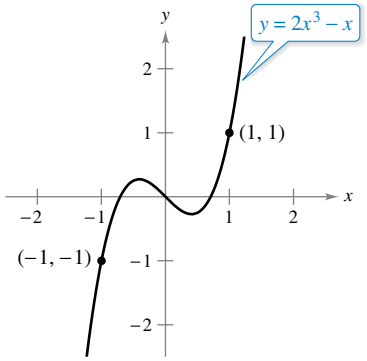
b. $y = 2x^3 - x$ Write original equation.

$-y = 2(-x)^3 - (-x)$ Replace x by $-x$ and y by $-y$.

$-y = -2x^3 + x$ Simplify.

$y = 2x^3 - x$ Equivalent equation

Replacing x by $-x$ and y by $-y$ yields an equivalent equation, so the graph of $y = 2x^3 - x$ is symmetric with respect to the origin, as shown in Figure P.8. ■



Origin symmetry

GO DIGITAL

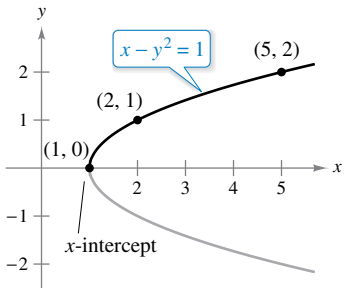

Figure P.9

EXAMPLE 4 Using Intercepts and Symmetry to Sketch a Graph

See LarsonCalculus.com for an interactive version of this type of example.

Sketch the graph of $x - y^2 = 1$.

Solution The graph is symmetric with respect to the x-axis because replacing y by $-y$ yields an equivalent equation.

$$\begin{aligned} x - y^2 &= 1 && \text{Write original equation.} \\ x - (-y)^2 &= 1 && \text{Replace } y \text{ by } -y. \\ x - y^2 &= 1 && \text{Equivalent equation} \end{aligned}$$

This means that the portion of the graph below the x-axis is a mirror image of the portion above the x-axis. To sketch the graph, first plot the x-intercept and the points above the x-axis. Then reflect in the x-axis to obtain the entire graph, as shown in Figure P.9. ■

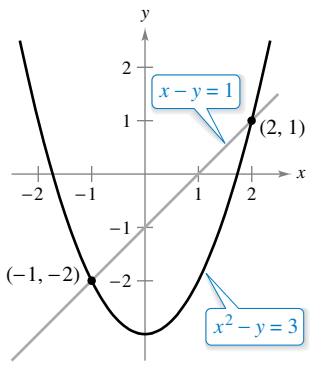
TECHNOLOGY Some graphing utilities are designed so that they most easily graph equations in which y is a function of x (see Section P.3 for a definition of *function*). To graph other types of equations, you may need to split the graph into two or more parts *or* you may need to use a different graphing mode. For instance, one way to graph the equation in Example 4 is to split it into two parts.

$$\begin{aligned} y_1 &= \sqrt{x - 1} && \text{Top portion of graph} \\ y_2 &= -\sqrt{x - 1} && \text{Bottom portion of graph} \end{aligned}$$

Points of Intersection

A **point of intersection** of the graphs of two equations is a point that satisfies both equations. You can find all points of intersection of two graphs by solving their equations simultaneously.

EXAMPLE 5 Finding Points of Intersection



Two points of intersection

Figure P.10

Find all points of intersection of the graphs of

$$x^2 - y = 3 \quad \text{and} \quad x - y = 1.$$

Solution Begin by sketching the graphs of both equations in the *same* rectangular coordinate system, as shown in Figure P.10. From the figure, it appears that the graphs have two points of intersection. You can find these two points as follows.

$$\begin{aligned} y &= x^2 - 3 && \text{Solve first equation for } y. \\ y &= x - 1 && \text{Solve second equation for } y. \\ x^2 - 3 &= x - 1 && \text{Equate } y\text{-values}. \\ x^2 - x - 2 &= 0 && \text{Write in general form.} \\ (x - 2)(x + 1) &= 0 && \text{Factor.} \\ x &= 2 \text{ or } -1 && \text{Solve for } x. \end{aligned}$$

The corresponding values of y are obtained by substituting $x = 2$ and $x = -1$ into either of the original equations. Doing this produces two points of intersection:

$$(2, 1) \quad \text{and} \quad (-1, -2). \qquad \text{Points of intersection}$$ ■

You can check the points of intersection in Example 5 by substituting into *both* of the original equations or by using the *intersect* feature of a graphing utility.

Big Ideas of Calculus

You will use the concepts in this chapter throughout your study of calculus. Take the time to fully grasp each concept now so that you are ready to apply that concept later. Be sure to complete all concept exercises in this text—Concept Checks, Exploring Concepts, and Building on Concepts. These exercises are denoted by .

Mathematical Models

Real-life applications of mathematics often use equations as **mathematical models.** In developing a mathematical model to represent actual data, you should strive for two (often conflicting) goals—accuracy and simplicity. That is, you want the model to be simple enough to be workable, yet accurate enough to produce meaningful results. Appendix G explores these goals more completely.

EXAMPLE 6 Comparing Two Mathematical Models

The Mauna Loa Observatory in Hawaii records the carbon dioxide (CO_2) concentration y (in parts per million) in Earth's atmosphere. The January readings for various years are shown in Figure P.11. In 1990, these data were used to predict the carbon dioxide level in Earth's atmosphere in 2035, using the quadratic model

$$y = 0.020t^2 + 0.68t + 316.7$$ Quadratic model for 1960–1990 data

where $t = 0$ represents 1960, as shown in Figure P.11(a). The data shown in Figure P.11(b) represent the years 1960 through 2020 and can be modeled by

$$y = 0.013t^2 + 0.85t + 316.2$$ Quadratic model for 1960–2020 data

where $t = 0$ represents 1960. What was the prediction given by the first model for 1960 through 1990? Given the second model for the 1960 through 2020 data, does this prediction for 2035 seem accurate?

The Mauna Loa Observatory in Hawaii has been measuring the increasing concentration of carbon dioxide in Earth's atmosphere since 1958.

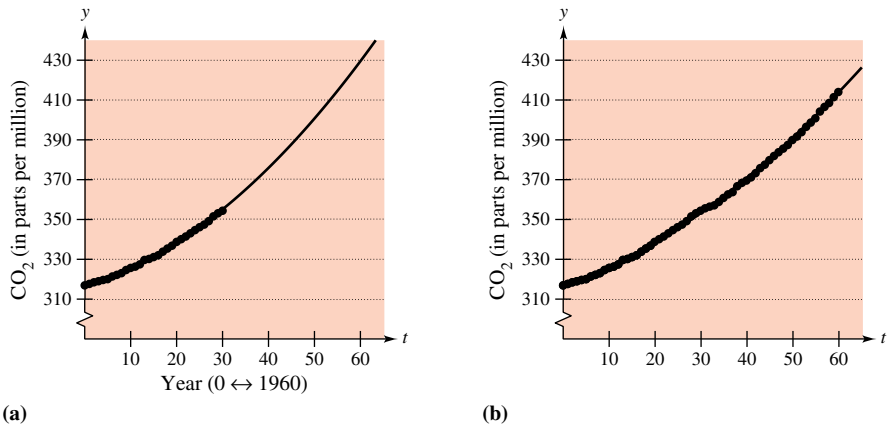

Figure P.11

Solution To answer the first question, substitute $t = 75$ (for 2035) into the first model.

$$y = 0.020(75)^2 + 0.68(75) + 316.7 = 480.2$$ Model for 1960–1990 data

So, according to this model, the carbon dioxide concentration in Earth's atmosphere would reach about 480 parts per million in 2035. Using the model for the 1960–2020 data, the prediction for 2035 is

$$y = 0.013(75)^2 + 0.85(75) + 316.2 = 453.075.$$ Model for 1960–2020 data

So, based on the second model, it appears that the 1990 prediction was too high. ■

The models in Example 6 were developed using a procedure called *least squares regression* (see Section 13.9). Note that you can use the regression capabilities of a graphing utility to find a mathematical model (see Exercises 69 and 70).

P.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

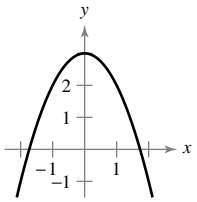
GO DIGITAL

Concept Check

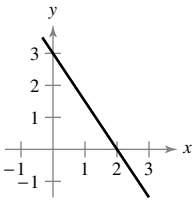
1. Describe how to find the x- and y-intercepts of the graph of an equation.
2. Explain how to use symmetry to sketch the graph of an equation.

Matching In Exercises 3–6, match the equation with its graph. [The graphs are labeled (a), (b), (c), and (d).]

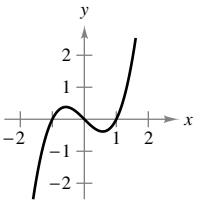
(a)



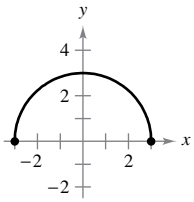
(b)



(c)



(d)



3. $y = -\frac{3}{2}x + 3$
4. $y = \sqrt{9 - x^2}$
5. $y = 3 - x^2$
6. $y = x^3 - x$

Sketching a Graph by Point Plotting In Exercises 7–16, sketch the graph of the equation by point plotting.

7. $y = \frac{1}{2}x + 2$
8. $y = 5 - 2x$
9. $y = 4 - x^2$
10. $y = (x - 3)^2$
11. $y = |x + 1|$
12. $y = |x| - 1$
13. $y = \sqrt{x} - 6$
14. $y = \sqrt{x + 2}$
15. $y = \dfrac{3}{x}$
16. $y = \dfrac{1}{x + 2}$

Approximating Solution Points In Exercises 17 and 18, use a graphing utility to graph the equation. Move the cursor along the curve to approximate the unknown coordinate of each solution point accurate to two decimal places.

17. $y = \sqrt{5 - x}$
    (a) $(2, y)$
    (b) $(x, 3)$
18. $y = x^5 - 5x$
    (a) $(-0.5, y)$
    (b) $(x, -4)$

Finding Intercepts In Exercises 19–28, find any intercepts.

19. $y = 2x - 5$
20. $y = 4x^2 + 3$
21. $y = x^2 + x - 2$
22. $y^2 = x^3 - 4x$
23. $y = x\sqrt{16 - x^2}$
24. $y = (x - 1)\sqrt{x^2 + 1}$
25. $y = \dfrac{2 - \sqrt{x}}{5x + 1}$
26. $y = \dfrac{x^2 + 3x}{(3x + 1)^2}$
27. $x^2y - x^2 + 4y = 0$
28. $y = 2x - \sqrt{x^2 + 1}$

Testing for Symmetry In Exercises 29–40, test for symmetry with respect to each axis and to the origin.

29. $y = x^2 - 6$
30. $y = 9x - x^2$
31. $y^2 = x^3 - 8x$
32. $y = x^3 + x$
33. $xy = 4$
34. $xy^2 = -10$
35. $y = 4 - \sqrt{x + 3}$
36. $xy - \sqrt{4 - x^2} = 0$
37. $y = \dfrac{x}{x^2 + 1}$
38. $y = \dfrac{x^5}{4 - x^2}$
39. $y = |x^3 + x|$
40. $|y| - x = 3$

Using Intercepts and Symmetry to Sketch a Graph In Exercises 41–58, find any intercepts and test for symmetry. Then sketch the graph of the equation.

41. $y = 2 - 3x$
42. $y = \frac{2}{3}x + 1$
43. $y = 9 - x^2$
44. $y = 2x^2 + x$
45. $y = x^3 + 2$
46. $y = x^3 - 4x$
47. $y = x\sqrt{x + 5}$
48. $y = \sqrt{25 - x^2}$
49. $x = y^3$
50. $x = y^4 - 16$
51. $y = \dfrac{8}{x}$
52. $y = \dfrac{10}{x^2 + 1}$
53. $y = 6 - |x|$
54. $y = |6 - x|$
55. $x^2 + y^2 = 9$
56. $x^2 + 4y^2 = 4$
57. $3y^2 - x = 9$
58. $3x - 4y^2 = 8$

Finding Points of Intersection In Exercises 59–64, find the points of intersection of the graphs of the equations.

59. $x + y = 8$
    $4x - y = 7$
60. $3x - 2y = -4$
    $4x + 2y = -10$
61. $x^2 + y = 15$
    $-3x + y = 11$
62. $x = 3 - y^2$
    $y = x - 1$
63. $x^2 + y^2 = 5$
    $x - y = 1$
64. $x^2 + y^2 = 16$
    $x + 2y = 4$

Finding Points of Intersection **In Exercises 65–68, use a graphing utility to find the points of intersection of the graphs of the equations. Check your results analytically.**

65. $y = x^3 - 2x^2 + x - 1$
$y = -x^2 + 3x - 1$

66. $y = x^4 - 2x^2 + 1$
$y = 1 - x^2$

67. $y = \sqrt{x + 6}$
$y = \sqrt{-x^2 - 4x}$

68. $y = -|2x - 3| + 6$
$y = 6 - x$

69. Modeling Data The table shows the gross domestic product, or GDP (in trillions of dollars), for 2012 through 2019. *(Source: U.S. Bureau of Economic Analysis)*

Year	2012	2013	2014	2015
GDP	16.2	16.8	17.5	18.2

Year	2016	2017	2018	2019
GDP	18.7	19.5	20.6	21.4

(a) Use the regression capabilities of a graphing utility to find a mathematical model of the form $y = at + b$ for the data. In the model, y represents the GDP (in trillions of dollars) and t represents the year, with $t = 12$ corresponding to 2012.

(b) Use a graphing utility to plot the data and graph the model. Compare the data with the model.

(c) Use the model to predict the GDP in the year 2029.

70. Modeling Data

The table shows the numbers of cell phone subscriptions (in billions) worldwide for 2012 through 2019. *(Source: Statista)*

Year	2012	2013	2014	2015
Number	6.3	6.7	7.0	7.2

Year	2016	2017	2018	2019
Number	7.5	7.8	7.9	8.3

(a) Use the regression capabilities of a graphing utility to find a mathematical model of the form $y = at^2 + bt + c$ for the data. In the model, y represents the number of subscriptions (in billions) and t represents the year, with $t = 12$ corresponding to 2012.

(b) Use a graphing utility to plot the data and graph the model. Compare the data with the model.

(c) Use the model to predict the number of cell phone subscriptions worldwide in the year 2029.

PeopleImages/Getty Images

71. Break-Even Point Find the sales necessary to break even ($R = C$) when the cost C of producing x units is $C = 2.04x + 5600$ and the revenue R from selling x units is $R = 3.29x$.

72. Using Solution Points For what values of k does the graph of $y^2 = 4kx$ pass through the point?

(a) $(1, 1)$ (b) $(2, 4)$

(c) $(0, 0)$ (d) $(3, 3)$

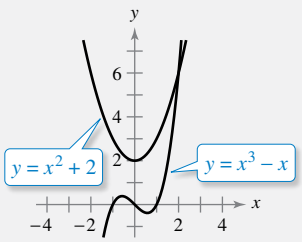
Exploring Concepts

73. Write an equation whose graph has intercepts at $x = -\frac{3}{2}$, $x = 4$, and $x = \frac{5}{2}$. (There is more than one correct answer.)

74. A graph is symmetric with respect to the x-axis and to the y-axis. Is the graph also symmetric with respect to the origin? Explain.

75. A graph is symmetric with respect to one axis and to the origin. Is the graph also symmetric with respect to the other axis? Explain.

76. HOW DO YOU SEE IT? Use the graphs of the two equations to answer the questions below.



(a) What are the intercepts for each equation?

(b) Determine the symmetry for each equation.

(c) Determine the point of intersection of the two equations.

True or False? **In Exercises 77–80, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

77. If $(-4, -5)$ is a point on a graph that is symmetric with respect to the x-axis, then $(4, -5)$ is also a point on the graph.

78. If $(-4, -5)$ is a point on a graph that is symmetric with respect to the y-axis, then $(4, -5)$ is also a point on the graph.

79. If $b^2 - 4ac > 0$ and $a \neq 0$, then the graph of

$y = ax^2 + bx + c$

has two x-intercepts.

80. If $b^2 - 4ac = 0$ and $a \neq 0$, then the graph of

$y = ax^2 + bx + c$

has only one x-intercept.

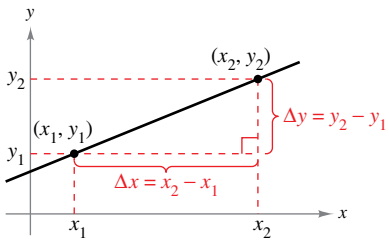
P.2 Linear Models and Rates of Change

GO DIGITAL

- **Find the slope of a line passing through two points.**
- **Write the equation of a line with a given point and slope.**
- **Interpret slope as a ratio or as a rate in a real-life application.**
- **Sketch the graph of a linear equation in slope-intercept form.**
- **Write equations of lines that are parallel or perpendicular to a given line.**

The Slope of a Line



$\Delta y = y_2 - y_1$ = change in y
$\Delta x = x_2 - x_1$ = change in x
Figure P.12

The **slope** of a nonvertical line is a measure of the number of units the line rises (or falls) vertically for each unit of horizontal change from left to right. Consider the two points (x_1, y_1) and (x_2, y_2) on the line in Figure P.12. As you move from left to right along this line, a vertical change of

$$\Delta y = y_2 - y_1 \qquad \text{Change in } y$$

units corresponds to a horizontal change of

$$\Delta x = x_2 - x_1 \qquad \text{Change in } x$$

units. (The symbol Δ is the uppercase Greek letter delta, and the symbols Δy and Δx are read "delta y" and "delta x.")

Definition of the Slope of a Line

The **slope** m of the nonvertical line passing through (x_1, y_1) and (x_2, y_2) is

$$m = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}, \quad x_1 \neq x_2. \qquad \text{Slope of a nonvertical line}$$

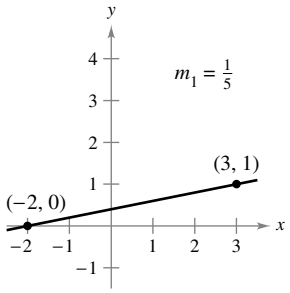
Slope is not defined for vertical lines.

When using the formula for slope, note that

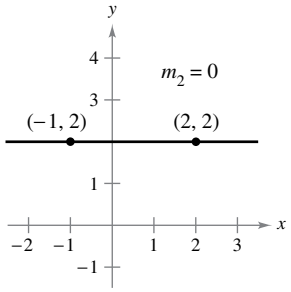
$$\frac{y_2 - y_1}{x_2 - x_1} = \frac{-(y_1 - y_2)}{-(x_1 - x_2)} = \frac{y_1 - y_2}{x_1 - x_2}. \qquad \text{Equivalent fractions}$$

So, it does not matter in which order you subtract *as long as* you are consistent and both "subtracted coordinates" come from the same point.

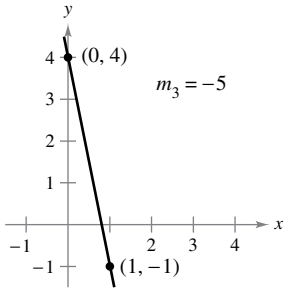
Figure P.13 shows four lines: one has a positive slope, one has a slope of zero, one has a negative slope, and one has an "undefined" slope. In general, the greater the absolute value of the slope of a line, the steeper the line. For instance, in Figure P.13, the line with a slope of -5 is steeper than the line with a slope of $\frac{1}{5}$.



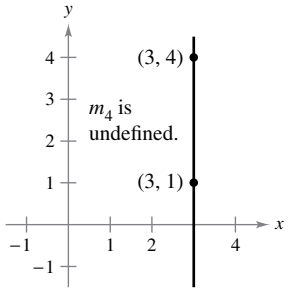
If m is positive, then the line rises from left to right.



If m is zero, then the line is horizontal.



If m is negative, then the line falls from left to right.



If m is undefined, then the line is vertical.

Figure P.13

Exploration

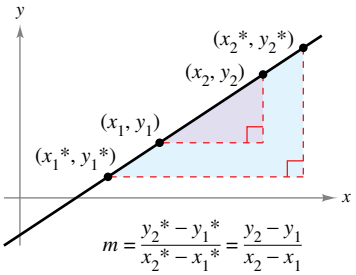
Investigating Equations of Lines Use a graphing utility to graph each linear equation. Which point is common to all seven lines? Which value in the equation determines the slope of each line?

a. $y - 4 = -2(x + 1)$
b. $y - 4 = -1(x + 1)$
c. $y - 4 = -\frac{1}{2}(x + 1)$
d. $y - 4 = 0(x + 1)$
e. $y - 4 = \frac{1}{2}(x + 1)$
f. $y - 4 = 1(x + 1)$
g. $y - 4 = 2(x + 1)$

Use your results to write an equation of a line passing through $(-1, 4)$ with a slope of m.

Equations of Lines

Any two points on a nonvertical line can be used to calculate its slope. This can be verified from the similar triangles shown in Figure P.14. (Recall that the ratios of corresponding sides of similar triangles are equal.)



Any two points on a nonvertical line can be used to determine its slope.
Figure P.14

If (x_1, y_1) is a point on a nonvertical line that has a slope of m and (x, y) is *any other* point on the line, then

$$\frac{y - y_1}{x - x_1} = m.$$

This equation in the variables x and y can be rewritten in the form

$$y - y_1 = m(x - x_1)$$

which is the **point-slope form** of the equation of a line.

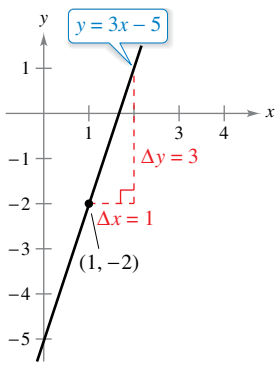
Point-Slope Form of the Equation of a Line

The **point-slope form** of the equation of the line that passes through the point (x_1, y_1) and has a slope of m is

$$y - y_1 = m(x - x_1).$$ Point-slope form

REMARK Remember that only nonvertical lines have a slope. Consequently, vertical lines cannot be written in point-slope form. For instance, the equation of the vertical line passing through the point $(1, -2)$ is $x = 1$.

GO DIGITAL



The line with a slope of 3 passing through the point $(1, -2)$
Figure P.15

EXAMPLE 1 Finding an Equation of a Line

Find an equation of the line that has a slope of 3 and passes through the point $(1, -2)$. Then sketch the line.

Solution

$$y - y_1 = m(x - x_1)$$ Point-slope form
$$y - (-2) = 3(x - 1)$$ Substitute -2 for y_1, 1 for x_1, and 3 for m.
$$y + 2 = 3x - 3$$ Simplify.
$$y = 3x - 5$$ Solve for y.

To sketch the line, first plot the point $(1, -2)$. Then, because the slope is $m = 3$, you can locate a second point on the line by moving one unit to the right and three units upward, as shown in Figure P.15.

GO DIGITAL

Ratios and Rates of Change

The slope of a line can be interpreted as either a *ratio* or a *rate*. If the x- and y-axes have the same unit of measure, then the slope has no units and is a **ratio.** If the x- and y-axes have different units of measure, then the slope is a rate or **rate of change.** In your study of calculus, you will encounter applications involving both interpretations of slope.

EXAMPLE 2 Using Slope as a Ratio

The maximum recommended slope of a wheelchair ramp is $\frac{1}{12}$. A business installs a wheelchair ramp that rises to a height of 22 inches over a length of 24 feet, as shown in Figure P.16. Is the ramp steeper than recommended? *(Source: ADA Standards for Accessible Design)*

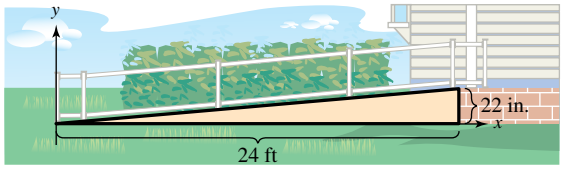

Figure P.16

Solution The length of the ramp is 24 feet or $12(24) = 288$ inches. The slope of the ramp is the ratio of its height (the vertical change) to its length (the horizontal change).

$$\begin{aligned}\text{Slope of ramp} &= \frac{\text{vertical change}}{\text{horizontal change}} \\ &= \frac{22 \text{ in.}}{288 \text{ in.}} \\ &\approx 0.076\end{aligned}$$

Because the slope of the ramp is less than $\frac{1}{12} \approx 0.083$, the ramp is not steeper than recommended. Note that the slope is a ratio and has no units.

EXAMPLE 3 Using Slope as a Rate of Change

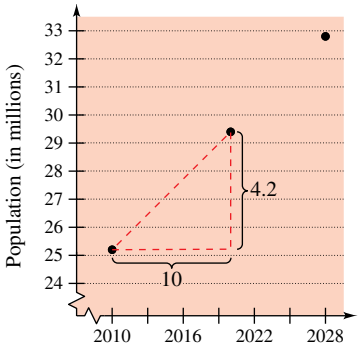
The population of Texas was about 25.2 million in 2010 and about 29.4 million in 2020. Find the average rate of change of the population over this ten-year period. What will the population of Texas be in 2028? *(Source: U.S. Census Bureau)*

Solution Over the ten-year period from 2010 through 2020, the average rate of change of the population of Texas was

$$\begin{aligned}\text{Rate of change} &= \frac{\text{change in population}}{\text{change in years}} \\ &= \frac{29.4 - 25.2}{2020 - 2010} \\ &= 0.42 \text{ million people per year.}\end{aligned}$$

Assuming the population of Texas continues to increase at this same rate for the next eight years, the population in 2028 will be about

$$29.4 + 8(0.42) \approx 32.8 \text{ million people.}$$ See Figure P.17.



Population of Texas

Figure P.17

The rate of change found in Example 3 is an **average rate of change.** An average rate of change is always calculated over an interval. In this case, the interval is [2010, 2020]. In Chapter 2, you will study another type of rate of change called an *instantaneous rate of change.*

GO DIGITAL

Graphing Linear Models

Many problems in coordinate geometry can be classified into two basic categories.

1. Given a graph (or parts of it), find its equation.
2. Given an equation, sketch its graph.

For lines, problems in the first category can be solved by using the point-slope form. The point-slope form, however, is not especially useful for solving problems in the second category. The form that is better suited to sketching the graph of a line is the **slope-intercept** form of the equation of a line.

The Slope-Intercept Form of the Equation of a Line

The graph of the linear equation

$$y = mx + b \qquad \text{Slope-intercept form}$$

is a line whose slope is m and whose y-intercept is $(0, b)$.

EXAMPLE 4 Sketching Graphs of Lines

Sketch the graph of each equation.

a. $y = 2x + 1$ **b.** $y = 2$ **c.** $3y + x - 6 = 0$

Solution

a. This equation is written in slope-intercept form.

$$y = 2x + 1 \qquad y = mx + b$$

Because $b = 1$, the y-intercept is $(0, 1)$. The slope is $m = 2$, so the line rises two units for each unit it moves to the right, as shown in Figure P.18(a).

b. By writing the equation $y = 2$ in slope-intercept form

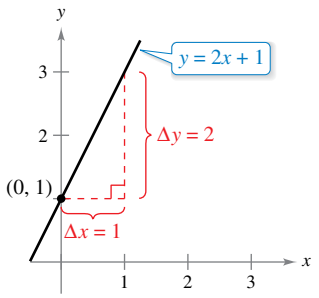
$$y = (0)x + 2 \qquad y = mx + b$$

you can see that the slope is $m = 0$ and the y-intercept is $(0, 2)$. Because the slope is zero, the line is horizontal, as shown in Figure P.18(b).

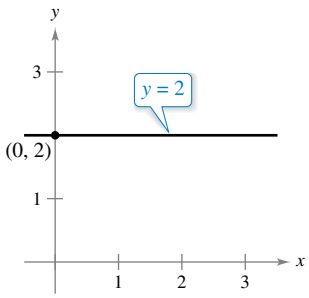
c. Begin by writing the equation in slope-intercept form.

$$\begin{aligned} 3y + x - 6 &= 0 && \text{Write original equation.} \\ 3y &= -x + 6 && \text{Isolate } y\text{-term on the left.} \\ y &= -\tfrac{1}{3}x + 2 && y = mx + b \end{aligned}$$

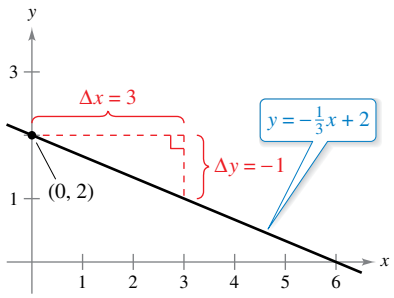
In this form, you can see that the y-intercept is $(0, 2)$ and the slope is $m = -\frac{1}{3}$. This means that the line falls one unit for every three units it moves to the right, as shown in Figure P.18(c).



(a) $m = 2$; line rises to the right



(b) $m = 0$; line is horizontal



(c) $m = -\frac{1}{3}$; line falls to the right

GO DIGITAL

Because the slope of a vertical line is not defined, its equation cannot be written in slope-intercept form. However, the equation of any line can be written in the **general form**

$$Ax + By + C = 0 \qquad \text{General form of the equation of a line}$$

where A and B are not *both* zero. For instance, the vertical line

$$x = a \qquad \text{Vertical line}$$

can be represented by the general form

$$x - a = 0. \qquad \text{General form}$$

REMARK Writing an equation of a line is an important concept in calculus. For example, in Chapter 2, you will use the point-slope form of a line to write equations of tangent lines.

Summary of Equations of Lines

1.	General form:	$Ax + By + C = 0$
2.	Vertical line:	$x = a$
3.	Horizontal line:	$y = b$
4.	Slope-intercept form:	$y = mx + b$
5.	Point-slope form:	$y - y_1 = m(x - x_1)$

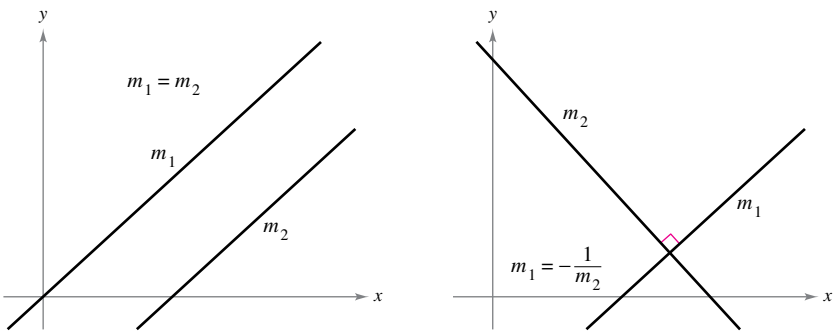
Parallel and Perpendicular Lines

The slope of a line is a convenient tool for determining whether two lines are parallel or perpendicular, as shown in Figure P.19. Specifically, distinct nonvertical lines with the same slope are parallel, and nonvertical lines whose slopes are negative reciprocals are perpendicular.

REMARK In mathematics, the phrase "if and only if" is a way of stating two implications in one statement. For instance, the definition of parallel lines can be rewritten as the two implications below.

a. If two distinct nonvertical lines are parallel, then their slopes are equal.

b. If two distinct nonvertical lines have equal slopes, then they are parallel.



Parallel lines — Perpendicular lines

Figure P.19

Parallel and Perpendicular Lines

1. Two distinct nonvertical lines are **parallel** if and only if their slopes are equal—that is, if and only if

$$m_1 = m_2. \qquad \text{Parallel} \iff \text{Slopes are equal.}$$

2. Two nonvertical lines are **perpendicular** if and only if their slopes are negative reciprocals of each other—that is, if and only if

$$m_1 = -\frac{1}{m_2}. \qquad \text{Perpendicular} \iff \text{Slopes are negative reciprocals.}$$

Lines parallel and perpendicular to $2x - 3y = 5$

Figure P.20

EXAMPLE 5 Finding Parallel and Perpendicular Lines

See LarsonCalculus.com for an interactive version of this type of example.

Find the general forms of the equations of the lines that pass through the point $(2, -1)$ and are (a) parallel to and (b) perpendicular to the line $2x - 3y = 5$.

Solution Begin by writing the linear equation $2x - 3y = 5$ in slope-intercept form.

$$2x - 3y = 5 \qquad \text{Write original equation.}$$
$$y = \tfrac{2}{3}x - \tfrac{5}{3} \qquad \text{Slope-intercept form}$$

So, the given line has a slope of $m = \frac{2}{3}$. (See Figure P.20.)

a. The line through $(2, -1)$ that is parallel to the given line also has a slope of $\frac{2}{3}$.

$$y - y_1 = m(x - x_1) \qquad \text{Point-slope form}$$
$$y - (-1) = \tfrac{2}{3}(x - 2) \qquad \text{Substitute.}$$
$$3(y + 1) = 2(x - 2) \qquad \text{Simplify.}$$
$$3y + 3 = 2x - 4 \qquad \text{Distributive Property}$$
$$2x - 3y - 7 = 0 \qquad \text{General form}$$

Note the similarity to the equation of the given line, $2x - 3y = 5$.

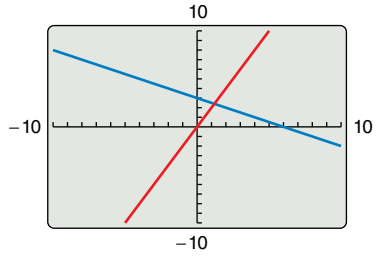
b. Use the negative reciprocal of the slope of the given line to determine that the slope of a line perpendicular to the given line is $-\frac{3}{2}$.

$$y - y_1 = m(x - x_1) \qquad \text{Point-slope form}$$
$$y - (-1) = -\tfrac{3}{2}(x - 2) \qquad \text{Substitute.}$$
$$2(y + 1) = -3(x - 2) \qquad \text{Simplify.}$$
$$2y + 2 = -3x + 6 \qquad \text{Distributive Property}$$
$$3x + 2y - 4 = 0 \qquad \text{General form}$$

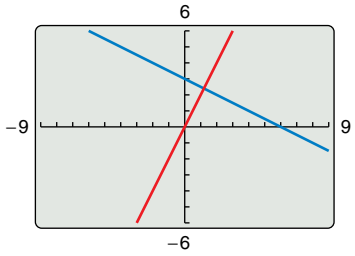
TECHNOLOGY PITFALL The slope of a line will appear distorted if you use different tick-mark spacing on the x- and y-axes. For instance, the graphing utility screens in Figures P.21(a) and P.21(b) both show the lines

$$y = 2x \quad \text{and} \quad y = -\tfrac{1}{2}x + 3.$$

Because these lines have slopes that are negative reciprocals, they must be perpendicular. In Figure P.21(a), however, the lines do not appear to be perpendicular because the tick-mark spacing on the x-axis is not the same as that on the y-axis. In Figure P.21(b), the lines appear perpendicular because the tick-mark spacing on the x-axis is the same as on the y-axis. This type of viewing window is said to have a *square setting*.



(a) Tick-mark spacing on the x-axis is not the same as tick-mark spacing on the y-axis.



(b) Tick-mark spacing on the x-axis is the same as tick-mark spacing on the y-axis.

P.2 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

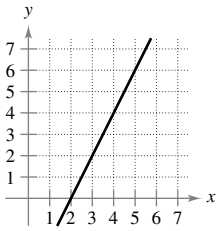
GO DIGITAL

Concept Check

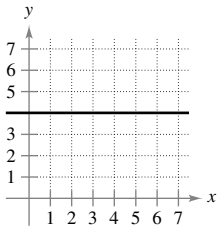
1. In the form $y = mx + b$, what does m represent? What does b represent?
2. Is it possible for two lines with positive slopes to be perpendicular lines? Why or why not?

Estimating Slope **In Exercises 3–6, estimate the slope of the line from its graph. To print an enlarged copy of the graph, go to *MathGraphs.com*.**

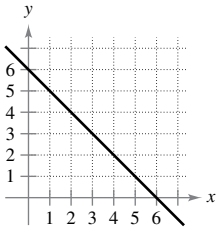
3.



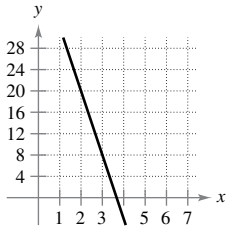
4.



5.



6.



Finding the Slope of a Line **In Exercises 7–12, plot the pair of points and find the slope of the line passing through them.**

7. $(3, -4), (5, 2)$
8. $(0, 0), (-2, 3)$
9. $(4, 6), (4, 1)$
10. $(3, -5), (5, -5)$
11. $\left(-\frac{1}{2}, \frac{2}{3}\right), \left(-\frac{3}{4}, \frac{1}{6}\right)$
12. $\left(\frac{7}{8}, \frac{3}{4}\right), \left(\frac{5}{4}, -\frac{1}{4}\right)$

Sketching Lines **In Exercises 13 and 14, sketch the lines through the point with the indicated slopes. Make the sketches on the same set of coordinate axes.**

	Point	Slopes			
13.	$(3, 4)$	(a) 1	(b) -2	(c) $-\frac{3}{2}$	(d) Undefined
14.	$(-2, 5)$	(a) 3	(b) -3	(c) $\frac{1}{3}$	(d) 0

Finding Points on a Line **In Exercises 15–18, use the point on the line and the slope of the line to find three additional points that the line passes through. (There is more than one correct answer.)**

	Point	Slope
15.	$(6, 2)$	$m = 0$
16.	$(-4, 3)$	m is undefined.
17.	$(1, 7)$	$m = -3$
18.	$(-2, -2)$	$m = 2$

Finding an Equation of a Line **In Exercises 19–24, find an equation of the line that passes through the point and has the indicated slope. Then sketch the line.**

	Point	Slope
19.	$(0, 3)$	$m = \frac{3}{4}$
20.	$(-5, -2)$	$m = \frac{6}{5}$
21.	$(1, 2)$	m is undefined.
22.	$(0, 4)$	$m = 0$
23.	$(3, -2)$	$m = 3$
24.	$(-2, 4)$	$m = -\frac{3}{5}$

25. **Road Grade** You are driving on a road that has a 6% uphill grade. This means that the slope of the road is $\frac{6}{100}$. Approximate the amount of vertical change in your position when you drive 200 feet.

26. **Conveyor Design**

A moving conveyor is built to rise 1 meter for each 3 meters of horizontal change.

(a) Find the slope of the conveyor.

(b) The conveyor runs between two floors in a factory. Find the length of the conveyor when the vertical distance between floors is 10 feet.

27. **Population** The table shows the populations y (in millions) of the United States for 2011 through 2020. The variable t represents the year, with $t = 11$ corresponding to 2011. (*Source: U.S. Census Bureau*)

t	11	12	13	14	15
y	312.0	314.2	316.3	318.6	320.9

t	16	17	18	19	20
y	323.2	325.2	326.9	328.5	330.1

(a) Plot the data and connect adjacent points with a line segment. Use the slope of each line segment to determine the year when the population increased least rapidly.

(b) Find the average rate of change of the population of the United States from 2011 through 2020.

(c) Use the average rate of change of the population to predict the population of the United States in 2030.

28. Biomass-Based Diesel Fuel Production The table shows the biomass-based diesel fuel productions y (in millions of barrels per day) for the United States for 2014 through 2019. The variable t represents the year, with $t = 14$ corresponding to 2014. *(Source: U.S. Energy Information Administration)*

t	14	15	16	17	18	19
y	83	82	102	104	121	112

(a) Plot the data and connect adjacent points with a line segment. Use the slope of each line segment to determine the year when biomass-based diesel fuel production increased most rapidly.

(b) Find the average rate of change of biomass-based diesel fuel production for the United States from 2014 through 2019.

(c) Should the average rate of change be used to predict future biomass-based diesel fuel production? Explain.

Finding the Slope and *y*-Intercept **In Exercises 29–34, find the slope and the *y*-intercept (if possible) of the line.**

29. $y = 4x - 3$

30. $-x + y = 1$

31. $5x + y = 20$

32. $6x - 5y = 15$

33. $x = 4$

34. $y = -1$

Sketching a Line in the Plane **In Exercises 35–42, sketch the graph of the equation.**

35. $y = -3$

36. $x = 4$

37. $y = -2x + 1$

38. $y = \frac{1}{3}x - 1$

39. $y - 2 = \frac{3}{2}(x - 1)$

40. $y - 1 = 3(x + 4)$

41. $3x - 3y + 1 = 0$

42. $x + 2y + 6 = 0$

Finding an Equation of a Line **In Exercises 43–50, find an equation of the line that passes through the points. Then sketch the line.**

43. $(4, 3), (0, -5)$

44. $(-2, -2), (1, 7)$

45. $(2, 8), (5, 0)$

46. $(-3, 6), (1, 2)$

47. $(6, 3), (6, 8)$

48. $(1, -2), (3, -2)$

49. $(3, 1), (5, 1)$

50. $(2, 5), (2, 7)$

51. Writing an Equation Write an equation for the line that passes through the points $(0, b)$ and $(3, 1)$.

52. Using Intercepts Show that the line with intercepts $(a, 0)$ and $(0, b)$ has the equation

$$\frac{x}{a} + \frac{y}{b} = 1, \quad a \neq 0, b \neq 0.$$

Writing an Equation in General Form **In Exercises 53–56, use the result of Exercise 52 to write an equation of the line with the given characteristics in general form.**

53. x-intercept: $(2, 0)$
y-intercept: $(0, 3)$

54. x-intercept: $\left(-\frac{2}{3}, 0\right)$
y-intercept: $(0, -2)$

55. Point on line: $(9, -2)$
x-intercept: $(2a, 0)$
y-intercept: $(0, a)$
$(a \neq 0)$

56. Point on line: $\left(-\frac{2}{3}, -2\right)$
x-intercept: $(a, 0)$
y-intercept: $(0, -a)$
$(a \neq 0)$

Finding Parallel and Perpendicular Lines **In Exercises 57–62, find the general forms of the equations of the lines that pass through the point and are (a) parallel to the given line and (b) perpendicular to the given line.**

	Point	Line
57.	$(-7, -2)$	$x = 1$
58.	$(-1, 0)$	$y = -3$
59.	$(-3, 2)$	$x + y = 7$
60.	$(2, 5)$	$x - y = -2$
61.	$\left(\frac{3}{4}, \frac{7}{8}\right)$	$5x - 3y = 0$
62.	$\left(\frac{5}{6}, -\frac{1}{2}\right)$	$7x + 4y = 8$

Rate of Change **In Exercises 63 and 64, you are given the dollar value of a product in 2021 *and* the rate at which the value of the product is expected to change during the next 5 years. Write a linear equation that gives the dollar value V of the product in terms of the year t. (Let $t = 0$ represent 2020.)**

	2021 Value	Rate
63.	\$1850	\$250 increase per year
64.	\$17,200	\$1600 decrease per year

Collinear Points **In Exercises 65 and 66, determine whether the points are collinear. (Three points are *collinear* when they lie on the same line.)**

65. $(-2, 1), (-1, 0), (2, -2)$

66. $(0, 4), (7, -6), (-5, 11)$

Exploring Concepts

67. Show that the points $(-1, 0)$, $(3, 0)$, $(1, 2)$, and $(1, -2)$ are vertices of a square.

68. A line is represented by the equation $ax + by = 4$.

(a) When is the line parallel to the x-axis?

(b) When is the line parallel to the y-axis?

(c) Give values for a and b such that the line has a slope of $\frac{5}{8}$.

(d) Give values for a and b such that the line is perpendicular to $y = \frac{2}{5}x + 3$.

(e) Give values for a and b such that the line coincides with the graph of $5x + 6y = 8$.

69. Finding a Tangent Line Find an equation of the line tangent to the circle $x^2 + y^2 = 169$ at the point $(5, 12)$.

70. Finding a Tangent Line Find an equation of the line tangent to the circle $(x - 1)^2 + (y - 1)^2 = 25$ at the point $(4, -3)$.

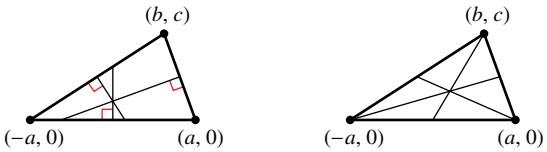
71. Finding Points of Intersection Find the coordinates of the point of intersection of the given segments.

(a) Perpendicular bisectors (b) Medians



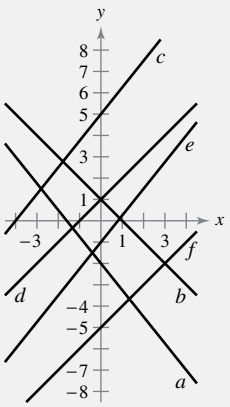
72. HOW DO YOU SEE IT? Several lines are shown in the figure below. (The lines are labeled *a*–*f*.)

(a) Which lines have a positive slope?

(b) Which lines have a negative slope?

(c) Which lines appear parallel?

(d) Which lines appear perpendicular?



73. Temperature Conversion Find a linear equation that expresses the relationship between the temperature in degrees Celsius C and degrees Fahrenheit F. Use the fact that water freezes at 0°C (32°F) and boils at 100°C (212°F). Use the equation to convert 72°F to degrees Celsius.

74. Choosing a Job As a salesperson, you receive a monthly salary of $2000, plus a commission of 7% of sales. You are offered a new job at $2300 per month, plus a commission of 5% of sales.

(a) Write linear equations for your monthly wage W in terms of your monthly sales s for your current job and your job offer.

(b) Use a graphing utility to graph each equation and find the point of intersection. What does it signify?

(c) You think you can sell $20,000 worth of a product per month. Should you change jobs? Explain.

75. Apartment Rental A real estate office manages an apartment complex with 50 one-bedroom units. When the rent is $780 per month, all 50 units are occupied. However, when the rent is $825, the average number of occupied units drops to 47. Assume that the relationship between the monthly rent p and the demand x is linear. (*Note:* The term *demand* refers to the number of occupied units.)

(a) Write a linear equation giving the demand x in terms of the rent p.

(b) *Linear extrapolation* Use a graphing utility to graph the demand equation and use the *trace* feature to predict the number of units occupied when the rent is raised to $855.

(c) *Linear interpolation* Predict the number of units occupied when the rent is lowered to $795. Verify graphically.

76. Modeling Data An instructor gives regular 20-point quizzes and 100-point exams in a mathematics course. Average scores for six students, given as ordered pairs (x, y), where x is the average quiz score and y is the average exam score, are (18, 87), (10, 55), (19, 96), (16, 79), (13, 76), and (15, 82).

(a) Use the regression capabilities of a graphing utility to find the least squares regression line for the data.

(b) Use a graphing utility to plot the points and graph the regression line in the same viewing window.

(c) Use the regression line to predict the average exam score for a student with an average quiz score of 17.

(d) Interpret the meaning of the slope of the regression line.

(e) The instructor adds 4 points to the average exam score of everyone in the class. Describe the changes in the positions of the plotted points and the change in the equation of the line.

77. Distance Show that the distance between the point (x_1, y_1) and the line $Ax + By + C = 0$ is

$$\text{Distance} = \frac{|Ax_1 + By_1 + C|}{\sqrt{A^2 + B^2}}.$$

78. Distance Write the distance d between the point (3, 1) and the line $y = mx + 4$ in terms of m. Use a graphing utility to graph the equation. When is the distance 0? Explain the result geometrically.

Distance **In Exercises 79 and 80, use the result of Exercise 77 to find the distance between the point and line.**

79. Point: $(-2, 1)$
Line: $x - y - 2 = 0$

80. Point: $(2, 3)$
Line: $4x + 3y = 10$

81. Proof Prove that the diagonals of a rhombus intersect at right angles. (A rhombus is a quadrilateral with sides of equal lengths.)

82. Proof Prove that the figure formed by connecting consecutive midpoints of the sides of any quadrilateral is a parallelogram.

83. Proof Prove that if the points (x_1, y_1) and (x_2, y_2) lie on the same line as (x_1^*, y_1^*) and (x_2^*, y_2^*), then

$$\frac{y_2^* - y_1^*}{x_2^* - x_1^*} = \frac{y_2 - y_1}{x_2 - x_1}.$$

Assume $x_1 \neq x_2$ and $x_1^* \neq x_2^*$.

84. Proof Prove that if the slopes of two nonvertical lines are negative reciprocals of each other, then the lines are perpendicular.

True or False? **In Exercises 85 and 86, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

85. The lines represented by

$$ax + by = c_1 \quad \text{and} \quad bx - ay = c_2$$

are perpendicular. Assume $a \neq 0$ and $b \neq 0$.

86. If a line contains points in both the first and third quadrants, then its slope must be positive.

P.3 Functions and Their Graphs

GO DIGITAL

- **Use function notation to represent and evaluate a function.**
- **Find the domain and range of a function.**
- **Sketch the graph of a function.**
- **Identify different types of transformations of functions.**
- **Classify functions and recognize combinations of functions.**

REMARK The concepts in this section are essential to your study of calculus. It is important that you grasp them now so you are able to learn more advanced material later.

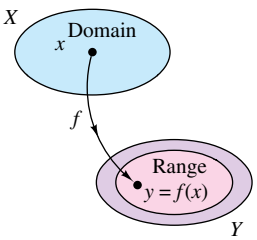
Functions and Function Notation

A **relation** between two sets X and Y is a set of ordered pairs, each of the form (x, y), where x is a member of X and y is a member of Y. A **function** from X to Y is a relation between X and Y that has the property that any two ordered pairs with the same x-value also have the same y-value. The variable x is the **independent variable,** and the variable y is the **dependent variable.**

Many real-life situations can be modeled by functions. For instance, the area A of a circle is a function of the circle's radius r.

$$A = \pi r^2 \qquad A \text{ is a function of } r.$$

In this case, r is the independent variable and A is the dependent variable.



A real-valued function f of a real variable

Figure P.22

Definition of a Real-Valued Function of a Real Variable

Let X and Y be sets of real numbers. A **real-valued function f of a real variable x** from X to Y is a correspondence that assigns to each number x in X exactly one number y in Y.

The **domain** of f is the set X. The number y is the **image** of x under f and is denoted by $f(x)$, which is called the **value of f at x.** The **range** of f is a subset of Y and consists of all images of numbers in X. (See Figure P.22.)

Functions can be specified in a variety of ways. In this text, however, you will concentrate primarily on functions that are given by equations involving the dependent and independent variables. For instance, the equation

$$x^2 + 2y = 1 \qquad \text{Equation in implicit form}$$

defines y, the dependent variable, as a function of x, the independent variable. To **evaluate** this function (that is, to find the y-value that corresponds to a given x-value), it is convenient to isolate y on the left side of the equation.

$$y = \frac{1}{2}(1 - x^2) \qquad \text{Equation in explicit form}$$

Using f as the name of the function, you can write this equation as

$$f(x) = \frac{1}{2}(1 - x^2). \qquad \text{Function notation}$$

The original equation $x^2 + 2y = 1$ **implicitly** defines y as a function of x. When you solve the equation for y, you are writing the equation in **explicit** form.

Function notation has the advantage of clearly identifying the dependent variable as $f(x)$ while at the same time telling you that x is the independent variable and that the function itself is "f." The symbol $f(x)$ is read "f of x." Function notation allows you to be less wordy. Instead of asking "What is the value of y that corresponds to $x = 3$?" you can ask "What is $f(3)$?"

FUNCTION NOTATION

The word *function* was first used by Gottfried Wilhelm Leibniz in 1694 as a term to denote any quantity connected with a curve, such as the coordinates of a point on a curve or the slope of a curve. Forty years later, Leonhard Euler used the word "function" to describe any expression made up of a variable and some constants. He introduced the notation $y = f(x)$. (To read more about Euler, see the biography on the next page.)

LEONHARD EULER (1707–1783)

In addition to making major contributions to almost every branch of mathematics, Euler was one of the first to apply calculus to real-life problems in physics. His extensive published writings include such topics as shipbuilding, acoustics, optics, astronomy, mechanics, and magnetism.

See LarsonCalculus.com to read more of this biography.

In an equation that defines a function of x, the role of the variable x is simply that of a placeholder. For instance, the function

$$f(x) = 2x^2 - 4x + 1 \qquad \text{Function of } x$$

can be described by the form

$$f(\square) = 2(\square)^2 - 4(\square) + 1 \qquad \text{Function of } \square$$

where rectangles are used instead of x. To evaluate $f(-2)$, replace each rectangle with -2.

$$\begin{aligned} f(-2) &= 2(-2)^2 - 4(-2) + 1 && \text{Substitute } -2 \text{ for } \square. \\ &= 2(4) + 8 + 1 && \text{Simplify.} \\ &= 17 && \text{Simplify.} \end{aligned}$$

Although f is often used as a convenient function name with x as the independent variable, you can use other symbols. For instance, these three equations all define the same function.

$$\begin{aligned} f(x) &= x^2 - 4x + 7 && \text{Function name is } f\text{; independent variable is } x. \\ h(t) &= t^2 - 4t + 7 && \text{Function name is } h\text{; independent variable is } t. \\ g(s) &= s^2 - 4s + 7 && \text{Function name is } g\text{; independent variable is } s. \end{aligned}$$

EXAMPLE 1 Evaluating a Function

For the function f defined by $f(x) = x^2 + 7$, evaluate each expression.

a. $f(3a)$ **b.** $f(b - 1)$ **c.** $\dfrac{f(x + \Delta x) - f(x)}{\Delta x}$

Solution

a. $\begin{aligned} f(3a) &= (3a)^2 + 7 && \text{Substitute } 3a \text{ for } x. \\ &= 9a^2 + 7 && \text{Simplify.} \end{aligned}$

b. $\begin{aligned} f(b - 1) &= (b - 1)^2 + 7 && \text{Substitute } b - 1 \text{ for } x. \\ &= b^2 - 2b + 1 + 7 && \text{Expand binomial.} \\ &= b^2 - 2b + 8 && \text{Simplify.} \end{aligned}$

c. $\begin{aligned} \frac{f(x + \Delta x) - f(x)}{\Delta x} &= \frac{[(x + \Delta x)^2 + 7] - (x^2 + 7)}{\Delta x} \\ &= \frac{x^2 + 2x\Delta x + (\Delta x)^2 + 7 - x^2 - 7}{\Delta x} \\ &= \frac{2x\Delta x + (\Delta x)^2}{\Delta x} \\ &= \frac{\Delta x(2x + \Delta x)}{\Delta x} \\ &= 2x + \Delta x, \quad \Delta x \neq 0 \end{aligned}$

REMARK The expression in Example 1(c) is called a *difference quotient* and has a special significance in calculus. You will learn more about this in Chapter 2.

In calculus, it is important to specify the domain of a function or expression clearly. For instance, in Example 1(c), the two expressions

$$\frac{f(x + \Delta x) - f(x)}{\Delta x} \quad \text{and} \quad 2x + \Delta x, \quad \Delta x \neq 0$$

are equivalent because $\Delta x = 0$ is excluded from the domain of each expression. Without a stated domain restriction, the two expressions would not be equivalent.

The Domain and Range of a Function

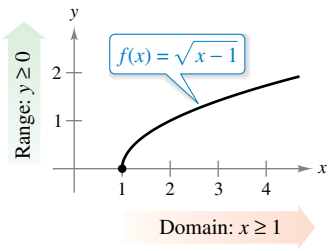
The domain of a function can be described explicitly, or it may be described *implicitly* by an equation used to define the function. The **implied domain** is the set of all real numbers for which the equation is defined, whereas an explicitly defined domain is one that is given along with the function. For example, the function

$$f(x) = \frac{1}{x^2 - 4}, \quad 4 \le x \le 5$$ *f* has an *explicitly* defined domain.

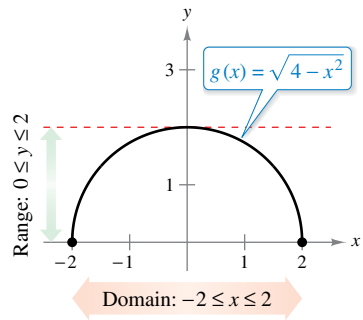
has an explicitly defined domain given by $\{x: 4 \le x \le 5\}$. On the other hand, the function

$$g(x) = \frac{1}{x^2 - 4}$$ *g* has an *implied* domain.

has an implied domain that is the set $\{x: x \neq \pm 2\}$.



(a) The domain of f is $[1, \infty)$, and the range is $[0, \infty)$.



(b) The domain of g is $[-2, 2]$, and the range is $[0, 2]$.

Figure P.23

EXAMPLE 2 Finding the Domains and Ranges of Functions

Find the domain and range of each function.

a. $f(x) = \sqrt{x - 1}$ **b.** $g(x) = \sqrt{4 - x^2}$

Solution

a. The domain of the function

$$f(x) = \sqrt{x - 1}$$

is the set of all x-values for which $x - 1 \ge 0$, which is the interval $[1, \infty)$. To find the range, observe that $f(x) = \sqrt{x - 1}$ is never negative. So, the range is the interval $[0, \infty)$, as shown in Figure P.23(a).

b. The domain of the function

$$g(x) = \sqrt{4 - x^2}$$

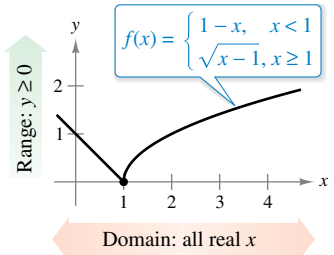
is the set of all values for which $4 - x^2 \ge 0$, or $x^2 \le 4$. So, the domain of g is the interval $[-2, 2]$. To find the range, observe that $g(x) = \sqrt{4 - x^2}$ is never negative and is at most 2. So, the range is the interval $[0, 2]$, as shown in Figure P.23(b). Note that the graph of g is a *semicircle* of radius 2.

EXAMPLE 3 A Function Defined by More than One Equation

For the piecewise-defined function

$$f(x) = \begin{cases} 1 - x, & x < 1 \\ \sqrt{x - 1}, & x \ge 1 \end{cases}$$

f is defined for $x < 1$ and $x \ge 1$. So, the domain is the set of all real numbers. On the portion of the domain for which $x \ge 1$, the function behaves as in Example 2(a). For $x < 1$, the values of $1 - x$ are positive. So, the range of the function is the interval $[0, \infty)$. (See Figure P.24.)



The domain of f is $(-\infty, \infty)$, and the range is $[0, \infty)$.

Figure P.24

A function from X to Y is **one-to-one** when to each y-value in the range there corresponds exactly one x-value in the domain. For instance, the function in Example 2(a) is one-to-one, whereas the functions in Examples 2(b) and 3 are not one-to-one. A function from X to Y is **onto** when its range consists of all of Y.

The graph of a function
Figure P.25

The Graph of a Function

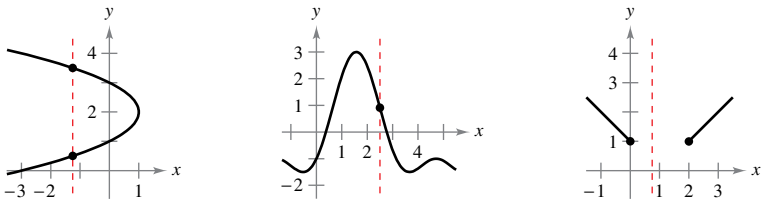
The graph of the function $y = f(x)$ consists of all points $(x, f(x))$, where x is in the domain of f. In Figure P.25, note that

x = the directed distance from the y-axis

and

$f(x)$ = the directed distance from the x-axis.

A vertical line can intersect the graph of a function of x at most *once*. This observation provides a convenient visual test, called the **Vertical Line Test,** for functions of x. That is, a graph in the coordinate plane is the graph of a function of x if and only if no vertical line intersects the graph at more than one point. For example, in Figure P.26(a), the graph does not define y as a function of x because a vertical line intersects the graph twice, whereas in Figures P.26(b) and (c), the graphs do define y as a function of x.



(a) Not a function of x **(b)** A function of x **(c)** A function of x

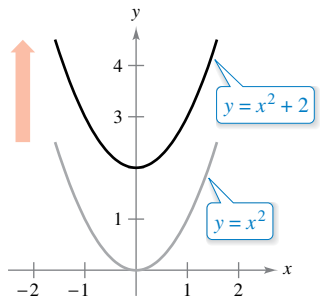
OLIVER HEAVISIDE (1850–1925)

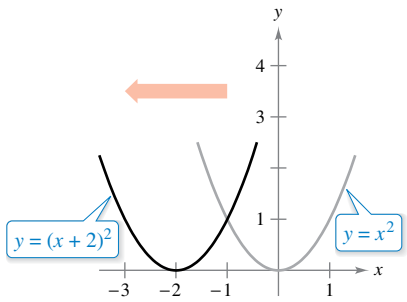
Heaviside was a British mathematician and physicist who contributed to the field of applied mathematics, especially applications of mathematics to electrical engineering. The *Heaviside function* is a classic type of "on-off" function that has applications to electricity and computer science. (See Exercise 62.)

Transformations of Functions

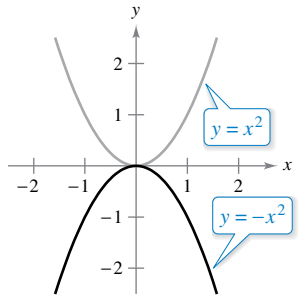
Some families of graphs have the same basic shape. For example, compare the graph of $y = x^2$ with the graphs of the four other quadratic functions shown in Figure P.28.



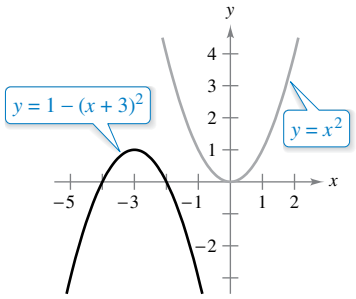
(a) Vertical shift upward



(b) Horizontal shift to the left



(c) Reflection



(d) Shift left, reflect, and shift upward

Figure P.28

Each graph in Figure P.28 is a **transformation** of the graph of $y = x^2$. The three basic types of transformations illustrated by these graphs are vertical shifts, horizontal shifts, and reflections. Function notation lends itself well to describing transformations of graphs in the plane. For instance, using

$f(x) = x^2$ Original function

as the original function, the transformations shown in Figure P.28 can be represented by these equations.

a. $y = f(x) + 2$ Vertical shift up two units

b. $y = f(x + 2)$ Horizontal shift to the left two units

c. $y = -f(x)$ Reflection about the x-axis

d. $y = -f(x + 3) + 1$ Shift left three units, reflect about the x-axis, and shift up one unit

Basic Types of Transformations ($c > 0$)

Original graph:	$y = f(x)$
Horizontal shift c units to the **right:**	$y = f(x - c)$
Horizontal shift c units to the **left:**	$y = f(x + c)$
Vertical shift c units **downward:**	$y = f(x) - c$
Vertical shift c units **upward:**	$y = f(x) + c$
Reflection (about the x-axis):	$y = -f(x)$
Reflection (about the y-axis):	$y = f(-x)$
Reflection (about the origin):	$y = -f(-x)$

Classifications and Combinations of Functions

The modern notion of a function is derived from the efforts of many seventeenth- and eighteenth-century mathematicians. Of particular note was Leonhard Euler, who introduced the function notation $y = f(x)$. By the end of the eighteenth century, mathematicians and scientists had concluded that many real-world phenomena could be represented by mathematical models taken from a collection of functions called **elementary functions.** Elementary functions fall into three categories.

1. Algebraic functions (polynomial, radical, rational)
2. Trigonometric functions (sine, cosine, tangent, and so on)
3. Exponential and logarithmic functions

You will review the trigonometric functions in the next section. The other nonalgebraic functions, such as the inverse trigonometric functions and the exponential and logarithmic functions, are introduced in Chapter 5.

The most common type of algebraic function is a **polynomial function**

$$f(x) = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

REMARK Note that the *ellipsis points* (the three dots between the plus signs) indicate that the pattern continues.

where n is a nonnegative integer. The numbers a_i are **coefficients,** with a_n the **leading coefficient** and a_0 the **constant term** of the polynomial function. If $a_n \neq 0$, then n is the **degree** of the polynomial function. The zero polynomial $f(x) = 0$ is not assigned a degree. It is common practice to use subscript notation for coefficients of general polynomial functions, but for polynomial functions of low degree, these simpler forms are often used. (Note that $a \neq 0$.)

Zeroth degree:	$f(x) = a$	Constant function
First degree:	$f(x) = ax + b$	Linear function
Second degree:	$f(x) = ax^2 + bx + c$	Quadratic function
Third degree:	$f(x) = ax^3 + bx^2 + cx + d$	Cubic function

Although the graph of a nonconstant polynomial function can have several turns, eventually the graph will rise or fall without bound as x moves to the right or left. Whether the graph of

$$f(x) = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

eventually rises or falls can be determined by the function's degree (odd or even) and by the leading coefficient a_n, as indicated in Figure P.29. Note that the dashed portions of the graphs indicate that the **Leading Coefficient Test** determines *only* the right and left behavior of the graph.

GO DIGITAL

Just as a rational number can be written as the quotient of two integers, a **rational function** can be written as the quotient of two polynomials. Specifically, a function f is rational when it has the form

$$f(x) = \frac{p(x)}{q(x)}, \quad q(x) \neq 0$$

where $p(x)$ and $q(x)$ are polynomials.

Polynomial functions and rational functions are examples of **algebraic functions.** An algebraic function of x is one that can be expressed as a finite number of sums, differences, multiples, quotients, and radicals involving x^n. For example, $f(x) = \sqrt{x+1}$ is algebraic. Functions that are not algebraic are **transcendental.** For instance, the trigonometric functions (see Section P.4) are transcendental.

Two functions can be combined in various ways to create new functions. For example, given $f(x) = 2x - 3$ and $g(x) = x^2 + 1$, you can form the functions shown.

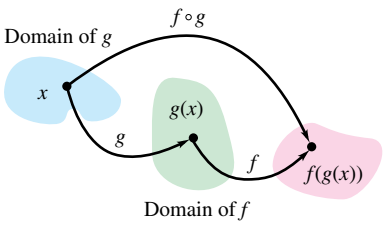
$(f + g)(x) = f(x) + g(x) = (2x - 3) + (x^2 + 1)$ Sum

$(f - g)(x) = f(x) - g(x) = (2x - 3) - (x^2 + 1)$ Difference

$(fg)(x) = f(x)g(x) = (2x - 3)(x^2 + 1)$ Product

$(f/g)(x) = \frac{f(x)}{g(x)} = \frac{2x - 3}{x^2 + 1}$ Quotient

You can combine two functions in yet another way, called **composition.** The resulting function is called a **composite function.**



The domain of the composite function $f \circ g$

Figure P.30

Definition of Composite Function

Let f and g be functions. The function $(f \circ g)(x) = f(g(x))$ is the **composite** of f with g. The domain of $f \circ g$ is the set of all x in the domain of g such that $g(x)$ is in the domain of f (see Figure P.30).

The composite of f with g is generally not the same as the composite of g with f. This is shown in the next example.

EXAMPLE 4 Finding Composite Functions

See LarsonCalculus.com for an interactive version of this type of example.

For $f(x) = 2x - 3$ and $g(x) = x^2 + 1$, find (a) $f \circ g$ and (b) $g \circ f$.

Solution

a. $(f \circ g)(x) = f(g(x))$ Definition of $f \circ g$

$= f(x^2 + 1)$ Substitute $x^2 + 1$ for $g(x)$.

$= 2(x^2 + 1) - 3$ Definition of $f(x)$

$= 2x^2 - 1$ Simplify.

b. $(g \circ f)x = g(f(x))$ Definition of $g \circ f$

$= g(2x - 3)$ Substitute $2x - 3$ for $f(x)$.

$= (2x - 3)^2 + 1$ Definition of $g(x)$

$= 4x^2 - 12x + 10$ Simplify.

Note that $(f \circ g)(x) \neq (g \circ f)(x)$.

FOR FURTHER INFORMATION

For more on the history of the concept of a function, see the article "Evolution of the Function Concept: A Brief Survey" by Israel Kleiner in *The College Mathematics Journal*. To view this article, go to *MathArticles.com.*

GO DIGITAL

In Section P.1, an x-intercept of a graph was defined to be a point $(a, 0)$ at which the graph crosses the x-axis. If the graph represents a function f, then the number a is a **zero** of f. In other words, *the zeros of a function f are the solutions of the equation $f(x) = 0$*. For example, the function

$$f(x) = x - 4$$

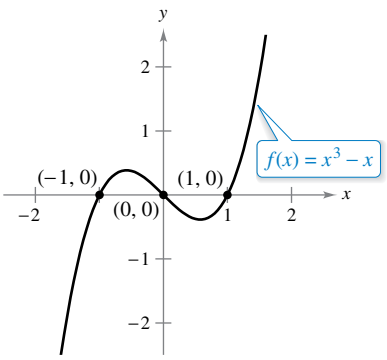
has a zero at $x = 4$ because $f(4) = 0$.

In Section P.1, you also studied different types of symmetry. In the terminology of functions, a function $y = f(x)$ is **even** when its graph is symmetric with respect to the y-axis, and is **odd** when its graph is symmetric with respect to the origin. The symmetry tests in Section P.1 yield the following test for even and odd functions.

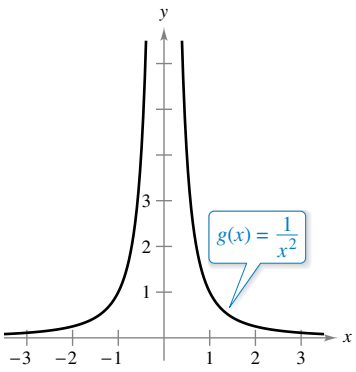
Test for Even and Odd Functions

The function $y = f(x)$ is **even** when $f(-x) = f(x)$. The function $y = f(x)$ is **odd** when $f(-x) = -f(x)$.

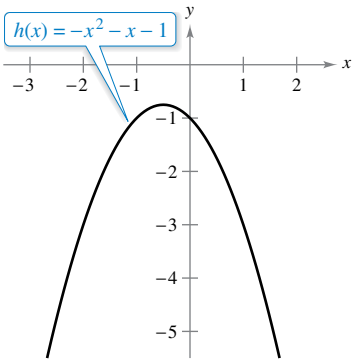
It is important to note that some functions are neither even nor odd, as shown in the next example.



(a) Odd function



(b) Even function



(c) Neither even nor odd

Figure P.31

EXAMPLE 5 Even and Odd Functions and Zeros of Functions

Determine whether each function is even, odd, or neither. Then find the zeros of the function.

a. $f(x) = x^3 - x$ **b.** $g(x) = \dfrac{1}{x^2}$ **c.** $h(x) = -x^2 - x - 1$

Solution

a. This function is odd because

$$f(-x) = (-x)^3 - (-x) = -x^3 + x = -(x^3 - x) = -f(x).$$

The zeros of f are

$$\begin{aligned} x^3 - x &= 0 && \text{Let } f(x) = 0. \\ x(x^2 - 1) &= 0 && \text{Factor out common monomial factor.} \\ x(x - 1)(x + 1) &= 0 && \text{Factor difference of two squares.} \\ x &= 0, 1, -1. && \text{Zeros of } f \end{aligned}$$

See Figure P.31(a).

b. This function is even because

$$g(-x) = \frac{1}{(-x)^2} = \frac{1}{x^2} = g(x).$$

This function does not have zeros because $1/x^2$ is positive for all x in the domain, as shown in Figure P.31(b).

c. Substituting $-x$ for x produces

$$h(-x) = -(-x)^2 - (-x) - 1 = -x^2 + x - 1.$$

Because $h(x) = -x^2 - x - 1$ and $-h(x) = x^2 + x + 1$, you can conclude that

$$h(-x) \neq h(x) \qquad \text{Function is } \textit{not} \text{ even.}$$

and

$$h(-x) \neq -h(x). \qquad \text{Function is } \textit{not} \text{ odd.}$$

So, the function is neither even nor odd. This function does not have zeros because $-x^2 - x - 1$ is negative for all x, as shown in Figure P.31(c). ■

P.3 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Are all functions also relations? Are all relations also functions? Explain.
2. Explain the meanings of *domain* and *range*.
3. What are the three basic types of function transformations?
4. Describe the four cases of the Leading Coefficient Test.

Evaluating a Function **In Exercises 5–12, evaluate the function at each value of the independent variable. Simplify the results.**

5. $f(x) = 3x - 2$
   (a) $f(0)$ (b) $f(5)$ (c) $f(b)$ (d) $f(x - 1)$
6. $f(x) = 7x - 4$
   (a) $f(0)$ (b) $f(-3)$ (c) $f(b)$ (d) $f(x + 2)$
7. $f(x) = \sqrt{x^2 + 4}$
   (a) $f(-2)$ (b) $f(3)$ (c) $f(2)$ (d) $f(x + bx)$
8. $f(x) = \sqrt{x + 5}$
   (a) $f(-4)$ (b) $f(11)$ (c) $f(4)$ (d) $f(x + \Delta x)$
9. $g(x) = 5 - x^2$
   (a) $g(0)$ (b) $g(\sqrt{5})$ (c) $g(-2)$ (d) $g(t - 1)$
10. $g(x) = x^2(x - 4)$
    (a) $g(4)$ (b) $g(\frac{3}{2})$ (c) $g(c)$ (d) $g(t + 4)$
11. $f(x) = x^3$
    $\dfrac{f(x + \Delta x) - f(x)}{\Delta x}$
12. $f(x) = 3x - 1$
    $\dfrac{f(x) - f(1)}{x - 1}$

Finding the Domain and Range of a Function **In Exercises 13–22, find the domain and range of the function.**

13. $f(x) = 4x^2$
14. $g(x) = x^2 - 5$
15. $h(x) = 4 - x^2$
16. $f(x) = x^3$
17. $g(x) = \sqrt{6x}$
18. $h(x) = -\sqrt{x + 3}$
19. $f(x) = \sqrt{16 - x^2}$
20. $f(x) = |x - 3|$
21. $f(x) = \dfrac{3}{x}$
22. $f(x) = \dfrac{x - 2}{x + 4}$

Finding the Domain of a Function **In Exercises 23–26, find the domain of the function.**

23. $f(x) = \sqrt{x} + \sqrt{1 - x}$
24. $f(x) = \sqrt{x^2 - 3x + 2}$
25. $f(x) = \dfrac{1}{|x + 3|}$
26. $g(x) = \dfrac{1}{|x^2 - 4|}$

Evaluating a Piecewise-Defined Function **In Exercises 27–30, evaluate the function at each value of the independent variable. Then find the domain and range.**

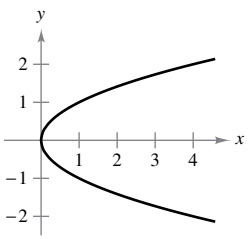
27. $f(x) = \begin{cases} 2x + 1, & x < 0 \\ 2x + 2, & x \geq 0 \end{cases}$
    (a) $f(-1)$ (b) $f(0)$ (c) $f(2)$ (d) $f(t^2 + 1)$
28. $f(x) = \begin{cases} x^2 + 2, & x \leq 1 \\ 2x^2 + 2, & x > 1 \end{cases}$
    (a) $f(-2)$ (b) $f(0)$ (c) $f(1)$ (d) $f(s^2 + 2)$
29. $f(x) = \begin{cases} |x| + 1, & x < 1 \\ -x + 1, & x \geq 1 \end{cases}$
    (a) $f(-3)$ (b) $f(1)$ (c) $f(3)$ (d) $f(b^2 + 1)$
30. $f(x) = \begin{cases} \sqrt{x + 4}, & x \leq 5 \\ (x - 5)^2, & x > 5 \end{cases}$
    (a) $f(-3)$ (b) $f(0)$ (c) $f(5)$ (d) $f(10)$

Sketching a Graph of a Function **In Exercises 31–42, sketch a graph of the function and find its domain and range. Use a graphing utility to verify your graph.**

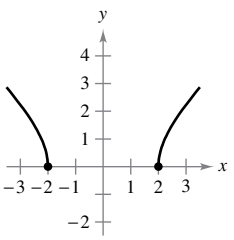
31. $f(x) = 4 - x$
32. $f(x) = \frac{5}{6} - \frac{2}{3}x$
33. $f(x) = x^2 + 5$
34. $f(x) = -2x^2 - 1$
35. $f(x) = (x - 1)^3 + 2$
36. $f(x) = \frac{1}{4}x^3 + 3$
37. $f(x) = \sqrt{9 - x^2}$
38. $f(x) = x + \sqrt{4 - x^2}$
39. $g(x) = |x| - 5$
40. $f(x) = |x^2 - 1|$
41. $g(x) = \dfrac{1}{x^2 + 2}$
42. $f(t) = \dfrac{2}{7 + t}$

Using the Vertical Line Test **In Exercises 43–46, use the Vertical Line Test to determine whether y is a function of x. To print an enlarged copy of the graph, go to *MathGraphs.com*.**

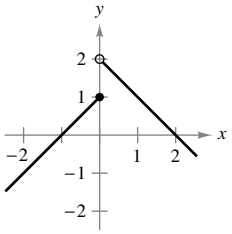
43. $x - y^2 = 0$



44. $\sqrt{x^2 - 4} - y = 0$



45. $y = \begin{cases} x + 1, & x \leq 0 \\ -x + 2, & x > 0 \end{cases}$



46. $x^2 + y^2 = 4$

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Determining Whether an Equation Is a Function **In Exercises 47–50, determine whether y is a function of x.**

47. $x^2 + y = 16$

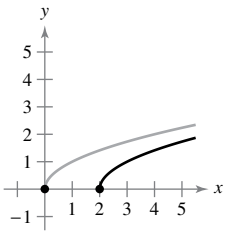
48. $x^2 + y^2 = 16$

49. $y^2 = x^2 - 1$

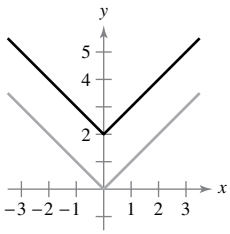
50. $x^2y - x^2 + 4y = 0$

Transformation of a Function **In Exercises 51–54, the graph shows one of the six basic functions on page 22 and a transformation of the function. Describe the transformation. Then use your description to write an equation for the transformation.**

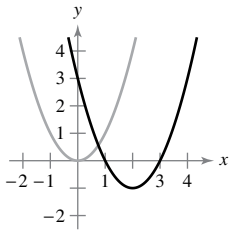
51.



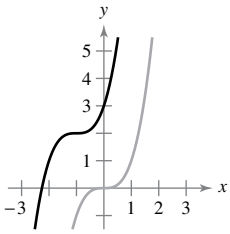
52.



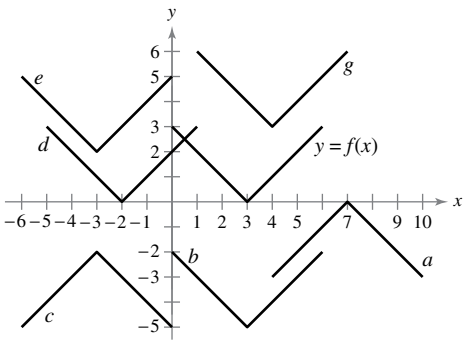
53.



54.



Matching **In Exercises 55–60, use the graph of $y = f(x)$ to match the function with its graph.**



55. $y = f(x + 5)$

56. $y = f(x) - 5$

57. $y = -f(-x) - 2$

58. $y = -f(x - 4)$

59. $y = f(x + 6) + 2$

60. $y = f(x - 1) + 3$

61. Sketching Transformations Use the graph of f shown in the figure to sketch the graph of each function. To print an enlarged copy of the graph, go to *MathGraphs.com*.

(a) $f(x + 3)$

(b) $f(x - 1)$

(c) $f(x) + 2$

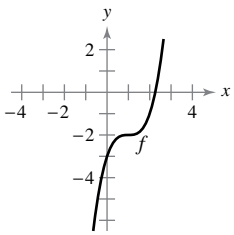
(d) $f(x) - 4$

(e) $3f(x)$

(f) $\frac{1}{4}f(x)$

(g) $-f(x)$

(h) $-f(-x)$



62. Heaviside Function The Heaviside function $H(x)$ is widely used in engineering applications.

$$H(x) = \begin{cases} 1, & x \geq 0 \\ 0, & x < 0 \end{cases}$$

Sketch the graph of the Heaviside function and the graphs of the following functions.

(a) $H(x) - 2$ (b) $H(x - 2)$ (c) $-H(x)$

(d) $H(-x)$ (e) $\frac{1}{2}H(x)$ (f) $-H(x - 2) + 2$

Combinations of Functions **In Exercises 63 and 64, find (a) $(f + g)(x)$, (b) $(f - g)(x)$, (c) $(fg)(x)$, and (d) $(f/g)(x)$.**

63. $f(x) = 2x - 5$, $g(x) = 4 - 3x$

64. $f(x) = x^2 + 5x + 4$, $g(x) = x + 1$

65. Evaluating Composite Functions Let $f(x) = \sqrt{x}$ and $g(x) = x^2 - 1$. Evaluate each expression.

(a) $f(g(1))$ (b) $g(f(1))$

(c) $g(f(0))$ (d) $f(g(-4))$

(e) $f(g(x))$ (f) $g(f(x))$

66. Evaluating Composite Functions Let $f(x) = 2x^3$ and $g(x) = 4x + 3$. Evaluate each expression.

(a) $f(g(0))$ (b) $f\left(g\left(\frac{1}{2}\right)\right)$

(c) $g(f(0))$ (d) $g\left(f\left(-\frac{1}{4}\right)\right)$

(e) $f(g(x))$ (f) $g(f(x))$

Finding Composite Functions **In Exercises 67–72, find the composite functions $f \circ g$ and $g \circ f$. Find the domain of each composite function. Are the two composite functions equal?**

67. $f(x) = x$, $g(x) = x^2$

68. $f(x) = \sqrt[3]{x - 5}$, $g(x) = x^3 + 5$

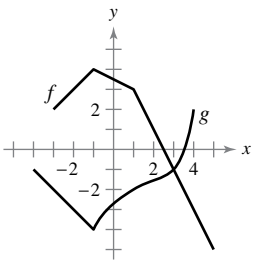
69. $f(x) = x^2$, $g(x) = \sqrt{x}$

70. $f(x) = x^2 - 1$, $g(x) = -x$

71. $f(x) = \frac{3}{x}$, $g(x) = x^2 - 1$

72. $f(x) = \frac{1}{x}$, $g(x) = \sqrt{x + 2}$

73. Evaluating Composite Functions Use the graphs of f and g to evaluate each expression. When the result is undefined, explain why.



(a) $(f \circ g)(3)$ (b) $g(f(2))$

(c) $g(f(5))$ (d) $(f \circ g)(-3)$

(e) $(g \circ f)(-1)$ (f) $f(g(-1))$

74. Ripples A pebble is dropped into a calm pond, causing ripples in the form of concentric circles. The radius (in feet) of the outer ripple is given by $r(t) = 0.6t$, where t is the time in seconds after the pebble strikes the water. The area of the circle is given by the function $A(r) = \pi r^2$. Find and interpret $(A \circ r)(t)$.

Think About It **In Exercises 75 and 76, $F(x) = f \circ g$. Identify functions for f and g. (There are many correct answers.)**

75. $F(x) = \sqrt{2x - 2}$

76. $F(x) = \dfrac{1}{4x^6}$

Think About It **In Exercises 77 and 78, find the coordinates of a second point on the graph of a function f when the given point is on the graph and the function is (a) even and (b) odd.**

77. $\left(-\frac{3}{2}, 4\right)$

78. $(4, 9)$

79. Even and Odd Functions The graphs of f, g, and h are shown in the figure. Decide whether each function is even, odd, or neither.

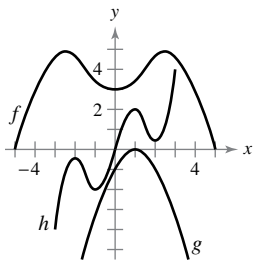

Figure for 79

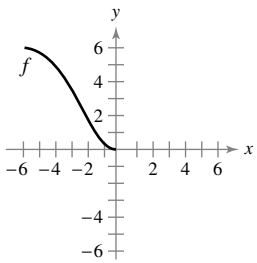

Figure for 80

80. Even and Odd Functions The domain of the function f shown in the figure is $-6 \le x \le 6$.

(a) Complete the graph of f when f is even.

(b) Complete the graph of f when f is odd.

Even and Odd Functions and Zeros of Functions **In Exercises 81–84, determine whether the function is even, odd, or neither. Then find the zeros of the function. Use a graphing utility to verify your result.**

81. $f(x) = x^2(4 - x^2)$

82. $f(x) = \sqrt[3]{x}$

83. $f(x) = 2\sqrt[6]{x}$

84. $f(x) = 4x^4 - 3x^2$

Writing Functions **In Exercises 85–88, write an equation for a function that has the given graph.**

85. Line segment connecting $(-2, 4)$ and $(0, -6)$

86. Line segment connecting $(3, 1)$ and $(5, 8)$

87. The bottom half of the parabola $x + y^2 = 0$

88. The bottom half of the circle $x^2 + y^2 = 36$

Sketching a Graph **In Exercises 89–92, sketch a possible graph of the situation.**

89. The speed of an airplane as a function of time during a 5-hour flight

90. The height of a baseball as a function of horizontal distance during a home run

91. A student commutes 15 miles to attend college. After driving for a few minutes, the student remembers that a term paper that is due has been forgotten. Driving faster than usual, the student returns home, picks up the paper, and once again starts toward school. Consider the student's distance from home as a function of time.

92. A person buys a new car and keeps it for 6 years. During year 4, the person buys several expensive upgrades. Consider the value of the car as a function of time.

93. Domain Find the value of c such that the domain of

$f(x) = \sqrt{c - x^2}$

is $[-5, 5]$.

94. Domain Find all values of c such that the domain of

$f(x) = \dfrac{x + 3}{x^2 + 3cx + 6}$

is the set of all real numbers.

Exploring Concepts

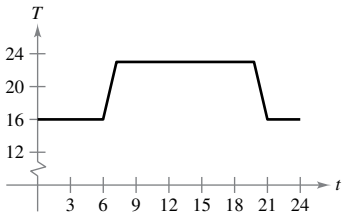
95. Can the graph of a one-to-one function intersect a horizontal line more than once? Explain.

96. Give an example of functions f and g such that $f \circ g = g \circ f$ and $f(x) \neq g(x)$. Do not use any pair of applicable functions from Exercises 67–72.

97. Does the degree of a polynomial function determine whether the function is even or odd? Explain.

98. Determine whether the function $f(x) = 0$ is even, odd, both, or neither. Explain.

99. Graphical Reasoning An electronically controlled thermostat is programmed to lower the temperature during the night automatically. The temperature T (in degrees Celsius) is given in terms of t, the time in hours on a 24-hour clock (see figure).



(a) Approximate $T(4)$ and $T(15)$.

(b) The thermostat is reprogrammed to produce a temperature $H(t) = T(t - 1)$. How does this change the temperature?

(c) The thermostat is reprogrammed to produce a temperature $H(t) = T(t) - 1$. How does this change the temperature?

(d) Write a piecewise-defined function that represents the graph.

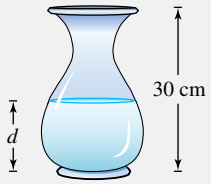
100. HOW DO YOU SEE IT? Water runs into a vase of height 30 centimeters at a constant rate. The vase is full after 5 seconds. Use this information and the shape of the vase shown to answer the questions when d is the depth of the water in centimeters and t is the time in seconds (see figure).



(a) Explain why d is a function of t.

(b) Determine the domain and range of the function.

(c) Sketch a possible graph of the function.

(d) Use the graph in part (c) to approximate $d(4)$. What does this represent?

101. Automobile Aerodynamics

The horsepower H required to overcome wind drag on a particular automobile is given by

$$H(x) = 0.00004636x^3$$

where x is the speed of the car in miles per hour.

(a) Use a graphing utility to graph the function.

(b) Rewrite the horsepower function so that x represents the speed in kilometers per hour. [Find $H(x/1.6)$.]

102. Writing Use a graphing utility to graph the polynomial functions

$$p_1(x) = x^3 - x + 1 \quad \text{and} \quad p_2(x) = x^3 - x.$$

How many zeros does each function have? Is there a cubic polynomial that has no zeros? Explain.

103. Proof Prove that the function is odd.

$$f(x) = a_{2n+1}x^{2n+1} + \cdots + a_3x^3 + a_1x$$

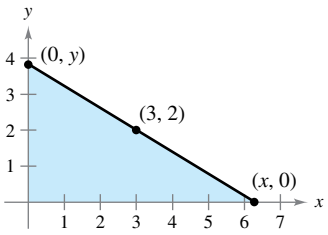
104. Proof Prove that the function is even.

$$f(x) = a_{2n}x^{2n} + a_{2n-2}x^{2n-2} + \cdots + a_2x^2 + a_0$$

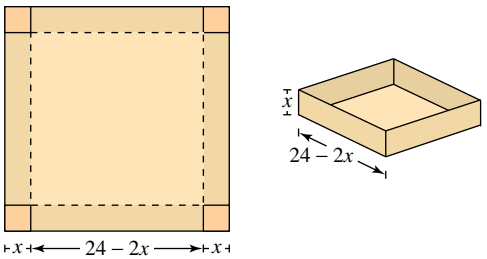
105. Proof Prove that the product of two even (or two odd) functions is even.

106. Proof Prove that the product of an odd function and an even function is odd.

107. Length A right triangle is formed in the first quadrant by the x- and y-axes and a line through the point $(3, 2)$ (see figure). Write the length L of the hypotenuse as a function of x.



108. Volume An open box of maximum volume is to be made from a square piece of material 24 centimeters on a side by cutting equal squares from the corners and turning up the sides (see figure).



(a) Write the volume V as a function of x, the length of the corner squares. What is the domain of the function?

(b) Use a graphing utility to graph the volume function and approximate the dimensions of the box that yield a maximum volume.

True or False? **In Exercises 109–114, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

109. If $f(a) = f(b)$, then $a = b$.

110. A vertical line can intersect the graph of a function at most once.

111. If $f(x) = f(-x)$ for all x in the domain of f, then the graph of f is symmetric with respect to the y-axis.

112. If f is a function, then $f(ax) = af(x)$.

113. The graph of a function of x cannot have symmetry with respect to the x-axis.

114. If the domain of a function consists of a single number, then its range must also consist of only one number.

PUTNAM EXAM CHALLENGE

115. Let R be the region consisting of the points (x, y) of the Cartesian plane satisfying both $|x| - |y| \leq 1$ and $|y| \leq 1$. Sketch the region R and find its area.

116. Consider a polynomial $f(x)$ with real coefficients having the property $f(g(x)) = g(f(x))$ for every polynomial $g(x)$ with real coefficients. Determine and prove the nature of $f(x)$.

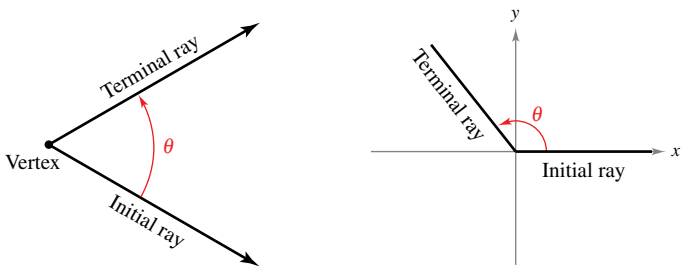
P.4 Review of Trigonometric Functions

GO DIGITAL

- **Describe angles and use degree measure.**
- **Use radian measure.**
- **Understand the definitions of the six trigonometric functions.**
- **Evaluate trigonometric functions.**
- **Solve trigonometric equations.**
- **Graph trigonometric functions.**

Angles and Degree Measure

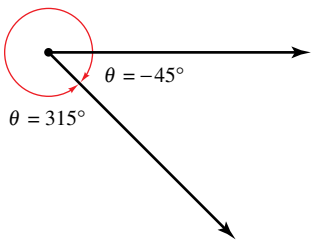
An **angle** has three parts: an **initial ray** (or side), a **terminal ray,** and a **vertex** (the point of intersection of the two rays), as shown in Figure P.32(a). An angle is in **standard position** when its initial ray coincides with the positive x-axis and its vertex is at the origin, as shown in Figure P.32(b).



(a) Angle **(b)** Angle in standard position

Figure P.32

It is assumed that you are familiar with the degree measure of an angle.* It is common practice to use θ (the lowercase Greek letter theta) to represent both an angle and its measure. Angles between 0° and 90° are **acute,** and angles between 90° and 180° are **obtuse.**

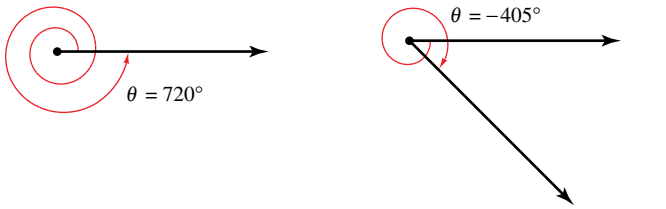


Coterminal angles

Figure P.33

Positive angles are measured *counterclockwise*, and negative angles are measured *clockwise*. For instance, Figure P.33 shows an angle whose measure is $-45°$. You cannot assign a measure to an angle by simply knowing where its initial and terminal rays are located. To measure an angle, you must also know how the terminal ray was rotated. For example, Figure P.33 shows that the angle measuring $-45°$ has the same terminal ray as the angle measuring 315°. Such angles are **coterminal.** In general, if θ is any angle, then $\theta + n(360)$, n is a nonzero integer, is coterminal with θ.

An angle that is larger than 360° is one whose terminal ray has been rotated more than one full revolution counterclockwise, as shown in Figure P.34(a). To form an angle whose measure is less than $-360°$, rotate a terminal ray more than one full revolution clockwise, as shown in Figure P.34(b).



(a) An angle whose measure is greater than 360° **(b)** An angle whose measure is less than $-360°$

Figure P.34

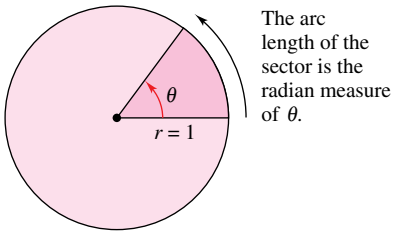
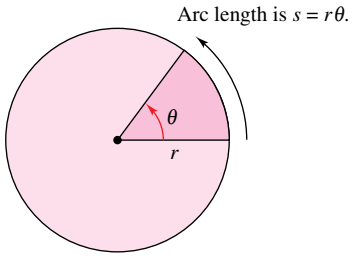
Radian Measure

To assign a radian measure to an angle θ, consider θ to be a central angle of a circle of radius 1, as shown in Figure P.35. The **radian measure** of θ is then defined to be the length of the arc of the sector. Because the circumference of a circle is $2\pi r$, the circumference of a **unit circle** (of radius 1) is 2π. This implies that the radian measure of an angle measuring 360° is 2π. In other words, $360^\circ = 2\pi$ radians.

Using radian measure for θ, the **length** s of a circular arc of radius r is $s = r\theta$, as shown in Figure P.36.

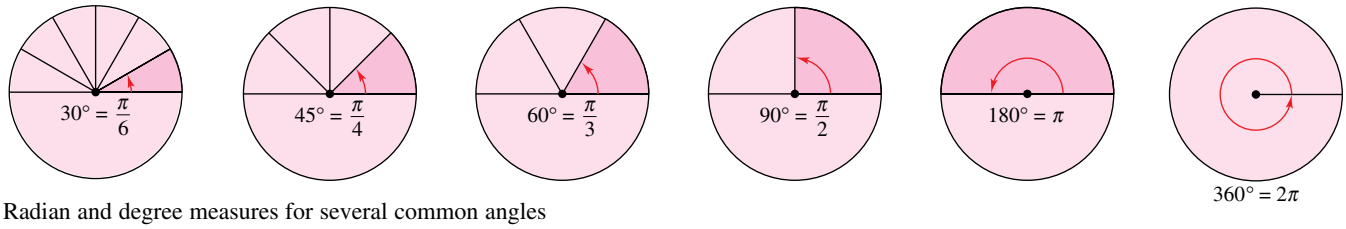


Unit circle
Figure P.35



Circle of radius r
Figure P.36

You should know the conversions of the common angles shown in Figure P.37. For other angles, use the fact that 180° is equal to π radians.



Radian and degree measures for several common angles
Figure P.37

EXAMPLE 1 Conversions Between Degrees and Radians

a. $40^\circ = (40 \text{ deg})\left(\dfrac{\pi \text{ rad}}{180 \text{ deg}}\right) = \dfrac{2\pi}{9}$ radian

b. $540^\circ = (540 \text{ deg})\left(\dfrac{\pi \text{ rad}}{180 \text{ deg}}\right) = 3\pi$ radians

c. $-270^\circ = (-270 \text{ deg})\left(\dfrac{\pi \text{ rad}}{180 \text{ deg}}\right) = -\dfrac{3\pi}{2}$ radians

d. $-\dfrac{\pi}{2}$ radians $= \left(-\dfrac{\pi}{2} \text{ rad}\right)\left(\dfrac{180 \text{ deg}}{\pi \text{ rad}}\right) = -90^\circ$

e. 2 radians $= (2 \text{ rad})\left(\dfrac{180 \text{ deg}}{\pi \text{ rad}}\right) = \left(\dfrac{360}{\pi}\right)^\circ \approx 114.59^\circ$

f. $\dfrac{9\pi}{2}$ radians $= \left(\dfrac{9\pi}{2} \text{ rad}\right)\left(\dfrac{180 \text{ deg}}{\pi \text{ rad}}\right) = 810^\circ$

TECHNOLOGY Most graphing utilities have both *degree* and *radian* modes. You should learn how to use your graphing utility to convert from degrees to radians, and vice versa. Use a graphing utility to verify the results of Example 1.

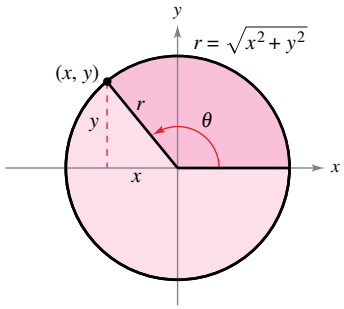
Sides of a right triangle
Figure P.38



An angle in standard position
Figure P.39

The Trigonometric Functions

There are two common approaches to the study of trigonometry. In one, the trigonometric functions are defined as ratios of two sides of a right triangle. In the other, these functions are defined in terms of a point on the terminal ray of an angle in standard position. The six trigonometric functions, **sine, cosine, tangent, cotangent, secant,** and **cosecant** (abbreviated as sin, cos, tan, cot, sec, and csc, respectively), are defined below from both viewpoints.

Definition of the Six Trigonometric Functions

Right triangle definitions, where $0 < \theta < \frac{\pi}{2}$ (see Figure P.38)

$$\sin\theta = \frac{\text{opposite}}{\text{hypotenuse}} \qquad \cos\theta = \frac{\text{adjacent}}{\text{hypotenuse}} \qquad \tan\theta = \frac{\text{opposite}}{\text{adjacent}}$$

$$\csc\theta = \frac{\text{hypotenuse}}{\text{opposite}} \qquad \sec\theta = \frac{\text{hypotenuse}}{\text{adjacent}} \qquad \cot\theta = \frac{\text{adjacent}}{\text{opposite}}$$

Circular function definitions, where θ *is any angle* (see Figure P.39)

$$\sin\theta = \frac{y}{r} \qquad \cos\theta = \frac{x}{r} \qquad \tan\theta = \frac{y}{x},\ x \neq 0$$

$$\csc\theta = \frac{r}{y},\ y \neq 0 \qquad \sec\theta = \frac{r}{x},\ x \neq 0 \qquad \cot\theta = \frac{x}{y},\ y \neq 0$$

The trigonometric identities listed below are direct consequences of the definitions. These identities and others are listed on the formula card inside the front cover. [Note that ϕ is the lowercase Greek letter phi and $\sin^2\theta$ is used to represent $(\sin\theta)^2$.]

Trigonometric Identities

Sum and Difference Formulas

$$\sin(\theta \pm \phi) = \sin\theta\cos\phi \pm \cos\theta\sin\phi$$

$$\cos(\theta \pm \phi) = \cos\theta\cos\phi \mp \sin\theta\sin\phi$$

$$\tan(\theta \pm \phi) = \frac{\tan\theta \pm \tan\phi}{1 \mp \tan\theta\tan\phi}$$

Power-Reducing Formulas

$$\sin^2\theta = \frac{1 - \cos 2\theta}{2}$$

$$\cos^2\theta = \frac{1 + \cos 2\theta}{2}$$

$$\tan^2\theta = \frac{1 - \cos 2\theta}{1 + \cos 2\theta}$$

Double-Angle Formulas

$$\sin 2\theta = 2\sin\theta\cos\theta$$

$$\cos 2\theta = 2\cos^2\theta - 1 = 1 - 2\sin^2\theta = \cos^2\theta - \sin^2\theta$$

$$\tan 2\theta = \frac{2\tan\theta}{1 - \tan^2\theta}$$

Pythagorean Identities

$$\sin^2\theta + \cos^2\theta = 1$$
$$1 + \tan^2\theta = \sec^2\theta$$
$$1 + \cot^2\theta = \csc^2\theta$$

Even/Odd Identities

$$\sin(-\theta) = -\sin\theta \qquad \csc(-\theta) = -\csc\theta$$
$$\cos(-\theta) = \cos\theta \qquad \sec(-\theta) = \sec\theta$$
$$\tan(-\theta) = -\tan\theta \qquad \cot(-\theta) = -\cot\theta$$

Reciprocal Identities

$$\csc\theta = \frac{1}{\sin\theta}$$

$$\sec\theta = \frac{1}{\cos\theta}$$

$$\cot\theta = \frac{1}{\tan\theta}$$

Cofunction Identities

$$\sin\left(\frac{\pi}{2} - u\right) = \cos u \qquad \cos\left(\frac{\pi}{2} - u\right) = \sin u$$

$$\tan\left(\frac{\pi}{2} - u\right) = \cot u \qquad \cot\left(\frac{\pi}{2} - u\right) = \tan u$$

$$\sec\left(\frac{\pi}{2} - u\right) = \csc u \qquad \csc\left(\frac{\pi}{2} - u\right) = \sec u$$

Evaluating Trigonometric Functions

There are two ways to evaluate trigonometric functions: (1) decimal approximations with a calculator and (2) exact evaluations using trigonometric identities and formulas from geometry. When using a calculator to evaluate a trigonometric function, remember to set the calculator to the appropriate mode—*degree* mode or *radian* mode.

EXAMPLE 2 Evaluating Trigonometric Functions

Find the exact value of the sine, cosine, and tangent of $\pi/3$.

Solution Because $60° = \pi/3$ radians, draw an equilateral triangle with sides of length 1 and θ as one of its angles, as shown in Figure P.40. Because the altitude of this triangle bisects its base, you know that $x = \frac{1}{2}$. Using the Pythagorean Theorem, you obtain

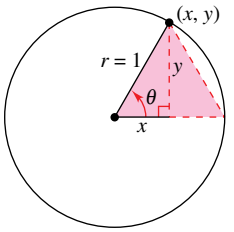
$$y = \sqrt{r^2 - x^2} = \sqrt{1 - \left(\frac{1}{2}\right)^2} = \sqrt{\frac{3}{4}} = \frac{\sqrt{3}}{2}.$$

Now, knowing the values of x, y, and r, evaluate the sine, cosine, and tangent of $\pi/3$.

$$\sin\frac{\pi}{3} = \frac{y}{r} = \frac{\sqrt{3}/2}{1} = \frac{\sqrt{3}}{2} \qquad \sin\theta = \frac{y}{r}$$

$$\cos\frac{\pi}{3} = \frac{x}{r} = \frac{1/2}{1} = \frac{1}{2} \qquad \cos\theta = \frac{x}{r}$$

$$\tan\frac{\pi}{3} = \frac{y}{x} = \frac{\sqrt{3}/2}{1/2} = \sqrt{3} \qquad \tan\theta = \frac{y}{x}$$



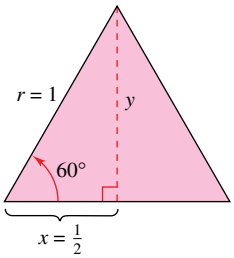


Figure P.40

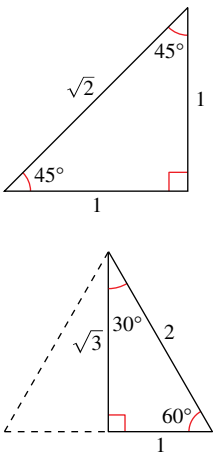
Note that all angles in this text are measured in radians unless stated otherwise. For example, when sin 3 is written, the sine of 3 radians is meant, and when sin 3° is written, the sine of 3 degrees is meant.

The degree and radian measures of several common angles are shown in the table below, along with the corresponding values of the sine, cosine, and tangent (see Figure P.41).

Trigonometric Values of Common Angles

θ (degrees)	0°	30°	45°	60°	90°	180°	270°
θ (radians)	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$	π	$\frac{3\pi}{2}$
$\sin\theta$	0	$\frac{1}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{\sqrt{3}}{2}$	1	0	-1
$\cos\theta$	1	$\frac{\sqrt{3}}{2}$	$\frac{\sqrt{2}}{2}$	$\frac{1}{2}$	0	-1	0
$\tan\theta$	0	$\frac{\sqrt{3}}{3}$	1	$\sqrt{3}$	Undefined	0	Undefined



Common angles

Figure P.41

EXAMPLE 3 Using Trigonometric Identities

a. $\sin\left(-\frac{\pi}{3}\right) = -\sin\frac{\pi}{3} = -\frac{\sqrt{3}}{2}$ $\qquad \sin(-\theta) = -\sin\theta$

b. $\sec 60° = \frac{1}{\cos 60°} = \frac{1}{1/2} = 2$ $\qquad \sec\theta = \frac{1}{\cos\theta}$

Quadrant signs for trigonometric functions

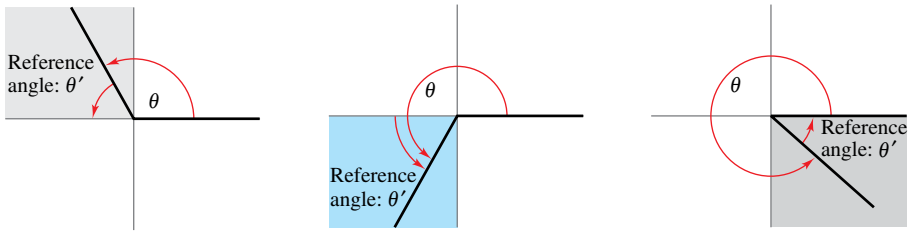
Figure P.42

The quadrant signs for the sine, cosine, and tangent functions are shown in Figure P.42. To extend the use of the table on the preceding page to angles in quadrants other than the first quadrant, you can use the concept of a **reference angle** (see Figure P.43), with the appropriate quadrant sign. For instance, the reference angle for $3\pi/4$ is $\pi/4$, and because the sine is positive in Quadrant II, you can write

$$\sin\frac{3\pi}{4} = \sin\frac{\pi}{4} = \frac{\sqrt{2}}{2}.$$

Similarly, because the reference angle for $330°$ is $30°$, and the tangent is negative in Quadrant IV, you can write

$$\tan 330° = -\tan 30° = -\frac{\sqrt{3}}{3}.$$



Quadrant II
$\theta' = \pi - \theta$ (radians)
$\theta' = 180° - \theta$ (degrees)

Quadrant III
$\theta' = \theta - \pi$ (radians)
$\theta' = \theta - 180°$ (degrees)

Quadrant IV
$\theta' = 2\pi - \theta$ (radians)
$\theta' = 360° - \theta$ (degrees)

Figure P.43

Solving Trigonometric Equations

How would you solve the equation $\sin\theta = 0$? You know that $\theta = 0$ is one solution, but this is not the only solution. Any one of the following values of θ is also a solution.

$$\ldots, -3\pi, -2\pi, -\pi, 0, \pi, 2\pi, 3\pi, \ldots$$

You can write this infinite solution set as $\{n\pi:\ n \text{ is an integer}\}$.

GO DIGITAL

EXAMPLE 4 Solving a Trigonometric Equation

Solve the equation $\sin\theta = -\frac{\sqrt{3}}{2}$.

Solution To solve the equation, you should consider that the sine function is negative in Quadrants III and IV and that

$$\sin\frac{\pi}{3} = \frac{\sqrt{3}}{2}.$$

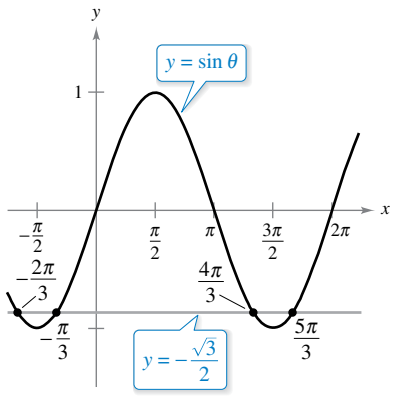
So, you are seeking values of θ in the third and fourth quadrants that have a reference angle of $\pi/3$. In the interval $[0, 2\pi]$, the two angles fitting these criteria are

$$\theta = \pi + \frac{\pi}{3} = \frac{4\pi}{3} \quad \text{and} \quad \theta = 2\pi - \frac{\pi}{3} = \frac{5\pi}{3}.$$

By adding integer multiples of 2π to each solution, you obtain the general solution

$$\theta = \frac{4\pi}{3} + 2n\pi \quad \text{or} \quad \theta = \frac{5\pi}{3} + 2n\pi \qquad \text{General solution}$$

where n is an integer. (See Figure P.44.)



Solution points of $\sin\theta = -\frac{\sqrt{3}}{2}$

Figure P.44

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

REMARK Be sure you understand the mathematical conventions regarding parentheses and trigonometric functions. For instance, in Example 5, $\cos 2\theta$ means $\cos(2\theta)$.

EXAMPLE 5 **Solving a Trigonometric Equation**

Solve the equation $\cos 2\theta = 2 - 3 \sin \theta$, where $0 \leq \theta \leq 2\pi$.

Solution The equation contains cosine and sine functions. Use the double-angle formula $\cos 2\theta = 1 - \sin^2 \theta$ to rewrite the equation so that it has only sine functions. Then treat the equation as quadratic in $\sin x$ and factor.

$$\begin{aligned} \cos 2\theta &= 2 - 3 \sin \theta && \text{Write original equation.} \\ 1 - 2 \sin^2 \theta &= 2 - 3 \sin \theta && \text{Double-angle formula} \\ 0 &= 2 \sin^2 \theta - 3 \sin \theta + 1 && \text{Equation of quadratic type } ax^2 + bx + c = 0 \\ 0 &= (2 \sin \theta - 1)(\sin \theta - 1) && \text{Factor.} \end{aligned}$$

If $2 \sin \theta - 1 = 0$, then $\sin \theta = 1/2$ and $\theta = \pi/6$ or $\theta = 5\pi/6$. If $\sin \theta - 1 = 0$, then $\sin \theta = 1$ and $\theta = \pi/2$. So, for $0 \leq \theta \leq 2\pi$, the solutions are

$$\theta = \frac{\pi}{6}, \quad \frac{5\pi}{6}, \quad \text{or} \quad \frac{\pi}{2}.$$

Graphs of Trigonometric Functions

A function f is **periodic** when there exists a positive real number p such that $f(x + p) = f(x)$ for all x in the domain of f. The least such positive value of p is the **period** of f. The sine, cosine, secant, and cosecant functions each have a period of 2π, and the other two trigonometric functions, tangent and cotangent, have a period of π, as shown in Figure P.45.

TECHNOLOGY

To produce the graphs shown in Figure P.45 with a graphing utility, make sure the graphing utility is set to *radian* mode.

Note in Figure P.45 that the maximum value of $\sin x$ and $\cos x$ is 1, and the minimum value is -1. The graphs of the functions $y = a \sin bx$ and $y = a \cos bx$ oscillate between $-a$ and a, and so they have an **amplitude** of $|a|$. Furthermore, because $bx = 0$ when $x = 0$ and $bx = 2\pi$ when $x = 2\pi/b$, it follows that the functions $y = a \sin bx$ and $y = a \cos bx$ each have a period of $2\pi/|b|$. The table below summarizes the amplitudes and periods of some types of trigonometric functions.

Function	Period	Amplitude
$y = a \sin bx$ or $y = a \cos bx$	$\frac{2\pi}{\lvert b\rvert}$	$\lvert a\rvert$
$y = a \tan bx$ or $y = a \cot bx$	$\frac{\pi}{\lvert b\rvert}$	Not applicable
$y = a \sec bx$ or $y = a \csc bx$	$\frac{2\pi}{\lvert b\rvert}$	Not applicable

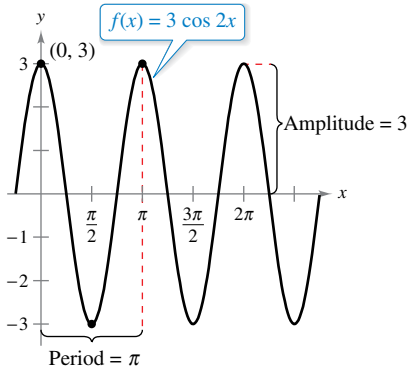

Figure P.46

EXAMPLE 6 Sketching the Graph of a Trigonometric Function

Sketch the graph of $f(x) = 3 \cos 2x$.

Solution The graph of $f(x) = 3 \cos 2x$ has an amplitude of 3 and a period of $2\pi/2 = \pi$. Using the basic shape of the graph of the cosine function, sketch one period of the function on the interval $[0, \pi]$, using the following pattern.

Maximum: $(0, 3)$

Minimum: $\left(\frac{\pi}{2}, -3\right)$

Maximum: $(\pi, 3)$

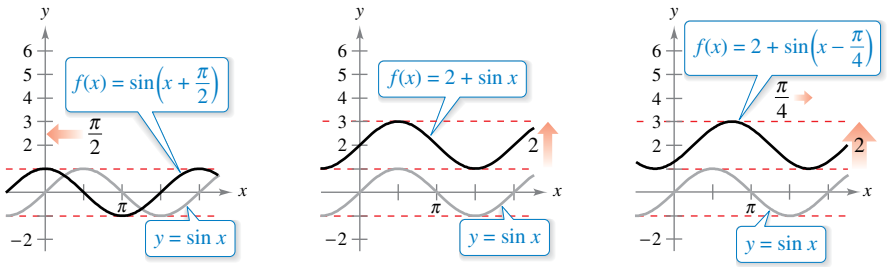
By continuing this pattern, you can sketch several cycles of the graph, as shown in Figure P.46.

EXAMPLE 7 Shifts of Graphs of Trigonometric Functions

a. To sketch the graph of $f(x) = \sin(x + \pi/2)$, shift the graph of $y = \sin x$ to the left $\pi/2$ units, as shown in Figure P.47(a).

b. To sketch the graph of $f(x) = 2 + \sin x$, shift the graph of $y = \sin x$ upward two units, as shown in Figure P.47(b).

c. To sketch the graph of $f(x) = 2 + \sin(x - \pi/4)$, shift the graph of $y = \sin x$ upward two units and to the right $\pi/4$ units, as shown in Figure P.47(c).



(a) Horizontal shift to the left **(b)** Vertical shift upward **(c)** Horizontal and vertical shifts

Transformations of the graph of $y = \sin x$

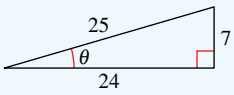
Concept Check

1. Explain how to find coterminal angles in radians.
2. Explain how to convert from degrees to radians.
3. Find $\sin\theta$, $\cos\theta$, and $\tan\theta$.



4. Describe the meaning of *amplitude* and *period*.

Coterminal Angles in Degrees **In Exercises 5 and 6, determine two coterminal angles in degree measure (one positive and one negative) for each angle.**

5. (a) 
(b) 
6. (a) 
(b) 
Coterminal Angles in Radians **In Exercises 7 and 8, determine two coterminal angles in radian measure (one positive and one negative) for each angle.**

7. (a) 
(b) 
8. (a) 
(b) 
Degrees to Radians **In Exercises 9 and 10, convert each degree measure to radian measure as a multiple of π and as a decimal accurate to three decimal places.**

9. (a) 30° (b) 150° (c) 315° (d) 120°
10. (a) −20° (b) −240° (c) −330° (d) 144°

Radians to Degrees **In Exercises 11 and 12, convert each radian measure to degree measure.**

11. (a) $\frac{3\pi}{2}$ (b) $\frac{7\pi}{6}$ (c) $-\frac{7\pi}{12}$ (d) -2.367
12. (a) $\frac{7\pi}{3}$ (b) $-\frac{11\pi}{30}$ (c) $\frac{11\pi}{6}$ (d) 0.438

13. **Completing a Table** Let r represent the radius of a circle, θ the central angle (measured in radians), and s the length of the arc subtended by the angle. Use the relationship $s = r\theta$ to complete the table.

r	8 ft	15 in.	85 cm		
s	12 ft			96 in.	8642 mi
θ		1.6	$\frac{3\pi}{4}$	4	$\frac{2\pi}{3}$

14. **Angular Speed** A car is moving at the rate of 50 miles per hour, and the diameter of its wheels is 2.5 feet.
   (a) Find the number of revolutions per minute that the wheels are rotating.
   (b) Find the angular speed of the wheels in radians per minute.

Evaluating Trigonometric Functions **In Exercises 15 and 16, evaluate the six trigonometric functions of each angle θ.**

15. (a) 
(b) 
16. (a) 
(b) 
Evaluating Trigonometric Functions **In Exercises 17–20, sketch a right triangle corresponding to the trigonometric function of the acute angle θ. Then evaluate the other five trigonometric functions of θ.**

17. $\sin\theta = \frac{1}{2}$
18. $\sin\theta = \frac{1}{3}$
19. $\cos\theta = \frac{4}{5}$
20. $\sec\theta = \frac{13}{5}$

Evaluating Trigonometric Functions **In Exercises 21 and 22, find the exact value of the sine, cosine, and tangent of each angle. Do not use a calculator.**

21. (a) $225°$ (b) $-225°$ (c) $\frac{5\pi}{3}$ (d) $\frac{11\pi}{6}$

22. (a) $60°$ (b) $120°$ (c) $\frac{\pi}{4}$ (d) $\frac{5\pi}{4}$

Using Trigonometric Identities **In Exercises 23 and 24, use trigonometric identities to find the exact value of each trigonometric function.**

23. (a) $\cos(-60°)$ (b) $\cot(\pi/6)$

24. (a) $\csc(\pi/3)$ (b) $\tan(-30°)$

Evaluating Trigonometric Functions **In Exercises 25–28, use a calculator to evaluate each trigonometric function. Round your answers to four decimal places.**

25. (a) $\sin 10°$ (b) $\csc 10°$

26. (a) $\sec 225°$ (b) $\sec 135°$

27. (a) $\tan\frac{\pi}{9}$ (b) $\tan\frac{10\pi}{9}$

28. (a) $\cot(1.35)$ (b) $\tan(1.35)$

Determining Quadrants **In Exercises 29 and 30, determine the quadrant in which θ lies.**

29. (a) $\sin\theta < 0$ and $\cos\theta < 0$
(b) $\sec\theta > 0$ and $\cot\theta < 0$

30. (a) $\sin\theta > 0$ and $\cos\theta < 0$
(b) $\csc\theta < 0$ and $\tan\theta > 0$

Solving Trigonometric Equations **In Exercises 31–34, find two solutions of each equation. Give your answers in radians ($0 \le \theta \le 2\pi$). Do not use a calculator.**

31. (a) $\cos\theta = \frac{\sqrt{2}}{2}$ (b) $\cos\theta = -\frac{\sqrt{2}}{2}$

32. (a) $\sec\theta = 2$ (b) $\sec\theta = -2$

33. (a) $\tan\theta = 1$ (b) $\cot\theta = -\sqrt{3}$

34. (a) $\sin\theta = \frac{\sqrt{3}}{2}$ (b) $\sin\theta = -\frac{1}{2}$

Solving a Trigonometric Equation **In Exercises 35–46, solve the equation for θ, where $0 \le \theta \le 2\pi$.**

35. $2\sin^2\theta = 1$

36. $\tan^2\theta = 3$

37. $\tan^2\theta - \tan\theta = 0$

38. $2\cos^2\theta - \cos\theta = 1$

39. $2\cos^2\theta + \cos\theta = 1$

40. $\csc^2\theta + \csc\theta - 2 = 0$

41. $\sec\theta\csc\theta = 2\csc\theta$

42. $\sin\theta = \cos\theta$

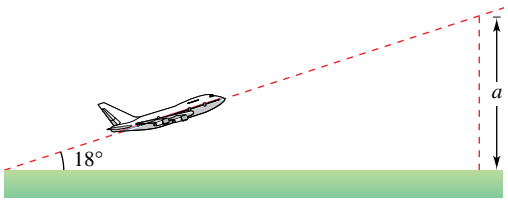
43. $\cos^2\theta + \sin\theta = 1$

44. $\tan^2\theta = \sec\theta - 1$

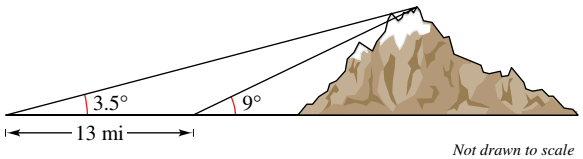
45. $\cos\frac{\theta}{2} - \cos\theta = 1$

46. $\cos\frac{\theta}{2} - \sin\theta = 0$

47. Airplane Ascent An airplane leaves the runway climbing at an angle of $18°$ with a speed of 275 feet per second (see figure). Find the altitude a of the plane after 1 minute.



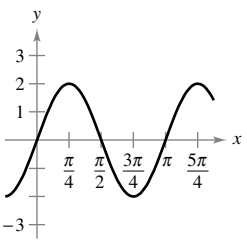
48. Height of a Mountain While traveling across flat land, you notice a mountain directly in front of you. Its angle of elevation (to the peak) is $3.5°$. After you drive 13 miles closer to the mountain, the angle of elevation is $9°$. Approximate the height of the mountain.



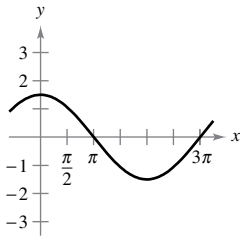
Not drawn to scale

Period and Amplitude of a Trigonometric Function **In Exercises 49–52, determine the period and amplitude of the function.**

49. $y = 2\sin 2x$



50. $y = \frac{3}{2}\cos\frac{x}{2}$



51. $y = -3\sin 4\pi x$

52. $y = \frac{2}{3}\cos\frac{\pi x}{10}$

Period of a Trigonometric Function **In Exercises 53–56, find the period of the function.**

53. $y = 5\tan 2x$

54. $y = 7\tan 2\pi x$

55. $y = \sec 5x$

56. $y = \csc 4x$

Writing **In Exercises 57 and 58, use a graphing utility to graph each function in the same viewing window for $c = -2$, $c = -1$, $c = 1$, and $c = 2$. Give a written description of how the graph changes when c changes.**

57. (a) $f(x) = c\sin x$
(b) $f(x) = \cos cx$
(c) $f(x) = \cos(\pi x - c)$

58. (a) $f(x) = \sin x + c$
(b) $f(x) = -\sin(2\pi x - c)$
(c) $f(x) = c\cos x$

Sketching the Graph of a Trigonometric Function **In Exercises 59–72, sketch the graph of the function.**

59. $y = 2\cos 2x$

60. $y = \sin\frac{x}{2}$

61. $y = -\sin\frac{2\pi x}{3}$

62. $y = 2\tan x$

63. $y = \tan 2x$

64. $y = \csc\frac{x}{2}$

65. $y = \csc 2\pi x$

66. $y = 2\sec 2x$

67. $y = \sin(x + \pi)$

68. $y = \cos\left(x - \frac{\pi}{3}\right)$

69. $y = 1 + \cos\left(x - \frac{\pi}{2}\right)$

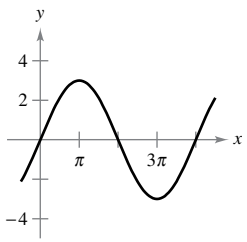
70. $y = 1 + \sin\left(x + \frac{\pi}{2}\right)$

71. $y = 3 + \sec\frac{\pi x}{2}$

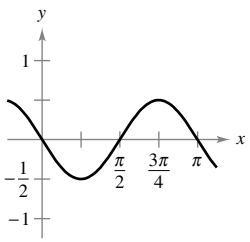
72. $y = -1 - 4\csc\left(3x - \frac{3\pi}{2}\right)$

Graphical Reasoning **In Exercises 73 and 74, find *a*, *b*, and *c* such that the graph of the function matches the graph in the figure.**

73. $y = a\cos(bx - c)$



74. $y = a\sin(bx - c)$



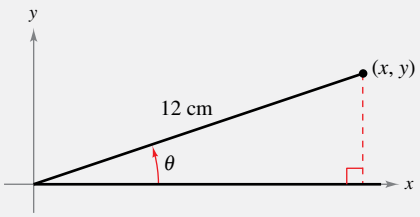
Exploring Concepts

75. You know the value of $\tan\theta$. Is it possible to find the value of $\sec\theta$ without finding the measure of θ? Explain.

76. Explain how to restrict the domain of the sine function so that it becomes a one-to-one function.

77. How do the ranges of the cosine function and the secant function compare?

78. HOW DO YOU SEE IT? Consider an angle in standard position with $r = 12$ centimeters, as shown in the figure. Describe the changes in the values of x, y, $\sin\theta$, $\cos\theta$, and $\tan\theta$ as θ increases continually from 0 to $\pi/2$.



79. Ferris Wheel

A model for the height h (in feet) of a Ferris wheel car is

$h = 50 + 50\sin 8\pi t$

where t is measured in minutes. (The Ferris wheel has a radius of 50 feet.) This model yields a height of 50 feet when $t = 0$. Alter the model so that the height of the car is 1 foot when $t = 0$.

80. Sales The monthly sales S (in thousands of units) of a seasonal product are modeled by

$$S = 58.3 + 32.5\cos\frac{\pi t}{6}$$

where t is the month, with $t = 1$ corresponding to January. Use a graphing utility to graph the model for S and determine the months when sales exceed 75,000 units.

81. Think About It Sketch the graphs of

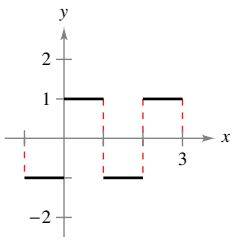
$$f(x) = \sin x, \quad g(x) = |\sin x|, \quad \text{and} \quad h(x) = \sin(|x|).$$

In general, how are the graphs of $|f(x)|$ and $f(|x|)$ related to the graph of f?

82. Pattern Recognition Use a graphing utility to compare the graph of

$$f(x) = \frac{4}{\pi}\left(\sin\pi x + \frac{1}{3}\sin 3\pi x\right)$$

with the graph below. Improve the approximation by adding a term to $f(x)$. Use a graphing utility to verify that your new approximation is better than the original. Can you find other terms to add to make the approximation even better? What is the pattern? (*Hint:* Use sine terms.)



True or False? **In Exercises 83–86, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

83. A measurement of 4 radians corresponds to two complete revolutions from the initial side to the terminal side of an angle.

84. Amplitude is always positive.

85. The function $y = \frac{1}{2}\sin 2x$ has an amplitude that is twice that of the function $y = \sin x$.

86. The function $y = 3\cos(x/3)$ has a period that is three times that of the function $y = \cos x$.

Review Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Exploring Concepts

In this chapter, you reviewed several mathematical concepts required for a successful study of calculus.

- Graphs of equations
- Functions
- Domain and range
- Six basic functions and their graphs
- Transformations
- Trigonometric functions

You will use functions and apply your knowledge of calculus to model and study real-life applications in science, business, and engineering.

1. Match the equation or equations with the given characteristic, if possible.

(i) $y = 3x^3 - 3x$ (ii) $y = (x + 3)^2$ (iii) $y = 3x - 3$

(iv) $y = \sqrt[3]{x}$ (v) $y = 3x^2 + 3$ (vi) $y = \sqrt{x + 3}$

(a) Symmetric with respect to the y-axis

(b) Three x-intercepts

(c) Symmetric with respect to the x-axis

(d) The point $(-2, 1)$ is on the graph

(e) Symmetric with respect to the origin

(f) Graph passes through the origin

2. Graph the equation $y = cx + 1$ for $c = 1, 2, 3, 4$, and 5. Then make a conjecture about the x-coefficient and the graph of the equation.

3. Give an example to justify each statement.

(a) $\sin(u + v) \neq \sin u + \sin v$

(b) $\cos(u + v) \neq \cos u + \cos v$

(c) $\tan(u + v) \neq \tan u + \tan v$

4. Use a graphing utility to graph $y = d + a\sin(bx - c)$ for several different values of a, b, c, and d. Write a paragraph describing the changes in the graph corresponding to changes in each constant.

5. Consider the functions $f(x) = 3\cos 2x$ and $g(x) = x|x|$.

(a) Determine the domain and range of each function.

(b) Discuss the symmetry of each function.

(c) Determine the intercepts of each function.

(d) Sketch the graph of each function.

(e) Find $f + g$, $f - g$, fg, and f/g.

(f) Find $f(g(x))$ and $g(f(x))$.

6. Consider the functions

$f(x) = x^2$ and $g(x) = \sqrt{x}$.

(a) Find $f(g(x))$ and $g(f(x))$.

(b) What are the domains of $f \circ g$ and $g \circ f$?

(c) What are the ranges of $f \circ g$ and $g \circ f$?

(d) Does $f(g(x)) = g(f(x))$? Explain your reasoning.

Finding Intercepts

In Exercises 7–10, find any intercepts.

7. $y = 5x - 8$

8. $y = x^2 - 8x + 12$

9. $y = \dfrac{x - 3}{x - 4}$

10. $y = (x - 3)\sqrt{x + 4}$

Testing for Symmetry

In Exercises 11–14, test for symmetry with respect to each axis and to the origin.

11. $y = x^2 + 4x$

12. $y = x^4 - x^2 + 3$

13. $y^2 = x^2 - 5$

14. $xy = -2$

Using Intercepts and Symmetry to Sketch a Graph

In Exercises 15–20, find any intercepts and test for symmetry. Then sketch the graph of the equation.

15. $y = -\frac{1}{2}x + 3$

16. $y = -x^2 + 4$

17. $y = 9x - x^3$

18. $y^2 = 9 - x$

19. $y = 2\sqrt{4 - x}$

20. $y = |x - 4| - 4$

Finding Points of Intersection

In Exercises 21–24, find the points of intersection of the graphs of the equations.

21. $5x + 3y = -1$
$x - y = -5$

22. $2x + 4y = 9$
$6x - 4y = 7$

23. $x - y = -5$
$x^2 - y = 1$

24. $x^2 + y^2 = 1$
$-x + y = 1$

Finding the Slope of a Line

In Exercises 25 and 26, plot the pair of points and find the slope of the line passing through them.

25. $\left(\frac{3}{2}, 1\right), \left(5, \frac{5}{2}\right)$

26. $(-7, 8), (-1, 8)$

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Finding an Equation of a Line **In Exercises 27–30, find an equation of the line that passes through the point and has the indicated slope. Then sketch the line.**

27. $(3, -5)$, $m = \frac{7}{4}$

28. $(-3, 0)$, $m = -\frac{2}{3}$

29. $(-8, 1)$, m is undefined

30. $(5, 4)$, $m = 0$

Finding the Slope and *y*-Intercept **In Exercises 31 and 32, find the slope and the *y*-intercept of the line.**

31. $y - 3x = 5$

32. $9 - y = x$

Sketching a Line in the Plane **In Exercises 33–36, sketch the graph of the equation.**

33. $y = 6$

34. $x = -3$

35. $y = 4x - 2$

36. $3x + 2y = 12$

Finding an Equation of a Line **In Exercises 37 and 38, find an equation of the line that passes through the points. Then sketch the line.**

37. $(0, 0)$, $(8, 2)$

38. $(-5, 5)$, $(10, -1)$

39. Finding Equations of Lines Find equations of the lines passing through $(-3, 5)$ and having each characteristic.

(a) Slope of $\frac{7}{16}$

(b) Parallel to the line $5x - 3y = 3$

(c) Perpendicular to the line $3x + 4y = 8$

(d) Parallel to the y-axis

40. Finding Equations of Lines Find equations of the lines passing through $(2, 4)$ and having each characteristic.

(a) Slope of $-\frac{2}{3}$

(b) Perpendicular to the line $x + y = 0$

(c) Parallel to the line $3x - y = 0$

(d) Parallel to the x-axis

41. Rate of Change The purchase price of a new machine is \$12,500, and its value will decrease by \$850 per year. Use this information to write a linear equation that gives the value V of the machine t years after it is purchased. Find its value at the end of 3 years.

42. Break-Even Analysis A contractor purchases a piece of equipment for \$36,500 that costs an average of \$9.25 per hour for fuel and maintenance. The equipment operator is paid \$13.50 per hour, and customers are charged \$30 per hour.

(a) Write a linear equation for the cost C of operating this equipment for t hours.

(b) Write a linear equation for the revenue R derived from t hours of use.

(c) Find the break-even point for this equipment by finding the time at which $R = C$.

Evaluating a Function **In Exercises 43–48, evaluate the function at each value of the independent variable. Simplify the results.**

43. $f(x) = 5x + 4$

(a) $f(0)$ (b) $f(5)$ (c) $f(-3)$ (d) $f(t + 1)$

44. $f(x) = x^3 - 2x$

(a) $f(-3)$ (b) $f(2)$ (c) $f(-1)$ (d) $f(c - 1)$

45. $f(x) = \begin{cases} x + 2, & x \le 1 \\ 2x - 3, & x > 1 \end{cases}$

(a) $f(-2)$ (b) $f(0)$ (c) $f(1)$ (d) $f(2)$

46. $f(x) = \begin{cases} |3x - 1|, & x < 0 \\ x^2 - 1, & x \ge 0 \end{cases}$

(a) $f(-1)$ (b) $f(0)$ (c) $f(1)$ (d) $f(a^2 + 3)$

47. $f(x) = 4x^2$

$$\frac{f(x + \Delta x) - f(x)}{\Delta x}$$

48. $f(x) = 2x - 6$

$$\frac{f(x) - f(1)}{x - 1}$$

Finding the Domain and Range of a Function **In Exercises 49–52, find the domain and range of the function.**

49. $f(x) = x^2 + 3$

50. $g(x) = \sqrt{6 - x}$

51. $f(x) = -|x + 1|$

52. $h(x) = \dfrac{2}{x + 1}$

Sketching a Graph of a Function **In Exercises 53–56, sketch a graph of the function and find its domain and range. Use a graphing utility to verify your graph.**

53. $f(x) = x^3 + x^2 - x - 1$

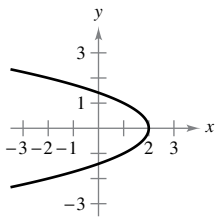
54. $g(x) = \sqrt{x + 1}$

55. $h(x) = |x + 3|$

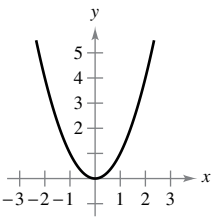
56. $f(x) = \dfrac{4}{2x - 1}$

Using the Vertical Line Test **In Exercises 57 and 58, use the Vertical Line Test to determine whether *y* is a function of *x*. To print an enlarged copy of the graph, go to *MathGraphs.com*.**

57. $x + y^2 = 2$



58. $x^2 - y = 0$



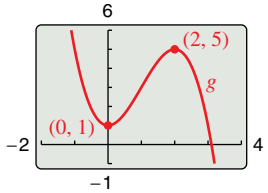
Determining Whether an Equation Is a Function **In Exercises 59 and 60, determine whether *y* is a function of *x*.**

59. $xy + x^3 - 2y = 0$

60. $x = 9 - y^2$

61. Transformations of Functions Use a graphing utility to graph $f(x) = x^3 - 3x^2$. Use the graph to write a formula for the function g shown in the figure.

(a)



(b)

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

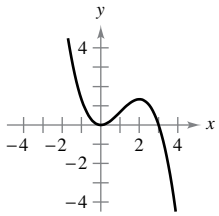
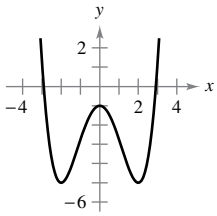
62. Think About It What is the minimum degree of the polynomial function whose graph approximates the graph shown? What sign must the leading coefficient have?

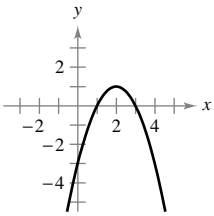
(a)



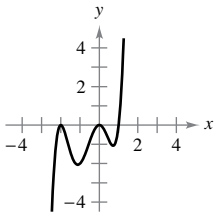
(b)



(c)



(d)



Finding Composite Functions **In Exercises 63 and 64, find the composite functions $f \circ g$ and $g \circ f$. Find the domain of each composite function. Are the two composite functions equal?**

63. $f(x) = 3x + 1$, $g(x) = -x$

64. $f(x) = \sqrt{x - 2}$, $g(x) = x^2$

Even and Odd Functions and Zeros of Functions **In Exercises 65 and 66, determine whether the function is even, odd, or neither. Then find the zeros of the function. Use a graphing utility to verify your result.**

65. $f(x) = x^4 - x^2$

66. $f(x) = \sqrt{x^3 + 1}$

Degrees to Radians **In Exercises 67–70, convert the degree measure to radian measure as a multiple of π and as a decimal accurate to three decimal places.**

67. $340°$

68. $300°$

69. $-480°$

70. $-900°$

Radians to Degrees **In Exercises 71–74, convert the radian measure to degree measure.**

71. $\frac{\pi}{6}$

72. $\frac{11\pi}{4}$

73. $-\frac{2\pi}{3}$

74. $-\frac{13\pi}{6}$

Evaluating Trigonometric Functions **In Exercises 75–80, find the exact value of the sine, cosine, and tangent of the angle. Do not use a calculator.**

75. $-45°$

76. $240°$

77. $\frac{13\pi}{6}$

78. $-\frac{4\pi}{3}$

79. $405°$

80. $180°$

Evaluating Trigonometric Functions **In Exercises 81–86, use a calculator to evaluate the trigonometric function. Round your answers to four decimal places.**

81. $\tan 33°$

82. $\cot 401°$

83. $\sec \frac{12\pi}{5}$

84. $\csc \frac{2\pi}{9}$

85. $\sin\left(-\frac{\pi}{9}\right)$

86. $\cos\left(-\frac{3\pi}{7}\right)$

Solving a Trigonometric Equation **In Exercises 87–92, solve the equation for θ, where $0 \le \theta \le 2\pi$.**

87. $2 \cos \theta + 1 = 0$

88. $2 \cos^2 \theta = 1$

89. $2 \sin^2 \theta + 3 \sin \theta = -1$

90. $\cos^3 \theta = \cos \theta$

91. $\sec^2 \theta - \sec \theta - 2 = 0$

92. $2 \sec^2 \theta + \tan^2 \theta = 5$

Sketching the Graph of a Trigonometric Function **In Exercises 93–100, sketch the graph of the function.**

93. $y = 9 \cos x$

94. $y = \sin \pi x$

95. $y = 3 \sin \frac{2x}{5}$

96. $y = 8 \cos \frac{x}{4}$

97. $y = \frac{1}{3} \tan x$

98. $y = \cot \frac{x}{2}$

99. $y = -\sec 2\pi x$

100. $y = -4 \csc 3x$

Building on Concepts

101. One of the fundamental themes of calculus is to find the slope of the tangent line to a curve at a point. To see how this can be done, consider the point $(4, 2)$ on the graph of $f(x) = \sqrt{x}$ (see figure).

(a) Find the slope m_1 of the line joining $(4, 2)$ and $(9, 3)$. Is the slope of the tangent line at $(4, 2)$ greater than or less than m_1?

(b) Find the slope m_2 of the line joining $(4, 2)$ and $(1, 1)$. Is the slope of the tangent line at $(4, 2)$ greater than or less than m_2?

(c) Find the slope m_3 of the line joining $(4, 2)$ and $(4.41, 2.1)$. Is the slope of the tangent line at $(4, 2)$ greater than or less than m_3?

(d) Find the slope of the line joining $(4, 2)$ and $(4 + h, f(4 + h))$ in terms of the nonzero number h.

(e) What is the slope of the tangent line at $(4, 2)$? Explain how you arrived at your answer.

P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Finding Tangent Lines Consider the circle

$x^2 + y^2 - 6x - 8y = 0$

as shown in the figure.

(a) Find the center and radius of the circle.

(b) Find an equation of the tangent line to the circle at the point $(0, 0)$.

(c) Find an equation of the tangent line to the circle at the point $(6, 0)$.

(d) Where do the two tangent lines intersect?

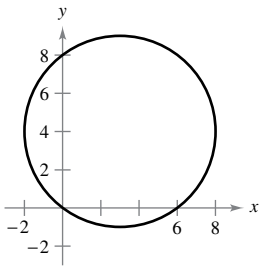

Figure for 1

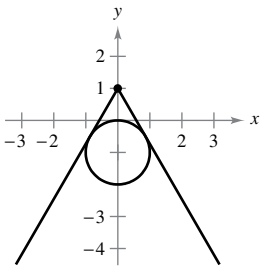

Figure for 2

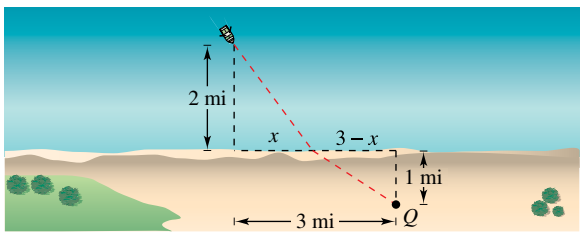
2. Finding Tangent Lines There are two tangent lines from the point $(0, 1)$ to the circle $x^2 + (y + 1)^2 = 1$ (see figure). Find equations of these two lines by using the fact that each tangent line intersects the circle at *exactly* one point.

3. Writing a Function A person is in a boat 2 miles from the nearest point on the coast. The person travels to a point Q located 3 miles down the coast and 1 mile inland (see figure). The person can row at 2 miles per hour and walk at 4 miles per hour. Write the total time T of the trip as a function of x.



4. Sketching Transformations Consider the graph of the function f shown below. Use this graph to sketch the graph of each function. To print an enlarged copy of the graph, go to *MathGraphs.com.*

(a) $f(x + 1)$

(b) $f(x) + 1$

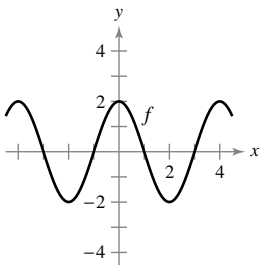
(c) $2f(x)$

(d) $f(-x)$

(e) $-f(x)$

(f) $|f(x)|$

(g) $f(|x|)$



5. Maximum Area A rancher plans to fence a rectangular pasture adjacent to a river. The rancher has 100 meters of fencing, and no fencing is needed along the river (see figure).

(a) Write the area A of the pasture as a function of x, the length of the side parallel to the river. What is the domain of A?

(b) Graph the area function and estimate the dimensions that yield the maximum amount of area for the pasture.

(c) Find the dimensions that yield the maximum amount of area for the pasture by completing the square.

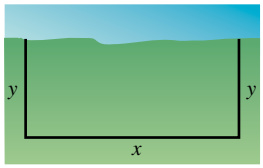


Figure for 5

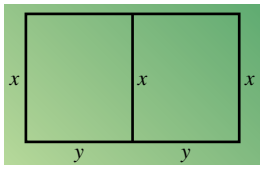

Figure for 6

6. Maximum Area A rancher has 300 feet of fencing to enclose two adjacent pastures (see figure).

(a) Write the total area A of the two pastures as a function of x. What is the domain of A?

(b) Graph the area function and estimate the dimensions that yield the maximum amount of area for the pastures.

(c) Find the dimensions that yield the maximum amount of area for the pastures by completing the square.

7. Average Speed You drive to the beach at a rate of 120 kilometers per hour. On the return trip, you drive at a rate of 60 kilometers per hour. What is your average speed for the entire trip? Explain your reasoning.

8. Composite Functions Let $f(x) = \dfrac{1}{1 - x}$.

(a) What are the domain and range of f?

(b) Find the composition $f(f(x))$. What is the domain of this function?

(c) Find $f(f(f(x)))$. What is the domain of this function?

(d) Graph $f(f(f(x)))$. Is the graph a line? Why or why not?

9. Lemniscate Let d_1 and d_2 be the distances from the point (x, y) to the points $(-1, 0)$ and $(1, 0)$, respectively, as shown in the figure. Show that the equation of the graph of all points (x, y) satisfying $d_1 d_2 = 1$ is

$(x^2 + y^2)^2 = 2(x^2 - y^2)$.

This curve is called a **lemniscate.** Graph the lemniscate and identify three points on the graph.

- **Describe what calculus is and how it compares with precalculus.**
- **Describe that the tangent line problem is basic to calculus.**
- **Describe that the area problem is also basic to calculus.**

What Is Calculus?

Calculus is the mathematics of change. For instance, calculus is the mathematics of velocities, accelerations, tangent lines, slopes, areas, volumes, arc lengths, centroids, curvatures, and a variety of other concepts that have enabled scientists, engineers, and economists to model real-life situations.

Although precalculus mathematics also deals with velocities, accelerations, tangent lines, slopes, and so on, there is a fundamental difference between precalculus mathematics and calculus. Precalculus mathematics is more static, whereas calculus is more dynamic. Here are some examples.

- An object traveling at a constant velocity can be analyzed with precalculus mathematics. To analyze the velocity of an accelerating object, you need calculus.
- The slope of a line can be analyzed with precalculus mathematics. To analyze the slope of a curve, you need calculus.
- The curvature of a circle is constant and can be analyzed with precalculus mathematics. To analyze the variable curvature of a general curve, you need calculus.
- The area of a rectangle can be analyzed with precalculus mathematics. To analyze the area under a general curve, you need calculus.

Each of these situations involves the same general strategy—the reformulation of precalculus mathematics through the use of a limit process. So, one way to answer the question "What is calculus?" is to say that calculus is a "limit machine" that involves three stages. The first stage is precalculus mathematics, such as the slope of a line or the area of a rectangle. The second stage is the limit process, and the third stage is a new calculus formulation, such as a derivative or integral.

Precalculus mathematics ⇨ Limit process ⇨ Calculus

Some students try to learn calculus as if it were simply a collection of new formulas. This is unfortunate. If you reduce calculus to the memorization of differentiation and integration formulas, you will miss a great deal of understanding, self-confidence, and satisfaction.

On the next two pages are listed some familiar precalculus concepts coupled with their calculus counterparts. Throughout the text, your goal should be to learn how precalculus formulas and techniques are used as building blocks to produce the more general calculus formulas and techniques. Do not worry if you are unfamiliar with some of the "old formulas" listed on the next two pages—you will be reviewing all of them.

As you proceed through this text, come back to this discussion repeatedly. Try to keep track of where you are relative to the three stages involved in the study of calculus. For instance, note how these chapters relate to the three stages.

Chapter P: Preparation for Calculus	Precalculus mathematics
Chapter 1: Limits and Their Properties	Limit process
Chapter 2: Differentiation	Calculus

This cycle is repeated many times on a smaller scale throughout the text.

REMARK As you progress through this course, remember that learning calculus is just one of your goals. Your most important goal is to learn how to use calculus to model and solve real-life problems. Here are a few problem-solving strategies that may help you.

- Be sure you understand the question. What is given? What are you asked to find?
- Outline a plan. There are many approaches you could use: look for a pattern, solve a simpler problem, work backwards, draw a diagram, use technology, or apply any of many other approaches.
- Complete your plan. Be sure to answer the question. Verbalize your answer. For example, rather than writing the answer as $x = 4.6$, it would be better to write the answer as, "The area of the region is 4.6 square meters."
- Look back at your work. Does your answer make sense? Is there a way to check the reasonableness of your answer?

The tangent line to the graph of f at P

Figure 1.1

The Tangent Line Problem

The notion of a limit is fundamental to the study of calculus. The following brief descriptions of two classic problems in calculus—*the tangent line problem* and *the area problem*—should give you some idea of the way limits are used in calculus.

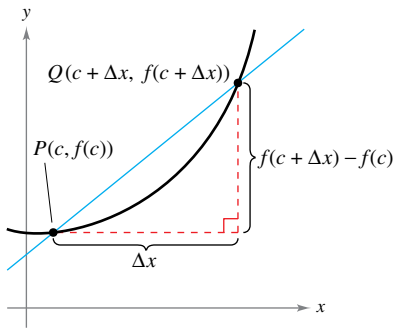
In the tangent line problem, you are given a function f and a point P on its graph and are asked to find an equation of the tangent line to the graph at point P, as shown in Figure 1.1.

Except for cases involving a vertical tangent line, the problem of finding the **tangent line** at a point P is equivalent to finding the *slope* of the tangent line at P. To approximate this slope, sketch a line through the point of tangency and a second point on the curve, as shown in Figure 1.2(a). This line is called a **secant line.** If $P(c, f(c))$ is the point of tangency and

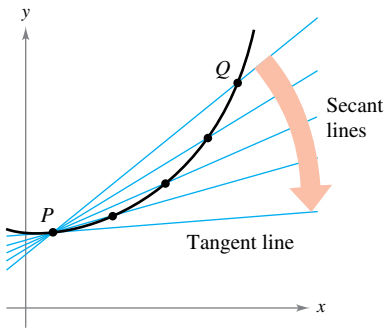
$$Q(c + \Delta x, f(c + \Delta x))$$

is a second point on the graph of f, then the slope of the secant line through these two points can be found using precalculus and is

$$m_{sec} = \frac{f(c + \Delta x) - f(c)}{c + \Delta x - c} = \frac{f(c + \Delta x) - f(c)}{\Delta x}.$$



(a) The secant line through $(c, f(c))$ and $(c + \Delta x, f(c + \Delta x))$



(b) As Q approaches P, the secant lines approach the tangent line.

Figure 1.2

As point Q approaches point P, the slopes of the secant lines approach the slope of the tangent line, as shown in Figure 1.2(b). When such a "limiting position" exists, the slope of the tangent line is said to be the **limit** of the slopes of the secant lines. (Much more will be said about this important calculus concept in Chapter 2.)

GRACE CHISHOLM YOUNG (1868–1944)

Grace Chisholm Young received her degree in mathematics from Girton College in Cambridge, England. Her early work was published under the name of William Young, her husband. Between 1914 and 1916, Grace Young published work on the foundations of calculus that won her the Gamble Prize from Girton College.

The Mistress and Fellows, Girton College, Cambridge

Exploration

The five points listed below lie on the graph of $f(x) = x^2$.

$$Q_1(1.5, f(1.5)), \quad Q_2(1.1, f(1.1)), \quad Q_3(1.01, f(1.01)),$$
$$Q_4(1.001, f(1.001)), \quad Q_5(1.0001, f(1.0001))$$

Each successive point gets closer to the point $P(1, 1)$. Find the slopes of the secant lines through Q_1 and P, Q_2 and P, and so on. Graph these secant lines on a graphing utility. Then use your results to estimate the slope of the tangent line to the graph of f at the point P.

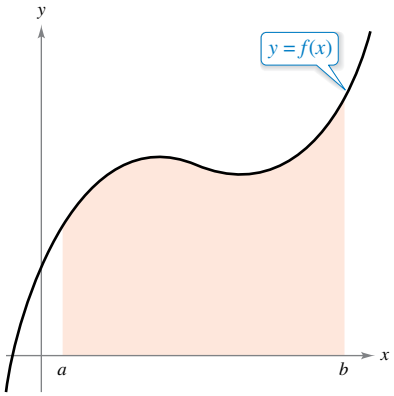
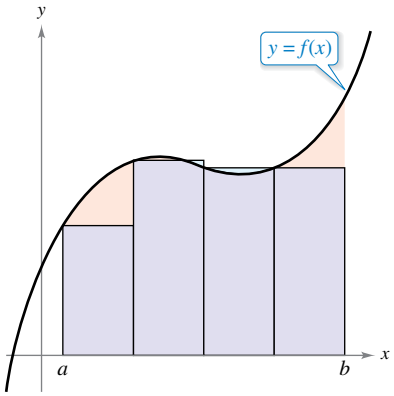
The Area Problem

In the tangent line problem, the limit process was applied to the slope of a line to find the slope of a general curve. A second classic problem in calculus is finding the area of a plane region that is bounded by the graphs of functions. This problem can also be solved with a limit process. In this case, the limit process is applied to the area of a rectangle to find the area of a general region.

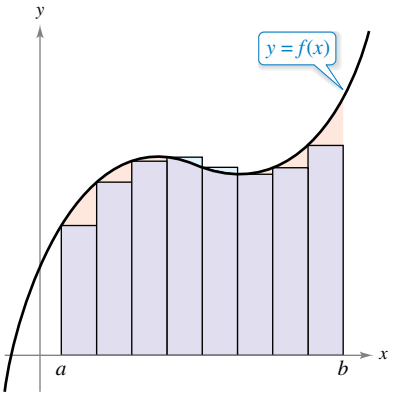
As a simple example, consider the region bounded by the graph of the function $y = f(x)$, the x-axis, and the vertical lines $x = a$ and $x = b$, as shown in Figure 1.3. You can approximate the area of the region with several rectangular regions, as shown in Figure 1.4. As you increase the number of rectangles, the approximation tends to become better and better because the amount of area missed by the rectangles decreases. Your goal is to determine the limit of the sum of the areas of the rectangles as the number of rectangles increases without bound.



Area under a curve
Figure 1.3



Approximation using four rectangles

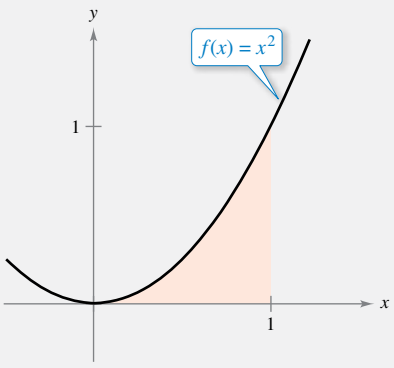


Approximation using eight rectangles
Figure 1.4

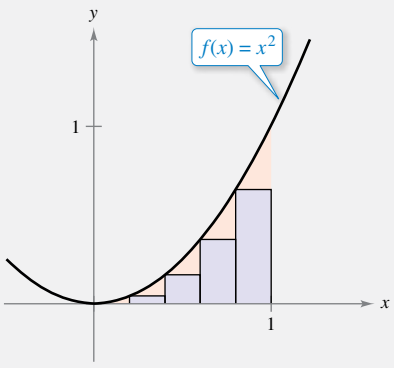
The discovery of the relationship between the tangent line problem and the area problem led to the birth of calculus. You will learn more about this relationship when you study the Fundamental Theorem of Calculus in Chapter 4.

Exploration

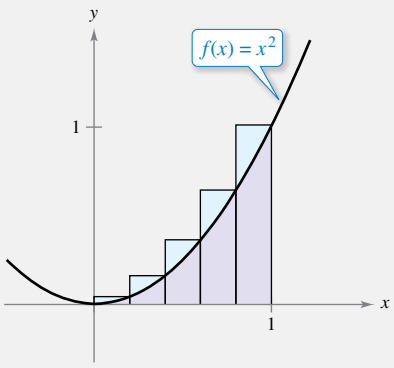
Consider the region bounded by the graphs of $f(x) = x^2$, $y = 0$, and $x = 1$, as shown in part (a) of the figure. The area of the region can be approximated by two sets of rectangles—one set inscribed within the region and the other set circumscribed over the region, as shown in parts (b) and (c). Find the sum of the areas of each set of rectangles. Then use your results to approximate the area of the region.



(a) Bounded region



(b) Inscribed rectangles



(c) Circumscribed rectangles

1.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

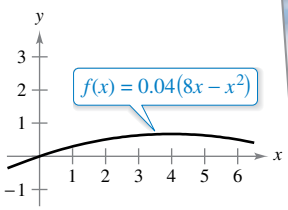
1. Describe the relationship between precalculus and calculus. List three precalculus concepts and their corresponding calculus counterparts.
2. Discuss the relationship between secant lines through a fixed point and a corresponding tangent line at that fixed point.

Precalculus or Calculus **In Exercises 3–6, decide whether the problem can be solved using precalculus or whether calculus is required. When the problem can be solved using precalculus, solve it. When the problem seems to require calculus, explain your reasoning and use a graphical or numerical approach to estimate the solution.**

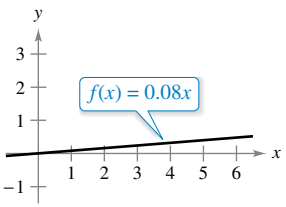
3. Find the distance traveled in 15 seconds by an object traveling at a constant velocity of 20 feet per second.
4. Find the distance traveled in 15 seconds by an object moving with a velocity of $v(t) = 20 + 7\cos t$ feet per second.

5. Rate of Change

A bicyclist is riding on a path modeled by the function $f(x) = 0.04(8x - x^2)$, where x and $f(x)$ are measured in miles (see figure). Find the rate of change of elevation at $x = 2$.



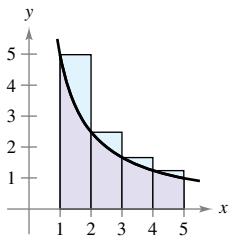
6. A bicyclist is riding on a path modeled by the function $f(x) = 0.08x$, where x and $f(x)$ are measured in miles (see figure). Find the rate of change of elevation at $x = 2$.

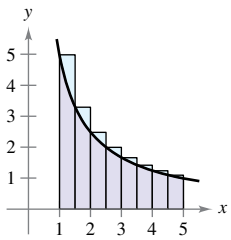


7. **Secant Lines** Consider the function $f(x) = \sqrt{x}$ and the point $P(4, 2)$ on the graph of f.
   (a) Graph f and the secant lines passing through $P(4, 2)$ and $Q(x, f(x))$ for x-values of 1, 3, and 5.
   (b) Find the slope of each secant line.
   (c) Use the results of part (b) to estimate the slope of the tangent line to the graph of f at $P(4, 2)$. Describe how to improve your approximation of the slope.

8. **Secant Lines** Consider the function $f(x) = 6x - x^2$ and the point $P(2, 8)$ on the graph of f.
   (a) Graph f and the secant lines passing through $P(2, 8)$ and $Q(x, f(x))$ for x-values of 3, 2.5, and 1.5.
   (b) Find the slope of each secant line.
   (c) Use the results of part (b) to estimate the slope of the tangent line to the graph of f at $P(2, 8)$. Describe how to improve your approximation of the slope.

9. **Approximating Area** Use the rectangles in each graph to approximate the area of the region bounded by $y = 5/x$, $y = 0$, $x = 1$, and $x = 5$. Describe how you could continue this process to obtain a more accurate approximation of the area.





10. **HOW DO YOU SEE IT?** How would you describe the instantaneous rate of change of an automobile's position on a highway?

Exploring Concepts

11. Consider the length of the graph of $f(x) = 5/x$ from $(1, 5)$ to $(5, 1)$.

   (a) Approximate the length of the curve by finding the distance between its two endpoints, as shown in the first figure.
   (b) Approximate the length of the curve by finding the sum of the lengths of four line segments, as shown in the second figure.
   (c) Describe how you could continue this process to obtain a more accurate approximation of the length of the curve.

A blue exercise number indicates that a video solution can be seen at *CalcView.com*.

1.2 Finding Limits Graphically and Numerically

GO DIGITAL

- **Estimate a limit using a numerical or graphical approach.**
- **Identify the ways that a limit fails to exist.**
- **Prove the existence of a limit using the formal definition of a limit.**

An Introduction to Limits

To sketch the graph of the function

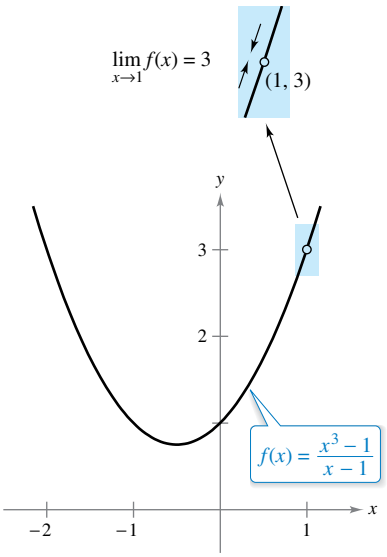
$$f(x) = \frac{x^3 - 1}{x - 1} \qquad f \text{ is undefined at } x = 1.$$

for values other than $x = 1$, you can use standard curve-sketching techniques. At $x = 1$, however, it is not clear what to expect. To get an idea of the behavior of the graph of f near $x = 1$, you can use two sets of x-values—one set that approaches 1 from the left and one set that approaches 1 from the right, as shown in the table.

x approaches 1 from the left. | x approaches 1 from the right.

x	0.75	0.9	0.99	0.999	1	1.001	1.01	1.1	1.25
$f(x)$	2.313	2.710	2.970	2.997	?	3.003	3.030	3.310	3.813

$f(x)$ approaches 3. | $f(x)$ approaches 3.



The limit of $f(x)$ as x approaches 1 is 3.
Figure 1.5

The graph of f has the shape of a parabola with a hole at the point $(1, 3)$, as shown in Figure 1.5. Although x cannot equal 1, you can move arbitrarily close to 1, and as a result $f(x)$ moves arbitrarily close to 3. Using limit notation, you can write

$$\lim_{x \to 1} f(x) = 3. \qquad \text{This is read as "the limit of } f(x) \text{ as } x \text{ approaches 1 is 3."}$$

This discussion leads to an informal definition of limit. If $f(x)$ becomes arbitrarily close to a single real number L as x approaches c from either side (but $x \neq c$), then the **limit** of $f(x)$ as x approaches c is L. This limit is written as

$$\lim_{x \to c} f(x) = L.$$

REMARK Note that if $f(x)$ does *not* become arbitrarily close to a single real number L as x approaches c from either side, then the limit of $f(x)$ *fails to exist*.

Exploration

Estimate the limit

$$\lim_{x \to 2} \frac{x^2 - 3x + 2}{x - 2}$$

numerically by completing the table below. Then use a graphing utility to estimate the limit graphically.

x	1.75	1.9	1.99	1.999	2	2.001	2.01	2.1	2.25
$f(x)$	?	?	?	?	?	?	?	?	?

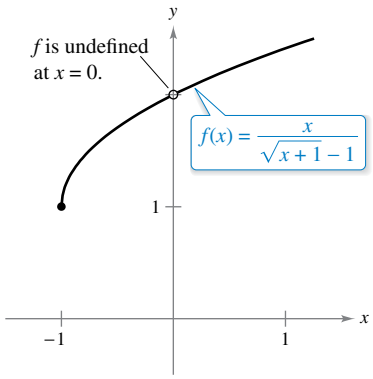
GO DIGITAL

EXAMPLE 1 Estimating a Limit Numerically

Evaluate the function $f(x) = x/\left(\sqrt{x+1} - 1\right)$ at several x-values near 0 and use the results to estimate the limit

$$\lim_{x \to 0} \frac{x}{\sqrt{x+1} - 1}.$$



The limit of $f(x)$ as x approaches 0 is 2.
Figure 1.6

Solution The table shows $f(x)$ for several x-values near 0.

x approaches 0 from the left. | x approaches 0 from the right.

x	-0.01	-0.001	-0.0001	0	0.0001	0.001	0.01
$f(x)$	1.99499	1.99950	1.99995	?	2.00005	2.00050	2.00499

$f(x)$ approaches 2. | $f(x)$ approaches 2.

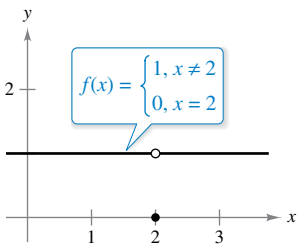
From the results shown in the table, you can estimate the limit to be 2. This limit is reinforced by the graph of f shown in Figure 1.6. ■

In Example 1, note that the function is undefined at $x = 0$, and yet $f(x)$ appears to be approaching a limit as x approaches 0. This often happens, and it is important to realize that *the existence or nonexistence of $f(x)$ at $x = c$ has no bearing on the existence of the limit of $f(x)$ as x approaches c.*

EXAMPLE 2 Finding a Limit

Find the limit of $f(x)$ as x approaches 2, where

$$f(x) = \begin{cases} 1, & x \neq 2 \\ 0, & x = 2 \end{cases}.$$



The limit of $f(x)$ as x approaches 2 is 1.
Figure 1.7

Solution Because $f(x) = 1$ for all x other than $x = 2$, you can estimate that the limit is 1, as shown in Figure 1.7. So, you can write

$$\lim_{x \to 2} f(x) = 1.$$ The limit of $f(x)$ as x approaches 2 is 1.

The fact that $f(2) = 0$ has no bearing on the existence or value of the limit as x approaches 2. For instance, as x approaches 2, the function

$$g(x) = \begin{cases} 1, & x \neq 2 \\ 2, & x = 2 \end{cases}$$ $\lim_{x \to 2} g(x) = 1$

has the same limit as f. ■

So far in this section, you have been estimating limits numerically and graphically. These approaches produce an *estimate* of the limit. In Section 1.3, you will study analytic techniques for evaluating limits. Throughout the course, try to develop a habit of using this three-pronged approach to problem solving.

1. Numerical approach — Construct a table of values.
2. Graphical approach — Sketch a graph.
3. Analytic approach — Use algebra or calculus.

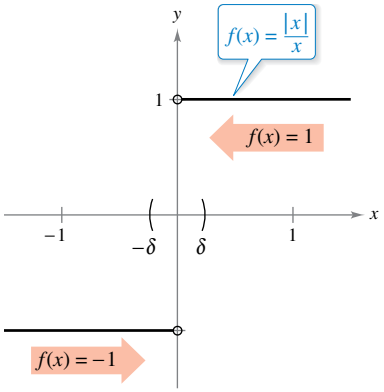
GO DIGITAL



$\lim_{x\to 0} f(x)$ does not exist.

Figure 1.8

Limits That Fail to Exist

In the next three examples, you will examine some limits that fail to exist.

EXAMPLE 3 Different Right and Left Behavior

Show that the limit $\lim_{x\to 0} \frac{|x|}{x}$ does not exist.

Solution Consider the graph of the function

$$f(x) = \frac{|x|}{x}.$$

In Figure 1.8 and from the definition of absolute value,

$$|x| = \begin{cases} x, & x \geq 0 \\ -x, & x < 0 \end{cases}$$ Definition of absolute value

you can see that

$$\frac{|x|}{x} = \begin{cases} 1, & x > 0 \\ -1, & x < 0 \end{cases}.$$

So, no matter how close x gets to 0, there will be both positive and negative x-values that yield $f(x) = 1$ or $f(x) = -1$. Specifically, if δ (the lowercase Greek letter delta) is a positive number, then for x-values satisfying the inequality $0 < |x| < \delta$, you can classify the values of $|x|/x$ as -1 or 1 on the intervals

$$(-\delta, 0) \quad \text{or} \quad (0, \delta).$$

Negative x-values yield $|x|/x = -1$.

Positive x-values yield $|x|/x = 1$.

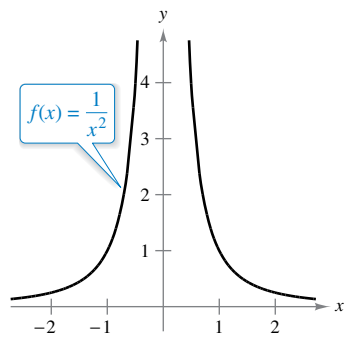
Because $|x|/x$ approaches a different number from the right side of 0 than it approaches from the left side, the limit $\lim_{x\to 0} (|x|/x)$ does not exist.

EXAMPLE 4 Unbounded Behavior

Discuss the existence of the limit $\lim_{x\to 0} \frac{1}{x^2}$.

Solution Consider the graph of the function

$$f(x) = \frac{1}{x^2}.$$



$\lim_{x\to 0} f(x)$ does not exist.

Figure 1.9

In Figure 1.9, note that as x approaches 0 from either the right or the left, $f(x)$ increases without bound. This means that by choosing x close enough to 0, you can force $f(x)$ to be as large as you want. For instance, $f(x)$ will be greater than 100 when you choose x within $\frac{1}{10}$ of 0. That is,

$$0 < |x| < \frac{1}{10} \quad \Rightarrow \quad f(x) = \frac{1}{x^2} > 100.$$

Similarly, you can force $f(x)$ to be greater than 1,000,000, as shown.

$$0 < |x| < \frac{1}{1000} \quad \Rightarrow \quad f(x) = \frac{1}{x^2} > 1{,}000{,}000$$

Because $f(x)$ does not become arbitrarily close to a single number L as x approaches 0, you can conclude that the limit does not exist. ■

$\lim_{x\to 0} f(x)$ does not exist.

Figure 1.10

EXAMPLE 5 Oscillating Behavior

See LarsonCalculus.com for an interactive version of this type of example.

Discuss the existence of the limit $\lim_{x\to 0} \sin\frac{1}{x}$.

Solution Let $f(x) = \sin(1/x)$. In Figure 1.10, you can see that as x approaches 0, $f(x)$ oscillates between -1 and 1. So, the limit does not exist because no matter how small you choose δ, it is possible to choose x_1 and x_2 within δ units of 0 such that $\sin(1/x_1) = 1$ and $\sin(1/x_2) = -1$, as shown in the table.

x	$\frac{2}{\pi}$	$\frac{2}{3\pi}$	$\frac{2}{5\pi}$	$\frac{2}{7\pi}$	$\frac{2}{9\pi}$	$\frac{2}{11\pi}$	$x\to 0$
$\sin\frac{1}{x}$	1	-1	1	-1	1	-1	Limit does not exist.

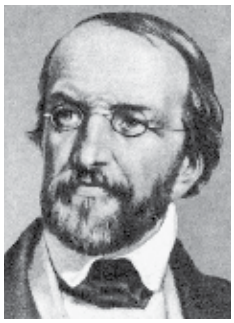
Common Types of Behavior Associated with Nonexistence of a Limit

1. $f(x)$ approaches a different number from the right side of c than it approaches from the left side.
2. $f(x)$ increases or decreases without bound as x approaches c.
3. $f(x)$ oscillates between two fixed values as x approaches c.

In addition to $f(x) = \sin(1/x)$, there are many other interesting functions that have unusual limit behavior. An often cited one is the *Dirichlet function*

$$f(x) = \begin{cases} 0, & \text{if } x \text{ is rational} \\ 1, & \text{if } x \text{ is irrational} \end{cases}.$$

Because this function has *no limit* at any real number c, it is *not continuous* at any real number c. You will study continuity more closely in Section 1.4.



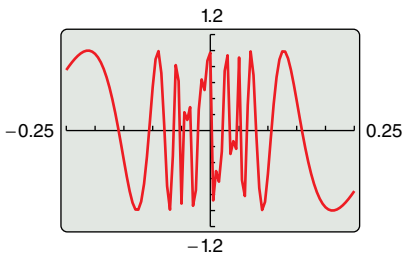
PETER GUSTAV DIRICHLET (1805–1859)

In the early development of calculus, the definition of a function was much more restricted than it is today, and "functions" such as the Dirichlet function would not have been considered. The modern definition of function is attributed to the German mathematician Peter Gustav Dirichlet.

See LarsonCalculus.com to read more of this biography.

INTERFOTO/Alamy Stock Photo

TECHNOLOGY PITFALL When you use a graphing utility to investigate the behavior of a function near the x-value at which you are trying to evaluate a limit, remember that you cannot always trust the graphs that graphing utilities draw. When you use a graphing utility to graph the function in Example 5 over an interval containing 0, you will most likely obtain an incorrect graph such as that shown in Figure 1.11. The reason that a graphing utility cannot show the correct graph is that the graph has infinitely many oscillations over any interval that contains 0.



Incorrect graph of $f(x) = \sin(1/x)$

A Formal Definition of Limit

Consider again the informal definition of limit. If $f(x)$ becomes arbitrarily close to a single number L as x approaches c from either side, then the limit of $f(x)$ as x approaches c is L, written as

$$\lim_{x \to c} f(x) = L.$$

At first glance, this definition looks fairly technical. Even so, it is informal because exact meanings have not yet been given to the two phrases

"$f(x)$ becomes arbitrarily close to L"

and

"x approaches c."

The first person to assign mathematically rigorous meanings to these two phrases was Augustin-Louis Cauchy. His ***ε-δ* definition of limit** is the standard used today.

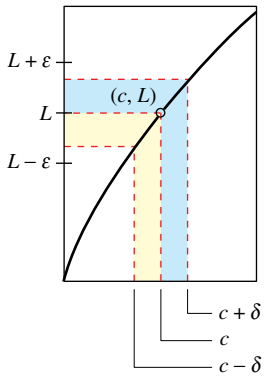
FOR FURTHER INFORMATION
For more on the introduction of rigor to calculus, see "Who Gave You the Epsilon? Cauchy and the Origins of Rigorous Calculus" by Judith V. Grabiner in *The American Mathematical Monthly*. To view this article, go to *MathArticles.com*.

In Figure 1.12, let ε (the lowercase Greek letter epsilon) represent a (small) positive number. Then the phrase "$f(x)$ becomes arbitrarily close to L" means that $f(x)$ lies in the interval $(L - \varepsilon, L + \varepsilon)$. Using absolute value, you can write this as

$$|f(x) - L| < \varepsilon.$$

Similarly, the phrase "x approaches c" means that there exists a positive number δ such that x lies in either the interval $(c - \delta, c)$ or the interval $(c, c + \delta)$. This fact can be concisely expressed by the double inequality

$$0 < |x - c| < \delta.$$



The ε-δ definition of the limit of $f(x)$ as x approaches c
Figure 1.12

The first inequality

$0 < |x - c|$ The distance between x and c is more than 0.

expresses the fact that $x \neq c$. The second inequality

$|x - c| < \delta$ x is within δ units of c.

says that x is within a distance δ of c.

Definition of Limit

Let f be a function defined on an open interval containing c (except possibly at c), and let L be a real number. The statement

$$\lim_{x \to c} f(x) = L$$

means that for each $\varepsilon > 0$ there exists a $\delta > 0$ such that if

$$0 < |x - c| < \delta$$

then

$$|f(x) - L| < \varepsilon.$$

REMARK Throughout this text, the expression

$$\lim_{x \to c} f(x) = L$$

implies two statements—the limit exists *and* the limit is L.

Some functions do not have limits as x approaches c, but those that do cannot have two different limits as x approaches c. That is, *if the limit of a function exists, then the limit is unique* (see Exercise 86).

The next three examples should help you develop a better understanding of the ε-δ definition of limit.

EXAMPLE 6 Finding a δ for a Given ε

Given the limit $\lim_{x \to 3} (2x - 5) = 1$, find δ such that

$$|(2x - 5) - 1| < 0.01$$

whenever

$$0 < |x - 3| < \delta.$$

Solution In this problem, you are working with a given value of ε—namely, $\varepsilon = 0.01$. To find an appropriate δ, try to establish a connection between the absolute values $|(2x - 5) - 1|$ and $|x - 3|$. Notice that

$$|(2x - 5) - 1| = |2x - 6| = 2|x - 3|.$$

Because the inequality $|(2x - 5) - 1| < 0.01$ is equivalent to $2|x - 3| < 0.01$, you can choose

$$\delta = \frac{1}{2}(0.01) = 0.005.$$ Choice for δ

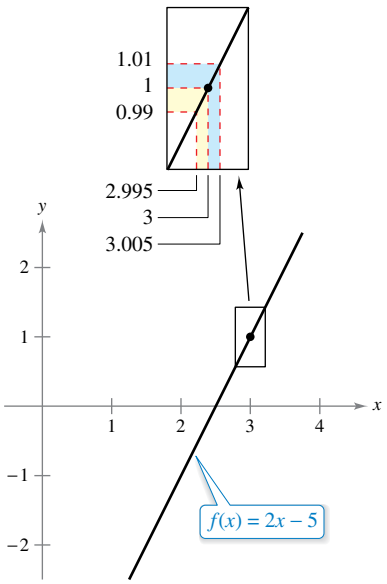
This choice works because

$$0 < |x - 3| < 0.005$$

implies that

$$|(2x - 5) - 1| = 2|x - 3| < 2(0.005) = 0.01.$$

Figure 1.13 shows that for any x-value within 0.005 of 3 ($x \neq 3$), $f(x)$ is within 0.01 of 1.



The limit of $f(x)$ as x approaches 3 is 1.
Figure 1.13

In Example 6, note that 0.005 is the *largest* value of δ that will guarantee

$$|(2x - 5) - 1| < 0.01 \quad \text{whenever} \quad 0 < |x - 3| < \delta.$$

Any *smaller* positive value of δ would also work.

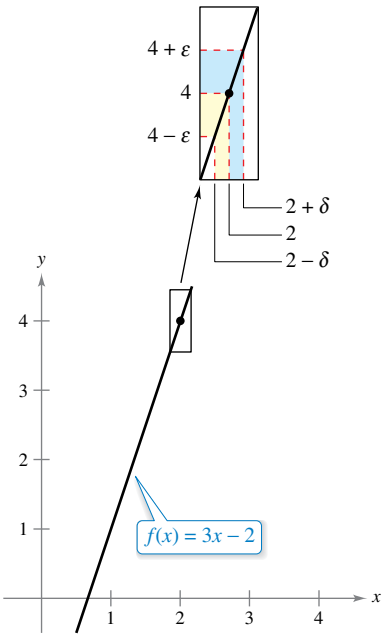
GO DIGITAL



The limit of $f(x)$ as x approaches 2 is 4.
Figure 1.14

In Example 6, you found a δ-value for a *given* ε. This does not prove the existence of the limit. To do that, you must prove that you can find a δ for *any* ε, as shown in the next example.

EXAMPLE 7 Using the ε-δ Definition of Limit

Use the ε-δ definition of limit to prove that

$$\lim_{x \to 2} (3x - 2) = 4.$$

Solution You must show that for each $\varepsilon > 0$, there exists a $\delta > 0$ such that

$$|(3x - 2) - 4| < \varepsilon$$

whenever

$$0 < |x - 2| < \delta.$$

Because your choice of δ depends on ε, you need to establish a connection between the absolute values $|(3x - 2) - 4|$ and $|x - 2|$.

$$|(3x - 2) - 4| = |3x - 6| = 3|x - 2|$$

So, for a given $\varepsilon > 0$, you can choose $\delta = \varepsilon/3$. This choice works because

$$0 < |x - 2| < \delta = \frac{\varepsilon}{3}$$

implies that

$$|(3x - 2) - 4| = 3|x - 2| < 3\left(\frac{\varepsilon}{3}\right) = \varepsilon.$$

Figure 1.14 shows that for any x-value within δ of 2 ($x \neq 2$), $f(x)$ is within ε of 4.

EXAMPLE 8 Using the ε-δ Definition of Limit

Use the ε-δ definition of limit to prove that $\lim_{x \to 2} x^2 = 4$.

Solution You must show that for each $\varepsilon > 0$, there exists a $\delta > 0$ such that

$$|x^2 - 4| < \varepsilon$$

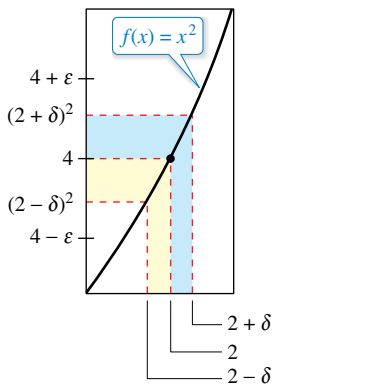
whenever

$$0 < |x - 2| < \delta.$$

To find an appropriate δ, begin by writing $|x^2 - 4| = |x - 2||x + 2|$. You are interested in values of x close to 2, so choose x in the interval $(1, 3)$. To satisfy this restriction, let $\delta < 1$. Furthermore, for all x in the interval $(1, 3)$, $x + 2 < 5$ and thus $|x + 2| < 5$. So, letting δ be the minimum of $\varepsilon/5$ and 1, it follows that, whenever $0 < |x - 2| < \delta$, you have

$$|x^2 - 4| = |x - 2||x + 2| < \left(\frac{\varepsilon}{5}\right)(5) = \varepsilon.$$

Figure 1.15 shows that for any x-value within δ of 2 ($x \neq 2$), $f(x)$ is within ε of 4.



The limit of $f(x)$ as x approaches 2 is 4.
Figure 1.15

Throughout this chapter, you will use the ε-δ definition of limit primarily to prove theorems about limits and to establish the existence or nonexistence of particular types of limits. For *finding* limits, you will learn techniques that are easier to use than the ε-δ definition of limit.

1.2 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Write a brief description of the meaning of the notation $\lim_{x\to 8} f(x) = 25$.
2. Identify three types of behavior associated with the nonexistence of a limit. Illustrate each type with a graph of a function.
3. Given the limit $\lim_{x\to 2} (2x + 1) = 5$, use a sketch to show the meaning of the phrase "$0 < |x - 2| < 0.25$ implies $|(2x + 1) - 5| < 0.5$."
4. Is the limit of $f(x)$ as x approaches c always equal to $f(c)$? Why or why not?

Estimating a Limit Numerically **In Exercises 5–10, complete the table and use the result to estimate the limit. Use a graphing utility to graph the function to confirm your result.**

5. $\lim_{x\to 4} \dfrac{x - 4}{x^2 - 5x + 4}$

x	3.9	3.99	3.999	4	4.001	4.01	4.1
$f(x)$				?			

6. $\lim_{x\to 3} \dfrac{x - 3}{x^2 - 9}$

x	2.9	2.99	2.999	3	3.001	3.01	3.1
$f(x)$				?			

7. $\lim_{x\to 0} \dfrac{\sqrt{x + 1} - 1}{x}$

x	-0.1	-0.01	-0.001	0	0.001	0.01	0.1
$f(x)$				?			

8. $\lim_{x\to 3} \dfrac{[1/(x + 1)] - (1/4)}{x - 3}$

x	2.9	2.99	2.999	3	3.001	3.01	3.1
$f(x)$				?			

9. $\lim_{x\to 0} \dfrac{\sin x}{x}$

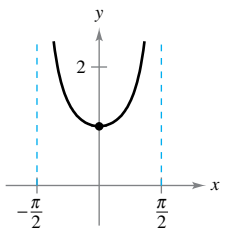
x	-0.1	-0.01	-0.001	0	0.001	0.01	0.1
$f(x)$				?			

10. $\lim_{x\to 0} \dfrac{\cos x - 1}{x}$

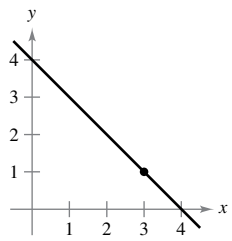
x	-0.1	-0.01	-0.001	0	0.001	0.01	0.1
$f(x)$				?			

Finding a Limit Graphically **In Exercises 11–18, use the graph to find the limit (if it exists). If the limit does not exist, explain why.**

11. $\lim_{x\to 0} \sec x$

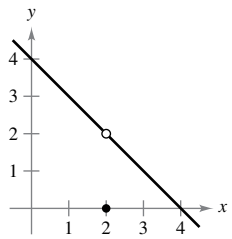


12. $\lim_{x\to 3} (4 - x)$



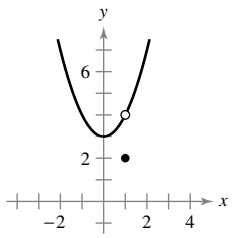
13. $\lim_{x\to 2} f(x)$

$$f(x) = \begin{cases} 4 - x, & x \neq 2 \\ 0, & x = 2 \end{cases}$$

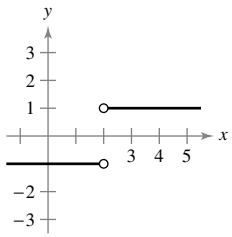


14. $\lim_{x\to 1} f(x)$

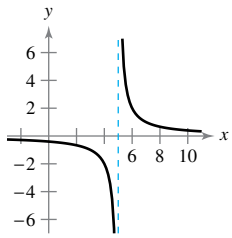
$$f(x) = \begin{cases} x^2 + 3, & x \neq 1 \\ 2, & x = 1 \end{cases}$$



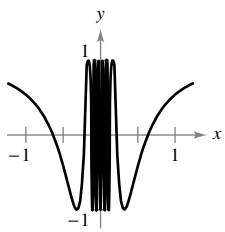
15. $\lim_{x\to 2} \dfrac{|x - 2|}{x - 2}$



16. $\lim_{x\to 5} \dfrac{2}{x - 5}$



17. $\lim_{x\to 0} \cos \dfrac{1}{x}$



18. $\lim_{x\to \pi/2} \tan x$

Estimating a Limit Numerically **In Exercises 19–30, create a table of values for the function and use the result to estimate the limit. Use a graphing utility to graph the function to confirm your result.**

19. $\lim_{x\to 4}\dfrac{x^2-16}{x-4}$

20. $\lim_{x\to 7}\dfrac{7-x}{x^2-49}$

21. $\lim_{x\to 1}\dfrac{x-2}{x^2+x-6}$

22. $\lim_{x\to -4}\dfrac{x+4}{x^2+9x+20}$

23. $\lim_{x\to 1}\dfrac{x^4-1}{x^6-1}$

24. $\lim_{x\to -3}\dfrac{x^3+27}{x+3}$

25. $\lim_{x\to -6}\dfrac{\sqrt{10-x}-4}{x+6}$

26. $\lim_{x\to 1}\dfrac{\sqrt{3}-\sqrt{x+2}}{1-x}$

27. $\lim_{x\to 0}\dfrac{[2/(x+2)]-1}{x}$

28. $\lim_{x\to 2}\dfrac{[x/(x+1)]-(2/3)}{x-2}$

29. $\lim_{x\to 0}\dfrac{\sin 2x}{x}$

30. $\lim_{x\to 0}\dfrac{\tan x}{\tan 2x}$

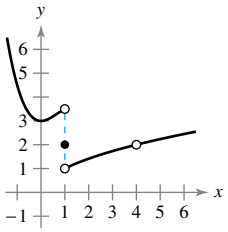
A Limit That Fails to Exist **In Exercises 31 and 32, create a table of values for the function and use the result to explain why the limit does not exist.**

31. $\lim_{x\to 0}\dfrac{2}{x^3}$

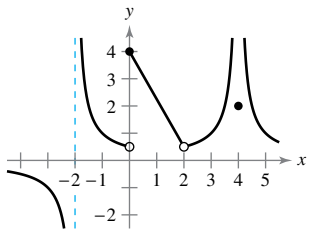
32. $\lim_{x\to 0}\dfrac{3|x|}{x^2}$

Graphical Reasoning **In Exercises 33 and 34, use the graph of the function f to decide whether each quantity exists. If it does, find it. If not, explain why.**

33. (a) $f(1)$
(b) $\lim_{x\to 1} f(x)$
(c) $f(4)$
(d) $\lim_{x\to 4} f(x)$



34. (a) $f(-2)$
(b) $\lim_{x\to -2} f(x)$
(c) $f(0)$
(d) $\lim_{x\to 0} f(x)$
(e) $f(2)$
(f) $\lim_{x\to 2} f(x)$
(g) $f(4)$
(h) $\lim_{x\to 4} f(x)$



Limits of a Piecewise Function **In Exercises 35 and 36, sketch the graph of f. Then identify the values of c for which $\lim_{x\to c} f(x)$ exists.**

35. $f(x)=\begin{cases} x^2, & x\le 2 \\ 8-2x, & 2<x<4 \\ 4, & x\ge 4 \end{cases}$

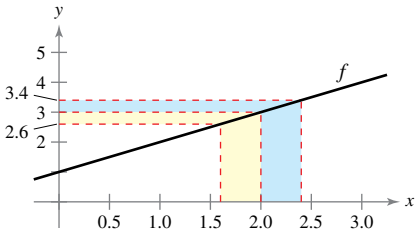
36. $f(x)=\begin{cases} \sin x, & x<0 \\ 1-\cos x, & 0\le x\le \pi \\ \cos x, & x>\pi \end{cases}$

Sketching a Graph **In Exercises 37 and 38, sketch a graph of a function f that satisfies each value. (There are many correct answers.)**

37. $f(0)$ is undefined.
$\lim_{x\to 0} f(x)=4$
$f(2)=6$
$\lim_{x\to 2} f(x)=3$

38. $f(-2)=0$
$f(2)=0$
$\lim_{x\to -2} f(x)=0$
$\lim_{x\to 2} f(x)$ does not exist.

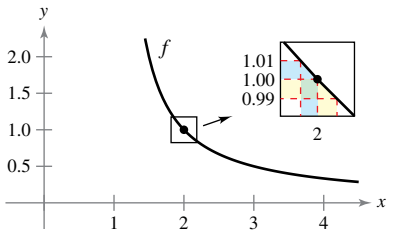
39. Finding δ The graph of $f(x)=x+1$ is shown in the figure. Find δ such that if $0<|x-2|<\delta$, then $|f(x)-3|<0.4$.



40. Finding δ The graph of

$$f(x)=\frac{1}{x-1}$$

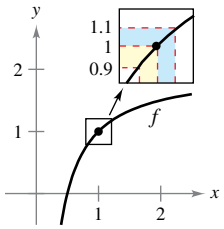
is shown in the figure. Find δ such that if $0<|x-2|<\delta$, then $|f(x)-1|<0.01$.



41. Finding δ The graph of

$$f(x)=2-\frac{1}{x}$$

is shown in the figure. Find δ such that if $0<|x-1|<\delta$, then $|f(x)-1|<0.1$.



42. Finding δ Repeat Exercise 41 for each value of ε. What happens to the value of δ as the value of ε gets smaller?

(a) $\varepsilon=0.05$ (b) $\varepsilon=0.01$
(c) $\varepsilon=0.005$ (d) $\varepsilon=0.001$

Finding δ **In Exercises 43–48, find the limit L. Then find δ such that $|f(x) - L| < \varepsilon$ whenever $0 < |x - c| < \delta$ for (a) $\varepsilon = 0.01$ and (b) $\varepsilon = 0.005$.**

43. $\lim_{x\to 2}(3x + 2)$

44. $\lim_{x\to 6}\left(6 - \frac{1}{3}x\right)$

45. $\lim_{x\to 2}(x^2 - 3)$

46. $\lim_{x\to 4}(x^2 + 6)$

47. $\lim_{x\to 4}(x^2 - x)$

48. $\lim_{x\to 3} x^2$

Using the ε-δ Definition of Limit **In Exercises 49–60, find the limit L. Then use the ε-δ definition to prove that the limit is L.**

49. $\lim_{x\to 4}(x + 2)$

50. $\lim_{x\to -2}(4x + 5)$

51. $\lim_{x\to -4}\left(\frac{1}{2}x - 1\right)$

52. $\lim_{x\to 3}\left(\frac{3}{4}x + 1\right)$

53. $\lim_{x\to 6} 3$

54. $\lim_{x\to 2}(-1)$

55. $\lim_{x\to 0}\sqrt[3]{x}$

56. $\lim_{x\to 4}\sqrt{x}$

57. $\lim_{x\to -5}|x - 5|$

58. $\lim_{x\to 3}|x - 3|$

59. $\lim_{x\to 1}(x^2 + 1)$

60. $\lim_{x\to -4}(x^2 + 4x)$

61. Finding a Limit What is the limit of $f(x) = 4$ as x approaches π?

62. Finding a Limit What is the limit of $g(x) = x$ as x approaches π?

Writing **In Exercises 63–66, use a graphing utility to graph the function and estimate the limit (if it exists). What is the domain of the function? Can you detect a possible error in determining the domain of a function solely by analyzing the graph generated by a graphing utility? Write a short paragraph about the importance of examining a function analytically as well as graphically.**

63. $f(x) = \dfrac{x - 3}{x^2 - 4x + 3}$

$\lim_{x\to 3} f(x)$

64. $f(x) = \dfrac{\sqrt{x + 5} - 3}{x - 4}$

$\lim_{x\to 4} f(x)$

65. $f(x) = \dfrac{x - 9}{\sqrt{x} - 3}$

$\lim_{x\to 9} f(x)$

66. $f(x) = \dfrac{x - 5}{x^2 - 25}$

$\lim_{x\to 5} f(x)$

67. Shipping Charge An online retailer charges \$7.50 shipping for a package that weighs up to one pound and \$0.75 for each additional pound or fraction thereof. A formula for the shipping charge C (in dollars) is given by $C(x) = 7.5 - 0.75[\![1 - x]\!]$, $x > 0$, where x is the weight of the package (in pounds). (*Note:* $[\![x]\!]$ = greatest integer n such that $n \le x$. For example, $[\![3.2]\!] = 3$ and $[\![-1.6]\!] = -2$.)

(a) Evaluate $C(10.75)$. What does $C(10.75)$ represent?

(b) Use a graphing utility to graph the shipping charge function for $0 < x \le 6$. Does the limit of $C(x)$ as x approaches 3 exist? Explain.

68. Modeling Data An online retailer charges \$26.35 priority shipping for a package that weighs up to 0.5 pound and \$0.40 for each additional half pound or fraction thereof.

(a) Write a formula for the shipping charge C (in dollars) in terms of the weight of the package x (in pounds). (*Hint:* See Exercise 67.)

(b) Use a graphing utility to graph the shipping charge function for $0 < x \le 10$. Does the limit of $C(x)$ as x approaches 9 exist? Explain.

Concept Check

69. When using the definition of limit to prove that L is the limit of $f(x)$ as x approaches c, you find the largest satisfactory value of δ. Why would any smaller positive value of δ also work?

70. The definition of limit on page 56 requires that f is a function defined on an open interval containing c, except possibly at c. Why is this requirement necessary?

71. When $f(2) = 4$, can you conclude anything about the limit of $f(x)$ as x approaches 2? Explain your reasoning.

72. When the limit of $f(x)$ as x approaches 2 is 4, can you conclude anything about $f(2)$? Explain your reasoning.

73. Jewelry A jeweler resizes a ring so that its inner circumference is 6 centimeters.

(a) What is the radius of the ring?

(b) The inner circumference of the ring varies between 5.5 centimeters and 6.5 centimeters. How does the radius vary?

(c) Use the ε-δ definition of limit to describe this situation. Identify ε and δ.

74. Sports

A sporting goods manufacturer designs a golf ball having a volume of 2.48 cubic inches.

(a) What is the radius of the golf ball?

(b) The volume of the golf ball varies between 2.45 cubic inches and 2.51 cubic inches. How does the radius vary?

(c) Use the ε-δ definition of limit to describe this situation. Identify ε and δ.

75. Estimating a Limit Consider the function $f(x) = (1 + x)^{1/x}$. Estimate the limit of $f(x)$ as x approaches 0 by evaluating f at x-values near 0. Sketch the graph of f.

The symbol indicates an exercise in which you are instructed to use a graphing utility or a symbolic computer algebra system. The solutions of other exercises may also be facilitated by the use of appropriate technology.

76. Estimating a Limit Consider the function

$$f(x) = \frac{|x + 1| - |x - 1|}{x}.$$

Estimate the limit of $f(x)$ as x approaches 0 by evaluating f at x-values near 0. Sketch the graph of f.

77. Graphical Reasoning The statement

$$\lim_{x\to 2} \frac{x^2 - 4}{x - 2} = 4$$

means that for each $\varepsilon > 0$ there corresponds a $\delta > 0$ such that if $0 < |x - 2| < \delta$, then

$$\left|\frac{x^2 - 4}{x - 2} - 4\right| < \varepsilon.$$

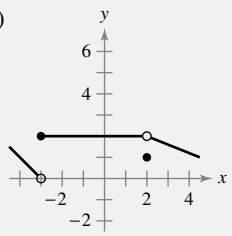
If $\varepsilon = 0.001$, then

$$\left|\frac{x^2 - 4}{x - 2} - 4\right| < 0.001.$$

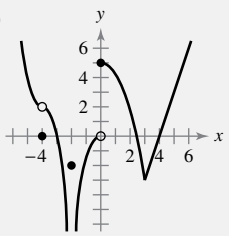
Use a graphing utility to graph each side of this inequality. Use the *zoom* feature to find an interval $(2 - \delta, 2 + \delta)$ such that the inequality is true.

78. HOW DO YOU SEE IT? Use the graph of f to identify the values of c for which $\lim_{x\to c} f(x)$ exists.

(a)



(b)



True or False? **In Exercises 79–82, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

79. If f is undefined at $x = c$, then the limit of $f(x)$ as x approaches c does not exist.

80. If the limit of $f(x)$ as x approaches c is 0, then there must exist a number k such that $f(k) < 0.001$.

81. If $f(c) = L$, then $\lim_{x\to c} f(x) = L$.

82. If $\lim_{x\to c} f(x) = L$, then $f(c) = L$.

Think About It **In Exercises 83 and 84, consider the function $f(x) = \sqrt{x}$.**

83. Is $\lim_{x\to 0.25} \sqrt{x} = 0.5$ a true statement? Explain.

84. Is $\lim_{x\to 0} \sqrt{x} = 0$ a true statement? Explain.

85. Proof Consider the line $f(x) = mx + b$, where $m \neq 0$. Use the ε-δ definition of limit to prove that $\lim_{x\to c} f(x) = mc + b$.

86. Proof Prove that if the limit of $f(x)$ as x approaches c exists, then the limit must be unique. [*Hint:* Let

$$\lim_{x\to c} f(x) = L_1 \quad \text{and} \quad \lim_{x\to c} f(x) = L_2$$

and prove that $L_1 = L_2$.]

87. Proof Prove that

$$\lim_{x\to c} f(x) = L$$

is equivalent to $\lim_{x\to c} [f(x) - L] = 0$.

88. Proof

(a) Show that

$$\lim_{x\to 0} (3x + 1)(3x - 1)x^2 + 0.01 = 0.01.$$

Then prove that there exists an open interval (a, b) containing 0 such that $(3x + 1)(3x - 1)x^2 + 0.01 > 0$ for all $x \neq 0$ in (a, b).

(b) When

$$\lim_{x\to c} g(x) = L, \quad \text{where} \quad L > 0$$

prove that there exists an open interval (a, b) containing c such that $g(x) > 0$ for all $x \neq c$ in (a, b).

89. Evaluating Limits Use a graphing utility to evaluate

$$\lim_{x\to 0} \frac{\sin nx}{x}$$

for several values of n. What do you notice?

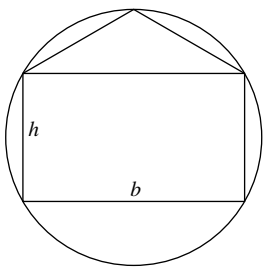
90. Evaluating Limits Use a graphing utility to evaluate

$$\lim_{x\to 0} \frac{\tan nx}{x}$$

for several values of n. What do you notice?

PUTNAM EXAM CHALLENGE

91. Inscribe a rectangle of base b and height h in a circle of radius one, and inscribe an isosceles triangle in a region of the circle cut off by one base of the rectangle (with that side as the base of the triangle). For what value of h do the rectangle and triangle have the same area?



92. A right circular cone has base of radius 1 and height 3. A cube is inscribed in the cone so that one face of the cube is contained in the base of the cone. What is the side length of the cube?

1.3 Evaluating Limits Analytically

GO DIGITAL

- Evaluate a limit using properties of limits.
- Develop and use a strategy for finding limits.
- Evaluate a limit using the dividing out technique.
- Evaluate a limit using the rationalizing technique.
- Evaluate a limit using the Squeeze Theorem.

Properties of Limits

In Section 1.2, you learned that the limit of $f(x)$ as x approaches c does not depend on the value of f at $x = c$. It may happen, however, that the limit is precisely $f(c)$. In such cases, you can evaluate the limit by **direct substitution.** That is,

$$\lim_{x \to c} f(x) = f(c). \qquad \text{Substitute } c \text{ for } x.$$

Such *well-behaved* functions are **continuous at *c*.** You will examine this concept more closely in Section 1.4.

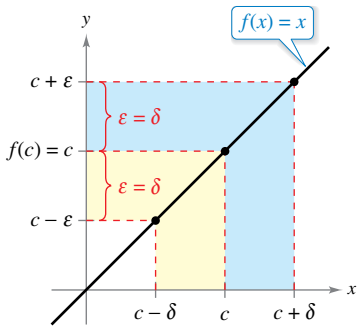

Figure 1.16

THEOREM 1.1 Some Basic Limits

Let b and c be real numbers, and let n be a positive integer.

1. $\lim_{x \to c} b = b$
2. $\lim_{x \to c} x = c$
3. $\lim_{x \to c} x^n = c^n$

Proof The proofs of Properties 1 and 3 of Theorem 1.1 are left as exercises (see Exercises 107 and 108). To prove Property 2, you need to show that for each $\varepsilon > 0$ there exists a $\delta > 0$ such that $|x - c| < \varepsilon$ whenever $0 < |x - c| < \delta$. To do this, choose $\delta = \varepsilon$. The second inequality then implies the first, as shown in Figure 1.16.

EXAMPLE 1 Evaluating Basic Limits

a. $\lim_{x \to 2} 3 = 3$ **b.** $\lim_{x \to -4} x = -4$ **c.** $\lim_{x \to 2} x^2 = 2^2 = 4$

REMARK To help you learn these properties, write each property in words. For example, in words, Property 4 of Theorem 1.2 says, "the limit of the product of two functions is the product of their limits." Write the other properties in words.

THEOREM 1.2 Properties of Limits

Let b and c be real numbers, let n be a positive integer, and let f and g be functions with the limits $\lim_{x \to c} f(x) = L$ and $\lim_{x \to c} g(x) = K$.

1. Scalar multiple: $\lim_{x \to c} [bf(x)] = bL$
2. Sum: $\lim_{x \to c} [f(x) + g(x)] = L + K$
3. Difference: $\lim_{x \to c} [f(x) - g(x)] = L - K$
4. Product: $\lim_{x \to c} [f(x)g(x)] = LK$
5. Quotient: $\lim_{x \to c} \frac{f(x)}{g(x)} = \frac{L}{K}, \quad K \neq 0$
6. Power: $\lim_{x \to c} [f(x)]^n = L^n$

The proof of Property 1 is left as an exercise (see Exercise 121).
The proofs of the other properties are given in Appendix A.

The limit of $f(x)$ as x approaches 2 is 19.
Figure 1.17

EXAMPLE 2 The Limit of a Polynomial

Find the limit: $\lim_{x\to 2}(4x^2 + 3)$.

Solution

$$\begin{aligned}\lim_{x\to 2}(4x^2 + 3) &= \lim_{x\to 2} 4x^2 + \lim_{x\to 2} 3 && \text{Property 2, Theorem 1.2}\\ &= 4\left(\lim_{x\to 2} x^2\right) + \lim_{x\to 2} 3 && \text{Property 1, Theorem 1.2}\\ &= 4(2^2) + 3 && \text{Properties 1 and 3, Theorem 1.1}\\ &= 19 && \text{Simplify.}\end{aligned}$$

This limit is reinforced by the graph of $f(x) = 4x^2 + 3$ shown in Figure 1.17. ■

In Example 2, note that the limit (as x approaches 2) of the *polynomial function* $p(x) = 4x^2 + 3$ is simply the value of p at $x = 2$.

$$\lim_{x\to 2} p(x) = p(2) = 4(2^2) + 3 = 19$$

This *direct substitution* property is valid for all polynomial functions. Direct substitution can also be used to find the limit of a rational function, unless the substitution results in a zero denominator.

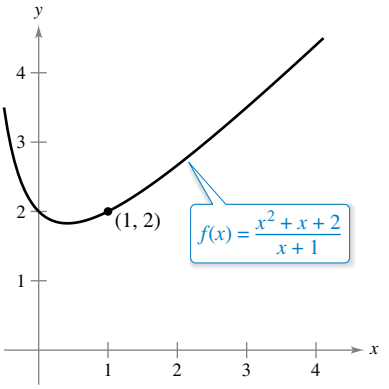
THEOREM 1.3 Limits of Polynomial and Rational Functions

If p is a polynomial function and c is a real number, then

$$\lim_{x\to c} p(x) = p(c). \qquad \text{Direct substitution}$$

If r is a rational function given by $r(x) = p(x)/q(x)$ and c is a real number such that $q(c) \neq 0$, then

$$\lim_{x\to c} r(x) = r(c) = \frac{p(c)}{q(c)}. \qquad \text{Direct substitution, } q(c) \neq 0$$



The limit of $f(x)$ as x approaches 1 is 2.
Figure 1.18

EXAMPLE 3 The Limit of a Rational Function

Find the limit: $\lim_{x\to 1} \dfrac{x^2 + x + 2}{x + 1}$.

Solution The denominator is not 0 when $x = 1$, so apply Theorem 1.3 to obtain

$$\lim_{x\to 1} \frac{x^2 + x + 2}{x + 1} = \frac{1^2 + 1 + 2}{1 + 1} = \frac{4}{2} = 2. \qquad \text{See Figure 1.18.}$$ ■

Polynomial functions and rational functions are two of the three basic types of algebraic functions. The next theorem deals with the limit of the third type of algebraic function—one that involves a radical.

THEOREM 1.4 The Limit of a Function Involving a Radical

Let n be a positive integer. The limit below is valid for all c when n is odd, and is valid for $c > 0$ when n is even.

$$\lim_{x\to c} \sqrt[n]{x} = \sqrt[n]{c} \qquad \text{Direct substitution}$$

A proof of this theorem is given in Appendix A.

Big Ideas of Calculus

The idea of a limit is central to calculus. You will use the concept of the limit of a function to develop some of the big ideas of calculus. such as differentiation and integration. Be sure to complete all concept exercises in this text — Concept Checks, Exploring Concepts, and Building on Concepts. These exercises are denoted by .

The next theorem greatly expands your ability to evaluate limits because it shows how to analyze the limit of a composite function.

THEOREM 1.5 The Limit of a Composite Function

If f and g are functions such that $\lim_{x\to c} g(x) = L$ and $\lim_{x\to L} f(x) = f(L)$, then

$$\lim_{x\to c} f(g(x)) = f\left(\lim_{x\to c} g(x)\right) = f(L).$$

A proof of this theorem is given in Appendix A.

EXAMPLE 4 Limits of Composite Functions

See LarsonCalculus.com for an interactive version of this type of example.

Find the limit.

a. $\lim_{x\to 0} \sqrt{x^2 + 4}$ **b.** $\lim_{x\to 3} \sqrt[3]{2x^2 - 10}$

Solution

a. Because

$$\lim_{x\to 0} (x^2 + 4) = 0^2 + 4 = 4 \quad \text{and} \quad \lim_{x\to 4} \sqrt{x} = \sqrt{4} = 2$$

you can conclude that

$$\lim_{x\to 0} \sqrt{x^2 + 4} = \sqrt{4} = 2.$$

b. Because

$$\lim_{x\to 3} (2x^2 - 10) = 2(3^2) - 10 = 8 \quad \text{and} \quad \lim_{x\to 8} \sqrt[3]{x} = \sqrt[3]{8} = 2$$

you can conclude that

$$\lim_{x\to 3} \sqrt[3]{2x^2 - 10} = \sqrt[3]{8} = 2.$$

You have seen that the limits of many algebraic functions can be evaluated by direct substitution. The six basic trigonometric functions also exhibit this desirable quality, as shown in the next theorem (presented without proof).

THEOREM 1.6 Limits of Trigonometric Functions

Let c be a real number in the domain of the given trigonometric function.

1. $\lim_{x\to c} \sin x = \sin c$
2. $\lim_{x\to c} \cos x = \cos c$
3. $\lim_{x\to c} \tan x = \tan c$
4. $\lim_{x\to c} \cot x = \cot c$
5. $\lim_{x\to c} \sec x = \sec c$
6. $\lim_{x\to c} \csc x = \csc c$

EXAMPLE 5 Limits of Trigonometric Functions

a. $\lim_{x\to 0} \tan x = \tan 0 = 0$

b. $\lim_{x\to \pi} (x \cos x) = \left(\lim_{x\to \pi} x\right)\left(\lim_{x\to \pi} \cos x\right) = \pi \cos \pi = -\pi$

c. $\lim_{x\to 0} \sin^2 x = \lim_{x\to 0} (\sin x)^2 = 0^2 = 0$

A Strategy for Finding Limits

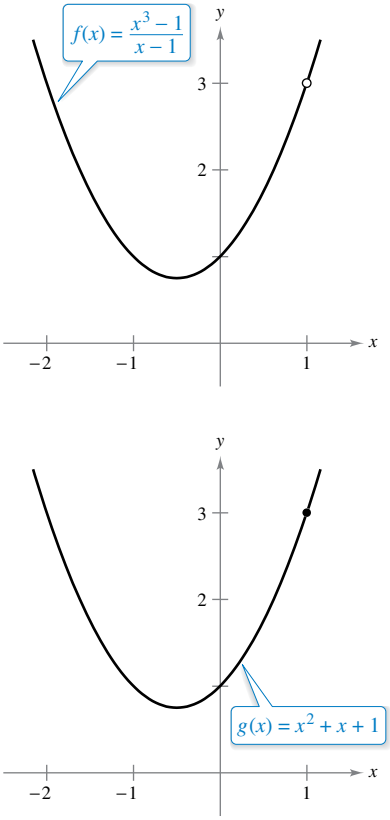
On the preceding three pages, you studied several types of functions whose limits can be evaluated by direct substitution. This knowledge, together with the next theorem, can be used to develop a strategy for finding limits.

THEOREM 1.7 Functions That Agree at All but One Point

Let c be a real number, and let $f(x) = g(x)$ for all $x \neq c$ in an open interval containing c. If the limit of $g(x)$ as x approaches c exists, then the limit of $f(x)$ also exists and

$$\lim_{x \to c} f(x) = \lim_{x \to c} g(x).$$

A proof of this theorem is given in Appendix A.



f and g agree at all but one point.
Figure 1.19

EXAMPLE 6 Finding the Limit of a Function

Find the limit.

$$\lim_{x \to 1} \frac{x^3 - 1}{x - 1}$$

Solution Let $f(x) = (x^3 - 1)/(x - 1)$. By factoring and dividing out common factors, you can rewrite f as

$$f(x) = \frac{(x - 1)(x^2 + x + 1)}{(x - 1)} = x^2 + x + 1 = g(x), \quad x \neq 1.$$

So, for all x-values other than $x = 1$, the functions f and g agree, as shown in Figure 1.19. Because the limit of $g(x)$ as x approaches 1 exists, you can apply Theorem 1.7 to conclude that f and g have the same limit at $x = 1$.

$$\begin{aligned}
\lim_{x \to 1} \frac{x^3 - 1}{x - 1} &= \lim_{x \to 1} \frac{(x - 1)(x^2 + x + 1)}{x - 1} && \text{Factor.} \\
&= \lim_{x \to 1} \frac{(x - 1)(x^2 + x + 1)}{(x - 1)} && \text{Divide out common factor.} \\
&= \lim_{x \to 1} (x^2 + x + 1) && \text{Apply Theorem 1.7.} \\
&= 1^2 + 1 + 1 && \text{Use direct substitution.} \\
&= 3 && \text{Simplify.}
\end{aligned}$$

REMARK When applying this strategy for finding a limit, remember that some functions do not have a limit (as x approaches c). For instance, the limit below does not exist.

$$\lim_{x \to 1} \frac{x^3 + 1}{x - 1}$$

A Strategy for Finding Limits

1. Learn to recognize which limits can be evaluated by direct substitution. (These limits are listed in Theorems 1.1 through 1.6.)
2. When the limit of $f(x)$ as x approaches c *cannot* be evaluated by direct substitution, try to find a function g that agrees with f for all x other than $x = c$. [Choose g such that the limit of $g(x)$ *can* be evaluated by direct substitution.] Then apply Theorem 1.7 to conclude *analytically* that
$$\lim_{x \to c} f(x) = \lim_{x \to c} g(x) = g(c).$$
3. Use a *graph* or *table* to reinforce your conclusion.

Dividing Out Technique

Another procedure for finding a limit analytically is the **dividing out technique.** This technique involves dividing out common factors, as shown in Example 7.

EXAMPLE 7 Dividing Out Technique

See LarsonCalculus.com for an interactive version of this type of example.

Find the limit: $\lim_{x \to -3} \frac{x^2 + x - 6}{x + 3}$.

Solution Although you are taking the limit of a rational function, you *cannot* apply Theorem 1.3 because the limit of the denominator is 0.

$$\lim_{x \to -3} \frac{x^2 + x - 6}{x + 3} \quad \begin{cases} \lim_{x \to -3} (x^2 + x - 6) = 0 \\ \text{Direct substitution fails.} \\ \lim_{x \to -3} (x + 3) = 0 \end{cases}$$

Because the limit of the numerator is also 0, the numerator and denominator have a *common factor* of $(x + 3)$. So, for all $x \neq -3$, you can divide out this factor to obtain

$$f(x) = \frac{x^2 + x - 6}{x + 3} = \frac{(x + 3)(x - 2)}{x + 3} = x - 2 = g(x), \quad x \neq -3.$$

Using Theorem 1.7, it follows that

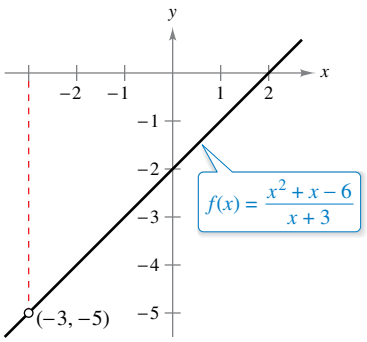
$$\lim_{x \to -3} \frac{x^2 + x - 6}{x + 3} = \lim_{x \to -3} (x - 2) \qquad \text{Apply Theorem 1.7.}$$
$$= -5. \qquad \text{Use direct substitution.}$$

This result is shown graphically in Figure 1.20. Note that the graph of the function f coincides with the graph of the function $g(x) = x - 2$, except that the graph of f has a hole at the point $(-3, -5)$. ■

REMARK In the solution to Example 7, be sure you see the usefulness of the Factor Theorem of Algebra. This theorem states that if c is a zero of a polynomial function, then $(x - c)$ is a factor of the polynomial. So, when you apply direct substitution to a rational function and obtain

$$r(c) = \frac{p(c)}{q(c)} = \frac{0}{0}$$

you can conclude that $(x - c)$ must be a common factor of both $p(x)$ and $q(x)$.



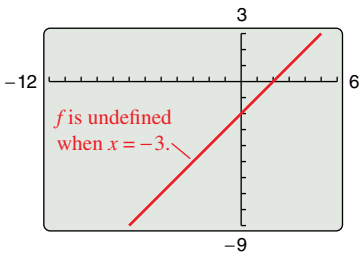
f is undefined when $x = -3$. The limit of $f(x)$ as x approaches -3 is -5.
Figure 1.20

In Example 7, direct substitution produced the meaningless fractional form $0/0$. An expression such as $0/0$ is called an **indeterminate form** because you cannot (from the form alone) determine the limit. When you try to evaluate a limit and encounter this form, remember that you must rewrite the fraction so that the new denominator does not have 0 as its limit. One way to do this is to *divide out common factors*. Another way is to use the *rationalizing technique* shown on the next page.

TECHNOLOGY PITFALL A graphing utility can give misleading information about the graph of a function. For instance, try graphing the function from Example 7

$$f(x) = \frac{x^2 + x - 6}{x + 3}$$

on a graphing utility. On some graphing utilities, the graph may appear to be defined at every real number, as shown in the figure at the right. However, f is undefined when $x = -3$, so the graph of f has a hole at $x = -3$. Check this on a graphing utility using the *trace* or *table* feature.



Misleading graph of f

GO DIGITAL

Rationalizing Technique

Another way to find a limit analytically is the **rationalizing technique,** which involves rationalizing either the numerator or denominator of a fractional expression. Recall that rationalizing the numerator (denominator) means multiplying the numerator and denominator by the conjugate of the numerator (denominator). For instance, to rationalize the numerator of

$$\frac{\sqrt{x}+4}{x}$$

multiply the numerator and denominator by the conjugate of $\sqrt{x}+4$, which is $\sqrt{x}-4$.

EXAMPLE 8 Rationalizing Technique

Find the limit: $\lim_{x\to 0}\dfrac{\sqrt{x+1}-1}{x}$.

Solution By direct substitution, you obtain the indeterminate form $0/0$.

$$\lim_{x\to 0}\frac{\sqrt{x+1}-1}{x}\quad\begin{cases}\lim_{x\to 0}\left(\sqrt{x+1}-1\right)=0\\ \lim_{x\to 0}x=0\end{cases}$$

Direct substitution fails.

In this case, you can rewrite the fraction by rationalizing the numerator.

$$\begin{aligned}\frac{\sqrt{x+1}-1}{x}&=\left(\frac{\sqrt{x+1}-1}{x}\right)\left(\frac{\sqrt{x+1}+1}{\sqrt{x+1}+1}\right)\\&=\frac{(x+1)-1}{x\left(\sqrt{x+1}+1\right)}&&\text{Multiply.}\\&=\frac{\cancel{x}}{\cancel{x}\left(\sqrt{x+1}+1\right)}&&\text{Divide out common factor.}\\&=\frac{1}{\sqrt{x+1}+1},\quad x\neq 0\end{aligned}$$

Now, using Theorem 1.7, you can evaluate the limit as shown.

$$\begin{aligned}\lim_{x\to 0}\frac{\sqrt{x+1}-1}{x}&=\lim_{x\to 0}\frac{1}{\sqrt{x+1}+1}&&\text{Apply Theorem 1.7.}\\&=\frac{1}{1+1}&&\text{Use direct substitution.}\\&=\frac{1}{2}&&\text{Simplify.}\end{aligned}$$

A table or a graph can reinforce your conclusion that the limit is $\frac{1}{2}$. (See Figure 1.21.)

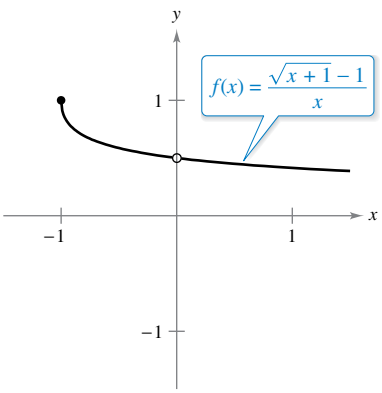
x approaches 0 from the left. / x approaches 0 from the right.

x	-0.25	-0.1	-0.01	-0.001	0	0.001	0.01	0.1	0.25
$f(x)$	0.5359	0.5132	0.5013	0.5001	?	0.4999	0.4988	0.4881	0.4721

$f(x)$ approaches 0.5. / $f(x)$ approaches 0.5.

REMARK The rationalizing technique for evaluating limits is based on multiplication by a convenient form of 1. In Example 8, the convenient form is

$$1=\frac{\sqrt{x+1}+1}{\sqrt{x+1}+1}.$$



The limit of $f(x)$ as x approaches 0 is $\frac{1}{2}$.
Figure 1.21

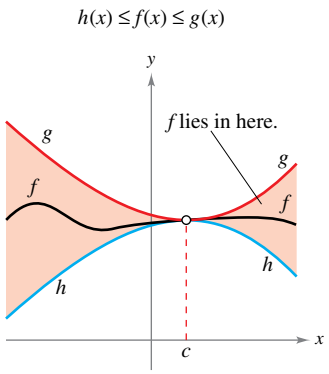
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The Squeeze Theorem

The next theorem concerns the limit of a function that is squeezed between two other functions, each of which has the same limit at a given x-value, as shown in Figure 1.22.



The Squeeze Theorem
Figure 1.22

THEOREM 1.8 The Squeeze Theorem

If $h(x) \le f(x) \le g(x)$ for all x in an open interval containing c, except possibly at c itself, and if

$$\lim_{x \to c} h(x) = L = \lim_{x \to c} g(x)$$

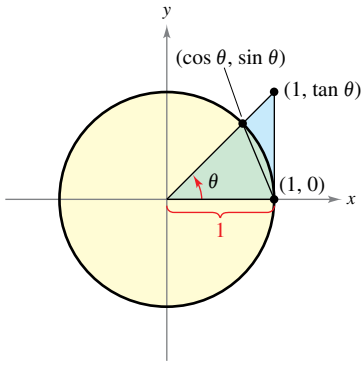
then $\lim_{x \to c} f(x)$ exists and is equal to L.

A proof of this theorem is given in Appendix A.

You can see the usefulness of the Squeeze Theorem (also called the Sandwich Theorem or the Pinching Theorem) in the proof of Theorem 1.9.

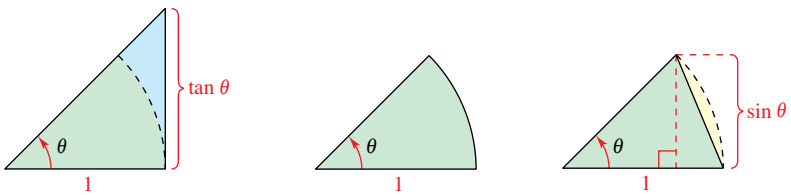
THEOREM 1.9 Two Special Trigonometric Limits

1. $\lim_{x \to 0} \frac{\sin x}{x} = 1$ **2.** $\lim_{x \to 0} \frac{1 - \cos x}{x} = 0$



A circular sector is used to prove Theorem 1.9.
Figure 1.23

Proof The proof of the second limit is left as an exercise (see Exercise 122). To avoid the confusion of two different uses of x, the proof of the first limit is presented using the variable θ, where θ is an acute positive angle *measured in radians*. Figure 1.23 shows a circular sector that is squeezed between two triangles.



$$\begin{array}{ccccc} \text{Area of triangle} & \ge & \text{Area of sector} & \ge & \text{Area of triangle} \\ \frac{\tan \theta}{2} & \ge & \frac{\theta}{2} & \ge & \frac{\sin \theta}{2} \end{array}$$

Multiplying each expression by $2/\sin \theta$ produces

$$\left(\frac{\tan \theta}{2}\right)\left(\frac{2}{\sin \theta}\right) \ge \left(\frac{\theta}{2}\right)\left(\frac{2}{\sin \theta}\right) \ge \left(\frac{\sin \theta}{2}\right)\left(\frac{2}{\sin \theta}\right) \quad \Rightarrow \quad \frac{1}{\cos \theta} \ge \frac{\theta}{\sin \theta} \ge 1$$

and taking reciprocals and reversing the inequalities yields

$$\cos \theta \le \frac{\sin \theta}{\theta} \le 1.$$

Because $\cos \theta = \cos(-\theta)$ and $(\sin \theta)/\theta = [\sin(-\theta)]/(-\theta)$, you can conclude that this inequality is valid for *all* nonzero θ in the open interval $(-\pi/2, \pi/2)$. Finally, because $\lim_{\theta \to 0} \cos \theta = 1$ and $\lim_{\theta \to 0} 1 = 1$, you can apply the Squeeze Theorem to conclude that

$$\lim_{\theta \to 0} \frac{\sin \theta}{\theta} = 1.$$

GO DIGITAL

EXAMPLE 9 A Limit Involving a Trigonometric Function

Find the limit: $\lim_{x\to 0} \frac{\tan x}{x}$.

Solution Direct substitution yields the indeterminate form $0/0$. To solve this problem, rewrite $\tan x$ as $(\sin x)/(\cos x)$ and obtain

$$\lim_{x\to 0} \frac{\tan x}{x} = \lim_{x\to 0} \left(\frac{\sin x}{x}\right)\left(\frac{1}{\cos x}\right).$$

Now, because

$$\lim_{x\to 0} \frac{\sin x}{x} = 1$$

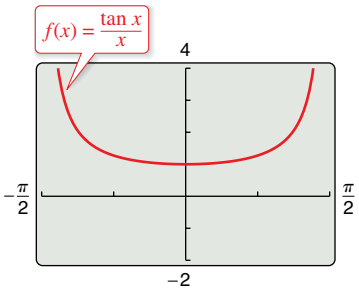
and

$$\lim_{x\to 0} \frac{1}{\cos x} = 1$$

you can obtain

$$\begin{aligned}\lim_{x\to 0} \frac{\tan x}{x} &= \left(\lim_{x\to 0} \frac{\sin x}{x}\right)\left(\lim_{x\to 0} \frac{1}{\cos x}\right)\\ &= (1)(1)\\ &= 1.\end{aligned}$$

(See Figure 1.24.)



The limit of $f(x)$ as x approaches 0 is 1.
Figure 1.24

REMARK Be sure you understand the mathematical conventions regarding parentheses and trigonometric functions. For instance, in Example 10, $\sin 4x$ means $\sin(4x)$.

EXAMPLE 10 A Limit Involving a Trigonometric Function

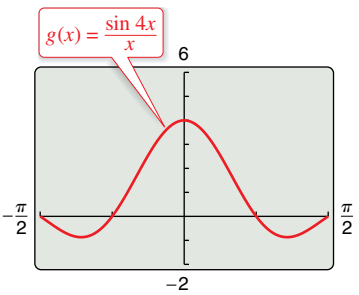
Find the limit: $\lim_{x\to 0} \frac{\sin 4x}{x}$.

Solution Direct substitution yields the indeterminate form $0/0$. To solve this problem, rewrite the limit as

$$\lim_{x\to 0} \frac{\sin 4x}{x} = 4\left(\lim_{x\to 0} \frac{\sin 4x}{4x}\right).$$ Multiply and divide by 4.

Now, by letting $y = 4x$ and observing that x approaches 0 if and only if y approaches 0, you can write

$$\begin{aligned}\lim_{x\to 0} \frac{\sin 4x}{x} &= 4\left(\lim_{x\to 0} \frac{\sin 4x}{4x}\right)\\ &= 4\left(\lim_{y\to 0} \frac{\sin y}{y}\right) && \text{Let } y = 4x.\\ &= 4(1) && \text{Apply Theorem 1.9(1).}\\ &= 4. && \text{See Figure 1.25.}\end{aligned}$$



The limit of $g(x)$ as x approaches 0 is 4.
Figure 1.25

TECHNOLOGY Use a graphing utility to confirm the limits in the examples and in the exercise set. For instance, Figures 1.24 and 1.25 show the graphs of

$$f(x) = \frac{\tan x}{x} \quad \text{and} \quad g(x) = \frac{\sin 4x}{x}.$$

Note that the first graph appears to contain the point $(0, 1)$ and the second graph appears to contain the point $(0, 4)$, which lends support to the conclusions obtained in Examples 9 and 10.

Concept Check

1. Describe how to find the limit of a polynomial function $p(x)$ as x approaches c.
2. What is meant by an indeterminate form?
3. Explain the Squeeze Theorem.
4. List the two special trigonometric limits.

Finding a Limit In Exercises 5–22, find the limit.

5. $\lim_{x\to 2} x^3$
6. $\lim_{x\to -3} x^4$
7. $\lim_{x\to -3} (2x + 5)$
8. $\lim_{x\to 9} (4x - 1)$
9. $\lim_{x\to -3} (x^2 + 3x)$
10. $\lim_{x\to 2} (-x^3 + 1)$
11. $\lim_{x\to -3} (2x^2 + 4x + 1)$
12. $\lim_{x\to 1} (2x^3 - 6x + 5)$
13. $\lim_{x\to 3} \sqrt{x + 8}$
14. $\lim_{x\to 2} \sqrt[3]{12x + 3}$
15. $\lim_{x\to -4} (1 - x)^3$
16. $\lim_{x\to 0} (3x - 2)^4$
17. $\lim_{x\to 2} \frac{3}{2x + 1}$
18. $\lim_{x\to -5} \frac{5}{x + 3}$
19. $\lim_{x\to 1} \frac{x}{x^2 + 4}$
20. $\lim_{x\to 1} \frac{3x + 5}{x + 1}$
21. $\lim_{x\to 7} \frac{3x}{\sqrt{x + 2}}$
22. $\lim_{x\to 3} \frac{\sqrt{x + 6}}{x + 2}$

Finding Limits In Exercises 23–26, find the limits.

23. $f(x) = 5 - x, g(x) = x^3$
    (a) $\lim_{x\to 1} f(x)$ (b) $\lim_{x\to 4} g(x)$ (c) $\lim_{x\to 1} g(f(x))$
24. $f(x) = x + 7, g(x) = x^2$
    (a) $\lim_{x\to -3} f(x)$ (b) $\lim_{x\to 4} g(x)$ (c) $\lim_{x\to -3} g(f(x))$
25. $f(x) = 4 - x^2, g(x) = \sqrt{x + 1}$
    (a) $\lim_{x\to 1} f(x)$ (b) $\lim_{x\to 3} g(x)$ (c) $\lim_{x\to 1} g(f(x))$
26. $f(x) = 2x^2 - 3x + 1, g(x) = \sqrt[3]{x + 6}$
    (a) $\lim_{x\to 4} f(x)$ (b) $\lim_{x\to 21} g(x)$ (c) $\lim_{x\to 4} g(f(x))$

Finding a Limit of a Trigonometric Function In Exercises 27–36, find the limit of the trigonometric function.

27. $\lim_{x\to \pi/2} \sin x$
28. $\lim_{x\to \pi} \tan x$
29. $\lim_{x\to 1} \cos \frac{\pi x}{3}$
30. $\lim_{x\to 2} \sin \frac{\pi x}{12}$
31. $\lim_{x\to 0} \sec 2x$
32. $\lim_{x\to \pi} \cos 3x$
33. $\lim_{x\to 5\pi/6} \sin x$
34. $\lim_{x\to 5\pi/3} \cos x$
35. $\lim_{x\to 3} \tan \frac{\pi x}{4}$
36. $\lim_{x\to 7} \sec \frac{\pi x}{6}$

Evaluating Limits In Exercises 37–40, use the information to evaluate the limits.

37. $\lim_{x\to c} f(x) = \frac{2}{5}$, $\lim_{x\to c} g(x) = 2$
    (a) $\lim_{x\to c} [5g(x)]$
    (b) $\lim_{x\to c} [f(x) + g(x)]$
    (c) $\lim_{x\to c} [f(x)g(x)]$
    (d) $\lim_{x\to c} \frac{f(x)}{g(x)}$
38. $\lim_{x\to c} f(x) = 2$, $\lim_{x\to c} g(x) = \frac{3}{4}$
    (a) $\lim_{x\to c} [4f(x)]$
    (b) $\lim_{x\to c} [f(x) + g(x)]$
    (c) $\lim_{x\to c} [f(x)g(x)]$
    (d) $\lim_{x\to c} \frac{f(x)}{g(x)}$
39. $\lim_{x\to c} f(x) = 16$
    (a) $\lim_{x\to c} [f(x)]^2$
    (b) $\lim_{x\to c} \sqrt{f(x)}$
    (c) $\lim_{x\to c} [3f(x)]$
    (d) $\lim_{x\to c} [f(x)]^{3/2}$
40. $\lim_{x\to c} f(x) = 27$
    (a) $\lim_{x\to c} \sqrt[3]{f(x)}$
    (b) $\lim_{x\to c} \frac{f(x)}{18}$
    (c) $\lim_{x\to c} [f(x)]^2$
    (d) $\lim_{x\to c} [f(x)]^{2/3}$

Finding a Limit In Exercises 41–46, write a simpler function that agrees with the given function at all but one point. Then find the limit of the function. Use a graphing utility to confirm your result.

41. $\lim_{x\to 0} \frac{x^2 + 3x}{x}$
42. $\lim_{x\to 0} \frac{x^4 - 5x^2}{x^2}$
43. $\lim_{x\to -1} \frac{x^2 - 1}{x + 1}$
44. $\lim_{x\to -2} \frac{3x^2 + 5x - 2}{x + 2}$
45. $\lim_{x\to 2} \frac{x^3 - 8}{x - 2}$
46. $\lim_{x\to -1} \frac{x^3 + 1}{x + 1}$

Finding a Limit In Exercises 47–62, find the limit.

47. $\lim_{x\to 0} \frac{x}{x^2 - x}$
48. $\lim_{x\to 0} \frac{7x^3 - x^2}{x}$
49. $\lim_{x\to 4} \frac{x - 4}{x^2 - 16}$
50. $\lim_{x\to 5} \frac{5 - x}{x^2 - 25}$
51. $\lim_{x\to -3} \frac{x^2 + x - 6}{x^2 - 9}$
52. $\lim_{x\to 2} \frac{x^2 + 2x - 8}{x^2 - x - 2}$
53. $\lim_{x\to 4} \frac{\sqrt{x + 5} - 3}{x - 4}$
54. $\lim_{x\to 3} \frac{\sqrt{x + 1} - 2}{x - 3}$
55. $\lim_{x\to 0} \frac{\sqrt{x + 5} - \sqrt{5}}{x}$
56. $\lim_{x\to 0} \frac{\sqrt{2 + x} - \sqrt{2}}{x}$
57. $\lim_{x\to 0} \frac{[1/(3 + x)] - (1/3)}{x}$
58. $\lim_{x\to 0} \frac{[1/(x + 4)] - (1/4)}{x}$
59. $\lim_{\Delta x\to 0} \frac{2(x + \Delta x) - 2x}{\Delta x}$
60. $\lim_{\Delta x\to 0} \frac{(x + \Delta x)^2 - x^2}{\Delta x}$
61. $\lim_{\Delta x\to 0} \frac{(x + \Delta x)^2 - 2(x + \Delta x) + 1 - (x^2 - 2x + 1)}{\Delta x}$
62. $\lim_{\Delta x\to 0} \frac{(x + \Delta x)^3 - x^3}{\Delta x}$

Finding a Limit **In Exercises 63–74, find the limit.**

63. $\lim_{x\to 0} \frac{\sin x}{5x}$

64. $\lim_{x\to 0} \frac{3(1-\cos x)}{x}$

65. $\lim_{x\to 0} \frac{(\sin x)(1-\cos x)}{x^2}$

66. $\lim_{\theta\to 0} \frac{\cos\theta \tan\theta}{\theta}$

67. $\lim_{x\to 0} \frac{\sin^2 x}{x}$

68. $\lim_{x\to 0} \frac{\tan^2 x}{x}$

69. $\lim_{h\to 0} \frac{(1-\cos h)^2}{h}$

70. $\lim_{x\to 0} \frac{\cos x - \sin x - 1}{2x}$

71. $\lim_{x\to 0} \frac{6-6\cos x}{3}$

72. $\lim_{\phi\to \pi} \phi \sec\phi$

73. $\lim_{t\to 0} \frac{\sin 3t}{2t}$

74. $\lim_{x\to 0} \frac{\sin 2x}{\sin 3x}$ $\left[\textit{Hint: Find } \lim_{x\to 0}\left(\frac{2\sin 2x}{2x}\right)\left(\frac{3x}{3\sin 3x}\right).\right]$

Graphical, Numerical, and Analytic Analysis **In Exercises 75–82, use a graphing utility to graph the function and estimate the limit. Use a table to reinforce your conclusion. Then find the limit by analytic methods.**

75. $\lim_{x\to 0} \frac{\sqrt{x+2}-\sqrt{2}}{x}$

76. $\lim_{x\to 16} \frac{4-\sqrt{x}}{x-16}$

77. $\lim_{x\to 0} \frac{[1/(2+x)]-(1/2)}{x}$

78. $\lim_{x\to 2} \frac{x^5-32}{x-2}$

79. $\lim_{t\to 0} \frac{\sin 3t}{t}$

80. $\lim_{x\to 0} \frac{\cos x - 1}{2x^2}$

81. $\lim_{x\to 0} \frac{\sin x^2}{x}$

82. $\lim_{x\to 0} \frac{\sin x}{\sqrt[3]{x}}$

Finding a Limit **In Exercises 83–90, find**

$$\lim_{\Delta x\to 0} \frac{f(x+\Delta x)-f(x)}{\Delta x}.$$

83. $f(x) = 3x - 2$

84. $f(x) = -6x + 3$

85. $f(x) = x^2 - 4x$

86. $f(x) = 3x^2 + 1$

87. $f(x) = 2\sqrt{x}$

88. $f(x) = \sqrt{x} - 5$

89. $f(x) = \frac{1}{x+3}$

90. $f(x) = \frac{1}{x^2}$

Using the Squeeze Theorem **In Exercises 91 and 92, use the Squeeze Theorem to find $\lim_{x\to c} f(x)$.**

91. $c = 0$

$4 - x^2 \le f(x) \le 4 + x^2$

92. $c = a$

$b - |x-a| \le f(x) \le b + |x-a|$

Using the Squeeze Theorem **In Exercises 93–96, use a graphing utility to graph f and the equations $y = |x|$ and $y = -|x|$ in the same viewing window. Using the graphs to observe the Squeeze Theorem visually, find $\lim_{x\to 0} f(x)$.**

93. $f(x) = |x| \sin x$

94. $f(x) = |x| \cos x$

95. $f(x) = x \sin\frac{1}{x}$

96. $f(x) = x \cos\frac{1}{x}$

Exploring Concepts

97. In the context of finding limits, discuss what is meant by two functions that agree at all but one point. Include an example.

98. Write a function of each specified type that has a limit of 4 as x approaches 8.

(a) linear

(b) polynomial of degree 2

(c) rational

(d) radical

(e) cosine

(f) sine

Free-Falling Object **In Exercises 99 and 100, use the position function $s(t) = -4.9t^2 + 200$, which gives the height (in meters) of an object that has fallen for t seconds from a height of 200 meters. The velocity at time $t = a$ seconds is given by**

$$\lim_{t\to a} \frac{s(a)-s(t)}{a-t}.$$

99. Find the velocity of the object when $t = 3$.

100. At what velocity will the object impact the ground?

Free-Falling Object

In Exercises 101 and 102, use the position function $s(t) = -16t^2 + 500$, which gives the height (in feet) of an object that has fallen for t seconds from a height of 500 feet. The velocity at time $t = a$ seconds is given by

$$\lim_{t\to a} \frac{s(a)-s(t)}{a-t}.$$

101. A construction worker drops a full paint can from a height of 500 feet. How fast will the paint can be falling after 2 seconds?

102. A construction worker drops a full paint can from a height of 500 feet. When will the paint can hit the ground? At what velocity will the paint can impact the ground?

103. Writing Use a graphing utility to graph

$$f(x) = x, \quad g(x) = \sin x, \quad \text{and} \quad h(x) = \frac{\sin x}{x}$$

in the same viewing window. Compare the magnitudes of $f(x)$ and $g(x)$ when x is close to 0. Use the comparison to write a short paragraph explaining why

$$\lim_{x\to 0} h(x) = 1.$$

104. Writing Use a graphing utility to graph

$$f(x) = x, \quad g(x) = \sin^2 x, \quad \text{and} \quad h(x) = \frac{\sin^2 x}{x}$$

in the same viewing window. Compare the magnitudes of $f(x)$ and $g(x)$ when x is close to 0. Use the comparison to write a short paragraph explaining why

$$\lim_{x\to 0} h(x) = 0.$$

105. Finding Functions Find two functions f and g such that $\lim_{x\to 0} f(x)$ and $\lim_{x\to 0} g(x)$ do not exist, but

$$\lim_{x\to 0} [f(x) + g(x)]$$

does exist.

106. Proof Prove that if $\lim_{x\to c} f(x)$ exists and

$$\lim_{x\to c} [f(x) + g(x)]$$

does not exist, then $\lim_{x\to c} g(x)$ does not exist.

107. Proof Prove Property 1 of Theorem 1.1.

108. Proof Prove Property 3 of Theorem 1.1. (You may use Property 4 of Theorem 1.2.)

109. Proof Prove that if

$$\lim_{x\to c} f(x) = 0 \quad \text{and} \quad |g(x)| \le M$$

for a fixed number M and all $x \neq c$, then

$$\lim_{x\to c} [f(x)g(x)] = 0.$$

110. Proof Prove that if

$$\lim_{x\to c} f(x) = L$$

then $\lim_{x\to c} |f(x)| = |L|$.

[*Hint:* Use the inequality $\big||f(x)| - |L|\big| \le |f(x) - L|$.]

111. Proof

(a) Prove that if

$$\lim_{x\to c} f(x) = 0$$

then $\lim_{x\to c} |f(x)| = 0$.

(b) Prove that if

$$\lim_{x\to c} |f(x)| = 0$$

then $\lim_{x\to c} f(x) = 0$.

[*Note:* This is the converse of part (a).]

112. Think About It Find a function f to show that the converse of Exercise 110 is not true. [*Hint:* Find a function f such that $\lim_{x\to c} |f(x)| = |L|$ but $\lim_{x\to c} f(x)$ does not exist.]

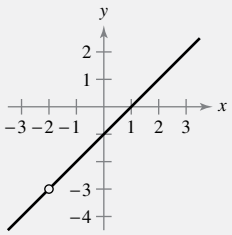
113. Think About It When using a graphing utility to generate a table to approximate

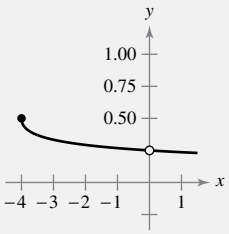
$$\lim_{x\to 0} \frac{\sin x}{x}$$

a student concluded that the limit was 0.01745 rather than 1. Determine the probable cause of the error.

114. HOW DO YOU SEE IT? Would you use the dividing out technique or the rationalizing technique to find the limit of each function? Explain your reasoning.

(a) $\lim_{x\to -2} \dfrac{x^2 + x - 2}{x + 2}$ (b) $\lim_{x\to 0} \dfrac{\sqrt{x+4} - 2}{x}$





True or False? **In Exercises 115–120, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

115. $\lim_{x\to 0} \dfrac{|x|}{x} = 1$

116. $\lim_{x\to \pi} \dfrac{\sin x}{x} = 1$

117. If $f(x) = g(x)$ for all real numbers other than $x = 0$ and $\lim_{x\to 0} f(x) = L$, then $\lim_{x\to 0} g(x) = L$.

118. If $\lim_{x\to c} f(x) = L$, then $f(c) = L$.

119. $\lim_{x\to 2} f(x) = 3$, where $f(x) = \begin{cases} 3, & x \le 2 \\ 0, & x > 2 \end{cases}$

120. If $f(x) < g(x)$ for all $x \neq a$, then $\lim_{x\to a} f(x) < \lim_{x\to a} g(x)$.

121. Proof Prove Property 1 of Theorem 1.2.

122. Proof Prove the second part of Theorem 1.9.

$$\lim_{x\to 0} \frac{1 - \cos x}{x} = 0$$

123. Graphical Reasoning Consider $f(x) = \dfrac{\sec x - 1}{x^2}$.

(a) Find the domain of f.

(b) Use a graphing utility to graph f. Is the domain of f obvious from the graph? If not, explain.

(c) Use the graph of f to approximate $\lim_{x\to 0} f(x)$.

(d) Confirm your answer to part (c) analytically.

124. Approximation

(a) Find $\lim_{x\to 0} \dfrac{1 - \cos x}{x^2}$.

(b) Use your answer to part (a) to derive the approximation $\cos x \approx 1 - \frac{1}{2}x^2$ for x near 0.

(c) Use your answer to part (b) to approximate $\cos(0.1)$.

(d) Use a calculator to approximate $\cos(0.1)$ to four decimal places. Compare the result with part (c).

125. Piecewise Functions Let

$$f(x) = \begin{cases} 0, & \text{if } x \text{ is rational} \\ 1, & \text{if } x \text{ is irrational} \end{cases} \quad \text{and} \quad g(x) = \begin{cases} 0, & \text{if } x \text{ is rational} \\ x, & \text{if } x \text{ is irrational} \end{cases}.$$

Find (if possible) $\lim_{x\to 0} f(x)$ and $\lim_{x\to 0} g(x)$.

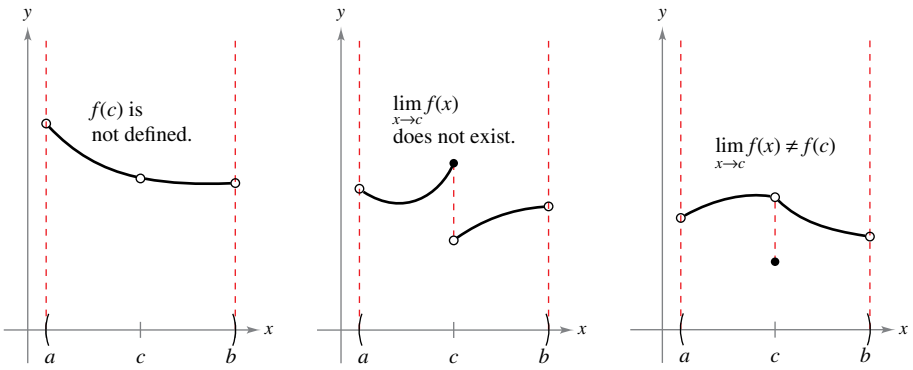
1.4 Continuity and One-Sided Limits

GO DIGITAL

- Determine continuity at a point and continuity on an open interval.
- Determine one-sided limits and continuity on a closed interval.
- Use properties of continuity.
- Explain and use the Intermediate Value Theorem.

Continuity at a Point and on an Open Interval

In mathematics, the term *continuous* has much the same meaning as it has in everyday usage. Informally, to say that a function f is continuous at $x = c$ means that there is no interruption in the graph of f at c. That is, its graph is unbroken at c, and there are no holes, jumps, or gaps. Figure 1.26 identifies three values of x at which the graph of f is *not* continuous. At all other points in the interval (a, b), the graph of f is uninterrupted and **continuous.**



Three conditions exist for which the graph of f is not continuous at $x = c$.
Figure 1.26

In Figure 1.26, it appears that continuity at $x = c$ can be destroyed by any one of three conditions.

1. The function is not defined at $x = c$.
2. The limit of $f(x)$ does not exist at $x = c$.
3. The limit of $f(x)$ exists at $x = c$, but it is not equal to $f(c)$.

If *none* of the three conditions is true, then the function f is **continuous at c,** as indicated in the important definition below.

Definition of Continuity

Continuity at a Point
A function f is **continuous at c** when these three conditions are met.

1. $f(c)$ is defined. **2.** $\lim_{x \to c} f(x)$ exists. **3.** $\lim_{x \to c} f(x) = f(c)$

Continuity on an Open Interval
A function is **continuous on an open interval (a, b)** when the function is continuous at each point in the interval. A function that is continuous on the entire real number line $(-\infty, \infty)$ is **everywhere continuous.**

A function may be continuous at some points and not continuous at others. A function that is continuous at all points *in its domain* is simply called **continuous.**

Exploration

Informally, a function is *continuous* on an open interval when its graph can be drawn with a pencil without lifting the pencil from the paper. Use a graphing utility to graph each function on the given interval. From the graphs, which functions would you say are continuous on the interval? Do you trust the results you obtained graphically? Explain your reasoning.

	Function	Interval
a.	$y = x^2 + 1$	$(-3, 3)$
b.	$y = \dfrac{1}{x - 2}$	$(-3, 3)$
c.	$y = \dfrac{\sin x}{x}$	$(-\pi, \pi)$
d.	$y = \dfrac{x^2 - 4}{x + 2}$	$(-3, 3)$

FOR FURTHER INFORMATION
For more information on the concept of continuity, see the article "Leibniz and the Spell of the Continuous" by Hardy Grant in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

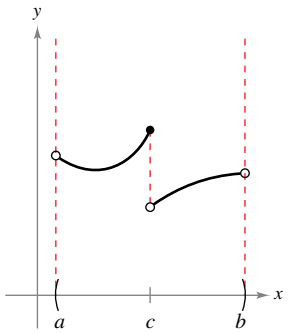
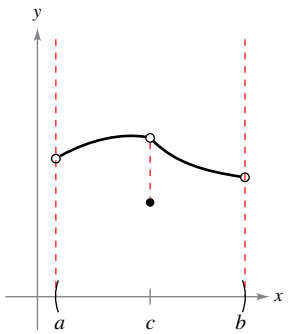
(a) Removable discontinuity



(b) Nonremovable discontinuity



(c) Removable discontinuity

Figure 1.27

Consider an open interval I that contains a real number c. If a function f is defined on I (except possibly at c), and f is not continuous at c, then f is said to have a **discontinuity** at c. Discontinuities fall into two categories: **removable** and **nonremovable.** A discontinuity at c is called removable when f can be made continuous by appropriately defining (or redefining) $f(c)$. For instance, the functions shown in Figures 1.27(a) and (c) have removable discontinuities at c and the function shown in Figure 1.27(b) has a nonremovable discontinuity at c.

EXAMPLE 1 Continuity of a Function

Discuss the continuity of each function.

a. $f(x) = \dfrac{1}{x}$ **b.** $g(x) = \dfrac{x^2 - 1}{x - 1}$ **c.** $h(x) = \begin{cases} x + 1, & x \leq 0 \\ x^2 + 1, & x > 0 \end{cases}$ **d.** $y = \sin x$

Solution

a. The domain of f is all nonzero real numbers. From Theorem 1.3, you can conclude that f is continuous at every x-value in its domain. At $x = 0$, f has a nonremovable discontinuity, as shown in Figure 1.28(a). In other words, there is no way to define $f(0)$ so as to make the function continuous at $x = 0$.

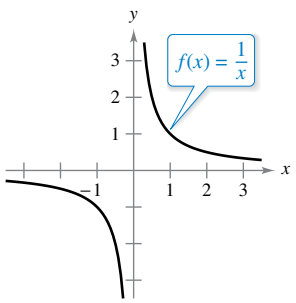
b. The domain of g is all real numbers except $x = 1$. From Theorem 1.3, you can conclude that g is continuous at every x-value in its domain. At $x = 1$, the function has a removable discontinuity, as shown in Figure 1.28(b). By defining $g(1)$ as 2, the "redefined" function is continuous for all real numbers.

c. The domain of h is all real numbers. The function h is continuous on $(-\infty, 0)$ and $(0, \infty)$. At $x = 0$, $h(0) = 1$. Also, note that

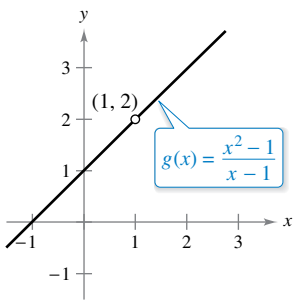
$$\lim_{x \to 0} h(x) = 1.$$ Limit of $h(x)$ as x approaches 0 exists and is equal to $h(0)$.

So, h is continuous on the entire real number line, as shown in Figure 1.28(c).

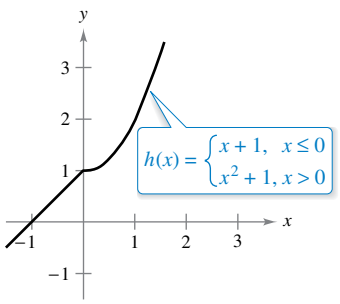
d. The domain of y is all real numbers. From Theorem 1.6, you can conclude that the function is continuous on its entire domain, $(-\infty, \infty)$, as shown in Figure 1.28(d).



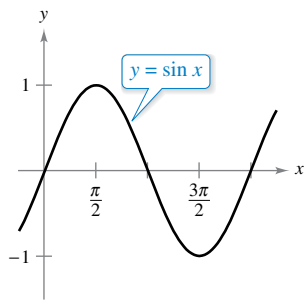
(a) Nonremovable discontinuity at $x = 0$



(b) Removable discontinuity at $x = 1$



(c) Continuous on entire real number line



(d) Continuous on entire real number line

Figure 1.28

REMARK You may want to refer to f in Example 1(a) as "discontinuous," but this terminology can be confusing. Rather than saying f is discontinuous, it is more precise to say that f has a discontinuity at $x = 0$.

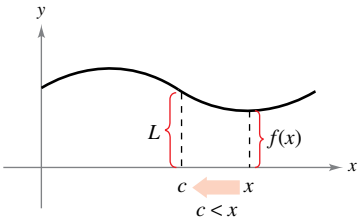
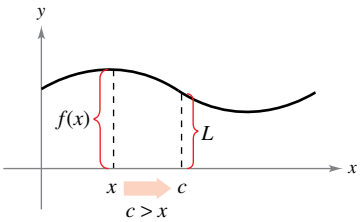
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



(a) Limit as x approaches c from the right.



(b) Limit as x approaches c from the left.

Figure 1.29

One-Sided Limits and Continuity on a Closed Interval

To understand continuity on a closed interval, you first need to look at a different type of limit called a **one-sided limit.** For instance, the **limit from the right** (or right-hand limit) means that x approaches c from values greater than c [see Figure 1.29(a)]. This limit is denoted as

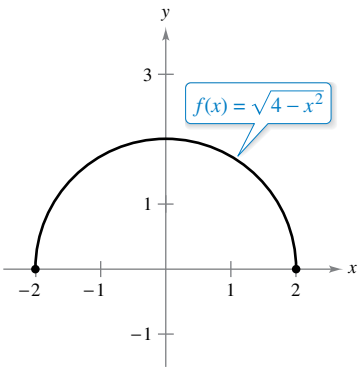
$$\lim_{x \to c^+} f(x) = L.$$ Limit from the right

Similarly, the **limit from the left** (or left-hand limit) means that x approaches c from values less than c [see Figure 1.29(b)]. This limit is denoted as

$$\lim_{x \to c^-} f(x) = L.$$ Limit from the left

One-sided limits are useful in taking limits of functions involving radicals. For instance, if n is an even integer, then

$$\lim_{x \to 0^+} \sqrt[n]{x} = 0.$$



The limit of $f(x)$ as x approaches -2 from the right is 0.

Figure 1.30

EXAMPLE 2 A One-Sided Limit

Find the limit of $f(x) = \sqrt{4 - x^2}$ as x approaches -2 from the right.

Solution As shown in Figure 1.30, the limit as x approaches -2 from the right is

$$\lim_{x \to -2^+} \sqrt{4 - x^2} = 0.$$

One-sided limits can be used to investigate the behavior of **step functions.** One common type of step function is the **greatest integer function** $[\![x]\!]$, defined as

$$[\![x]\!] = \text{greatest integer } n \text{ such that } n \leq x.$$ Greatest integer function

For instance, $[\![2.5]\!] = 2$ and $[\![-2.5]\!] = -3$.

EXAMPLE 3 The Greatest Integer Function

Find the limit of the greatest integer function $f(x) = [\![x]\!]$ as x approaches 0 from the left and from the right.

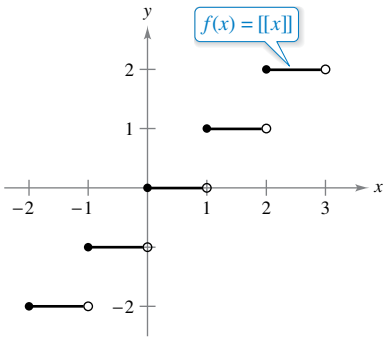
Solution As shown in Figure 1.31, the limit as x approaches 0 *from the left* is

$$\lim_{x \to 0^-} [\![x]\!] = -1$$

and the limit as x approaches 0 *from the right* is

$$\lim_{x \to 0^+} [\![x]\!] = 0.$$

So, f has a discontinuity at zero because the left- and right-hand limits at zero are different. By similar reasoning, you can conclude that the greatest integer function has a discontinuity at any integer n.



Greatest integer function

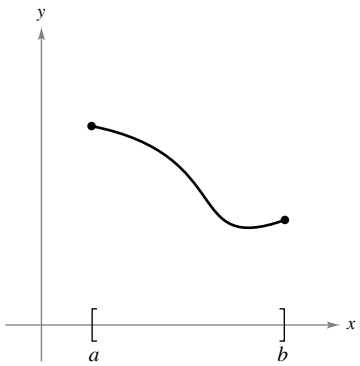
When the limit from the left is not equal to the limit from the right, the (two-sided) limit *does not exist*. The next theorem makes this more explicit. The proof of this theorem follows directly from the definition of a one-sided limit.

THEOREM 1.10 The Existence of a Limit

Let f be a function, and let c and L be real numbers. The limit of $f(x)$ as x approaches c is L if and only if

$$\lim_{x \to c^-} f(x) = L \quad \text{and} \quad \lim_{x \to c^+} f(x) = L.$$

The concept of a one-sided limit allows you to extend the definition of continuity to closed intervals. Basically, a function is continuous on a closed interval when it is continuous in the interior of the interval and exhibits one-sided continuity at the endpoints. This is stated formally in the next definition.



Continuous function on a closed interval
Figure 1.32

Definition of Continuity on a Closed Interval

A function f is **continuous on the closed interval** $[a, b]$ when f is continuous on the open interval (a, b) and

$$\lim_{x \to a^+} f(x) = f(a)$$ Limit as x approaches a from the right

and

$$\lim_{x \to b^-} f(x) = f(b).$$ Limit as x approaches b from the left

The function f is **continuous from the right** at a and **continuous from the left** at b (see Figure 1.32).

Similar definitions can be made to cover continuity on intervals of the form $(a, b]$ and $[a, b)$ that are neither open nor closed, or on infinite intervals. For example,

$$f(x) = \sqrt{x}$$

is continuous on the infinite interval $[0, \infty)$, and the function

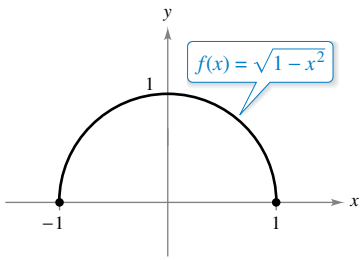
$$g(x) = \sqrt{2 - x}$$

is continuous on the infinite interval $(-\infty, 2]$.

EXAMPLE 4 Continuity on a Closed Interval

Discuss the continuity of

$$f(x) = \sqrt{1 - x^2}.$$



f is continuous on $[-1, 1]$.
Figure 1.33

Solution The domain of f is the closed interval $[-1, 1]$. At all points in the open interval $(-1, 1)$, the continuity of f follows from Theorems 1.4 and 1.5. Moreover, because

$$\lim_{x \to -1^+} \sqrt{1 - x^2} = 0 = f(-1)$$ Continuous from the right

and

$$\lim_{x \to 1^-} \sqrt{1 - x^2} = 0 = f(1)$$ Continuous from the left

you can conclude that f is continuous on the closed interval $[-1, 1]$, as shown in Figure 1.33. ■

The next example uses a one-sided limit to investigate the "lower limit" of the temperature of matter.

REMARK Charles's Law for gases (assuming constant pressure) can be stated as

$$V = kT$$

where V is volume, k is a constant, and T is temperature.

EXAMPLE 5 Charles's Law and Absolute Zero

On the Kelvin scale, *absolute zero* is the temperature 0 K. Although temperatures very close to 0 K have been produced in laboratories, absolute zero has never been attained. In fact, evidence suggests that absolute zero *cannot* be attained. How did scientists determine that 0 K is the "lower limit" of the temperature of matter? What is absolute zero on the Celsius scale?

Solution The determination of absolute zero stems from the work of the French physicist Jacques Charles (1746–1823). Charles discovered that the volume of gas at a constant pressure increases linearly with the temperature of the gas. The table illustrates this relationship between volume and temperature. To generate the values in the table, one mole of hydrogen is held at a constant pressure of one atmosphere. The volume V is approximated and is measured in liters, and the temperature T is measured in degrees Celsius.

Liquid helium is used to cool superconducting magnets, such as those used in magnetic resonance imaging (MRI) machines or in the Large Hadron Collider (see photo). The magnets are made with materials that only superconduct at temperatures a few degrees above absolute zero. These temperatures are possible with liquid helium because helium becomes a liquid at −269°C, or 4.15 K.

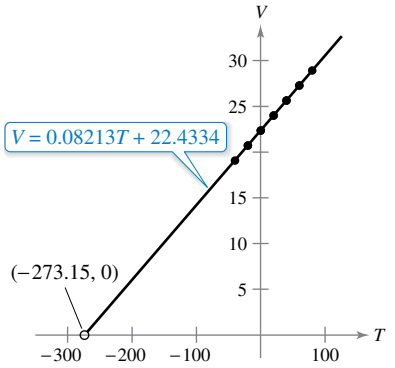
T	−40	−20	0	20	40	60	80
V	19.1482	20.7908	22.4334	24.0760	25.7186	27.3612	29.0038

The points represented by the table are shown in the figure at the right. Moreover, by using the points in the table, you can determine that T and V are related by the linear equation

$$V = 0.08213T + 22.4334.$$

Solving for T, you get an equation for the temperature of the gas.

$$T = \frac{V - 22.4334}{0.08213}$$



The volume of hydrogen gas depends on its temperature.

By reasoning that the volume of the gas can approach 0 (but can never equal or go below 0), you can determine that the "least possible temperature" is

$$\lim_{V \to 0^+} T = \lim_{V \to 0^+} \frac{V - 22.4334}{0.08213}$$ Limit from the right

$$= \frac{0 - 22.4334}{0.08213}$$ Use direct substitution.

$$\approx -273.15.$$

So, absolute zero on the Kelvin scale (0 K) is approximately −273.15° on the Celsius scale. ■

The table below shows the temperatures in Example 5 converted to the Fahrenheit scale. Try repeating the solution shown in Example 5 using these temperatures and volumes. Use the result to find the value of absolute zero on the Fahrenheit scale.

T	−40	−4	32	68	104	140	176
V	19.1482	20.7908	22.4334	24.0760	25.7186	27.3612	29.0038

Properties of Continuity

In Section 1.3, you studied several properties of limits. Each of those properties yields a corresponding property pertaining to the continuity of a function. For instance, Theorem 1.11 follows directly from Theorem 1.2.

AUGUSTIN-LOUIS CAUCHY (1789–1857)

The concept of a continuous function was first introduced by Augustin-Louis Cauchy in 1821. The definition given in his text *Cours d'Analyse* stated that indefinite small changes in y were the result of indefinite small changes in x. "…$f(x)$ will be called a *continuous* function if … the numerical values of the difference $f(x + \alpha) - f(x)$ decrease indefinitely with those of α…."

See LarsonCalculus.com to read more of this biography.

THEOREM 1.11 Properties of Continuity

If b is a real number and f and g are continuous at $x = c$, then the functions listed below are also continuous at c.

1. Scalar multiple: bf
2. Sum: $f + g$
3. Difference: $f - g$
4. Product: fg
5. Quotient: $\frac{f}{g}$, $g(c) \neq 0$

A proof of this theorem is given in Appendix A.

It is important for you to be able to recognize functions that are continuous at every point in their domains. The list below summarizes the functions you have studied so far that are continuous at every point in their domains.

1. Polynomial: $p(x) = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_1 x + a_0$
2. Rational: $r(x) = \frac{p(x)}{q(x)}$, $q(x) \neq 0$
3. Radical: $f(x) = \sqrt[n]{x}$
4. Trigonometric: $\sin x$, $\cos x$, $\tan x$, $\cot x$, $\sec x$, $\csc x$

Combining Theorem 1.11 with this list yields a wide variety of elementary functions that are continuous at every point in their domains.

EXAMPLE 6 Applying Properties of Continuity

See LarsonCalculus.com for an interactive version of this type of example.

By Theorem 1.11, it follows that each function below is continuous at every point in its domain.

$$f(x) = x + \sin x, \quad f(x) = 3 \tan x, \quad f(x) = \frac{x^2 + 1}{\cos x}$$

The next theorem, which is a consequence of Theorem 1.5, allows you to determine the continuity of *composite* functions such as

$$f(x) = \sin 3x, \quad f(x) = \sqrt{x^2 + 1}, \quad \text{and} \quad f(x) = \tan \frac{1}{x}.$$

REMARK One consequence of Theorem 1.12 is that when f and g satisfy the given conditions, you can determine the limit of $f(g(x))$ as x approaches c to be

$$\lim_{x \to c} f(g(x)) = f(g(c)).$$

THEOREM 1.12 Continuity of a Composite Function

If g is continuous at c and f is continuous at $g(c)$, then the composite function given by $(f \circ g)(x) = f(g(x))$ is continuous at c.

Proof By the definition of continuity, $\lim_{x \to c} g(x) = g(c)$ and $\lim_{x \to g(c)} f(x) = f(g(c))$.

Apply Theorem 1.5 with $L = g(c)$ to obtain $\lim_{x \to c} f(g(x)) = f\left(\lim_{x \to c} g(x)\right) = f(g(c))$. So, $(f \circ g)(x) = f(g(x))$ is continuous at c.

EXAMPLE 7 Testing for Continuity

Describe the interval(s) on which each function is continuous.

a. $f(x) = \tan x$ **b.** $g(x) = \begin{cases} \sin\frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$ **c.** $h(x) = \begin{cases} x \sin\frac{1}{x}, & x \neq 0 \\ 0, & x = 0 \end{cases}$

Solution

a. The tangent function $f(x) = \tan x$ is undefined at

$$x = \frac{\pi}{2} + n\pi, \quad n \text{ is an integer.}$$

At all other points, f is continuous. So, $f(x) = \tan x$ is continuous on the open intervals

$$\ldots, \left(-\frac{3\pi}{2}, -\frac{\pi}{2}\right), \left(-\frac{\pi}{2}, \frac{\pi}{2}\right), \left(\frac{\pi}{2}, \frac{3\pi}{2}\right), \ldots$$

as shown in Figure 1.34(a).

b. Because $y = 1/x$ is continuous except at $x = 0$ and the sine function is continuous for all real values of x, it follows from Theorem 1.12 that

$$y = \sin\frac{1}{x}$$

is continuous at all real values except $x = 0$. At $x = 0$, the limit of $g(x)$ does not exist (see Example 5, Section 1.2). So, g is continuous on the intervals $(-\infty, 0)$ and $(0, \infty)$, as shown in Figure 1.34(b).

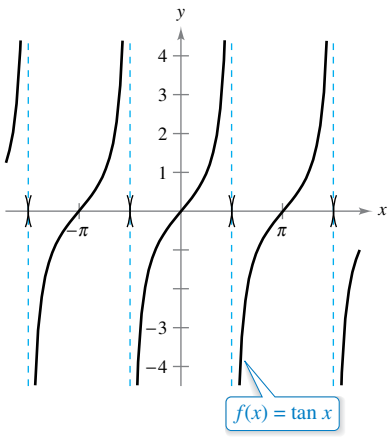
c. This function is similar to the function in part (b) except that the oscillations are damped by the factor x. For $x \neq 0$, $y = x \sin(1/x)$ is continuous. Note that

$$-|x| \leq x \sin\frac{1}{x} \leq |x|, \quad x \neq 0 \qquad \text{and} \qquad \lim_{x\to 0}\left(-|x|\right) = 0 = \lim_{x\to 0}|x|.$$

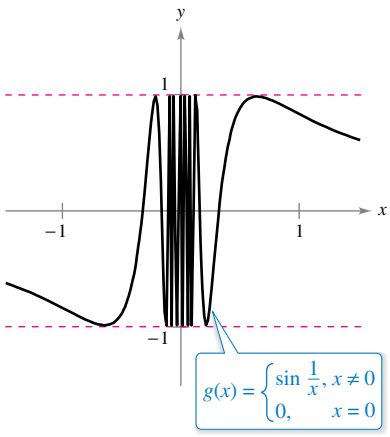
So, apply the Squeeze Theorem to conclude that

$$\lim_{x\to 0} h(x) = 0.$$

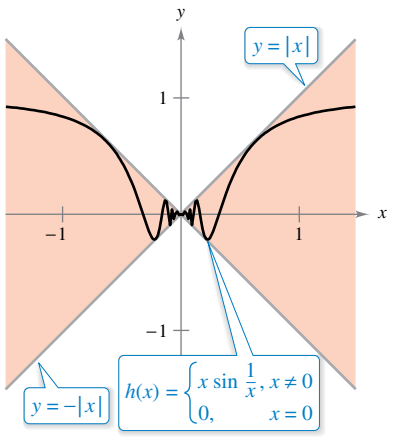
Because $h(0) = 0$, you know that h is continuous at $x = 0$. So, h is continuous on the entire real number line, as shown in Figure 1.34(c).



(a) f is continuous on each open interval in its domain.



(b) g is continuous on $(-\infty, 0)$ and $(0, \infty)$.



(c) h is continuous on the entire real number line.

The Intermediate Value Theorem

Theorem 1.13 is an important theorem concerning the behavior of functions that are continuous on a closed interval.

THEOREM 1.13 Intermediate Value Theorem

If f is continuous on the closed interval $[a, b]$, $f(a) \neq f(b)$, and k is any number between $f(a)$ and $f(b)$, then there is at least one number c in $[a, b]$ such that

$$f(c) = k.$$

REMARK The Intermediate Value Theorem tells you that at least one number c exists, but it does not provide a method for finding c. Such theorems are called **existence theorems.** By referring to a text on advanced calculus, you will find that a proof of this theorem is based on a property of real numbers called *completeness*. The Intermediate Value Theorem states that for a continuous function f, if x takes on all values between a and b, then $f(x)$ must take on all values between $f(a)$ and $f(b)$.

As an example of the application of the Intermediate Value Theorem, consider a person's height. A person is 5 feet tall on their thirteenth birthday and 5 feet 2 inches tall on their fourteenth birthday. Then, for any height h between 5 feet and 5 feet 2 inches, there must have been a time t when their height was exactly h. This seems reasonable because human growth is continuous and a person's height does not abruptly change from one value to another.

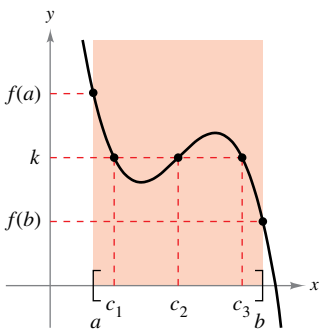
The Intermediate Value Theorem guarantees the existence of *at least one* number c in the closed interval $[a, b]$. There may, of course, be more than one number c such that

$$f(c) = k$$

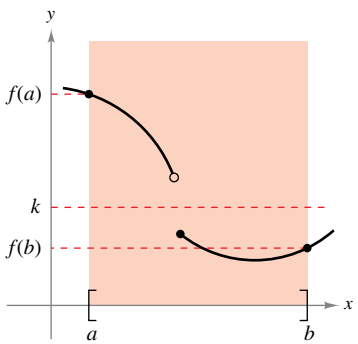
as shown in Figure 1.35. A function that is not continuous does not necessarily exhibit the intermediate value property. For example, the graph of the function shown in Figure 1.36 jumps over the horizontal line

$$y = k$$

and for this function there is no value of c in $[a, b]$ such that $f(c) = k$.



f is continuous on $[a, b]$.
[There exist three c's such that $f(c) = k$.]
Figure 1.35



f is not continuous on $[a, b]$.
[There are no c's such that $f(c) = k$.]
Figure 1.36

The Intermediate Value Theorem often can be used to locate the zeros of a function that is continuous on a closed interval. Specifically, if f is continuous on $[a, b]$ and $f(a)$ and $f(b)$ differ in sign, then the Intermediate Value Theorem guarantees the existence of at least one zero of f in the closed interval $[a, b]$.

EXAMPLE 8 An Application of the Intermediate Value Theorem

Use the Intermediate Value Theorem to show that the polynomial function

$$f(x) = x^3 + 2x - 1$$

has a zero in the interval $[0, 1]$.

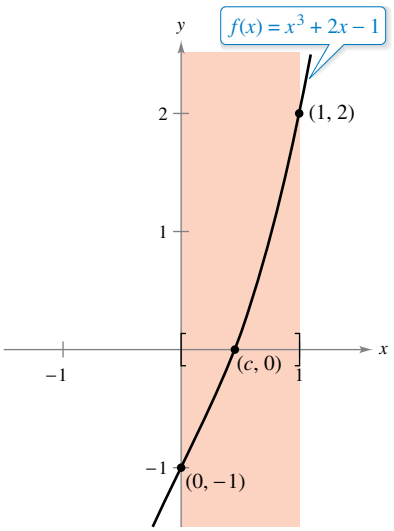
Solution Note that f is continuous on the closed interval $[0, 1]$. Because

$$f(0) = 0^3 + 2(0) - 1 = -1 \quad \text{and} \quad f(1) = 1^3 + 2(1) - 1 = 2$$

it follows that $f(0) < 0$ and $f(1) > 0$. So, apply the Intermediate Value Theorem to conclude that there must be some c in $[0, 1]$ such that

$$f(c) = 0 \qquad f \text{ has a zero in the closed interval } [0, 1].$$

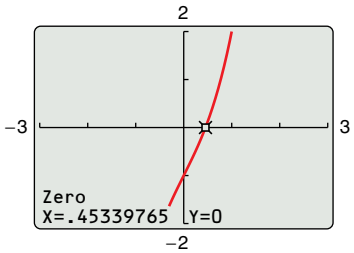
as shown in Figure 1.37.



f is continuous on $[0, 1]$ with $f(0) < 0$ and $f(1) > 0$.
Figure 1.37

The **bisection method** for approximating the real zeros of a continuous function is similar to the method used in Example 8. If you know that a zero exists in the closed interval $[a, b]$, then the zero must lie in the interval $[a, (a + b)/2]$ or $[(a + b)/2, b]$. From the sign of $f([a + b]/2)$, you can determine which interval contains the zero. By repeatedly bisecting the interval, you can "close in" on the zero of the function.

TECHNOLOGY You can use the *root* or *zero* feature of a graphing utility to approximate the real zeros of a continuous function. Using this feature, the zero of the function in Example 8, $f(x) = x^3 + 2x - 1$, is approximately 0.453, as shown in the figure.



Zero of $f(x) = x^3 + 2x - 1$

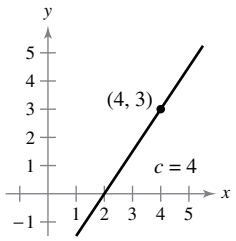
Concept Check

1. Describe the three conditions that are met when a function is continuous at a point.
2. What is the value of c?
   $\lim_{x \to c^+} 2\sqrt{x+1} = 0$
3. Determine whether $\lim_{x \to 3} f(x)$ exists. Explain.
   $\lim_{x \to 3^-} f(x) = 1$ and $\lim_{x \to 3^+} f(x) = 1$
4. Explain the Intermediate Value Theorem.

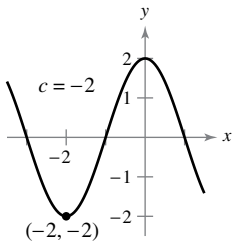
Limits and Continuity **In Exercises 5–10, use the graph to determine each limit, and discuss the continuity of the function.**

(a) $\lim_{x \to c^+} f(x)$ (b) $\lim_{x \to c^-} f(x)$ (c) $\lim_{x \to c} f(x)$

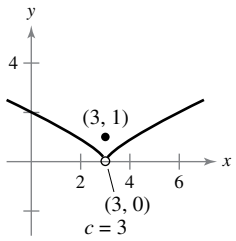
5.



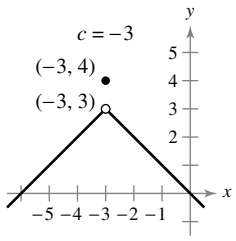
6.



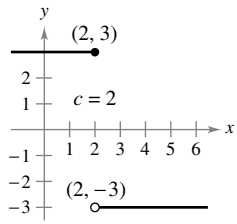
7.



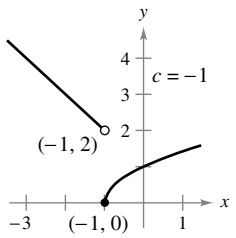
8.



9.



10.

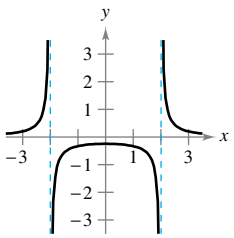


Finding a Limit **In Exercises 11–34, find the limit (if it exists). If it does not exist, explain why.**

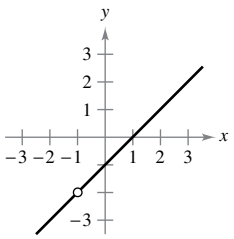
11. $\lim_{x \to 8^+} \frac{1}{x+8}$
12. $\lim_{x \to 3^+} \frac{2}{x+3}$
13. $\lim_{x \to 5^+} \frac{x-5}{x^2-25}$
14. $\lim_{x \to 4^+} \frac{4-x}{x^2-16}$
15. $\lim_{x \to 1^-} \frac{x^2-2x+1}{x-1}$
16. $\lim_{x \to -3^+} \frac{x+3}{x^2+7x+12}$
17. $\lim_{x \to -3^-} \frac{x}{\sqrt{x^2-9}}$
18. $\lim_{x \to 4^-} \frac{\sqrt{x}-2}{x-4}$
19. $\lim_{x \to 0^-} \frac{|x|}{x}$
20. $\lim_{x \to 10^+} \frac{|x-10|}{x-10}$
21. $\lim_{x \to 1^-} \csc \frac{\pi x}{2}$
22. $\lim_{x \to 3/2^+} \cos \frac{\pi x}{3}$
23. $\lim_{x \to \pi} \cot x$
24. $\lim_{x \to \pi/2} \sec x$
25. $\lim_{x \to 4^-} (5[\![x]\!] - 7)$
26. $\lim_{x \to 2^+} (2x - [\![x]\!])$
27. $\lim_{x \to -1} \left(\left[\!\left[\frac{x}{3} \right]\!\right] + 3 \right)$
28. $\lim_{x \to 1} \left(1 - \left[\!\left[-\frac{x}{2} \right]\!\right] \right)$
29. $\lim_{\Delta x \to 0^-} \frac{\frac{1}{x+\Delta x} - \frac{1}{x}}{\Delta x}$
30. $\lim_{\Delta x \to 0^+} \frac{(x+\Delta x)^2 + x + \Delta x - (x^2+x)}{\Delta x}$
31. $\lim_{x \to 3^-} f(x)$, where $f(x) = \begin{cases} \frac{x+2}{2}, & x \le 3 \\ \frac{12-2x}{3}, & x > 3 \end{cases}$
32. $\lim_{x \to 3} f(x)$, where $f(x) = \begin{cases} x^2 - 4x + 6, & x < 3 \\ -x^2 + 4x - 2, & x \ge 3 \end{cases}$
33. $\lim_{x \to 1} f(x)$, where $f(x) = \begin{cases} x^3 + 1, & x < 1 \\ x + 1, & x \ge 1 \end{cases}$
34. $\lim_{x \to 1^+} f(x)$, where $f(x) = \begin{cases} x, & x \le 1 \\ 1 - x, & x > 1 \end{cases}$

Continuity of a Function **In Exercises 35–38, discuss the continuity of the function.**

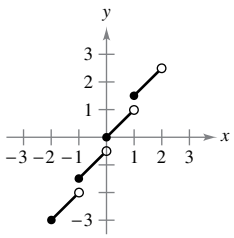
35. $f(x) = \frac{1}{x^2-4}$



36. $f(x) = \frac{x^2-1}{x+1}$



37. $f(x) = \frac{1}{2}[\![x]\!] + x$



38. $f(x) = \begin{cases} x, & x < 1 \\ 2, & x = 1 \\ 2x - 1, & x > 1 \end{cases}$

Continuity on a Closed Interval

In Exercises 39–42, discuss the continuity of the function on the closed interval.

Function	Interval
39. $g(x) = \sqrt{49 - x^2}$	$[-7, 7]$
40. $f(t) = 3 - \sqrt{9 - t^2}$	$[-3, 3]$
41. $f(x) = \begin{cases} 3 - x, & x \le 0 \\ 3 + \frac{1}{2}x, & x > 0 \end{cases}$	$[-1, 4]$
42. $g(x) = \dfrac{1}{x^2 - 4}$	$[-1, 2]$

Removable and Nonremovable Discontinuities

In Exercises 43–68, find the x-values (if any) at which f is not continuous. State whether the discontinuities are removable or nonremovable.

43. $f(x) = \dfrac{6}{x}$

44. $f(x) = \dfrac{4}{x - 6}$

45. $f(x) = x^2 - 9$

46. $f(x) = x^2 - 4x + 4$

47. $f(x) = \dfrac{1}{4 - x^2}$

48. $f(x) = \dfrac{1}{x^2 + 1}$

49. $f(x) = 3x - \cos x$

50. $f(x) = \sin x - 8x$

51. $f(x) = \dfrac{x}{x^2 - x}$

52. $f(x) = \dfrac{x}{x^2 - 4}$

53. $f(x) = \dfrac{x}{x^2 + 1}$

54. $f(x) = \dfrac{x - 5}{x^2 - 25}$

55. $f(x) = \dfrac{x + 2}{x^2 - 3x - 10}$

56. $f(x) = \dfrac{x + 2}{x^2 - x - 6}$

57. $f(x) = \dfrac{|x + 7|}{x + 7}$

58. $f(x) = \dfrac{2|x - 3|}{x - 3}$

59. $f(x) = \csc 2x$

60. $f(x) = \tan \dfrac{\pi x}{2}$

61. $f(x) = [\![x - 8]\!]$

62. $f(x) = 5 - [\![x]\!]$

63. $f(x) = \begin{cases} x, & x \le 1 \\ x^2, & x > 1 \end{cases}$

64. $f(x) = \begin{cases} -2x + 3, & x < 1 \\ x^2, & x \ge 1 \end{cases}$

65. $f(x) = \begin{cases} \frac{1}{2}x + 1, & x \le 2 \\ 3 - x, & x > 2 \end{cases}$

66. $f(x) = \begin{cases} -2x, & x \le 2 \\ x^2 - 4x + 1, & x > 2 \end{cases}$

67. $f(x) = \begin{cases} \tan \dfrac{\pi x}{4}, & |x| < 1 \\ x, & |x| \ge 1 \end{cases}$

68. $f(x) = \begin{cases} \csc \dfrac{\pi x}{6}, & |x - 3| \le 2 \\ 2, & |x - 3| > 2 \end{cases}$

Making a Function Continuous

In Exercises 69–74, find the constant a, or the constants a and b, such that the function is continuous on the entire real number line.

69. $f(x) = \begin{cases} 3x^2, & x \ge 1 \\ ax - 4, & x < 1 \end{cases}$

70. $f(x) = \begin{cases} 3x^3, & x \le 1 \\ ax + 5, & x > 1 \end{cases}$

71. $f(x) = \begin{cases} x^3, & x \le 2 \\ ax^2, & x > 2 \end{cases}$

72. $g(x) = \begin{cases} \dfrac{4 \sin x}{x}, & x < 0 \\ a - 2x, & x \ge 0 \end{cases}$

73. $f(x) = \begin{cases} 2, & x \le -1 \\ ax + b, & -1 < x < 3 \\ -2, & x \ge 3 \end{cases}$

74. $g(x) = \begin{cases} \dfrac{x^2 - a^2}{x - a}, & x \ne a \\ 8, & x = a \end{cases}$

Continuity of a Composite Function

In Exercises 75–80, discuss the continuity of the composite function $h(x) = f(g(x))$.

75. $f(x) = x^2$, $g(x) = x - 1$

76. $f(x) = 5x + 1$, $g(x) = x^3$

77. $f(x) = \dfrac{1}{x - 6}$, $g(x) = x^2 + 5$

78. $f(x) = \dfrac{1}{\sqrt{x}}$, $g(x) = x - 1$

79. $f(x) = \tan x$, $g(x) = \dfrac{x}{2}$

80. $f(x) = \sin x$, $g(x) = x^2$

Finding Discontinuities

In Exercises 81–84, use a graphing utility to graph the function. Use the graph to determine any x-values at which the function is not continuous.

81. $f(x) = [\![x]\!] - x$

82. $h(x) = \dfrac{1}{x^2 + 2x - 15}$

83. $g(x) = \begin{cases} x^2 - 3x, & x > 4 \\ 2x - 5, & x \le 4 \end{cases}$

84. $f(x) = \begin{cases} \dfrac{\cos x - 1}{x}, & x < 0 \\ 5x, & x \ge 0 \end{cases}$

Testing for Continuity

In Exercises 85–92, describe the interval(s) on which the function is continuous.

85. $f(x) = \dfrac{x}{x^2 + x + 2}$

86. $f(x) = \dfrac{x + 1}{\sqrt{x}}$

87. $f(x) = 3 - \sqrt{x}$

88. $f(x) = x\sqrt{x + 3}$

89. $f(x) = \sec \dfrac{\pi x}{4}$

90. $f(x) = \cos \dfrac{1}{x}$

91. $f(x) = \begin{cases} \dfrac{x^2 - 1}{x - 1}, & x \ne 1 \\ 2, & x = 1 \end{cases}$

92. $f(x) = \begin{cases} 2x - 4, & x \ne 3 \\ 1, & x = 3 \end{cases}$

Existence of a Zero

In Exercises 93–96, explain why the function has at least one zero in the given interval.

Function	Interval
93. $f(x) = \frac{1}{12}x^4 - x^3 + 4$	$[1, 2]$
94. $f(x) = x^3 + 5x - 3$	$[0, 1]$
95. $f(x) = x^2 - 2 - \cos x$	$[0, \pi]$
96. $f(x) = -\dfrac{5}{x} + \tan \dfrac{\pi x}{10}$	$[1, 4]$

Existence of Multiple Zeros

In Exercises 97 and 98, explain why the function has at least two zeros in the interval $[1, 5]$.

97. $f(x) = (x - 3)^2 - 2$

98. $f(x) = 2 \cos x$

Using the Intermediate Value Theorem **In Exercises 99–104, use the Intermediate Value Theorem and a graphing utility to approximate the zero of the function in the interval $[0, 1]$. Repeatedly "zoom in" on the graph of the function to approximate the zero accurate to two decimal places. Use the *zero* or *root* feature of the graphing utility to approximate the zero accurate to four decimal places.**

99. $f(x) = x^3 + x - 1$

100. $f(x) = x^4 - x^2 + 3x - 1$

101. $g(t) = 2\cos t - 3t$

102. $h(\theta) = \tan\theta + 3\theta - 4$

103. $f(x) = \sqrt{x^2 + 17x + 19} - 6$

104. $f(x) = \sqrt{x^4 + 39x + 13} - 4$

Using the Intermediate Value Theorem **In Exercises 105–110, verify that the Intermediate Value Theorem applies to the indicated interval and find the value of c guaranteed by the theorem.**

105. $f(x) = x^2 + x - 1, \quad [0, 5], \quad f(c) = 11$

106. $f(x) = x^2 - 6x + 8, \quad [0, 3], \quad f(c) = 0$

107. $f(x) = \sqrt{x + 7} - 2, \quad [0, 5], \quad f(c) = 1$

108. $f(x) = \sqrt[3]{x} + 8, \quad [-9, -6], \quad f(c) = 6$

109. $f(x) = \dfrac{x - x^3}{x - 4}, \quad [1, 3], \quad f(c) = 3$

110. $f(x) = \dfrac{x^2 + x}{x - 1}, \quad \left[\dfrac{5}{2}, 4\right], \quad f(c) = 6$

Exploring Concepts

111. (a) Write a function f that is continuous on (a, b) but not continuous on $[a, b]$.

(b) Write a function g that is defined and nonzero on $[a, b]$, where $g(a)$ and $g(b)$ have opposite signs. Is g continuous on $[a, b]$? Explain.

112. Sketch the graph of any function f such that

$$\lim_{x\to 3^+} f(x) = 1 \quad \text{and} \quad \lim_{x\to 3^-} f(x) = 0.$$

Is the function continuous at $x = 3$? Explain.

113. When the functions f and g are continuous for all real x, is $f + g$ always continuous for all real x? Is f/g always continuous for all real x? If either is not continuous, give an example to verify your conclusion.

114. Describe the difference between a discontinuity that is removable and a discontinuity that is nonremovable. Then give an example of a function that satisfies each description.

(a) A function with a nonremovable discontinuity at $x = 4$

(b) A function with a removable discontinuity at $x = -4$

(c) A function that has both of the characteristics described in parts (a) and (b)

True or False? **In Exercises 115–120, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

115. If $\lim_{x\to c} f(x) = L$ and $f(c) = L$, then f is continuous at c.

116. If $f(x) = g(x)$ for $x \neq c$ and $f(c) \neq g(c)$, then either f or g is not continuous at c.

117. The Intermediate Value Theorem guarantees that $f(a)$ and $f(b)$ differ in sign when a continuous function f has at least one zero on $[a, b]$.

118. The limit of the greatest integer function as x approaches 0 from the left is -1.

119. A rational function can have infinitely many x-values at which it is not continuous.

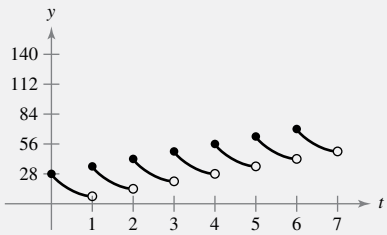
120. The function $f(x) = \dfrac{|x - 1|}{x - 1}$ is continuous on $(-\infty, \infty)$.

121. Think About It Describe how the functions

$$f(x) = 3 + [\![x]\!] \quad \text{and} \quad g(x) = 3 - [\![-x]\!]$$

differ.

122. HOW DO YOU SEE IT? Every day you dissolve 28 ounces of chlorine in a swimming pool. The graph shows the amount of chlorine $f(t)$ in the pool after t days. Estimate and interpret $\lim_{t\to 4^-} f(t)$ and $\lim_{t\to 4^+} f(t)$.



123. Parking Garage A parking garage charges \$3 to park up to one hour and \$1 for each additional hour or fraction thereof, up to a daily maximum of \$15.

(a) Write a formula for the parking charge C (in dollars) in terms of the number of hours parked t.

(b) Sketch the graph of the parking charge function and discuss its continuity.

124. Inventory Management The number of units in inventory in a small company is given by

$$N(t) = 25\left(2\left[\!\left[\frac{t + 2}{2}\right]\!\right] - t\right)$$

where t is the time in months. Sketch the graph of this function and discuss its continuity. How often must this company replenish its inventory?

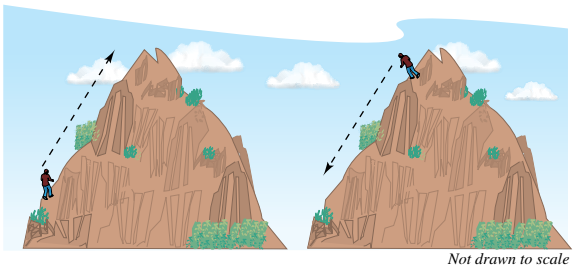
125. Déjà Vu At 8:00 A.M. on Saturday, a person begins running up the side of a mountain to a weekend campsite (see figure). At 8:00 A.M. on Sunday, the person runs back down the mountain. It takes 20 minutes to run up but only 10 minutes to run down. Prove that at some point on the way down, the person passed the same place at exactly the same time on Saturday. [*Hint:* Let $s(t)$ and $r(t)$ be the position functions for the runs up and down, and apply the Intermediate Value Theorem to the function $f(t) = s(t) - r(t)$.]



Not drawn to scale

Saturday 8:00 A.M. Sunday 8:00 A.M.

126. Volume Use the Intermediate Value Theorem to show that for all spheres with radii in the interval $[5, 8]$, there is one with a volume of 1500 cubic centimeters.

127. Proof Prove that if f is continuous and has no zeros on $[a, b]$, then either

$f(x) > 0$ for all x in $[a, b]$ or $f(x) < 0$ for all x in $[a, b]$.

128. Dirichlet Function Show that the Dirichlet function

$$f(x) = \begin{cases} 0, & \text{if } x \text{ is rational} \\ 1, & \text{if } x \text{ is irrational} \end{cases}$$

is not continuous at any real number.

129. Continuity of a Function Show that the function

$$f(x) = \begin{cases} 0, & \text{if } x \text{ is rational} \\ kx, & \text{if } x \text{ is irrational} \end{cases}$$

is continuous only at $x = 0$. (Assume that k is any nonzero real number.)

130. Signum Function The **signum function** is defined by

$$\operatorname{sgn}(x) = \begin{cases} -1, & x < 0 \\ 0, & x = 0 \\ 1, & x > 0 \end{cases}.$$

Sketch a graph of $\operatorname{sgn}(x)$ and find each limit (if possible).

(a) $\lim_{x \to 0^-} \operatorname{sgn}(x)$ (b) $\lim_{x \to 0^+} \operatorname{sgn}(x)$ (c) $\lim_{x \to 0} \operatorname{sgn}(x)$

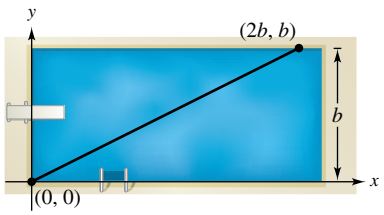
131. Frequency The table lists the frequency F (in Hertz) of a musical note at various times t (in seconds).

t	0	1	2	3	4	5
F	436	444	434	446	433	444

(a) Plot the data and connect the points with a curve.

(b) Does there appear to be a limiting frequency of the note? Explain.

132. Creating Models A swimmer crosses a pool of width b by swimming straight from $(0, 0)$ to $(2b, b)$. (See figure.)



(a) Let f be a function defined as the y-coordinate of the point on the long side of the pool that is nearest the swimmer at any time during the swimmer's crossing of the pool. Determine the function f and sketch its graph. Is f continuous? Explain.

(b) Let g be the minimum distance between the swimmer and the long sides of the pool. Determine the function g and sketch its graph. Is g continuous? Explain.

133. Making Functions Continuous Find all values of c such that each function is continuous on $(-\infty, \infty)$.

(a) $f(x) = \begin{cases} x^3, & x \le c \\ 3x^2 - 2x, & x > c \end{cases}$

(b) $g(x) = \begin{cases} 1 - x^2, & x \le c \\ x, & x > c \end{cases}$

134. Making a Function Continuous Let

$$f(x) = \frac{\sqrt{x + c^2} - c}{x}, \quad c > 0.$$

What is the domain of f? How can you define f at $x = 0$ for f to be continuous there?

135. Proof Prove that for any real number y there exists x in $(-\pi/2, \pi/2)$ such that $\tan x = y$.

136. Proof Prove that if

$$\lim_{\Delta x \to 0} f(c + \Delta x) = f(c)$$

then f is continuous at c.

137. Continuity of a Function Discuss the continuity of the function $h(x) = x[\![x]\!]$.

138. Proof

(a) Let $f_1(x)$ and $f_2(x)$ be continuous on the closed interval $[a, b]$. When $f_1(a) < f_2(a)$ and $f_1(b) > f_2(b)$, prove that there exists c between a and b such that $f_1(c) = f_2(c)$.

(b) Show that there exists c in $\left[0, \frac{\pi}{2}\right]$ such that $\cos x = x$. Use a graphing utility to approximate c to three decimal places.

PUTNAM EXAM CHALLENGE

139. Prove or disprove: If x and y are real numbers with $y \ge 0$ and $y(y + 1) \le (x + 1)^2$, then $y(y - 1) \le x^2$.

140. Determine all polynomials $P(x)$ such that

$$P(x^2 + 1) = (P(x))^2 + 1 \text{ and } P(0) = 0.$$

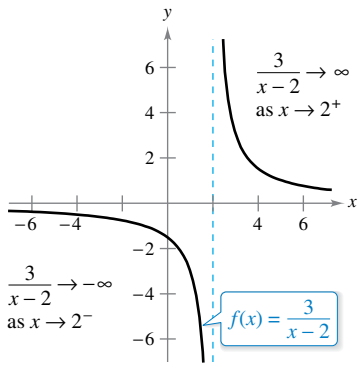
1.5 Infinite Limits

GO DIGITAL

- **Determine infinite limits from the left and from the right.**
- **Find and sketch the vertical asymptotes of the graph of a function.**



$f(x)$ increases and decreases without bound as x approaches 2.
Figure 1.38

Infinite Limits

Consider the function $f(x) = 3/(x - 2)$. From Figure 1.38 and the table, notice that $f(x)$ *decreases without bound* as x approaches 2 from the left, and $f(x)$ *increases without bound* as x approaches 2 from the right.

x approaches 2 from the left. | x approaches 2 from the right.

x	1.5	1.9	1.99	1.999	2	2.001	2.01	2.1	2.5
$f(x)$	−6	−30	−300	−3000	?	3000	300	30	6

$f(x)$ decreases without bound. | $f(x)$ increases without bound.

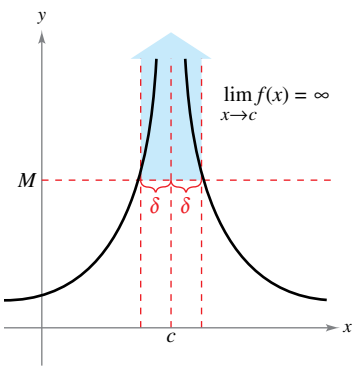
This behavior is denoted as

$$\lim_{x \to 2^-} \frac{3}{x - 2} = -\infty$$ $f(x)$ decreases without bound as x approaches 2 from the left.

and

$$\lim_{x \to 2^+} \frac{3}{x - 2} = \infty.$$ $f(x)$ increases without bound as x approaches 2 from the right.

The symbols ∞ and $-\infty$ refer to positive infinity and negative infinity, respectively. These symbols do not represent real numbers. They are convenient symbols used to describe unbounded conditions more concisely. A limit in which $f(x)$ increases or decreases without bound as x approaches c is called an **infinite limit.**



Infinite limits
Figure 1.39

Definition of Infinite Limits

Let f be a function that is defined at every real number in some open interval containing c (except possibly at c itself). The statement

$$\lim_{x \to c} f(x) = \infty$$

means that for each $M > 0$ there exists a $\delta > 0$ such that $f(x) > M$ whenever $0 < |x - c| < \delta$ (see Figure 1.39). Similarly, the statement

$$\lim_{x \to c} f(x) = -\infty$$

means that for each $N < 0$ there exists a $\delta > 0$ such that $f(x) < N$ whenever $0 < |x - c| < \delta$. To define the **infinite limit from the left,** replace $0 < |x - c| < \delta$ by $c - \delta < x < c$. To define the **infinite limit from the right,** replace $0 < |x - c| < \delta$ by $c < x < c + \delta$.

Be sure you understand that the equal sign in the statement $\lim f(x) = \infty$ does not mean that the limit exists! On the contrary, it tells you how the limit **fails to exist** by denoting the unbounded behavior of $f(x)$ as x approaches c.

Exploration

Use a graphing utility to graph each function. For each function, analytically find the single real number c that is not in the domain. Then graphically estimate the limit (if it exists) of $f(x)$ as x approaches c from the left and from the right.

a. $f(x) = \dfrac{3}{x - 4}$

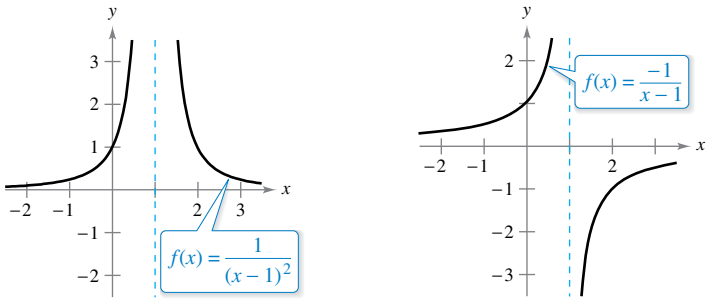
b. $f(x) = \dfrac{1}{2 - x}$

c. $f(x) = \dfrac{2}{(x - 3)^2}$

d. $f(x) = \dfrac{-3}{(x + 2)^2}$

EXAMPLE 1 Determining Infinite Limits from a Graph

Determine the limit of each function shown in Figure 1.40 as x approaches 1 from the left and from the right.



(a) **(b)**

Each graph has an asymptote at $x = 1$.

Figure 1.40

Solution

a. When x approaches 1 from the left or the right, $(x - 1)^2$ is a small positive number. Thus, the quotient $1/(x - 1)^2$ is a large positive number, and $f(x)$ approaches infinity from each side of $x = 1$. So, you can conclude that

$$\lim_{x \to 1} \frac{1}{(x - 1)^2} = \infty.$$ Limit from each side is infinity.

Figure 1.40(a) supports this analysis.

b. When x approaches 1 from the left, $x - 1$ is a small negative number. Thus, the quotient $-1/(x - 1)$ is a large positive number, and $f(x)$ approaches infinity from the left of $x = 1$. So, you can conclude that

$$\lim_{x \to 1^-} \frac{-1}{x - 1} = \infty.$$ Limit from the left side is infinity.

When x approaches 1 from the right, $x - 1$ is a small positive number. Thus, the quotient $-1/(x - 1)$ is a large negative number, and $f(x)$ approaches negative infinity from the right of $x = 1$. So, you can conclude that

$$\lim_{x \to 1^+} \frac{-1}{x - 1} = -\infty.$$ Limit from the right side is negative infinity.

Figure 1.40(b) supports this analysis. ■

TECHNOLOGY Remember that you can use a numerical approach to analyze a limit. For instance, you can use a graphing utility to create a table of values to analyze the limit in Example 1(a), as shown in the figure below.

Enter x-values using *ask* mode.

X	Y1
.9	100
.99	10000
.999	1E6
1	ERROR
1.001	1E6
1.01	10000
1.1	100

X=1

As x approaches 1 from the left, $f(x)$ increases without bound.

As x approaches 1 from the right, $f(x)$ increases without bound.

Use a graphing utility to make a table of values to analyze the limit in Example 1(b).

GO DIGITAL

Vertical Asymptotes

If it were possible to extend the graphs in Figure 1.40 toward positive and negative infinity, you would see that each graph becomes arbitrarily close to the vertical line $x = 1$. This line is a **vertical asymptote** of the graph of f. (You will study other types of asymptotes in Sections 3.5 and 3.6.)

REMARK If the graph of a function f has a vertical asymptote at $x = c$, then f is *not continuous* at c.

Definition of Vertical Asymptote

If $f(x)$ approaches infinity (or negative infinity) as x approaches c from the right or the left, then the line $x = c$ is a **vertical asymptote** of the graph of f.

In Example 1, note that each function is a *quotient* and that the vertical asymptote occurs at a number at which the denominator is 0 (and the numerator is not 0). The next theorem generalizes this observation.

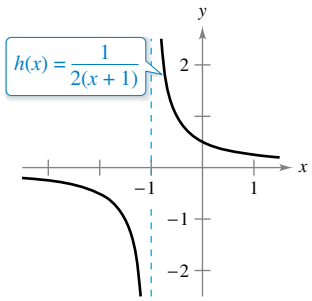
THEOREM 1.14 Vertical Asymptotes

Let f and g be continuous on an open interval containing c. If $f(c) \neq 0$, $g(c) = 0$, and there exists an open interval containing c such that $g(x) \neq 0$ for all $x \neq c$ in the interval, then the graph of the function

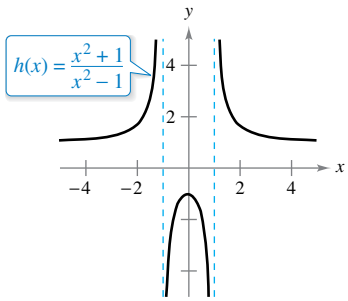
$$h(x) = \frac{f(x)}{g(x)}$$

has a vertical asymptote at $x = c$.

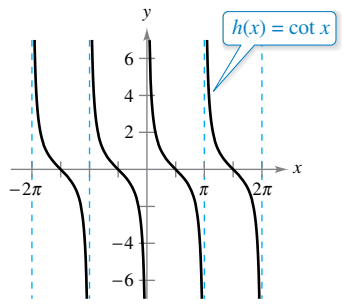
A proof of this theorem is given in Appendix A.



(a)



(b)



(c)

Functions with vertical asymptotes

Figure 1.41

EXAMPLE 2 Finding Vertical Asymptotes

See LarsonCalculus.com for an interactive version of this type of example.

a. When $x = -1$, the denominator of

$$h(x) = \frac{1}{2(x + 1)}$$

is 0 and the numerator is not 0. So, by Theorem 1.14, you can conclude that $x = -1$ is a vertical asymptote, as shown in Figure 1.41(a).

b. By factoring the denominator as

$$h(x) = \frac{x^2 + 1}{x^2 - 1} = \frac{x^2 + 1}{(x - 1)(x + 1)}$$ Factor difference of two squares

you can determine that the denominator is 0 at $x = -1$ and $x = 1$. Also, because the numerator is not 0 at these two points, you can apply Theorem 1.14 to conclude that the graph of f has two vertical asymptotes, as shown in Figure 1.41(b).

c. By writing the cotangent function in the form

$$h(x) = \cot x = \frac{\cos x}{\sin x}$$ Quotient identity

you can apply Theorem 1.14 to conclude that vertical asymptotes occur at all values of x such that $\sin x = 0$ and $\cos x \neq 0$, as shown in Figure 1.41(c). So, the graph of this function has infinitely many vertical asymptotes. These asymptotes occur at $x = n\pi$, where n is an integer.

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

GO DIGITAL

Theorem 1.14 requires that the value of the numerator at $x = c$ be nonzero. When both the numerator and the denominator are 0 at $x = c$, you obtain the *indeterminate form* $0/0$, and you cannot determine the limit behavior at $x = c$ without further investigation, as illustrated in Example 3.

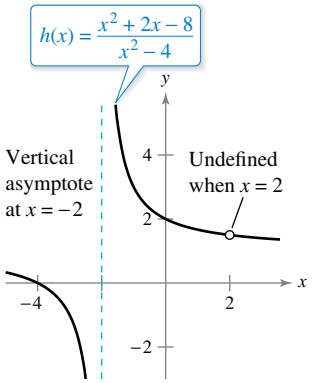
EXAMPLE 3 A Rational Function with Common Factors

Determine all vertical asymptotes of the graph of

$$h(x) = \frac{x^2 + 2x - 8}{x^2 - 4}.$$

Solution Begin by simplifying the expression, as shown.

$$\begin{aligned} h(x) &= \frac{x^2 + 2x - 8}{x^2 - 4} && \text{Write original function.} \\ &= \frac{(x + 4)(x - 2)}{(x + 2)(x - 2)} && \text{Factor and divide out common factor.} \\ &= \frac{x + 4}{x + 2}, \quad x \neq 2 && \text{Simplify.} \end{aligned}$$



$h(x)$ increases and decreases without bound as x approaches -2.

Figure 1.42

At all x-values other than $x = 2$, the graph of h coincides with the graph of $k(x) = (x + 4)/(x + 2)$. So, you can apply Theorem 1.14 to k to conclude that there is a vertical asymptote at $x = -2$, as shown in Figure 1.42. From the graph, you can see that

$$\lim_{x \to -2^-} \frac{x^2 + 2x - 8}{x^2 - 4} = -\infty \quad \text{and} \quad \lim_{x \to -2^+} \frac{x^2 + 2x - 8}{x^2 - 4} = \infty.$$

Note that $x = 2$ is *not* a vertical asymptote.

EXAMPLE 4 Determining Infinite Limits

Find each limit.

$$\lim_{x \to 1^-} \frac{x^2 - 3x}{x - 1} \quad \text{and} \quad \lim_{x \to 1^+} \frac{x^2 - 3x}{x - 1}$$

Solution Because the denominator is 0 when $x = 1$ (and the numerator is not 0), you know that the graph of

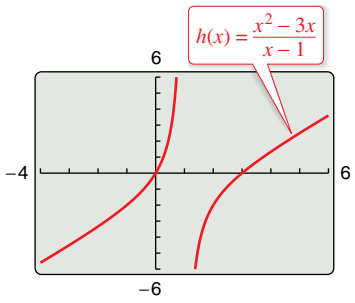
$$h(x) = \frac{x^2 - 3x}{x - 1}$$

has a vertical asymptote at $x = 1$. This means that each of the given limits is either ∞ or $-\infty$. You can determine the result by analyzing h at values of x close to 1 or by using a graphing utility. From the graph of h shown in Figure 1.43, you can see that the graph approaches ∞ from the left of $x = 1$ and approaches $-\infty$ from the right of $x = 1$. So, you can conclude that

$$\lim_{x \to 1^-} \frac{x^2 - 3x}{x - 1} = \infty \qquad \text{The limit from the left is infinity.}$$

and

$$\lim_{x \to 1^+} \frac{x^2 - 3x}{x - 1} = -\infty. \qquad \text{The limit from the right is negative infinity.}$$



The graph of h has a vertical asymptote at $x = 1$.

Figure 1.43

TECHNOLOGY PITFALL When using a graphing utility, be careful to interpret correctly the graph of a function with a vertical asymptote—some graphing utilities have difficulty drawing this type of graph.

THEOREM 1.15 Properties of Infinite Limits

Let c and L be real numbers, and let f and g be functions such that

$$\lim_{x\to c} f(x) = \infty \quad \text{and} \quad \lim_{x\to c} g(x) = L.$$

1. Sum: $\lim_{x\to c} [f(x) + g(x)] = \infty$
2. Difference: $\lim_{x\to c} [f(x) - g(x)] = \infty$
3. Product: $\lim_{x\to c} [f(x)g(x)] = \infty, \quad L > 0$

   $\lim_{x\to c} [f(x)g(x)] = -\infty, \quad L < 0$
4. Quotient: $\lim_{x\to c} \frac{g(x)}{f(x)} = 0$

Similar properties hold for one-sided limits and for functions for which the limit of $f(x)$ as x approaches c is $-\infty$ [see Example 5(d)].

REMARK Be sure you understand that Property 3 of Theorem 1.15 is not valid when $\lim_{x\to c} g(x) = 0$.

Proof Here is a proof of the sum property. (The proofs of the remaining properties are left as an exercise [see Exercise 78].) To show that the limit of $f(x) + g(x)$ is infinite, choose $M > 0$. You then need to find $\delta > 0$ such that $[f(x) + g(x)] > M$ whenever $0 < |x - c| < \delta$. For simplicity's sake, you can assume L is positive. Let $M_1 = M + 1$. Because the limit of $f(x)$ is infinite, there exists δ_1 such that $f(x) > M_1$ whenever $0 < |x - c| < \delta_1$. Also, because the limit of $g(x)$ is L, there exists δ_2 such that $|g(x) - L| < 1$ whenever $0 < |x - c| < \delta_2$. By letting δ be the smaller of δ_1 and δ_2, you can conclude that $0 < |x - c| < \delta$ implies $f(x) > M + 1$ and $|g(x) - L| < 1$. The second of these two inequalities implies that $g(x) > L - 1$, and adding this to the first inequality, you can write

$$f(x) + g(x) > (M + 1) + (L - 1) = M + L > M.$$

So, you can conclude that

$$\lim_{x\to c} [f(x) + g(x)] = \infty.$$

EXAMPLE 5 Determining Limits

a. Because $\lim_{x\to 0} 1 = 1$ and $\lim_{x\to 0} \frac{1}{x^2} = \infty$, you can write

$$\lim_{x\to 0} \left(1 + \frac{1}{x^2}\right) = \infty.$$ Property 1, Theorem 1.15

b. Because $\lim_{x\to 1^-} (x^2 + 1) = 2$ and $\lim_{x\to 1^-} (\cot \pi x) = -\infty$, you can write

$$\lim_{x\to 1^-} \frac{x^2 + 1}{\cot \pi x} = 0.$$ Property 4, Theorem 1.15

c. Because $\lim_{x\to 0^+} 3 = 3$ and $\lim_{x\to 0^+} \cot x = \infty$, you can write

$$\lim_{x\to 0^+} 3 \cot x = \infty.$$ Property 3, Theorem 1.15

d. Because $\lim_{x\to 0^-} x^2 = 0$ and $\lim_{x\to 0^-} \frac{1}{x} = -\infty$, you can write

$$\lim_{x\to 0^-} \left(x^2 + \frac{1}{x}\right) = -\infty.$$ Property 1, Theorem 1.15

REMARK Note that the solution to Example 5(d) uses Property 1 from Theorem 1.15 for which the limit of $f(x)$ as x approaches c is $-\infty$.

1.5 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

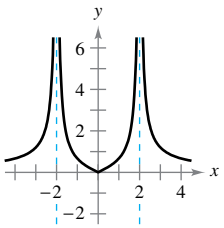
GO DIGITAL

Concept Check

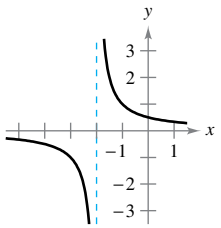
1. Describe the meaning of an infinite limit. What does ∞ represent?
2. Describe what is meant by a vertical asymptote of a graph.

Determining Infinite Limits from a Graph In Exercises 3–6, determine whether $f(x)$ approaches ∞ or $-\infty$ as x approaches -2 from the left and from the right.

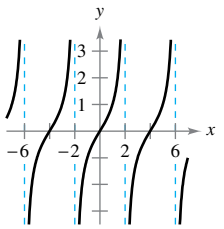
3. $f(x) = 2\left|\dfrac{x}{x^2-4}\right|$



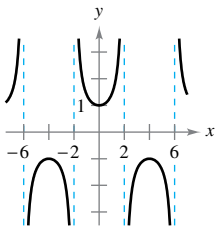
4. $f(x) = \dfrac{1}{x+2}$



5. $f(x) = \tan\dfrac{\pi x}{4}$



6. $f(x) = \sec\dfrac{\pi x}{4}$



Determining Infinite Limits In Exercises 7–10, determine whether $f(x)$ approaches ∞ or $-\infty$ as x approaches 4 from the left and from the right.

7. $f(x) = \dfrac{1}{x-4}$
8. $f(x) = \dfrac{-1}{x-4}$
9. $f(x) = \dfrac{1}{(x-4)^2}$
10. $f(x) = \dfrac{-1}{(x-4)^2}$

Numerical and Graphical Analysis In Exercises 11–18, create a table of values for the function and use the result to determine whether $f(x)$ approaches ∞ or $-\infty$ as x approaches -3 from the left and from the right. Use a graphing utility to graph the function to confirm your answer.

11. $f(x) = \dfrac{1}{x^2-9}$
12. $f(x) = \dfrac{x}{x^2-9}$
13. $f(x) = \dfrac{x^2}{x^2-9}$
14. $f(x) = -\dfrac{1}{3+x}$
15. $f(x) = \cot\dfrac{\pi x}{3}$
16. $f(x) = \tan\dfrac{\pi x}{6}$
17. $f(x) = \sec\dfrac{\pi x}{6}$
18. $f(x) = \csc\dfrac{\pi x}{3}$

Finding Vertical Asymptotes In Exercises 19–34, find the vertical asymptotes (if any) of the graph of the function.

19. $f(x) = \dfrac{1}{x^2}$
20. $f(x) = \dfrac{2}{(x-3)^3}$
21. $f(x) = \dfrac{x^2}{x^2-4}$
22. $f(x) = \dfrac{3x}{x^2+9}$
23. $g(t) = \dfrac{t-1}{t^2+1}$
24. $h(s) = \dfrac{3s+4}{s^2-16}$
25. $f(x) = \dfrac{3}{x^2+x-2}$
26. $g(x) = \dfrac{x^2-5x+25}{x^3+125}$
27. $f(x) = \dfrac{x^2-2x-15}{x^3-5x^2+x-5}$
28. $h(t) = \dfrac{t^2-2t}{t^4-16}$
29. $f(x) = \dfrac{4x^2+4x-24}{x^4-2x^3-9x^2+18x}$
30. $h(x) = \dfrac{x^2-9}{x^3+3x^2-x-3}$
31. $f(x) = \csc x$
32. $f(x) = \tan \pi x$
33. $s(t) = \dfrac{t}{\sin t}$
34. $g(\theta) = \dfrac{\tan\theta}{\theta}$

Vertical Asymptote or Removable Discontinuity In Exercises 35–38, determine whether the graph of the function has a vertical asymptote or a removable discontinuity at $x = -1$. Graph the function using a graphing utility to confirm your answer.

35. $f(x) = \dfrac{x^2-1}{x+1}$
36. $f(x) = \dfrac{x^2-2x-8}{x+1}$
37. $f(x) = \dfrac{\cos(x^2-1)}{x+1}$
38. $f(x) = \dfrac{\sin(x+1)}{x+1}$

Finding a One-Sided Limit In Exercises 39–56, find the one-sided limit (if it exists).

39. $\lim\limits_{x\to -1^+} \dfrac{1}{x+1}$
40. $\lim\limits_{x\to 1^-} \dfrac{-1}{(x-1)^2}$
41. $\lim\limits_{x\to 2^+} \dfrac{x}{x-2}$
42. $\lim\limits_{x\to 2^-} \dfrac{x^2}{x^2+4}$
43. $\lim\limits_{x\to -3^-} \dfrac{x+3}{x^2+x-6}$
44. $\lim\limits_{x\to (-1/2)^+} \dfrac{6x^2+x-1}{4x^2-4x-3}$
45. $\lim\limits_{x\to 0^-} \left(1+\dfrac{1}{x}\right)$
46. $\lim\limits_{x\to 0^+} \left(6-\dfrac{1}{x^3}\right)$
47. $\lim\limits_{x\to -4^-} \left(x^2+\dfrac{2}{x+4}\right)$
48. $\lim\limits_{x\to 0^+} \left(x-\dfrac{1}{x}+3\right)$
49. $\lim\limits_{x\to 0^+} \left(\sin x+\dfrac{1}{x}\right)$
50. $\lim\limits_{x\to 3^+} \left(\dfrac{x}{3}+\cot\dfrac{\pi x}{2}\right)$
51. $\lim\limits_{x\to 0^+} \dfrac{2}{\sin x}$
52. $\lim\limits_{x\to (\pi/2)^+} \dfrac{-2}{\cos x}$
53. $\lim\limits_{x\to \pi^+} \dfrac{\sqrt{x}}{\csc x}$
54. $\lim\limits_{x\to 0^-} \dfrac{x+2}{\cot x}$
55. $\lim\limits_{x\to (1/2)^-} x \sec \pi x$
56. $\lim\limits_{x\to (1/2)^+} x^2 \tan \pi x$

Finding a One-Sided Limit **In Exercises 57 and 58, use a graphing utility to graph the function and determine the one-sided limit.**

57. $\lim_{x\to 1^+} \dfrac{x^2 + x + 1}{x^3 - 1}$

58. $\lim_{x\to 1^-} \dfrac{x^3 - 1}{x^2 + x + 1}$

Determining Limits **In Exercises 59 and 60, use the information to determine each limit.**

59. $\lim_{x\to c} f(x) = \infty$, $\lim_{x\to c} g(x) = -2$

(a) $\lim_{x\to c} [f(x) + g(x)]$

(b) $\lim_{x\to c} [f(x)g(x)]$

(c) $\lim_{x\to c} \dfrac{g(x)}{f(x)}$

60. $\lim_{x\to c} f(x) = -\infty$, $\lim_{x\to c} g(x) = 3$

(a) $\lim_{x\to c} [f(x) + g(x)]$

(b) $\lim_{x\to c} [f(x)g(x)]$

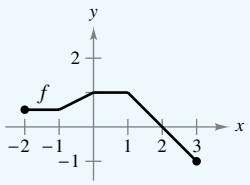
(c) $\lim_{x\to c} \dfrac{g(x)}{f(x)}$

Exploring Concepts

61. Write a rational function with vertical asymptotes at $x = 6$ and $x = -2$, and with a zero at $x = 3$.

62. Does the graph of every rational function have a vertical asymptote? Explain.

63. Use the graph of the function f (see figure) to sketch the graph of $g(x) = 1/f(x)$ on the interval $[-2, 3]$. To print an enlarged copy of the graph, go to *MathGraphs.com*.



64. Relativity According to the theory of relativity, the mass m of a particle depends on its velocity v. That is,

$$m = \frac{m_0}{\sqrt{1 - (v^2/c^2)}}$$

where m_0 is the mass when the particle is at rest and c is the speed of light. Find the limit of the mass as v approaches c from the left.

65. Numerical and Graphical Reasoning Use a graphing utility to complete the table for each function and graph each function to estimate the limit. What is the value of the limit when the power of x in the denominator is greater than 3?

x	1	0.5	0.2	0.1	0.01	0.001	0.0001
$f(x)$							

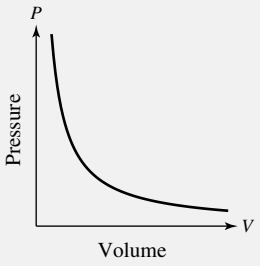
(a) $\lim_{x\to 0^+} \dfrac{x - \sin x}{x}$

(b) $\lim_{x\to 0^+} \dfrac{x - \sin x}{x^2}$

(c) $\lim_{x\to 0^+} \dfrac{x - \sin x}{x^3}$

(d) $\lim_{x\to 0^+} \dfrac{x - \sin x}{x^4}$

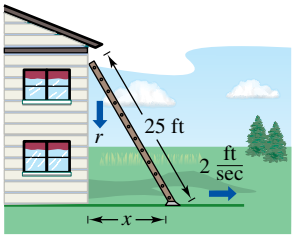
66. HOW DO YOU SEE IT? For a quantity of gas at a constant temperature, the pressure P is inversely proportional to the volume V. What is the limit of P as V approaches 0 from the right? Explain what this means in the context of the problem.



67. Rate of Change A 25-foot ladder is leaning against a house (see figure). When the base of the ladder is pulled away from the house at a rate of 2 feet per second, the top will move down the wall at a rate of

$$r = \frac{2x}{\sqrt{625 - x^2}} \text{ ft/sec}$$

where x is the distance between the base of the ladder and the house, and r is the rate in feet per second.



(a) Find the rate r when x is 15 feet.

(b) Find the limit of r as x approaches 25 from the left.

68. Average Speed

On a trip of d miles to another city, a truck driver's average speed was x miles per hour. On the return trip, the average speed was y miles per hour. The average speed for the round trip was 50 miles per hour.

(a) Verify that

$$y = \frac{25x}{x - 25}.$$

What is the domain?

(b) Create a table that shows corresponding values of y (in miles per hour) for x values of 30, 40, 50, and 60 miles per hour. Are the values of y different than you expected? Explain.

(c) Find the limit of y as x approaches 25 from the right and interpret its meaning.

69. Limit of a Sum A sum S is inversely proportional to $1 - r$, where $0 < |r| < 1$. Find the limit of S as $r \to 1^-$.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

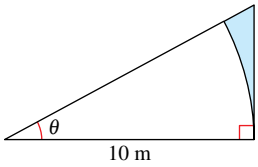
70. Limit of a Quantity A quantity Q varies inversely as the square root of $t - 4$. Find the limit of Q as $t \to 4^+$.

71. Numerical and Graphical Analysis Consider the shaded region outside the sector of a circle of radius 10 meters and inside a right triangle (see figure).



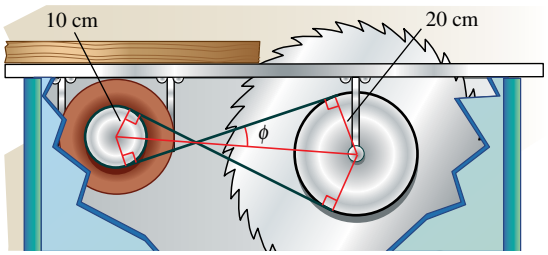
(a) Write the area A of the region as a function of θ. Determine the domain of the function.

(b) Use a graphing utility to complete the table and graph the function over the appropriate domain.

θ	0.3	0.6	0.9	1.2	1.5
$f(\theta)$					

(c) Find the limit of A as θ approaches $\pi/2$ from the left.

72. Numerical and Graphical Reasoning A crossed belt connects a 20-centimeter pulley (10-cm radius) on an electric motor with a 40-centimeter pulley (20-cm radius) on a saw arbor (see figure). The electric motor runs at 1700 revolutions per minute.



(a) Determine the number of revolutions per minute of the saw.

(b) How does crossing the belt affect the saw in relation to the motor?

(c) Let L be the total length of the belt. Write L as a function of ϕ, where ϕ is measured in radians. What is the domain of the function? (*Hint:* Add the lengths of the straight sections of the belt and the length of the belt around each pulley.)

(d) Use a graphing utility to complete the table.

ϕ	0.3	0.6	0.9	1.2	1.5
L					

(e) Use a graphing utility to graph the function over the appropriate domain.

(f) Find $\lim_{\phi \to (\pi/2)^-} L$.

(g) Use a geometric argument as the basis of a second method of finding the limit in part (f).

(h) Find $\lim_{\phi \to 0^+} L$.

True or False? **In Exercises 73–76, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

73. The graph of a function cannot cross a vertical asymptote.

74. The graphs of polynomial functions have no vertical asymptotes.

75. The graphs of trigonometric functions have no vertical asymptotes.

76. If f has a vertical asymptote at $x = 0$, then f is undefined at $x = 0$.

77. Finding Functions Find functions f and g such that $\lim_{x \to c} f(x) = \infty$ and $\lim_{x \to c} g(x) = \infty$, but $\lim_{x \to c} [f(x) - g(x)] \neq 0$.

78. Proof Prove the difference, product, and quotient properties in Theorem 1.15.

79. Proof Prove that if $\lim_{x \to c} f(x) = \infty$, then $\lim_{x \to c} \frac{1}{f(x)} = 0$.

80. Proof Prove that if

$$\lim_{x \to c} \frac{1}{f(x)} = 0$$

then $\lim_{x \to c} f(x)$ does not exist.

Proof **In Exercises 81–84, use the ε–δ definition of infinite limits to prove the statement.**

81. $\lim_{x \to 3^+} \frac{1}{x - 3} = \infty$

82. $\lim_{x \to 5^-} \frac{1}{x - 5} = -\infty$

83. $\lim_{x \to 8^+} \frac{3}{8 - x} = -\infty$

84. $\lim_{x \to 9^-} \frac{6}{9 - x} = \infty$

SECTION PROJECT

Graphs and Limits of Trigonometric Functions

Recall from Theorem 1.9 that the limit of

$$f(x) = \frac{\sin x}{x}$$

as x approaches 0 is 1.

(a) Use a graphing utility to graph the function f on the interval $-\pi \leq x \leq \pi$. Explain how the graph helps confirm this theorem.

(b) Explain how you could use a table of values to confirm the value of this limit numerically.

(c) Graph $g(x) = \sin x$ by hand. Sketch a tangent line at the point $(0, 0)$ and visually estimate the slope of this tangent line.

(d) Let $(x, \sin x)$ be a point on the graph of g near $(0, 0)$, and write a formula for the slope of the secant line joining $(x, \sin x)$ and $(0, 0)$. Evaluate this formula at $x = 0.1$ and $x = 0.01$. Then find the exact slope of the tangent line to g at the point $(0, 0)$.

(e) Sketch the graph of the cosine function $h(x) = \cos x$. What is the slope of the tangent line at the point $(0, 1)$? Use limits to find this slope analytically.

(f) Find the slope of the tangent line to $k(x) = \tan x$ at $(0, 0)$.

Exploring Concepts

The core idea of this chapter is the concept of the limit of a function. Limits will be used to develop three major ideas of calculus: the derivative, the integral, and infinite series. The statement

$$\lim_{x \to c} f(x) = L$$

means that if $f(x)$ becomes arbitrarily close to a single number L as x approaches c (from either side), then the limit of $f(x)$ as x approaches c is L. Otherwise, the limit fails to exist. The concept of limit leads naturally to the definition of continuity, which has three conditions: (1) $f(c)$ is defined, (2) $\lim_{x \to c} f(x)$ exists, and (3) $\lim_{x \to c} f(x) = f(c)$.

1. Find a function f that satisfies the first two conditions in the definition of continuity but not the third one.

2. Can a function that is continuous for all real x have a vertical asymptote? Explain.

3. Consider the function $f(x) = \sqrt{x(x-1)}$.

(a) Find the domain of f.

(b) Find $\lim_{x \to 0^-} f(x)$.

(c) Find $\lim_{x \to 1^+} f(x)$.

4. Consider the function

$$g(x) = \frac{1}{x-4}.$$

(a) Find the domain of g.

(b) Discuss the continuity of g.

(c) Describe the behavior of g as x gets closer and closer to 4.

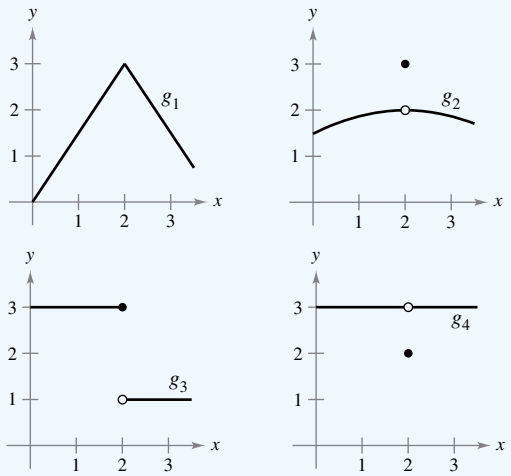
5. Consider the function

$$f(x) = \frac{\tan 2x}{x}.$$

(a) Find $\lim_{x \to 0} f(x)$, if it exists.

(b) Can f be defined at $x = 0$ such that f is continuous at $x = 0$?

6. Consider the graphs of the functions g_1, g_2, g_3, and g_4.



For each given condition of the function f, which of the graphs could be the graph of f?

(a) $\lim_{x \to 2} f(x) = 3$

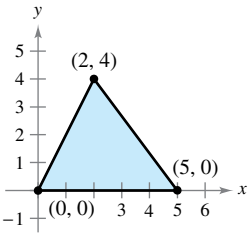
(b) f is continuous at 2.

(c) $\lim_{x \to 2^-} f(x) = 3$

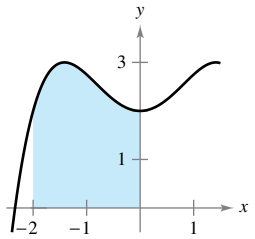
Precalculus or Calculus **In Exercises 7 and 8, decide whether each problem can be solved using precalculus or whether calculus is required. When the problem can be solved using precalculus, solve it. When the problem seems to require calculus, explain your reasoning and use a graphical or numerical approach to estimate the solution.**

7. Find the area of the shaded region.

(a)



(b)



8. Find the distance between the points $(1, 1)$ and $(3, 9)$ (a) along the curve $y = x^2$ and (b) along the line $y = 4x - 3$.

Estimating a Limit Numerically **In Exercises 9–14, create a table of values for the function and use the result to estimate the limit. Use a graphing utility to graph the function to confirm your result.**

9. $\lim_{t \to 5} \dfrac{t^2 - 25}{t - 5}$

10. $\lim_{x \to 3} \dfrac{x - 3}{x^2 - 7x + 12}$

11. $\lim_{x \to 0} \dfrac{\sqrt{x+4} - 2}{x}$

12. $\lim_{x \to 1} \dfrac{1 - \sqrt[3]{x}}{x - 1}$

13. $\lim_{x \to 0} \dfrac{[1/(x+7)] - (1/7)}{x}$

14. $\lim_{x \to 0} \dfrac{[4/(x+2)] - 2}{x}$

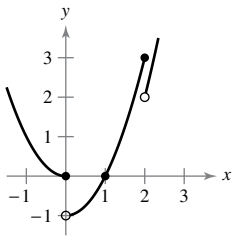
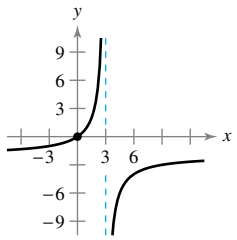
Finding a Limit Graphically **In Exercises 15 and 16, use the graph to find the limit (if it exists). If the limit does not exist, explain why.**

15. $h(x) = \left[\!\left[-\frac{x}{2}\right]\!\right] + x^2$



(a) $\lim_{x\to 2} h(x)$ (b) $\lim_{x\to 1} h(x)$

16. $g(x) = \dfrac{-2x}{x-3}$



(a) $\lim_{x\to 3} g(x)$ (b) $\lim_{x\to 0} g(x)$

Using the ε-δ Definition of Limit **In Exercises 17–20, find the limit L. Then use the ε-δ definition to prove that the limit is L.**

17. $\lim_{x\to 1}(x+4)$

18. $\lim_{x\to 9}\sqrt{x}$

19. $\lim_{x\to 2}(1-x^2)$

20. $\lim_{x\to 5} 9$

Finding a Limit **In Exercises 21–38, find the limit.**

21. $\lim_{x\to -6} x^2$

22. $\lim_{x\to 0}(5x-3)$

23. $\lim_{t\to 4}\sqrt{t+2}$

24. $\lim_{x\to 2}\sqrt{x^3+1}$

25. $\lim_{x\to 27}\left(\sqrt[3]{x}-1\right)^4$

26. $\lim_{x\to 7}(x-4)^3$

27. $\lim_{x\to 4}\dfrac{4}{x-1}$

28. $\lim_{x\to 2}\dfrac{x}{x^2+1}$

29. $\lim_{x\to -3}\dfrac{2x^2+11x+15}{x+3}$

30. $\lim_{t\to 4}\dfrac{t^2-16}{t-4}$

31. $\lim_{x\to 4}\dfrac{\sqrt{x-3}-1}{x-4}$

32. $\lim_{x\to 0}\dfrac{\sqrt{4+x}-2}{x}$

33. $\lim_{x\to 0}\dfrac{[1/(x+1)]-1}{x}$

34. $\lim_{s\to 0}\dfrac{\left(1/\sqrt{1+s}\right)-1}{s}$

35. $\lim_{x\to 0}\dfrac{1-\cos x}{\sin x}$

36. $\lim_{x\to \pi/4}\dfrac{4x}{\tan x}$

37. $\lim_{\Delta x\to 0}\dfrac{\sin[(\pi/6)+\Delta x]-(1/2)}{\Delta x}$

[*Hint:* $\sin(\theta+\phi) = \sin\theta\cos\phi + \cos\theta\sin\phi$]

38. $\lim_{\Delta x\to 0}\dfrac{\cos(\pi+\Delta x)+1}{\Delta x}$

[*Hint:* $\cos(\theta+\phi) = \cos\theta\cos\phi - \sin\theta\sin\phi$]

Evaluating a Limit **In Exercises 39–42, evaluate the limit when $\lim_{x\to c} f(x) = -6$ and $\lim_{x\to c} g(x) = \frac{1}{2}$.**

39. $\lim_{x\to c}[f(x)g(x)]$

40. $\lim_{x\to c}\dfrac{f(x)}{g(x)}$

41. $\lim_{x\to c}[f(x)+2g(x)]$

42. $\lim_{x\to c}[f(x)]^2$

Graphical, Numerical, and Analytic Analysis **In Exercises 43–46, use a graphing utility to graph the function and estimate the limit. Use a table to reinforce your conclusion. Then find the limit by analytic methods.**

43. $\lim_{x\to 0}\dfrac{\sqrt{2x+9}-3}{x}$

44. $\lim_{x\to 0}\dfrac{[1/(x+4)]-(1/4)}{x}$

45. $\lim_{x\to -9}\dfrac{x^3+729}{x+9}$

46. $\lim_{x\to 0}\dfrac{\cos x - 1}{x}$

Free-Falling Object **In Exercises 47 and 48, use the position function $s(t) = -4.9t^2 + 250$, which gives the height (in meters) of an object that has fallen for t seconds from a height of 250 meters. The velocity at time $t = a$ seconds is given by**

$$\lim_{t\to a}\frac{s(a)-s(t)}{a-t}.$$

47. Find the velocity of the object when $t = 4$.

48. When will the object hit the ground? At what velocity will the object impact the ground?

Finding a Limit **In Exercises 49–60, find the limit (if it exists). If it does not exist, explain why.**

49. $\lim_{x\to 3^+}\dfrac{1}{x+3}$

50. $\lim_{x\to 6^-}\dfrac{x-6}{x^2-36}$

51. $\lim_{x\to 10^+}\dfrac{x}{\sqrt{x^2-100}}$

52. $\lim_{x\to 25^+}\dfrac{\sqrt{x}-5}{x-25}$

53. $\lim_{x\to 3^-}\dfrac{|x-3|}{x-3}$

54. $\lim_{x\to 2^-}\dfrac{x^2-4}{|x-2|}$

55. $\lim_{x\to 2^-}(2[\![x]\!]+1)$

56. $\lim_{x\to 4}[\![x-1]\!]$

57. $\lim_{x\to 2} f(x)$, where $f(x) = \begin{cases}(x-2)^2, & x \le 2\\ 2-x, & x > 2\end{cases}$

58. $\lim_{x\to 1^+} g(x)$, where $g(x) = \begin{cases}\sqrt{1-x}, & x \le 1\\ x+1, & x > 1\end{cases}$

59. $\lim_{t\to 1} h(t)$, where $h(t) = \begin{cases}t^3+1, & t < 1\\ \frac{1}{2}(t+1), & t \ge 1\end{cases}$

60. $\lim_{s\to -2} f(s)$, where $f(s) = \begin{cases}-s^2-4s-2, & s \le -2\\ s^2+4s+6, & s > -2\end{cases}$

Continuity on a Closed Interval **In Exercises 61 and 62, discuss the continuity of the function on the closed interval.**

61. $g(x) = \sqrt{8-x^3}$, $[-2, 2]$

62. $h(x) = \dfrac{3}{5-x}$, $[0, 5]$

Removable and Nonremovable Discontinuities **In Exercises 63–68, find the x-values (if any) at which f is not continuous. State whether the discontinuities are removable or nonremovable.**

63. $f(x) = x^4 - 81x$

64. $f(x) = x^2 - x + 20$

65. $f(x) = \dfrac{4}{x-5}$

66. $f(x) = \dfrac{1}{x^2-9}$

67. $f(x) = \dfrac{x}{x^3-x}$

68. $f(x) = \dfrac{x+3}{x^2-3x-18}$

69. Making a Function Continuous Find the value of c such that f is continuous on the entire real number line.

$$f(x) = \begin{cases} x + 3, & x \le 2 \\ cx + 6, & x > 2 \end{cases}$$

70. Making a Function Continuous Find the values of b and c such that f is continuous on the entire real number line.

$$f(x) = \begin{cases} x + 1, & 1 < x < 3 \\ x^2 + bx + c, & |x - 2| \ge 1 \end{cases}$$

Testing for Continuity **In Exercises 71–76, describe the interval(s) on which the function is continuous.**

71. $f(x) = -3x^2 + 7$

72. $f(x) = \dfrac{4x^2 + 7x - 2}{x + 2}$

73. $f(x) = \sqrt{x} + \cos x$

74. $f(x) = [\![x + 3]\!]$

75. $f(x) = \begin{cases} \dfrac{3x^2 - x - 2}{x - 1}, & x \ne 1 \\ 0, & x = 1 \end{cases}$

76. $f(x) = \begin{cases} 5 - x, & x \le 2 \\ 2x - 3, & x > 2 \end{cases}$

77. Using the Intermediate Value Theorem Use the Intermediate Value Theorem to show that

$$f(x) = 2x^3 - 3$$

has a zero in the interval $[1, 2]$.

78. Using the Intermediate Value Theorem Use the Intermediate Value Theorem to show that

$$f(x) = x^2 + x - 2$$

has at least two zeros in the interval $[-3, 3]$.

Using the Intermediate Value Theorem **In Exercises 79 and 80, verify that the Intermediate Value Theorem applies to the indicated interval and find the value of c guaranteed by the theorem.**

79. $f(x) = x^2 + 5x - 4, \quad [-1, 2], \quad f(c) = 2$

80. $f(x) = (x - 6)^3 + 4, \quad [4, 7], \quad f(c) = 3$

Determining Infinite Limits **In Exercises 81 and 82, determine whether $f(x)$ approaches ∞ or $-\infty$ as x approaches 6 from the left and from the right.**

81. $f(x) = \dfrac{1}{x - 6}$

82. $f(x) = \dfrac{-1}{(x - 6)^2}$

Finding Vertical Asymptotes **In Exercises 83–88, find the vertical asymptotes (if any) of the graph of the function.**

83. $f(x) = \dfrac{3}{x}$

84. $f(x) = \dfrac{5}{(x - 2)^4}$

85. $f(x) = \dfrac{x^3}{x^2 - 9}$

86. $h(x) = \dfrac{6x}{36 - x^2}$

87. $f(x) = \sec \dfrac{\pi x}{2}$

88. $f(x) = \csc \pi x$

Finding a One-Sided Limit **In Exercises 89–98, find the one-sided limit (if it exists).**

89. $\lim\limits_{x \to 1^-} \dfrac{x^2 + 2x + 1}{x - 1}$

90. $\lim\limits_{x \to (1/2)^+} \dfrac{x}{2x - 1}$

91. $\lim\limits_{x \to -1^+} \dfrac{x + 1}{x^3 + 1}$

92. $\lim\limits_{x \to -1^-} \dfrac{x + 1}{x^4 - 1}$

93. $\lim\limits_{x \to 0^+} \left(x - \dfrac{1}{x^3}\right)$

94. $\lim\limits_{x \to 2^-} \dfrac{1}{\sqrt[3]{x^2 - 4}}$

95. $\lim\limits_{x \to 0^+} \dfrac{\sin 4x}{5x}$

96. $\lim\limits_{x \to 0^-} \dfrac{\sec x^3}{2x}$

97. $\lim\limits_{x \to 0^+} \dfrac{\csc 2x}{x}$

98. $\lim\limits_{x \to 0^-} \dfrac{\cos^2 x}{x}$

99. Environment A utility company burns coal to generate electricity. The cost C in dollars of removing $p\%$ of the air pollutants in the stack emissions is given by

$$C = \frac{80{,}000p}{100 - p}, \quad 0 \le p < 100.$$

(a) Find the cost of removing 90% of the pollutants.

(b) Find the limit of C as p approaches 100 from the left and interpret its meaning.

Building on Concepts

100. Consider the function

$$f(x) = \frac{x^2 - 4}{x - 2}.$$

(a) Find the domain of f.

(b) Factor the numerator and simplify the function. Describe the graph of f.

(c) Describe the behavior of f as x gets closer and closer to 2. Support your answer with an appropriate table.

(d) Find $\lim\limits_{x \to 2} f(x)$.

(e) Consider the parabola $h(x) = x^2$. Find the slope of the secant line joining the points $(2, 4)$ and $(2.1, 4.41)$ on the graph of h. Explain how you could find the slope of the tangent line to h at the point $(2, 4)$.

101. For positive numbers $a < b$, the **pulse function** is defined as

$$P_{a,b}(x) = H(x - a) - H(x - b) = \begin{cases} 0, & x < a \\ 1, & a \le x < b \\ 0, & x \ge b \end{cases}$$

where H is the Heaviside function (see Exercise 62, page 28).

(a) Sketch the graph of the pulse function.

(b) Find $\lim\limits_{x \to a^+} P_{a,b}(x)$, $\lim\limits_{x \to a^-} P_{a,b}(x)$, $\lim\limits_{x \to b^+} P_{a,b}(x)$, and $\lim\limits_{x \to b^-} P_{a,b}(x)$.

(c) Discuss the continuity of the pulse function.

(d) Why is U called the **unit pulse function?**

$$U(x) = \frac{1}{b - a} P_{a,b}(x)$$

P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Perimeter and Area Let $P(x, y)$ be a point on the parabola $y = x^2$ in the first quadrant. Consider the triangle $\triangle PAO$ formed by P, $A(0, 1)$, and the origin $O(0, 0)$, and the triangle $\triangle PBO$ formed by P, $B(1, 0)$, and the origin (see figure).

(a) Write the perimeter of each triangle in terms of x.

(b) Let $r(x)$ be the ratio of the perimeters of the two triangles,

$$r(x) = \frac{\text{Perimeter } \triangle PAO}{\text{Perimeter } \triangle PBO}.$$

Complete the table. Calculate $\lim_{x \to 0^+} r(x)$.

x	4	2	1	0.1	0.01
Perimeter $\triangle PAO$					
Perimeter $\triangle PBO$					
$r(x)$					

(c) Write the area of each triangle in terms of x.

(d) Let $a(x)$ be the ratio of the areas of the two triangles,

$$a(x) = \frac{\text{Area } \triangle PBO}{\text{Area } \triangle PAO}.$$

Complete the table. Calculate $\lim_{x \to 0^+} a(x)$.

x	4	2	1	0.1	0.01
Area $\triangle PAO$					
Area $\triangle PBO$					
$a(x)$					

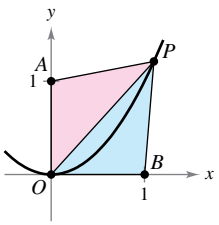

Figure for 1

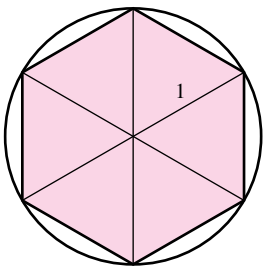

Figure for 2

2. Area

(a) Find the area of a regular hexagon inscribed in a circle of radius 1 (see figure). How close is this area to that of the circle?

(b) Find the area A_n of an n-sided regular polygon inscribed in a circle of radius 1. Write your answer as a function of n.

(c) Complete the table. What number does A_n approach as n gets larger and larger?

n	6	12	24	48	96
A_n					

3. Tangent Line Let $P(5, -12)$ be a point on the circle $x^2 + y^2 = 169$.

(a) What is the slope of the line joining P and $O(0, 0)$?

(b) Find an equation of the tangent line to the circle at P.

(c) Let $Q(x, y)$ be another point on the circle in the fourth quadrant. Find the slope m_x of the line joining P and Q in terms of x.

(d) Calculate $\lim_{x \to 5} m_x$. How does this number relate to your answer in part (b)?

4. Findings Limits Let

$$\lim_{x \to c} [f(x) + g(x)] = 5 \quad \text{and} \quad \lim_{x \to c} [f(x) - g(x)] = 12.$$

Find $\lim_{x \to c} [f(x)g(x)]$ and $\lim_{x \to c} [f(x)/g(x)]$.

5. Finding Values Find values of a and b such that

$$\lim_{x \to 0} \frac{\sqrt{a + bx} - \sqrt{3}}{x} = \sqrt{3}.$$

6. Escape Velocity To escape Earth's gravitational field, a rocket must be launched with an initial velocity called the **escape velocity.** A rocket launched from the surface of Earth has velocity v (in miles per second) given by

$$v = \sqrt{\frac{2GM}{r} + v_0^2 - \frac{2GM}{R}} \approx \sqrt{\frac{192{,}000}{r} + v_0^2 - 48}$$

where v_0 is the initial velocity, r is the distance from the rocket to the center of Earth, G is the gravitational constant, M is the mass of Earth, and R is the radius of Earth (approximately 4000 miles).

(a) Find the value of v_0 for which you obtain an infinite limit for r as v approaches zero. This value of v_0 is the escape velocity for Earth.

(b) A rocket launched from the surface of the moon has velocity v (in miles per second) given by

$$v = \sqrt{\frac{1920}{r} + v_0^2 - 2.17}.$$

Find the escape velocity for the moon.

(c) A rocket launched from the surface of a planet has velocity v (in miles per second) given by

$$v = \sqrt{\frac{10{,}600}{r} + v_0^2 - 6.99}.$$

Find the escape velocity for this planet. Is the mass of this planet larger or smaller than that of Earth? (Assume that the mean density of this planet is the same as that of Earth.)

7. Proof Let a be a nonzero constant. Prove that if $\lim_{x \to 0} f(x) = L$, then $\lim_{x \to 0} f(ax) = L$. Show by means of an example that a must be nonzero.

2.1 The Derivative and the Tangent Line Problem

GO DIGITAL

- **Find the slope of the tangent line to a curve at a point.**
- **Use the limit definition to find the derivative of a function.**
- **Describe the relationship between differentiability and continuity.**

The Tangent Line Problem

Calculus grew out of four major problems that European mathematicians were working on during the seventeenth century.

1. The tangent line problem (Section 1.1 and this section)
2. The velocity and acceleration problem (Sections 2.2 and 2.3)
3. The minimum and maximum problem (Section 3.1)
4. The area problem (Sections 1.1 and 4.2)

Each problem involves the notion of a limit, and calculus can be introduced with any of the four problems.

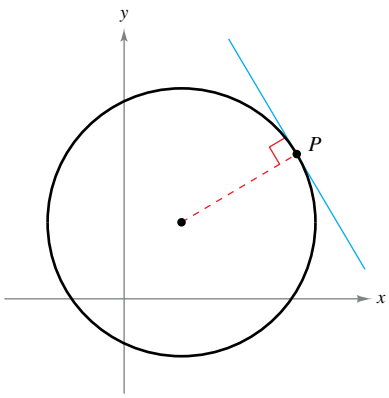
A brief introduction to the tangent line problem is given in Section 1.1. Although partial solutions to this problem were given by Pierre de Fermat (1601–1665), René Descartes (1596–1650), Christian Huygens (1629–1695), and Isaac Barrow (1630–1677), credit for the first general solution is usually given to Isaac Newton (1642–1727) and Gottfried Leibniz (1646–1716). Newton's work on this problem stemmed from his interest in optics and light refraction.

ISAAC NEWTON (1642–1727)

In addition to his work in calculus, Newton made revolutionary contributions to physics, including the Law of Universal Gravitation and his three laws of motion.

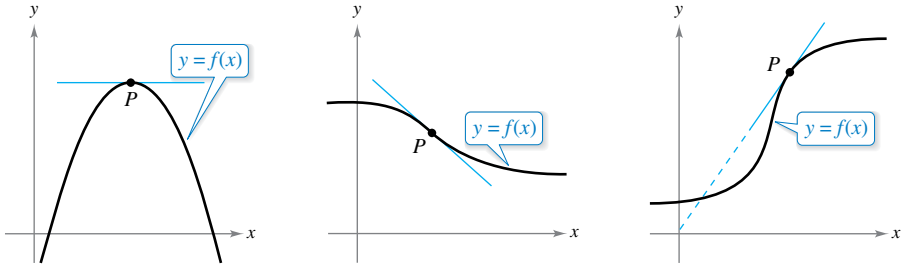
See LarsonCalculus.com to read more of this biography.

What does it mean to say that a line is tangent to a curve at a point? For a circle, the tangent line at a point P is the line that is perpendicular to the radial line at point P, as shown in Figure 2.1.



Tangent line to a circle
Figure 2.1

For a general curve, however, the problem is more difficult. For instance, how would you define the tangent lines shown in Figure 2.2? You might say that a line is tangent to a curve at a point P when it touches, but does not cross, the curve at point P. This definition would work for the first curve shown in Figure 2.2 but not for the second. *Or* you might say that a line is tangent to a curve when the line touches or intersects the curve at exactly one point. This definition would work for a circle but not for more general curves, as the third curve in Figure 2.2 shows.



Tangent line to a curve at a point
Figure 2.2

Exploration

Use a graphing utility to graph $f(x) = 2x^3 - 4x^2 + 3x - 5$. On the same screen, graph $y = x - 5$, $y = 2x - 5$, and $y = 3x - 5$. Which of these lines, if any, appears to be tangent to the graph of f at the point $(0, -5)$? Explain your reasoning.

The secant line through $(c, f(c))$ and $(c + \Delta x, f(c + \Delta x))$
Figure 2.3

Essentially, the problem of finding the tangent line at a point P boils down to the problem of finding the *slope* of the tangent line at point P. You can approximate this slope using a **secant line*** through the point of tangency and a second point on the curve, as shown in Figure 2.3. If $(c, f(c))$ is the point of tangency and

$$(c + \Delta x, f(c + \Delta x))$$

is a second point on the graph of f, then the slope of the secant line through the two points is given by substitution into the slope formula

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

$$m_{\text{sec}} = \frac{f(c + \Delta x) - f(c)}{(c + \Delta x) - c} \qquad \frac{\text{Change in } y}{\text{Change in } x}$$

$$m_{\text{sec}} = \frac{f(c + \Delta x) - f(c)}{\Delta x}. \qquad \text{Slope of secant line}$$

The expression on the right side of this equation is a **difference quotient.** The denominator Δx is the **change in x,** and the numerator

$$\Delta y = f(c + \Delta x) - f(c)$$

is the **change in y.**

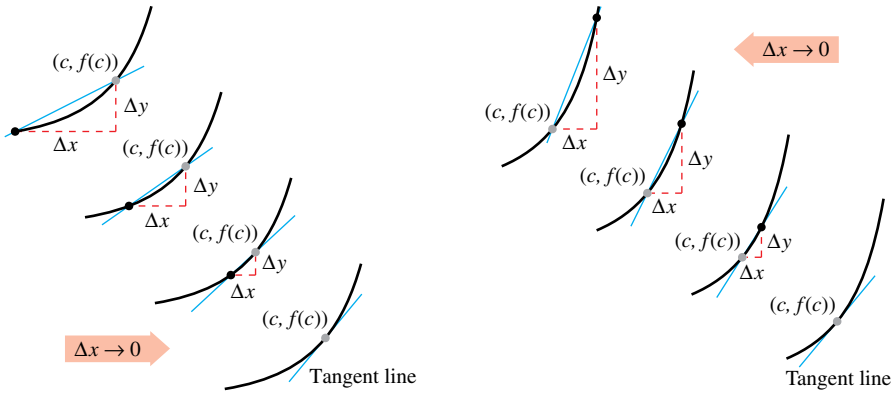
The beauty of this procedure is that you can obtain more and more accurate approximations of the slope of the tangent line by choosing points closer and closer to the point of tangency, as shown in Figure 2.4.

GO DIGITAL

THE TANGENT LINE PROBLEM

In 1637, mathematician René Descartes stated this about the tangent line problem:

"And I dare say that this is not only the most useful and general problem in geometry that I know, but even that I ever desire to know."



Tangent line approximations
Figure 2.4

REMARK The variable Δx is used to represent the change in x in the definition of the slope of a graph. Other variables may also be used. Sometimes this definition is written as

$$m = \lim_{h \to 0} \frac{f(c + h) - f(c)}{h}.$$

Definition of Tangent Line with Slope m

If f is defined on an open interval containing c, and if the limit

$$\lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \to 0} \frac{f(c + \Delta x) - f(c)}{\Delta x} = m$$

exists, then the line passing through $(c, f(c))$ with slope m is the **tangent line** to the graph of f at the point $(c, f(c))$.

The slope of the tangent line to the graph of f at the point $(c, f(c))$ is also called the **slope of the graph of f at $x = c$.**

* This use of the word *secant* comes from the Latin *secare*, meaning to cut, and is not a reference to the trigonometric function of the same name.

The slope of f at $(2, 1)$ is $m = 2$.
Figure 2.5

EXAMPLE 1 The Slope of the Graph of a Linear Function

To find the slope of the graph of $f(x) = 2x - 3$ when $c = 2$, you can apply the definition of the slope of a tangent line, as shown.

$$\lim_{\Delta x \to 0} \frac{f(2 + \Delta x) - f(2)}{\Delta x} = \lim_{\Delta x \to 0} \frac{[2(2 + \Delta x) - 3] - [2(2) - 3]}{\Delta x}$$

$$= \lim_{\Delta x \to 0} \frac{4 + 2\Delta x - 3 - 4 + 3}{\Delta x}$$

$$= \lim_{\Delta x \to 0} \frac{2\cancel{\Delta x}}{\cancel{\Delta x}} \qquad \text{Combine like terms.}$$

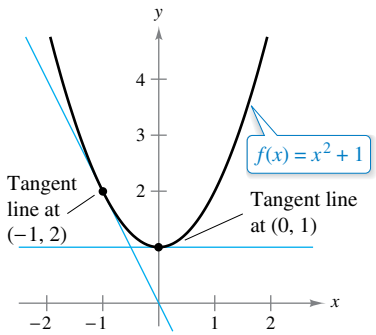
$$= \lim_{\Delta x \to 0} 2 \qquad \text{Divide out common factor.}$$

$$= 2 \qquad \text{Property 1, Theorem 1.1}$$

The slope of f at $(c, f(c)) = (2, 1)$ is $m = 2$, as shown in Figure 2.5. Notice that the limit definition of the slope of f agrees with the definition of the slope of a line as discussed in Section P.2. ■

GO DIGITAL

The graph of a linear function has the same slope at any point. This is not true of nonlinear functions, as shown in the next example.



The slope of f at any point $(c, f(c))$ is $m = 2c$.
Figure 2.6

EXAMPLE 2 Tangent Lines to the Graph of a Nonlinear Function

Find the slopes of the tangent lines to the graph of $f(x) = x^2 + 1$ at the points $(0, 1)$ and $(-1, 2)$, as shown in Figure 2.6.

Solution Let $(c, f(c))$ represent an arbitrary point on the graph of f. Then the slope of the tangent line at $(c, f(c))$ can be found as shown below. [Note in the limit process that c is held constant (as Δx approaches 0).]

$$\lim_{\Delta x \to 0} \frac{f(c + \Delta x) - f(c)}{\Delta x} = \lim_{\Delta x \to 0} \frac{[(c + \Delta x)^2 + 1] - (c^2 + 1)}{\Delta x}$$

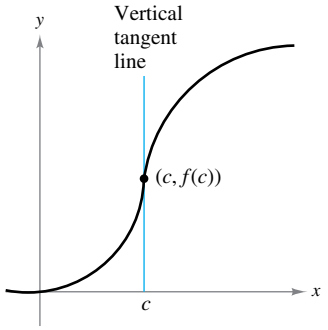
$$= \lim_{\Delta x \to 0} \frac{c^2 + 2c(\Delta x) + (\Delta x)^2 + 1 - c^2 - 1}{\Delta x}$$

$$= \lim_{\Delta x \to 0} \frac{2c(\Delta x) + (\Delta x)^2}{\Delta x} \qquad \text{Combine like terms.}$$

$$= \lim_{\Delta x \to 0} (2c + \Delta x) \qquad \text{Divide out common factor.}$$

$$= 2c \qquad \text{Use direct substitution and simplify.}$$

So, the slope at *any* point $(c, f(c))$ on the graph of f is $m = 2c$. At the point $(0, 1)$, the slope is $m = 2(0) = 0$, and at $(-1, 2)$, the slope is $m = 2(-1) = -2$. ■



The graph of f has a vertical tangent line at $(c, f(c))$.
Figure 2.7

The definition of a tangent line to a curve does not cover the possibility of a vertical tangent line. For vertical tangent lines, use the following definition. If f is continuous at c and

$$\lim_{\Delta x \to 0} \frac{f(c + \Delta x) - f(c)}{\Delta x} = \infty \quad \text{or} \quad \lim_{\Delta x \to 0} \frac{f(c + \Delta x) - f(c)}{\Delta x} = -\infty$$

then the vertical line $x = c$ passing through $(c, f(c))$ is a **vertical tangent line** to the graph of f. For example, the function shown in Figure 2.7 has a vertical tangent line at $(c, f(c))$. When the domain of f is the closed interval $[a, b]$, you can extend the definition of a vertical tangent line to include the endpoints by considering continuity and limits from the right (for $x = a$) and from the left (for $x = b$).

GO DIGITAL

The Derivative of a Function

You have now arrived at a crucial point in the study of calculus. The limit used to define the slope of a tangent line is also used to define one of the two fundamental operations of calculus—**differentiation.**

Definition of the Derivative of a Function

The **derivative** of f at x is

$$f'(x) = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$$

provided the limit exists. For all x for which this limit exists, f' is a function of x.

REMARK The notation $f'(x)$ is read as "f prime of x."

Be sure you understand that the derivative of a function of x is also a function of x. This "new" function gives the slope of the tangent line to the graph of f at the point $(x, f(x))$, provided that the graph has a tangent line at this point. The derivative can also be used to determine the **instantaneous rate of change** (or simply the **rate of change**) of one variable with respect to another.

Big Ideas of Calculus

The derivative of a function, a major theme of calculus, gives the slope of the graph of the function at any point. Such information has many real-life applications in science, business, and engineering. For example, you can use a derivative to find velocity, acceleration, maximum profit, or minimum distance.

The process of finding the derivative of a function is called **differentiation.** A function is **differentiable at x** when its derivative exists at x and is **differentiable on an open interval (a, b)** when it is differentiable at every point in the interval. Also, a function is **differentiable** when its derivative exists at every point in its domain.

In addition to $f'(x)$, other notations are used to denote the derivative of $y = f(x)$. The most common are

$$f'(x), \quad \frac{dy}{dx}, \quad y', \quad \frac{d}{dx}[f(x)], \quad D_x[y].$$

Notations for derivatives

The notation dy/dx is read as "the derivative of y *with respect to* x" or simply "dy, dx." Using limit notation, you can write

$$\frac{dy}{dx} = \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} = f'(x).$$

EXAMPLE 3 Finding the Derivative by the Limit Process

See LarsonCalculus.com for an interactive version of this type of example.

To find the derivative of $f(x) = x^3 + 2x$, use the definition of the derivative as shown.

$$\begin{aligned}
f'(x) &= \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} && \text{Definition of derivative} \\
&= \lim_{\Delta x \to 0} \frac{(x + \Delta x)^3 + 2(x + \Delta x) - (x^3 + 2x)}{\Delta x} \\
&= \lim_{\Delta x \to 0} \frac{x^3 + 3x^2\Delta x + 3x(\Delta x)^2 + (\Delta x)^3 + 2x + 2\Delta x - x^3 - 2x}{\Delta x} \\
&= \lim_{\Delta x \to 0} \frac{3x^2\Delta x + 3x(\Delta x)^2 + (\Delta x)^3 + 2\Delta x}{\Delta x} && \text{Combine like terms.} \\
&= \lim_{\Delta x \to 0} \frac{\Delta x[3x^2 + 3x\Delta x + (\Delta x)^2 + 2]}{\Delta x} && \text{Factor out common factor.} \\
&= \lim_{\Delta x \to 0} [3x^2 + 3x\Delta x + (\Delta x)^2 + 2] && \text{Divide out common factor.} \\
&= 3x^2 + 2 && \text{Use direct substitution.}
\end{aligned}$$

REMARK When using the definition to find a derivative of a function, the key is to rewrite the difference quotient so that Δx does not occur as a factor of the denominator.

REMARK Remember that the derivative of a function f is itself a function, which can be used to find the slope of the tangent line at the point $(x, f(x))$ on the graph of f.

EXAMPLE 4 Using the Derivative to Find the Slope at a Point

Find $f'(x)$ for $f(x) = \sqrt{x}$. Then find the slopes of the graph of f at the points $(1, 1)$ and $(4, 2)$. Discuss the behavior of f at $(0, 0)$.

Solution Use the procedure for rationalizing numerators, as discussed in Section 1.3.

$$f'(x) = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$$ Definition of derivative

$$= \lim_{\Delta x \to 0} \frac{\sqrt{x + \Delta x} - \sqrt{x}}{\Delta x}$$

$$= \lim_{\Delta x \to 0} \left(\frac{\sqrt{x + \Delta x} - \sqrt{x}}{\Delta x} \right) \left(\frac{\sqrt{x + \Delta x} + \sqrt{x}}{\sqrt{x + \Delta x} + \sqrt{x}} \right)$$

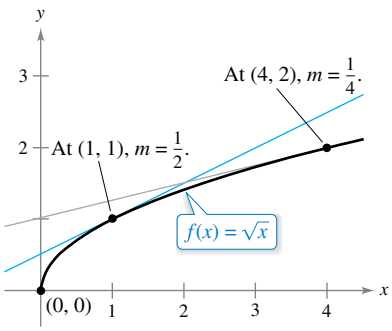
$$= \lim_{\Delta x \to 0} \frac{(x + \Delta x) - x}{\Delta x\left(\sqrt{x + \Delta x} + \sqrt{x}\right)}$$ Rationalize numerator.

$$= \lim_{\Delta x \to 0} \frac{\Delta x}{\Delta x\left(\sqrt{x + \Delta x} + \sqrt{x}\right)}$$ Combine like terms.

$$= \lim_{\Delta x \to 0} \frac{1}{\sqrt{x + \Delta x} + \sqrt{x}}$$ Divide out common factor.

$$= \frac{1}{2\sqrt{x}}$$ Use direct substitution and simplify.

At the point $(1, 1)$, the slope is $f'(1) = \frac{1}{2}$. At the point $(4, 2)$, the slope is $f'(4) = \frac{1}{4}$. See Figure 2.8. The domain of f' is all $x > 0$, so the slope of f is undefined at $(0, 0)$. Moreover, the graph of f has a vertical tangent line at $(0, 0)$.



For $x > 0$, the slope of f at $(x, f(x))$ is $m = 1/(2\sqrt{x})$.
Figure 2.8

REMARK In many applications, it is convenient to use a variable other than x as the independent variable, as shown in Example 5.

EXAMPLE 5 Finding the Derivative of a Function

See LarsonCalculus.com for an interactive version of this type of example.

Find the derivative with respect to t for the function $y = 2/t$.

Solution Considering $y = f(t)$, you obtain

$$\frac{dy}{dt} = \lim_{\Delta t \to 0} \frac{f(t + \Delta t) - f(t)}{\Delta t}$$ Definition of derivative

$$= \lim_{\Delta t \to 0} \frac{\frac{2}{t + \Delta t} - \frac{2}{t}}{\Delta t}$$ $f(t + \Delta t) = \frac{2}{t + \Delta t}$ and $f(t) = \frac{2}{t}$

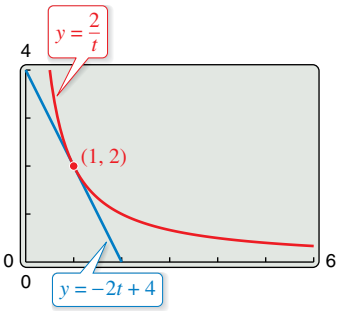
$$= \lim_{\Delta t \to 0} \frac{\frac{2t - 2(t + \Delta t)}{t(t + \Delta t)}}{\Delta t}$$ Combine fractions in numerator.

$$= \lim_{\Delta t \to 0} \frac{-2\Delta t}{\Delta t(t)(t + \Delta t)}$$ Invert divisor and multiply. Combine like terms.

$$= \lim_{\Delta t \to 0} \frac{-2}{t(t + \Delta t)}$$ Divide out common factor.

$$= -\frac{2}{t^2}.$$ Use direct substitution and simplify.

GO DIGITAL



At the point $(1, 2)$, the line $y = -2t + 4$ is tangent to the graph of $y = 2/t$.
Figure 2.9

TECHNOLOGY You can use a graphing utility to support the result in Example 5. For instance, using $dy/dt = -2/t^2$, the slope of the graph of $y = 2/t$ at the point $(1, 2)$ is $m = -2$. Using the point-slope form, the equation of the tangent line to the graph at $(1, 2)$ is

$$y - 2 = -2(t - 1) \quad \text{or} \quad y = -2t + 4.$$ See Figure 2.9.

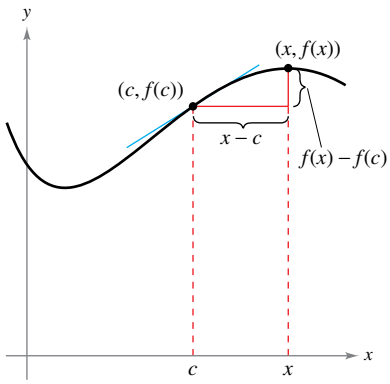
Differentiability and Continuity

The alternative limit form of the derivative shown below is useful in investigating the relationship between differentiability and continuity. The derivative of f at c is

$$f'(c) = \lim_{x \to c} \frac{f(x) - f(c)}{x - c}$$ Alternative form of derivative

provided this limit exists (see Figure 2.10). (A proof of the equivalence of the alternative form of the derivative is given in Appendix A.)

FOR FURTHER INFORMATION
For more information on the crediting of mathematical discoveries to the first "discoverers," see the article "Mathematical Firsts—Who Done It?" by Richard H. Williams and Roy D. Mazzagatti in *Mathematics Teacher*. To view this article, go to *MathArticles.com*.



As x approaches c, the secant line approaches the tangent line.
Figure 2.10

Note that the existence of the limit in this alternative form requires that the one-sided limits

$$\lim_{x \to c^-} \frac{f(x) - f(c)}{x - c}$$ x approaches c from the left.

and

$$\lim_{x \to c^+} \frac{f(x) - f(c)}{x - c}$$ x approaches c from the right.

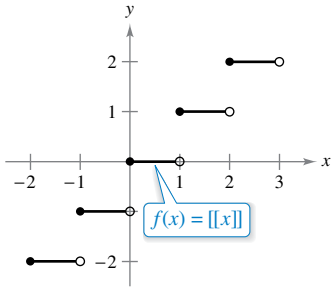
exist and are equal. These one-sided limits are called the **derivatives from the left and from the right,** respectively. It follows that f is **differentiable on the closed interval** $[a, b]$ when it is differentiable on (a, b) and when the derivative from the right at a and the derivative from the left at b both exist.

When a function is not continuous at $x = c$, it is also not differentiable at $x = c$. For instance, the greatest integer function $f(x) = [\![x]\!]$ is not continuous at $x = 0$, and so it is not differentiable at $x = 0$ (see Figure 2.11). To verify this, note that the derivative from the left is

$$\lim_{x \to 0^-} \frac{f(x) - f(0)}{x - 0} = \lim_{x \to 0^-} \frac{[\![x]\!] - 0}{x} = \infty$$ Derivative from the left

and the derivative from the right is

$$\lim_{x \to 0^+} \frac{f(x) - f(0)}{x - 0} = \lim_{x \to 0^+} \frac{[\![x]\!] - 0}{x} = 0.$$ Derivative from the right



The greatest integer function is not differentiable at $x = 0$ because it is not continuous at $x = 0$.
Figure 2.11

Although it is true that differentiability implies continuity (as shown in Theorem 2.1 on the next page), the converse is not true. That is, it is possible for a function to be continuous at $x = c$ and *not* differentiable at $x = c$. Examples 6 and 7 illustrate this possibility.

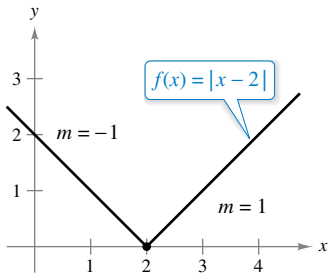
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



f is not differentiable at $x = 2$ because the derivatives from the left and from the right are not equal.
Figure 2.12

EXAMPLE 6 A Graph with a Sharp Turn

See LarsonCalculus.com for an interactive version of this type of example.

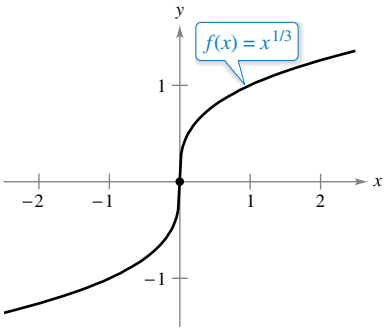
The function $f(x) = |x - 2|$, shown in Figure 2.12, is continuous at $x = 2$. The one-sided limits, however,

$$\lim_{x\to 2^-} \frac{f(x) - f(2)}{x - 2} = \lim_{x\to 2^-} \frac{|x - 2| - 0}{x - 2} = -1$$ Derivative from the left

and

$$\lim_{x\to 2^+} \frac{f(x) - f(2)}{x - 2} = \lim_{x\to 2^+} \frac{|x - 2| - 0}{x - 2} = 1$$ Derivative from the right

are not equal. So, f is not differentiable at $x = 2$ and the graph of f does not have a tangent line at the point $(2, 0)$.



f is not differentiable at $x = 0$ because f has a vertical tangent line at $x = 0$.
Figure 2.13

EXAMPLE 7 A Graph with a Vertical Tangent Line

The function $f(x) = x^{1/3}$ is continuous at $x = 0$, as shown in Figure 2.13. However, because the limit

$$\lim_{x\to 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x\to 0} \frac{x^{1/3} - 0}{x} = \lim_{x\to 0} \frac{1}{x^{2/3}} = \infty$$

is infinite, you can conclude that the tangent line is vertical at $x = 0$. So, f is not differentiable at $x = 0$. ■

From Examples 6 and 7, you can see that a function is not differentiable at a point at which its graph has a sharp turn (see Figure 2.12) *or* a vertical tangent line (see Figure 2.13).

GO DIGITAL

THEOREM 2.1 Differentiability Implies Continuity

If f is differentiable at $x = c$, then f is continuous at $x = c$.

Proof You can prove that f is continuous at $x = c$ by showing that $f(x)$ approaches $f(c)$ as $x \to c$. To do this, use the differentiability of f at $x = c$ and consider the following limit. (Note the use of the alternative limit form of the derivative.)

$$\begin{aligned}
\lim_{x\to c} [f(x) - f(c)] &= \lim_{x\to c} \left[(x - c)\left(\frac{f(x) - f(c)}{x - c}\right)\right] && \text{Multiply and divide by } x - c. \\
&= \left[\lim_{x\to c} (x - c)\right]\left[\lim_{x\to c} \frac{f(x) - f(c)}{x - c}\right] && \text{Property 4, Theorem 1.2} \\
&= (0)[f'(c)] && \text{Alternative form of derivative} \\
&= 0
\end{aligned}$$

Because the difference $f(x) - f(c)$ approaches zero as $x \to c$, you can conclude that $\lim_{x\to c} f(x) = f(c)$. So, f is continuous at $x = c$. ■

The relationship between continuity and differentiability is summarized below.

1. If a function is differentiable at $x = c$, then it is continuous at $x = c$. So, differentiability implies continuity.
2. It is possible for a function to be continuous at $x = c$ and not be differentiable at $x = c$. So, continuity does not imply differentiability (see Examples 6 and 7).

TECHNOLOGY

Some graphing utilities have a *derivative* feature that performs *numerical differentiation* by finding values of derivatives using the formula

$$f'(x) \approx \frac{f(x + \Delta x) - f(x - \Delta x)}{2\Delta x}$$

where Δx is a small number such as 0.001. Do you see any problems with this definition? For instance, using this definition, what is the value of the derivative of $f(x) = |x|$ when $x = 0$?

2.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

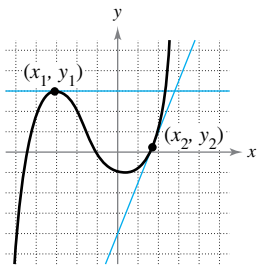
GO DIGITAL

Concept Check

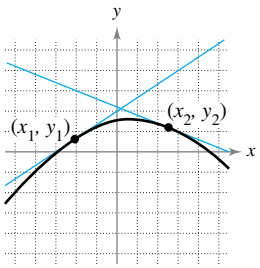
1. Describe how to find the slope of the tangent line to the graph of a function at a point.
2. List four notation alternatives to $f'(x)$.
3. Describe how to find the derivative of a function using the limit process.
4. Describe the relationship between continuity and differentiability.

Estimating Slope **In Exercises 5 and 6, estimate the slope of the graph at the points (x_1, y_1) and (x_2, y_2).**

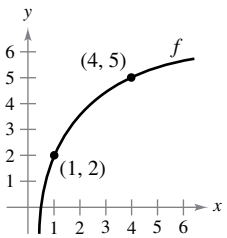
5.



6.



Slopes of Secant Lines **In Exercises 7 and 8, use the graph shown in the figure. To print an enlarged copy of the graph, go to *MathGraphs.com*.**



7. Identify or sketch each of the quantities on the figure.
   (a) $f(1)$ and $f(4)$ (b) $f(4) - f(1)$
   (c) $4 - 1$ (d) $y - 2 = \dfrac{f(4) - f(1)}{4 - 1}(x - 1)$
8. Insert the proper inequality symbol ($<$ or $>$) between the given quantities.
   (a) $\dfrac{f(4) - f(1)}{4 - 1}$ $\dfrac{f(4) - f(3)}{4 - 3}$
   (b) $\dfrac{f(4) - f(1)}{4 - 1}$ $f'(1)$

Finding the Slope of a Tangent Line **In Exercises 9–14, find the slope of the tangent line to the graph of the function at the given point.**

9. $f(x) = 3 - 5x, \quad (-1, 8)$
10. $g(x) = \frac{3}{2}x + 1, \quad (-2, -2)$
11. $f(x) = 2x^2 - 3, \quad (2, 5)$
12. $f(x) = 5 - x^2, \quad (3, -4)$
13. $f(t) = 3t - t^2, \quad (0, 0)$
14. $h(t) = t^2 + 4t, \quad (1, 5)$

Finding the Derivative by the Limit Process **In Exercises 15–28, find the derivative of the function using the limit process.**

15. $f(x) = 7$
16. $g(x) = -3$
17. $f(x) = -5x$
18. $f(x) = 7x - 3$
19. $h(s) = 3 + \frac{2}{3}s$
20. $f(x) = 5 - \frac{2}{3}x$
21. $f(x) = x^2 + x - 3$
22. $f(x) = x^2 - 5$
23. $f(x) = x^3 - 12x$
24. $g(t) = t^3 + 4t$
25. $f(x) = \dfrac{1}{x - 1}$
26. $f(x) = \dfrac{1}{x^2}$
27. $f(x) = \sqrt{x + 4}$
28. $h(s) = -2\sqrt{s}$

Finding an Equation of a Tangent Line **In Exercises 29–36, (a) find an equation of the tangent line to the graph of f at the given point, (b) use a graphing utility to graph the function and its tangent line at the point, and (c) use the *tangent* feature of a graphing utility to confirm your results.**

29. $f(x) = x^2 + 3, \quad (-1, 4)$
30. $f(x) = x^2 + 2x - 1, \quad (1, 2)$
31. $f(x) = x^3, \quad (2, 8)$
32. $f(x) = x^3 + 1, \quad (-1, 0)$
33. $f(x) = \sqrt{x}, \quad (1, 1)$
34. $f(x) = \sqrt{x - 1}, \quad (5, 2)$
35. $f(x) = x + \dfrac{4}{x}, \quad (-4, -5)$
36. $f(x) = x - \dfrac{1}{x}, \quad (1, 0)$

Finding an Equation of a Tangent Line **In Exercises 37–42, find an equation of the line that is tangent to the graph of f *and* parallel to the given line.**

Function	Line
37. $f(x) = -\frac{1}{4}x^2$	$x + y = 0$
38. $f(x) = 2x^2$	$4x + y + 3 = 0$
39. $f(x) = x^3$	$3x - y + 1 = 0$
40. $f(x) = x^3 + 2$	$3x - y - 4 = 0$
41. $f(x) = \dfrac{1}{\sqrt{x}}$	$x + 2y - 6 = 0$
42. $f(x) = \dfrac{1}{\sqrt{x - 1}}$	$x + 2y + 7 = 0$

Sketching a Derivative **In Exercises 43–48, sketch the graph of f'. Explain how you found your answer.**

Exploring Concepts

49. Sketch a graph of a function whose derivative is always negative. Explain how you found your answer.

50. Sketch a graph of a function whose derivative is zero at exactly two points. Explain how you found your answer.

51. Do f and f' always have the same domain? Explain.

52. A function f is symmetric with respect to the origin. Is f' necessarily symmetric with respect to the origin? Explain.

53. Using a Tangent Line The tangent line to the graph of $y = g(x)$ at the point $(4, 5)$ passes through the point $(7, 0)$. Find $g(4)$ and $g'(4)$.

54. Using a Tangent Line The tangent line to the graph of $y = h(x)$ at the point $(-1, 4)$ passes through the point $(3, 6)$. Find $h(-1)$ and $h'(-1)$.

Working Backwards **In Exercises 55–58, the limit represents $f'(c)$ for a function f and a number c. Find f and c.**

55. $\lim_{\Delta x \to 0} \dfrac{[5 - 3(1 + \Delta x)] - 2}{\Delta x}$

56. $\lim_{\Delta x \to 0} \dfrac{(-2 + \Delta x)^3 + 8}{\Delta x}$

57. $\lim_{x \to 6} \dfrac{-x^2 + 36}{x - 6}$

58. $\lim_{x \to 9} \dfrac{2\sqrt{x} - 6}{x - 9}$

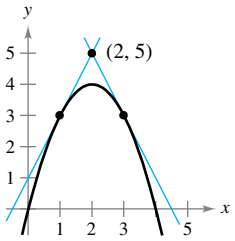
Writing a Function Using Derivatives **In Exercises 59 and 60, identify a function f that satisfies each characteristic. Then sketch the function.**

59. $f(0) = 2$; $f'(x) = -3$ for $-\infty < x < \infty$

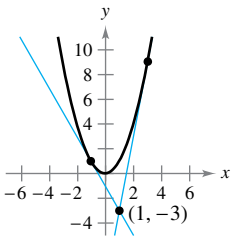
60. $f(0) = 4$; $f'(0) = 0$; $f'(x) < 0$ for $x < 0$; $f'(x) > 0$ for $x > 0$

Finding an Equation of a Tangent Line **In Exercises 61 and 62, find equations of the two tangent lines to the graph of f that pass through the indicated point.**

61. $f(x) = 4x - x^2$



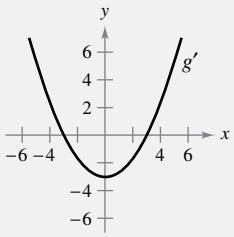
62. $f(x) = x^2$



63. Graphical Reasoning Use a graphing utility to graph each function and its tangent lines at $x = -1$, $x = 0$, and $x = 1$. Based on the results, determine whether the slopes of tangent lines to the graph of a function at different values of x are always distinct.

(a) $f(x) = x^2$ (b) $g(x) = x^3$

64. HOW DO YOU SEE IT? The figure shows the graph of g'.



(a) $g'(0) =$ (b) $g'(3) =$

(c) What can you conclude about the graph of g knowing that $g'(1) = -\frac{8}{3}$?

(d) What can you conclude about the graph of g knowing that $g'(-4) = \frac{7}{3}$?

(e) Is $g(6) - g(4)$ positive or negative? Explain.

(f) Is it possible to find $g(2)$ from the graph? Explain.

65. Graphical Reasoning Consider the function $f(x) = \frac{1}{2}x^2$.

(a) Use a graphing utility to graph the function and estimate the values of $f'(0)$, $f'(\frac{1}{2})$, $f'(1)$, and $f'(2)$.

(b) Use your results from part (a) to determine the values of $f'(-\frac{1}{2})$, $f'(-1)$, and $f'(-2)$.

(c) Sketch a possible graph of f'.

(d) Use the definition of derivative to find $f'(x)$.

66. Graphical Reasoning Consider the function $f(x) = \frac{1}{3}x^3$.

(a) Use a graphing utility to graph the function and estimate the values of $f'(0)$, $f'(\frac{1}{2})$, $f'(1)$, $f'(2)$, and $f'(3)$.

(b) Use your results from part (a) to determine the values of $f'(-\frac{1}{2})$, $f'(-1)$, $f'(-2)$, and $f'(-3)$.

(c) Sketch a possible graph of f'.

(d) Use the definition of derivative to find $f'(x)$.

Approximating a Derivative **In Exercises 67 and 68, evaluate $f(2)$ and $f(2.1)$ and use the results to approximate $f'(2)$.**

67. $f(x) = x(4 - x)$ **68.** $f(x) = \frac{1}{4}x^3$

Using the Alternative Form of the Derivative **In Exercises 69–78, use the alternative form of the derivative to find the derivative at $x = c$, if it exists.**

69. $f(x) = x^2 - 5,\ c = 3$ **70.** $g(x) = x^2 - x,\ c = 1$

71. $f(x) = x^3 + 2x^2 + 1,\ c = -2$

72. $f(x) = x^3 + 6x,\ c = 2$

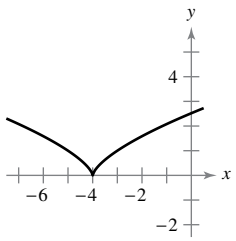
73. $g(x) = \sqrt{|x|},\ c = 0$ **74.** $f(x) = 3/x,\ c = 4$

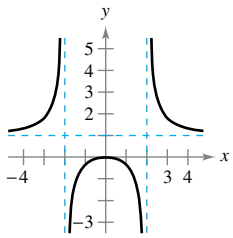
75. $f(x) = (x - 6)^{2/3},\ c = 6$ **76.** $g(x) = (x + 3)^{1/3},\ c = -3$

77. $h(x) = |x + 7|,\ c = -7$ **78.** $f(x) = |x - 6|,\ c = 6$

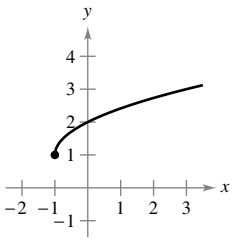
Determining Differentiability **In Exercises 79–82, describe the x-values at which f is differentiable.**

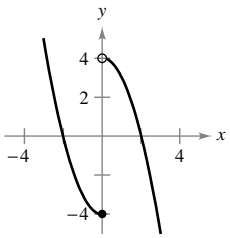
79. $f(x) = (x + 4)^{2/3}$ **80.** $f(x) = \dfrac{x^2}{x^2 - 4}$





81. $f(x) = \sqrt{x + 1} + 1$ **82.** $f(x) = \begin{cases} x^2 - 4, & x \le 0 \\ 4 - x^2, & x > 0 \end{cases}$





Graphical Analysis **In Exercises 83–86, use a graphing utility to graph the function and find the x-values at which f is differentiable.**

83. $f(x) = |x - 5|$ **84.** $f(x) = \dfrac{4x}{x - 3}$

85. $f(x) = x^{2/5}$

86. $f(x) = \begin{cases} x^3 - 3x^2 + 3x, & x \le 1 \\ x^2 - 2x, & x > 1 \end{cases}$

Determining Differentiability **In Exercises 87–90, find the derivatives from the left and from the right at $x = 1$ (if they exist). Is the function differentiable at $x = 1$?**

87. $f(x) = |x - 1|$ **88.** $f(x) = \sqrt{1 - x^2}$

89. $f(x) = \begin{cases} (x - 1)^3, & x \le 1 \\ (x - 1)^2, & x > 1 \end{cases}$ **90.** $f(x) = (1 - x)^{2/3}$

Determining Differentiability **In Exercises 91 and 92, determine whether the function is differentiable at $x = 2$.**

91. $f(x) = \begin{cases} x^2 + 1, & x \le 2 \\ 4x - 3, & x > 2 \end{cases}$ **92.** $f(x) = \begin{cases} \frac{1}{2}x + 2, & x < 2 \\ \sqrt{2x}, & x \ge 2 \end{cases}$

93. Graphical Reasoning A line with slope m passes through the point $(0, 4)$ and has the equation $y = mx + 4$.

(a) Write the distance d between the line and the point $(3, 1)$ as a function of m.

(b) Use a graphing utility to graph the function d in part (a). Based on the graph, is the function differentiable at every value of m? If not, where is it not differentiable?

94. Conjecture Consider the functions $f(x) = x^2$ and $g(x) = x^3$.

(a) Graph f and f' on the same set of axes.

(b) Graph g and g' on the same set of axes.

(c) Identify a pattern between f and g and their respective derivatives. Use the pattern to make a conjecture about $h'(x)$ when $h(x) = x^n$, where n is an integer and $n \ge 2$.

(d) Find $f'(x)$ if $f(x) = x^4$. Compare the result with the conjecture in part (c). Is this a proof of your conjecture? Explain.

True or False? **In Exercises 95–98, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

95. The slope of the tangent line to the differentiable function f at the point $(2, f(2))$ is

$$\frac{f(2 + \Delta x) - f(2)}{\Delta x}.$$

96. If a function is continuous at a point, then it is differentiable at that point.

97. If a function has derivatives from both the right and the left at a point, then it is differentiable at that point.

98. If a function is differentiable at a point, then it is continuous at that point.

99. Differentiability and Continuity Let

$$f(x) = \begin{cases} x \sin\dfrac{1}{x}, & x \ne 0 \\ 0, & x = 0 \end{cases}$$

and

$$g(x) = \begin{cases} x^2 \sin\dfrac{1}{x}, & x \ne 0 \\ 0, & x = 0 \end{cases}.$$

Show that f is continuous, but not differentiable, at $x = 0$. Show that g is differentiable at 0 and find $g'(0)$.

100. Writing Use a graphing utility to graph the two functions $f(x) = x^2 + 1$ and $g(x) = |x| + 1$ in the same viewing window. Use the *zoom* and *trace* features to analyze the graphs near the point $(0, 1)$. What do you observe? Which function is differentiable at this point? Write a short paragraph describing the geometric significance of differentiability at a point.

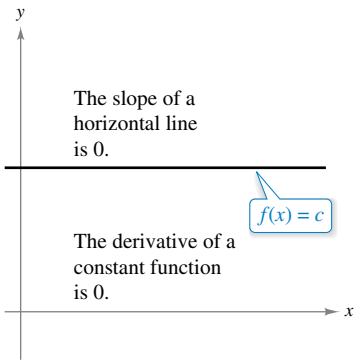
2.2 Basic Differentiation Rules and Rates of Change

GO DIGITAL

- Find the derivative of a function using the Constant Rule.
- Find the derivative of a function using the Power Rule.
- Find the derivative of a function using the Constant Multiple Rule.
- Find the derivative of a function using the Sum and Difference Rules.
- Find the derivatives of the sine function and of the cosine function.
- Use derivatives to find rates of change.

The Constant Rule

In Section 2.1, you used the limit definition to find derivatives. In this and the next two sections, you will be introduced to several "differentiation rules" that allow you to find derivatives without the *direct* use of the limit definition.



Notice that the Constant Rule is equivalent to saying that the slope of a horizontal line is 0. This demonstrates the relationship between slope and derivative.

Figure 2.14

THEOREM 2.2 The Constant Rule

The derivative of a constant function is 0. That is, if c is a real number, then

$$\frac{d}{dx}[c] = 0.$$ See Figure 2.14.

Proof Let $f(x) = c$. Then, by the limit definition of the derivative,

$$\begin{aligned}\frac{d}{dx}[c] &= f'(x)\\ &= \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} && \text{Definition of derivative}\\ &= \lim_{\Delta x \to 0} \frac{c - c}{\Delta x} && f(x + \Delta x) = f(x) = c\\ &= \lim_{\Delta x \to 0} 0\\ &= 0.\end{aligned}$$

EXAMPLE 1 Using the Constant Rule

Function	Derivative
a. $y = 7$	$dy/dx = 0$
b. $f(x) = 0$	$f'(x) = 0$
c. $s(t) = -3$	$s'(t) = 0$
d. $y = k\pi^2$, k is constant	$dy/dx = 0$

Exploration

Writing a Conjecture Use the definition of the derivative given in Section 2.1 to find the derivative of each function. What patterns do you see? Use your results to write a conjecture about the derivative of $f(x) = x^n$.

a. $f(x) = x^1$ **b.** $f(x) = x^2$ **c.** $f(x) = x^3$

d. $f(x) = x^4$ **e.** $f(x) = x^{1/2}$ **f.** $f(x) = x^{-1}$

GO DIGITAL

The Power Rule

Before proving the next rule, it is important to review the procedure for expanding a binomial.

$$(x + \Delta x)^2 = x^2 + 2x\Delta x + (\Delta x)^2$$
$$(x + \Delta x)^3 = x^3 + 3x^2\Delta x + 3x(\Delta x)^2 + (\Delta x)^3$$
$$(x + \Delta x)^4 = x^4 + 4x^3\Delta x + 6x^2(\Delta x)^2 + 4x(\Delta x)^3 + (\Delta x)^4$$
$$(x + \Delta x)^5 = x^5 + 5x^4\Delta x + 10x^3(\Delta x)^2 + 10x^2(\Delta x)^3 + 5x(\Delta x)^4 + (\Delta x)^5$$

The general binomial expansion for a positive integer n is

$$(x + \Delta x)^n = x^n + nx^{n-1}(\Delta x) + \underbrace{\frac{n(n-1)x^{n-2}}{2}(\Delta x)^2 + \cdots + (\Delta x)^n}_{(\Delta x)^2 \text{ is a factor of these terms.}}.$$

This binomial expansion is used in proving a special case of the Power Rule.

THEOREM 2.3 The Power Rule

If n is a rational number, then the function $f(x) = x^n$ is differentiable and

$$\frac{d}{dx}[x^n] = nx^{n-1}.$$

For f to be differentiable at $x = 0$, n must be a number such that x^{n-1} is defined on an interval containing 0.

REMARK Recall from Example 7 in Section 2.1 that the function $f(x) = x^{1/3}$ is defined at $x = 0$ but is not differentiable at $x = 0$. This is because $x^{-2/3}$ is not defined on an interval containing 0.

Proof If n is a positive integer greater than 1, then the binomial expansion produces

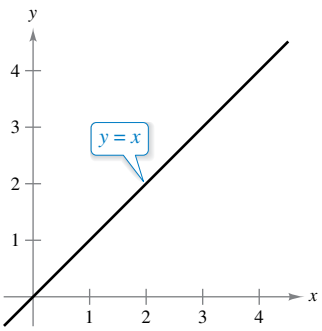
$$\begin{aligned}\frac{d}{dx}[x^n] &= \lim_{\Delta x \to 0} \frac{(x + \Delta x)^n - x^n}{\Delta x} \\ &= \lim_{\Delta x \to 0} \frac{x^n + nx^{n-1}(\Delta x) + \dfrac{n(n-1)x^{n-2}}{2}(\Delta x)^2 + \cdots + (\Delta x)^n - x^n}{\Delta x} \\ &= \lim_{\Delta x \to 0} \left[nx^{n-1} + \frac{n(n-1)x^{n-2}}{2}(\Delta x) + \cdots + (\Delta x)^{n-1} \right] \\ &= nx^{n-1} + 0 + \cdots + 0 \\ &= nx^{n-1}.\end{aligned}$$

This proves the case for which n is a positive integer greater than 1. It is left to you to prove the case for $n = 1$. Example 7 in Section 2.3 proves the case for which n is a negative integer. In Exercise 73 in Section 2.5, you are asked to prove the case for which n is rational. (In Section 5.5, the Power Rule will be extended to cover irrational values of n.)

When using the Power Rule, the case for which $n = 1$ is best thought of as a separate differentiation rule. That is,

$$\frac{d}{dx}[x] = 1. \qquad \text{Power Rule when } n = 1$$

This rule is consistent with the fact that the slope of the line $y = x$ is 1, as shown in Figure 2.15.



The slope of the line $y = x$ is 1.

EXAMPLE 2 Using the Power Rule

Function	Derivative
a. $f(x) = x^3$	$f'(x) = 3x^2$
b. $g(x) = \sqrt[3]{x}$	$g'(x) = \frac{d}{dx}[x^{1/3}] = \frac{1}{3}x^{-2/3} = \frac{1}{3x^{2/3}}$
c. $y = \frac{1}{x^2}$	$\frac{dy}{dx} = \frac{d}{dx}[x^{-2}] = (-2)x^{-3} = -\frac{2}{x^3}$

In Example 2(c), note that *before* differentiating, $1/x^2$ was rewritten as x^{-2}. Rewriting is the first step in *many* differentiation problems.

Given: $y = \frac{1}{x^2}$ ⇨ Rewrite: $y = x^{-2}$ ⇨ Differentiate: $\frac{dy}{dx} = (-2)x^{-3}$ ⇨ Simplify: $\frac{dy}{dx} = -\frac{2}{x^3}$

EXAMPLE 3 Finding the Slope of a Graph

See LarsonCalculus.com for an interactive version of this type of example.

Find the slope of the graph of $f(x) = x^4$ for each value of x.

a. $x = -1$ **b.** $x = 0$ **c.** $x = 1$

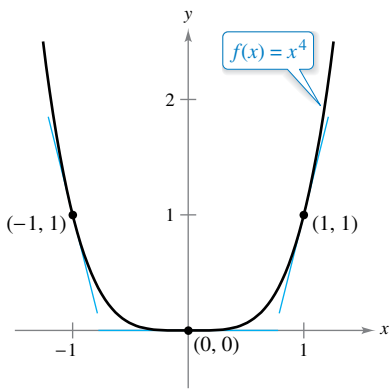
Solution The slope of a graph at a point is the value of the derivative at that point. The derivative of f is $f'(x) = 4x^3$.

a. When $x = -1$, the slope is $f'(-1) = 4(-1)^3 = -4$. Slope is negative.

b. When $x = 0$, the slope is $f'(0) = 4(0)^3 = 0$. Slope is zero.

c. When $x = 1$, the slope is $f'(1) = 4(1)^3 = 4$. Slope is positive.

See Figure 2.16.



Note that the slope of the graph is negative at the point $(-1, 1)$, the slope is zero at the point $(0, 0)$, and the slope is positive at the point $(1, 1)$.
Figure 2.16

EXAMPLE 4 Finding an Equation of a Tangent Line

See LarsonCalculus.com for an interactive version of this type of example.

Find an equation of the tangent line to the graph of $f(x) = x^2$ when $x = -2$.

Solution To find the *point* on the graph of f, evaluate the original function at $x = -2$.

$(-2, f(-2)) = (-2, 4)$ Point on graph

To find the *slope* of the graph when $x = -2$, evaluate the derivative, $f'(x) = 2x$, at $x = -2$.

$m = f'(-2) = -4$ Slope of graph at $(-2, 4)$

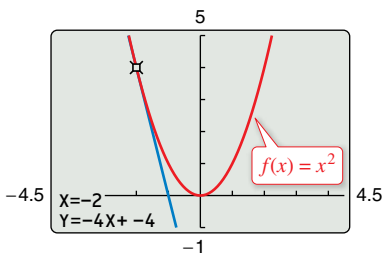
Now, use the point-slope form (see Section P.2) to write an equation of the tangent line.

$y - y_1 = m(x - x_1)$ Point-slope form

$y - 4 = -4[x - (-2)]$ Substitute for y_1, m, and x_1.

$y = -4x - 4$ Simplify.

You can check this result using the *tangent* feature of a graphing utility, as shown in Figure 2.17.



The line $y = -4x - 4$ is tangent to the graph of $f(x) = x^2$ at the point $(-2, 4)$.

The Constant Multiple Rule

THEOREM 2.4 The Constant Multiple Rule

If f is a differentiable function and c is a real number, then cf is also differentiable and

$$\frac{d}{dx}[cf(x)] = cf'(x).$$

Proof

$$\begin{aligned}
\frac{d}{dx}[cf(x)] &= \lim_{\Delta x \to 0} \frac{cf(x+\Delta x) - cf(x)}{\Delta x} && \text{Definition of derivative} \\
&= \lim_{\Delta x \to 0} c\left[\frac{f(x+\Delta x) - f(x)}{\Delta x}\right] && \text{Factor out } c. \\
&= c\left[\lim_{\Delta x \to 0} \frac{f(x+\Delta x) - f(x)}{\Delta x}\right] && \text{Property 1, Theorem 1.2} \\
&= cf'(x) && \text{Definition of the derivative of } f
\end{aligned}$$

Informally, the Constant Multiple Rule states that constants can be factored out of the differentiation process, even when the constants appear in the denominator.

$$\frac{d}{dx}[cf(x)] = c\frac{d}{dx}[f(x)] = cf'(x)$$

$$\frac{d}{dx}\left[\frac{f(x)}{c}\right] = \frac{d}{dx}\left[\left(\frac{1}{c}\right)f(x)\right] = \left(\frac{1}{c}\right)\frac{d}{dx}[f(x)] = \left(\frac{1}{c}\right)f'(x)$$

EXAMPLE 5 Using the Constant Multiple Rule

	Function	Derivative
a.	$y = 5x^3$	$\frac{dy}{dx} = \frac{d}{dx}[5x^3] = 5\frac{d}{dx}[x^3] = 5(3)x^2 = 15x^2$
b.	$y = \frac{2}{x}$	$\frac{dy}{dx} = \frac{d}{dx}[2x^{-1}] = 2\frac{d}{dx}[x^{-1}] = 2(-1)x^{-2} = -\frac{2}{x^2}$
c.	$f(t) = \frac{4t^2}{5}$	$f'(t) = \frac{d}{dt}\left[\frac{4}{5}t^2\right] = \frac{4}{5}\frac{d}{dt}[t^2] = \frac{4}{5}(2t) = \frac{8}{5}t$
d.	$y = 2\sqrt{x}$	$\frac{dy}{dx} = \frac{d}{dx}[2x^{1/2}] = 2\left(\frac{1}{2}x^{-1/2}\right) = x^{-1/2} = \frac{1}{\sqrt{x}}$
e.	$y = \frac{1}{2\sqrt[3]{x^2}}$	$y' = \frac{d}{dx}\left[\frac{1}{2}x^{-2/3}\right] = \frac{1}{2}\left(-\frac{2}{3}\right)x^{-5/3} = -\frac{1}{3x^{5/3}}$
f.	$y = -\frac{3x}{2}$	$\frac{dy}{dx} = \frac{d}{dx}\left[-\frac{3}{2}x\right] = -\frac{3}{2}(1) = -\frac{3}{2}$

REMARK Before differentiating functions involving radicals, rewrite the function with rational exponents.

The Constant Multiple Rule and the Power Rule can be combined into one rule. The combination rule is

$$\frac{d}{dx}[cx^n] = cnx^{n-1}.$$

EXAMPLE 6 **Using Parentheses When Differentiating**

	Original Function	Rewrite	Differentiate	Simplify
a.	$y = \frac{5}{2x^3}$	$y = \frac{5}{2}(x^{-3})$	$y' = \frac{5}{2}(-3x^{-4})$	$y' = -\frac{15}{2x^4}$
b.	$y = \frac{5}{(2x)^3}$	$y = \frac{5}{8}(x^{-3})$	$y' = \frac{5}{8}(-3x^{-4})$	$y' = -\frac{15}{8x^4}$
c.	$y = \frac{7}{3x^{-2}}$	$y = \frac{7}{3}(x^2)$	$y' = \frac{7}{3}(2x)$	$y' = \frac{14x}{3}$
d.	$y = \frac{7}{(3x)^{-2}}$	$y = 63(x^2)$	$y' = 63(2x)$	$y' = 126x$

The Sum and Difference Rules

REMARK To help you learn the differentiation rules, write them in words. For example, in words, the Sum Rule says, "the derivative of the sum of two differentiable functions is the sum of their derivatives." You can also write the rules in prime notation, such as

$$(f + g)' = f' + g'.$$

THEOREM 2.5 The Sum and Difference Rules

The sum (or difference) of two differentiable functions f and g is itself differentiable. Moreover, the derivative of $f + g$ (or $f - g$) is the sum (or difference) of the derivatives of f and g.

$$\frac{d}{dx}[f(x) + g(x)] = f'(x) + g'(x) \quad \text{Sum Rule}$$

$$\frac{d}{dx}[f(x) - g(x)] = f'(x) - g'(x) \quad \text{Difference Rule}$$

Proof A proof of the Sum Rule follows from Theorem 1.2. (The Difference Rule can be proved in a similar way.)

$$\begin{aligned}
\frac{d}{dx}[f(x) + g(x)] &= \lim_{\Delta x \to 0} \frac{[f(x + \Delta x) + g(x + \Delta x)] - [f(x) + g(x)]}{\Delta x} \\
&= \lim_{\Delta x \to 0} \frac{f(x + \Delta x) + g(x + \Delta x) - f(x) - g(x)}{\Delta x} \\
&= \lim_{\Delta x \to 0} \left[\frac{f(x + \Delta x) - f(x)}{\Delta x} + \frac{g(x + \Delta x) - g(x)}{\Delta x}\right] \\
&= \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} + \lim_{\Delta x \to 0} \frac{g(x + \Delta x) - g(x)}{\Delta x} \\
&= f'(x) + g'(x)
\end{aligned}$$

The Sum and Difference Rules can be extended to any finite number of functions. For instance, if $F(x) = f(x) + g(x) - h(x)$, then $F'(x) = f'(x) + g'(x) - h'(x)$.

REMARK In Example 7(c), note that before differentiating,

$$\frac{3x^2 - x + 1}{x}$$

was rewritten as

$$3x - 1 + \frac{1}{x}.$$

EXAMPLE 7 **Using the Sum and Difference Rules**

	Function	Derivative
a.	$f(x) = x^3 - 4x + 5$	$f'(x) = 3x^2 - 4$
b.	$g(x) = -\frac{x^4}{2} + 3x^3 - 2x$	$g'(x) = -2x^3 + 9x^2 - 2$
c.	$y = \frac{3x^2 - x + 1}{x} = 3x - 1 + \frac{1}{x}$	$y' = 3 - \frac{1}{x^2} = \frac{3x^2 - 1}{x^2}$

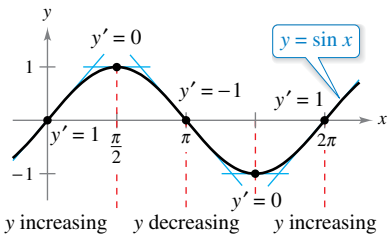
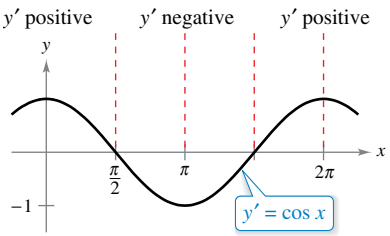
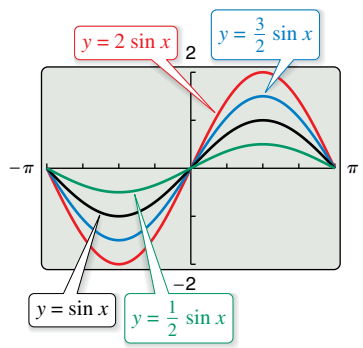
FOR FURTHER INFORMATION
For the outline of a geometric proof of the derivatives of the sine and cosine functions, see the article "The Spider's Spacewalk Derivation of sin′ and cos′" by Tim Hesterberg in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

GO DIGITAL





The derivative of the sine function is the cosine function.
Figure 2.18



$\frac{d}{dx}[a \sin x] = a \cos x$
Figure 2.19

Derivatives of the Sine and Cosine Functions

In Section 1.3, you studied the limits

$$\lim_{\Delta x \to 0} \frac{\sin \Delta x}{\Delta x} = 1 \quad \text{and} \quad \lim_{\Delta x \to 0} \frac{1 - \cos \Delta x}{\Delta x} = 0.$$ Theorem 1.9

These two limits can be used to prove differentiation rules for the sine and cosine functions. (The derivatives of the other four trigonometric functions are discussed in Section 2.3.)

THEOREM 2.6 Derivatives of Sine and Cosine Functions

$$\frac{d}{dx}[\sin x] = \cos x \qquad \frac{d}{dx}[\cos x] = -\sin x$$

Proof Here is a proof of the first rule. (The proof of the second rule is left as an exercise [see Exercise 114].) In the proof, note the use of the trigonometric identity $\sin(x + \Delta x) = \sin x \cos \Delta x + \cos x \sin \Delta x$.

$$\begin{aligned}
\frac{d}{dx}[\sin x] &= \lim_{\Delta x \to 0} \frac{\sin(x + \Delta x) - \sin x}{\Delta x} && \text{Definition of derivative} \\
&= \lim_{\Delta x \to 0} \frac{\sin x \cos \Delta x + \cos x \sin \Delta x - \sin x}{\Delta x} && \text{Trigonometric identity} \\
&= \lim_{\Delta x \to 0} \frac{\cos x \sin \Delta x - (\sin x)(1 - \cos \Delta x)}{\Delta x} && \text{Rearrange terms and factor.} \\
&= \lim_{\Delta x \to 0} \left[(\cos x)\left(\frac{\sin \Delta x}{\Delta x}\right) - (\sin x)\left(\frac{1 - \cos \Delta x}{\Delta x}\right) \right] && \text{Write as two fractions.} \\
&= (\cos x)\left(\lim_{\Delta x \to 0} \frac{\sin \Delta x}{\Delta x}\right) - (\sin x)\left(\lim_{\Delta x \to 0} \frac{1 - \cos \Delta x}{\Delta x}\right) && \text{Property of limits} \\
&= (\cos x)(1) - (\sin x)(0) \\
&= \cos x
\end{aligned}$$

This differentiation rule is shown graphically in Figure 2.18. Note that for each x, the *slope* of the sine curve is equal to the value of the cosine. ■

EXAMPLE 8 Derivatives Involving Sines and Cosines

See LarsonCalculus.com for an interactive version of this type of example.

Function	Derivative
a. $y = 2 \sin x$	$y' = 2 \cos x$
b. $y = \frac{\sin x}{2} = \frac{1}{2} \sin x$	$y' = \frac{1}{2} \cos x = \frac{\cos x}{2}$
c. $y = x + \cos x$	$y' = 1 - \sin x$
d. $y = \cos x - \frac{\pi}{3} \sin x$	$y' = -\sin x - \frac{\pi}{3} \cos x$

■

TECHNOLOGY A graphing utility can provide insight into the interpretation of a derivative. For instance, Figure 2.19 shows the graphs of $y = a \sin x$ for $a = \frac{1}{2}, 1, \frac{3}{2}$, and 2. Estimate the slope of each graph at the point $(0, 0)$. Then verify your estimates analytically by evaluating the derivative of each function when $x = 0$.

Rates of Change

You have seen how the derivative is used to determine slope. The derivative can also be used to determine the rate of change of one variable with respect to another. Applications involving rates of change, sometimes referred to as instantaneous rates of change, occur in a wide variety of fields. A few examples are population growth rates, production rates, water flow rates, velocity, and acceleration.

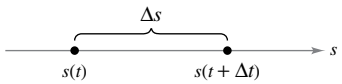
A common use for rate of change is to describe the motion of an object moving in a straight line. In such problems, it is customary to use either a horizontal or a vertical line with a designated origin to represent the line of motion. On such lines, movement to the right (or upward) is considered to be in the positive direction, and movement to the left (or downward) is considered to be in the negative direction.

The function s that gives the position (relative to the origin) of an object as a function of time t is called a **position function.** If, over a period of time Δt, the object changes its position by the amount $\Delta s = s(t + \Delta t) - s(t)$, then, by the familiar formula

$$\text{Rate} = \frac{\text{distance}}{\text{time}}$$

the **average velocity** is

$$\frac{\text{Change in distance}}{\text{Change in time}} = \frac{\Delta s}{\Delta t}. \qquad \text{Average velocity}$$



This figure shows the positions of an object moving along a line at time t and shortly later at time $t + \Delta t$. In this case, the line is horizontal.
Figure 2.20

Note that the change in position Δs is also called the **displacement** of the object over the time interval from t to $t + \Delta t$. (See Figure 2.20.)

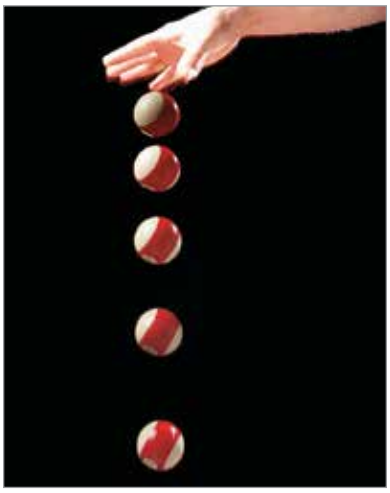
EXAMPLE 9 Finding Average Velocity of a Falling Object

A billiard ball is dropped from a height of 100 feet. The ball's height s at time t is the position function

$$s = -16t^2 + 100 \qquad \text{Position function}$$

where s is measured in feet and t is measured in seconds. Find the average velocity over each time interval.

a. $[1, 2]$ **b.** $[1, 1.5]$ **c.** $[1, 1.1]$



Time-lapse photograph of a free-falling billiard ball

Richard Megna/Fundamental Photographs

Solution

a. For the interval $[1, 2]$, the object falls from a height of $s(1) = -16(1)^2 + 100 = 84$ feet to a height of $s(2) = -16(2)^2 + 100 = 36$ feet. The average velocity is

$$\frac{\Delta s}{\Delta t} = \frac{36 - 84}{2 - 1} = \frac{-48}{1} = -48 \text{ feet per second.}$$

b. For the interval $[1, 1.5]$, the object falls from a height of 84 feet to a height of $s(1.5) = -16(1.5)^2 + 100 = 64$ feet. The average velocity is

$$\frac{\Delta s}{\Delta t} = \frac{64 - 84}{1.5 - 1} = \frac{-20}{0.5} = -40 \text{ feet per second.}$$

c. For the interval $[1, 1.1]$, the object falls from a height of 84 feet to a height of $s(1.1) = -16(1.1)^2 + 100 = 80.64$ feet. The average velocity is

$$\frac{\Delta s}{\Delta t} = \frac{80.64 - 84}{1.1 - 1} = \frac{-3.36}{0.1} = -33.6 \text{ feet per second.}$$

Note that the average velocities are *negative*, indicating that the object is moving downward. ■

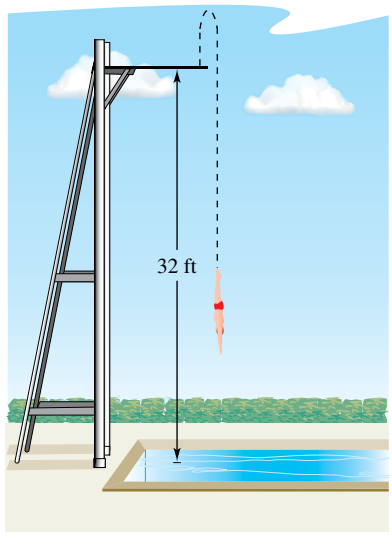
The average velocity between t_1 and t_2 is the slope of the secant line, and the instantaneous velocity at t_1 is the slope of the tangent line.
Figure 2.21



Velocity is positive when an object is rising and is negative when an object is falling. Notice that the diver moves upward for the first half-second because the velocity is positive for $0 < t < \frac{1}{2}$. When the velocity is 0, the diver has reached the maximum height of the dive.
Figure 2.22

Suppose that in Example 9, you wanted to find the *instantaneous* velocity (or simply the velocity) of the object when $t = 1$. Just as you can approximate the slope of the tangent line by calculating the slope of the secant line, you can approximate the velocity at $t = 1$ by calculating the average velocity over a small interval $[1, 1 + \Delta t]$ (see Figure 2.21). By taking the limit as Δt approaches zero, you obtain the velocity when $t = 1$. Try doing this—you will find that the velocity when $t = 1$ is -32 feet per second.

In general, if $s = s(t)$ is the position function for an object moving along a straight line, then the **velocity** of the object at time t is

$$v(t) = \lim_{\Delta t \to 0} \frac{s(t + \Delta t) - s(t)}{\Delta t} = s'(t). \qquad \text{Velocity function}$$

In other words, the velocity function is the derivative of the position function. Velocity can be negative, zero, or positive. The **speed** of an object is the absolute value of its velocity. Speed cannot be negative.

The position of a free-falling object (neglecting air resistance) under the influence of gravity can be represented by the equation

$$s(t) = -\frac{1}{2}gt^2 + v_0 t + s_0 \qquad \text{Position function}$$

where s_0 is the initial height of the object, v_0 is the initial velocity of the object, and g is the acceleration due to gravity. On Earth, the value of g is approximately 32 feet per second per second or 9.8 meters per second per second.

EXAMPLE 10 Using the Derivative to Find Velocity

At time $t = 0$ seconds, a diver jumps from a platform diving board that is 32 feet above the water (see Figure 2.22). The initial velocity of the diver is 16 feet per second. When does the diver hit the water? What is the diver's velocity at impact?

Solution Begin by writing an equation to represent the position of the diver. Using the position function given above with $g = 32$ feet per second per second, $v_0 = 16$ feet per second, and $s_0 = 32$ feet, you can write

$$\begin{aligned} s(t) &= -\frac{1}{2}(32)t^2 + 16t + 32 \\ &= -16t^2 + 16t + 32. \end{aligned} \qquad \text{Position function}$$

To find the time t when the diver hits the water, let $s = 0$ and solve for t.

$$\begin{aligned} -16t^2 + 16t + 32 &= 0 && \text{Set position function equal to 0.} \\ -16(t + 1)(t - 2) &= 0 && \text{Factor.} \\ t &= -1 \text{ or } 2 && \text{Solve for } t. \end{aligned}$$

Because $t \geq 0$, choose the positive value to conclude that the diver hits the water at $t = 2$ seconds. The velocity at time t is given by the derivative

$$s'(t) = -32t + 16. \qquad \text{Velocity function}$$

So, the velocity at time $t = 2$ is

$$s'(2) = -32(2) + 16 = -48 \text{ feet per second.}$$

In Example 10, note that the unit for $s'(t)$ is the unit for s (feet) divided by the unit for t (seconds). In general, the unit for $f'(x)$ is the unit for f divided by the unit for x.

2.2 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

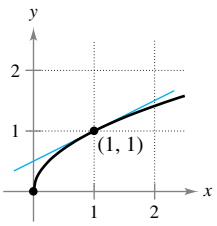
GO DIGITAL

Concept Check

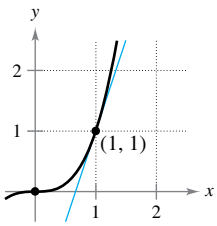
1. Explain how to find the derivative of a constant function.
2. Explain how to find the derivative of the function $f(x) = cx^n$.
3. Identify the derivatives of the sine and cosine functions.
4. Describe the difference between average velocity and velocity.

Estimating Slope In Exercises 5 and 6, use the graph to estimate the slope of the tangent line to $y = x^n$ at the point (1, 1). Verify your answer analytically. To print an enlarged copy of the graph, go to *MathGraphs.com*.

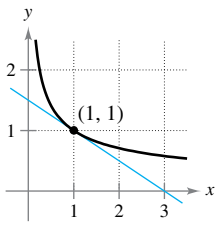
5. (a) $y = x^{1/2}$



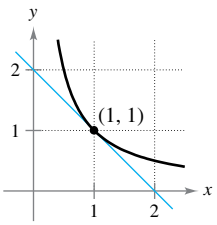
(b) $y = x^3$



6. (a) $y = x^{-1/2}$



(b) $y = x^{-1}$



Finding a Derivative In Exercises 7–26, use differentiation rules to find the derivative of the function.

7. $y = 12$
8. $f(x) = -9$
9. $y = x^7$
10. $y = x^{12}$
11. $y = \dfrac{1}{x^5}$
12. $y = \dfrac{3}{x^7}$
13. $f(x) = \sqrt[9]{x}$
14. $g(x) = \sqrt[4]{x}$
15. $f(x) = x + 11$
16. $g(x) = 6x + 3$
17. $f(t) = -3t^2 + 2t - 4$
18. $y = t^2 - 3t + 1$
19. $g(x) = x^2 + 4x^3$
20. $y = 4x - 3x^3$
21. $s(t) = t^3 + 5t^2 - 3t + 8$
22. $y = 2x^3 + 6x^2 - 1$
23. $y = \dfrac{\pi}{2}\sin\theta$
24. $g(t) = \pi\cos t$
25. $y = x^2 - \frac{1}{2}\cos x$
26. $y = 7x^4 + 2\sin x$

Rewriting a Function Before Differentiating In Exercises 27–30, complete the table to find the derivative of the function.

Function	Rewrite	Differentiate	Simplify
27. $y = \dfrac{2}{7x^4}$			
28. $y = \dfrac{8}{5x^{-5}}$			
29. $y = \dfrac{6}{(5x)^3}$			
30. $y = \dfrac{3}{(2x)^{-2}}$			

Finding the Slope of a Graph In Exercises 31–38, find the slope of the graph of the function at the given point. Use the *derivative* feature of a graphing utility to verify your results.

Function	Point
31. $f(x) = \dfrac{8}{x^2}$	(2, 2)
32. $f(t) = 2 - \dfrac{4}{t}$	(4, 1)
33. $f(x) = -\frac{1}{2} + \frac{7}{5}x^3$	$\left(0, -\frac{1}{2}\right)$
34. $y = 2x^4 - 3$	(1, −1)
35. $y = (4x + 1)^2$	(0, 1)
36. $f(x) = 2(x - 4)^2$	(2, 8)
37. $f(\theta) = 4\sin\theta - \theta$	(0, 0)
38. $g(t) = -2\cos t + 5$	$(\pi, 7)$

Finding a Derivative In Exercises 39–54, find the derivative of the function.

39. $f(x) = x^2 + 5 - 3x^{-2}$
40. $f(x) = x^3 - 2x + 3x^{-3}$
41. $g(t) = t^2 - \dfrac{4}{t^3}$
42. $f(x) = 8x + \dfrac{3}{x^2}$
43. $f(x) = \dfrac{x^3 - 3x^2 + 4}{x^2}$
44. $h(x) = \dfrac{4x^3 + 2x + 5}{x}$
45. $g(t) = \dfrac{3t^2 + 4t - 8}{t^{3/2}}$
46. $h(s) = \dfrac{s^5 + 2s + 6}{s^{1/3}}$
47. $y = x(x^2 + 1)$
48. $y = x^2(2x^2 - 3x)$
49. $f(x) = \sqrt{x} - 6\sqrt[3]{x}$
50. $f(t) = t^{2/3} - t^{1/3} + 4$
51. $f(x) = 6\sqrt{x} + 5\cos x$
52. $f(x) = \dfrac{2}{\sqrt[3]{x}} + 3\cos x$
53. $y = \dfrac{1}{(3x)^{-2}} - 5\cos x$
54. $y = \dfrac{3}{(2x)^3} + 2\sin x$

Finding an Equation of a Tangent Line **In Exercises 55–58, (a) find an equation of the tangent line to the graph of the function at the given point, (b) sketch a graph of the function and its tangent line at the point, and (c) use the *tangent* feature of a graphing utility to verify your results.**

Function	Point
55. $f(x) = -2x^4 + 5x^2 - 3$	$(1, 0)$
56. $y = x^3 - 3x$	$(2, 2)$
57. $f(x) = \dfrac{2}{\sqrt[4]{x^3}}$	$(1, 2)$
58. $y = (x - 2)(x^2 + 3x)$	$(1, -4)$

Horizontal Tangent Line **In Exercises 59–64, determine the points (if any) at which the graph of the function has a horizontal tangent line.**

59. $y = x^4 - 2x^2 + 3$
60. $y = x^3 + x$
61. $y = \dfrac{1}{x^2}$
62. $y = x^2 + 9$
63. $y = x + \sin x, \quad 0 \le x < 2\pi$
64. $y = \sqrt{3}x + 2\cos x, \quad 0 \le x < 2\pi$

Finding a Value **In Exercises 65–68, find k such that the line is tangent to the graph of the function.**

Function	Line
65. $f(x) = k - x^2$	$y = -6x + 1$
66. $f(x) = kx^2$	$y = -2x + 3$
67. $f(x) = \dfrac{k}{x}$	$y = -\dfrac{3}{4}x + 3$
68. $f(x) = k\sqrt{x}$	$y = x + 4$

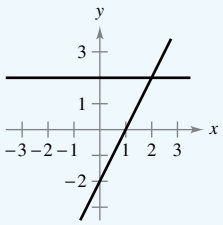
Exploring Concepts

In Exercises 69–72, the relationship between f and g is given. Explain the relationship between f' and g'.

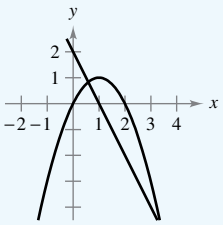
69. $g(x) = f(x) + 6$
70. $g(x) = 2f(x)$
71. $g(x) = -5f(x)$
72. $g(x) = 3f(x) - 1$

In Exercises 73 and 74, the graphs of a function f and its derivative f' are shown on the same set of coordinate axes. Label the graphs as f or f' and write a short paragraph stating the criteria you used in making your selection. To print an enlarged copy of the graph, go to *MathGraphs.com*.

73.

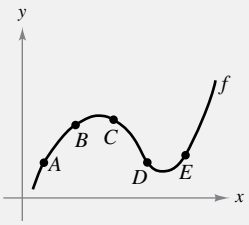


74.



75. **Sketching a Graph** Sketch the graph of a function f such that $f' > 0$ for all x and the rate of change of the function is decreasing.

76. **HOW DO YOU SEE IT?** Use the graph of f to answer each question. To print an enlarged copy of the graph, go to *MathGraphs.com*.



(a) Between which two consecutive points is the average rate of change of the function greatest?

(b) Is the average rate of change of the function between A and B greater than or less than the instantaneous rate of change at B?

(c) Sketch a tangent line to the graph between C and D such that the slope of the tangent line is the same as the average rate of change of the function between C and D.

77. **Finding Equations of Tangent Lines** Sketch the graphs of $y = x^2$ and $y = -x^2 + 6x - 5$, and sketch the two lines that are tangent to both graphs. Find equations of these lines.

78. **Tangent Lines** Show that the graphs of the two equations

$$y = x \quad \text{and} \quad y = \frac{1}{x}$$

have tangent lines that are perpendicular to each other at their point of intersection.

79. **Horizontal Tangent Line** Show that the graph of the function

$$f(x) = 3x + \sin x + 2$$

does not have a horizontal tangent line.

80. **Tangent Line** Show that the graph of the function

$$f(x) = x^5 + 3x^3 + 5x$$

does not have a tangent line with a slope of 3.

Finding an Equation of a Tangent Line **In Exercises 81 and 82, find an equation of the tangent line to the graph of the function f through the point (x_0, y_0) not on the graph. To find the point of tangency (x, y) on the graph of f, solve the equation**

$$f'(x) = \frac{y_0 - y}{x_0 - x}.$$

81. $f(x) = \sqrt{x}$, $(x_0, y_0) = (-4, 0)$
82. $f(x) = \dfrac{2}{x}$, $(x_0, y_0) = (5, 0)$

83. Linear Approximation Consider the function $f(x) = x^{3/2}$ with the solution point (4, 8).

(a) Use a graphing utility to graph f. Use the *zoom* feature to obtain successive magnifications of the graph in the neighborhood of the point (4, 8). After zooming in a few times, the graph should appear nearly linear. Use the *trace* feature to determine the coordinates of a point near (4, 8). Find an equation of the secant line $S(x)$ through the two points.

(b) Find the equation of the line $T(x) = f'(4)(x - 4) + f(4)$ tangent to the graph of f passing through the given point. Why are the linear functions S and T nearly the same?

(c) Use a graphing utility to graph f and T on the same set of coordinate axes. Note that T is a good approximation of f when x is close to 4. What happens to the accuracy of the approximation as you move farther away from the point of tangency?

(d) Demonstrate the conclusion in part (c) by completing the table.

Δx	-3	-2	-1	-0.5	-0.1	0
$f(4 + \Delta x)$						
$T(4 + \Delta x)$						

Δx	0.1	0.5	1	2	3
$f(4 + \Delta x)$					
$T(4 + \Delta x)$					

84. Linear Approximation Repeat Exercise 83 for the function $f(x) = x^3$, where $T(x)$ is the line tangent to the graph at the point (1, 1). Explain why the accuracy of the linear approximation decreases more rapidly than in Exercise 83.

True or False? **In Exercises 85–90, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

85. If $f'(x) = g'(x)$, then $f(x) = g(x)$.

86. If $y = x^{a+2} + bx$, then $dy/dx = (a + 2)x^{a+1} + b$.

87. If $y = \pi^2$, then $dy/dx = 2\pi$.

88. If $f(x) = -g(x) + b$, then $f'(x) = -g'(x)$.

89. If $f(x) = 0$, then $f'(x)$ is undefined.

90. If $f(x) = \dfrac{1}{x^n}$, then $f'(x) = \dfrac{1}{nx^{n-1}}$.

Finding Rates of Change **In Exercises 91–94, find the average rate of change of the function over the given interval. Compare this average rate of change with the instantaneous rates of change at the endpoints of the interval.**

91. $f(t) = 3t + 5$, $[1, 2]$

92. $f(t) = t^2 - 7$, $[3, 3.1]$

93. $f(x) = \dfrac{-1}{x}$, $[1, 2]$

94. $f(x) = \sin x$, $\left[0, \dfrac{\pi}{6}\right]$

Vertical Motion **In Exercises 95 and 96, use the position function $s(t) = -16t^2 + v_0t + s_0$ for free-falling objects.**

95. A coin is dropped from the top of a building that is 1362 feet tall.

(a) Determine the position and velocity functions for the coin.

(b) Determine the average velocity on the interval $[1, 2]$.

(c) Find the instantaneous velocities when $t = 1$ and $t = 2$.

(d) Find the time required for the coin to reach ground level.

(e) Find the velocity of the coin at impact.

96. A ball is thrown straight down from the top of a 220-foot building with an initial velocity of -22 feet per second. What is its velocity after 3 seconds? What is its velocity after falling 108 feet?

Vertical Motion **In Exercises 97 and 98, use the position function $s(t) = -4.9t^2 + v_0t + s_0$ for free-falling objects.**

97. A projectile is shot upward from the surface of Earth with an initial velocity of 120 meters per second. What is its velocity after 5 seconds? After 10 seconds?

98. A rock is dropped from the edge of a cliff that is 214 meters above water.

(a) Determine the position and velocity functions for the rock.

(b) Determine the average velocity on the interval $[2, 5]$.

(c) Find the instantaneous velocities when $t = 2$ and $t = 5$.

(d) Find the time required for the rock to reach the surface of the water.

(e) Find the velocity of the rock at impact.

99. Think About It The graph of the position function (see figure) represents the distance in miles that a person drives during a 10-minute trip to work. Make a sketch of the corresponding velocity function.

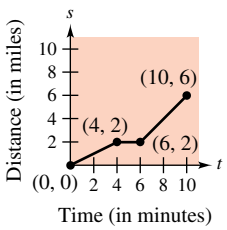

Figure for 99

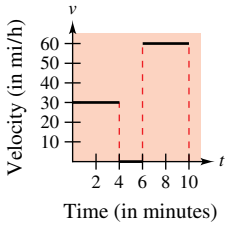

Figure for 100

100. Think About It The graph of the velocity function (see figure) represents the velocity in miles per hour a person drives during a 10-minute trip to work. Make a sketch of the corresponding position function.

101. Volume The volume of a cube with sides of length s is given by $V = s^3$. Find the rate of change of the volume with respect to s when $s = 6$ centimeters.

102. Area The area of a square with sides of length s is given by $A = s^2$. Find the rate of change of the area with respect to s when $s = 6$ meters.

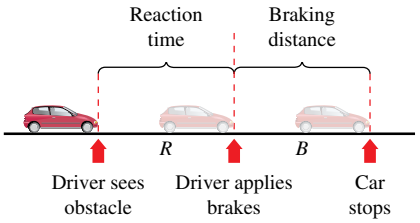
103. Modeling Data

The stopping distance of an automobile, on dry, level pavement, traveling at a speed v (in kilometers per hour) is the distance R (in meters) the car travels during the reaction time of the driver plus the distance B (in meters) the car travels after the brakes are applied (see figure). The table shows the results of an experiment.



Speed, v	20	40	60	80	100
Reaction Time Distance, R	8.3	16.7	25.0	33.3	41.7
Braking Time Distance, B	2.3	9.0	20.2	35.8	55.9

(a) Use the regression capabilities of a graphing utility to find a linear model for reaction time distance R.

(b) Use the regression capabilities of a graphing utility to find a quadratic model for braking time distance B.

(c) Determine the polynomial giving the total stopping distance T.

(d) Use a graphing utility to graph the functions R, B, and T in the same viewing window.

(e) Find the derivative of T and the rates of change of the total stopping distance for $v = 40$, $v = 80$, and $v = 100$.

(f) Use the results of this exercise to draw conclusions about the total stopping distance as speed increases.

104. Fuel Cost A car is driven 15,000 miles a year and gets x miles per gallon. Assume that the average fuel cost is \$3.48 per gallon. Find the annual cost of fuel C as a function of x and use this function to complete the table.

x	10	15	20	25	30	35	40
C							
dC/dx							

Who would benefit more from a one-mile-per-gallon increase in fuel efficiency—the driver of a car that gets 15 miles per gallon or the driver of a car that gets 35 miles per gallon? Explain.

105. Velocity Verify that the average velocity over the time interval $[t_0 - \Delta t, t_0 + \Delta t]$ is the same as the instantaneous velocity at $t = t_0$ for the position function

$$s(t) = -\frac{1}{2}at^2 + c.$$

106. Inventory Management The annual inventory cost C for a manufacturer is

$$C = \frac{1{,}008{,}000}{Q} + 6.3Q$$

where Q is the order size when the inventory is replenished. Find the change in annual cost when Q is increased from 350 to 351 and compare this with the instantaneous rate of change when $Q = 350$.

107. Finding an Equation of a Parabola Find an equation of the parabola $y = ax^2 + bx + c$ that passes through $(0, 1)$ and is tangent to the line $y = x - 1$ at $(1, 0)$.

108. Proof Let (a, b) be an arbitrary point on the graph of $y = 1/x$, $x > 0$. Prove that the area of the triangle formed by the tangent line through (a, b) and the coordinate axes is 2.

109. Tangent Lines Find equations of the tangent lines to the graph of the curve $y = x^3 - 9x$ through the point $(1, -9)$ not on the graph.

110. Tangent Lines Find equations of the tangent lines to the graph of the parabola $y = x^2$ through the given point not on the graph.

(a) $(0, a)$ (b) $(a, 0)$

Are there any restrictions on the constant a?

Making a Function Differentiable **In Exercises 111 and 112, find a and b such that f is differentiable everywhere.**

111. $f(x) = \begin{cases} ax^3, & x \le 2 \\ x^2 + b, & x > 2 \end{cases}$

112. $f(x) = \begin{cases} \cos x, & x < 0 \\ ax + b, & x \ge 0 \end{cases}$

113. Determining Differentiability Where are the functions $f_1(x) = |\sin x|$ and $f_2(x) = \sin|x|$ differentiable?

114. Proof Prove that $\frac{d}{dx}[\cos x] = -\sin x$.

2.3 Product and Quotient Rules and Higher-Order Derivatives

GO DIGITAL

- Find the derivative of a function using the Product Rule.
- Find the derivative of a function using the Quotient Rule.
- Find the derivative of a trigonometric function.
- Find a higher-order derivative of a function.

The Product Rule

In Section 2.2, you learned that the derivative of the sum of two functions is simply the sum of their derivatives. The rules for the derivatives of the product and quotient of two functions are not as simple.

REMARK A version of the Product Rule that some people prefer is

$$\frac{d}{dx}[f(x)g(x)] = f'(x)g(x) + f(x)g'(x).$$

The advantage of this form is that it generalizes easily to products of three or more factors.

THEOREM 2.7 The Product Rule

The product of two differentiable functions f and g is itself differentiable. Moreover, the derivative of fg is the first function times the derivative of the second, plus the second function times the derivative of the first.

$$\frac{d}{dx}[f(x)g(x)] = f(x)g'(x) + g(x)f'(x)$$

Proof Some mathematical proofs, such as the proof of the Sum Rule, are straightforward. Others involve clever steps that may appear unmotivated to a reader. This proof involves such a step—subtracting and adding the same quantity. In this case, the quantity is $f(x + \Delta x)g(x)$. After this step, note how the functions f and g are separated by rewriting the fraction as the sum of two fractions and then factoring the numerators.

$$\begin{aligned}
\frac{d}{dx}[f(x)g(x)] &= \lim_{\Delta x\to 0}\frac{f(x+\Delta x)g(x+\Delta x) - f(x)g(x)}{\Delta x}\\
&= \lim_{\Delta x\to 0}\frac{f(x+\Delta x)g(x+\Delta x) - f(x+\Delta x)g(x) + f(x+\Delta x)g(x) - f(x)g(x)}{\Delta x}\\
&= \lim_{\Delta x\to 0}\left[f(x+\Delta x)\frac{g(x+\Delta x)-g(x)}{\Delta x} + g(x)\frac{f(x+\Delta x)-f(x)}{\Delta x}\right]\\
&= \lim_{\Delta x\to 0}\left[f(x+\Delta x)\frac{g(x+\Delta x)-g(x)}{\Delta x}\right] + \lim_{\Delta x\to 0}\left[g(x)\frac{f(x+\Delta x)-f(x)}{\Delta x}\right]\\
&= \lim_{\Delta x\to 0} f(x+\Delta x)\cdot \overbrace{\lim_{\Delta x\to 0}\frac{g(x+\Delta x)-g(x)}{\Delta x}}^{\text{Definition of } g'(x)} + \lim_{\Delta x\to 0} g(x)\cdot \overbrace{\lim_{\Delta x\to 0}\frac{f(x+\Delta x)-f(x)}{\Delta x}}^{\text{Definition of } f'(x)}\\
&= f(x)g'(x) + g(x)f'(x)
\end{aligned}$$

In the last step, note that because f is differentiable at x, you know from Theorem 2.1 that f is continuous at x. So, $\lim_{\Delta x\to 0} f(x+\Delta x) = f(x)$. ■

THE PRODUCT RULE

When Leibniz originally wrote a formula for the Product Rule, he was motivated by the expression

$$(x + dx)(y + dy) - xy$$

from which he subtracted $dx\,dy$ (as being negligible) and obtained the differential form $x\,dy + y\,dx$. This derivation resulted in the traditional form of the Product Rule. *(Source: The History of Mathematics by David M. Burton)*

The Product Rule can be extended to cover products involving more than two factors. For example, if f, g, and h are differentiable functions of x, then

$$\frac{d}{dx}[f(x)g(x)h(x)] = f'(x)g(x)h(x) + f(x)g'(x)h(x) + f(x)g(x)h'(x).$$

(See Exercise 139.) So, the derivative of $y = x^2 \sin x \cos x$ is

$$\begin{aligned}
y' &= 2x\sin x\cos x + x^2\cos x\cos x + x^2(\sin x)(-\sin x)\\
&= 2x\sin x\cos x + x^2(\cos^2 x - \sin^2 x).
\end{aligned}$$

The derivative of a product of two functions is not (in general) given by the product of the derivatives of the two functions. To demonstrate this, try comparing the product of the derivatives of

$$f(x) = 3x - 2x^2$$

and

$$g(x) = 5 + 4x$$

with the derivative in Example 1.

EXAMPLE 1 Using the Product Rule

Find the derivative of $h(x) = (3x - 2x^2)(5 + 4x)$.

Solution

$$\begin{aligned} h'(x) &= \overbrace{(3x - 2x^2)}^{\text{First}} \overbrace{\frac{d}{dx}[5 + 4x]}^{\text{Derivative of second}} + \overbrace{(5 + 4x)}^{\text{Second}} \overbrace{\frac{d}{dx}[3x - 2x^2]}^{\text{Derivative of first}} && \text{Apply Product Rule.} \\ &= (3x - 2x^2)(4) + (5 + 4x)(3 - 4x) && \text{Find the derivatives.} \\ &= (12x - 8x^2) + (15 - 8x - 16x^2) && \text{Multiply.} \\ &= -24x^2 + 4x + 15 && \text{Simplify.} \end{aligned}$$

In Example 1, you have the option of finding the derivative with or without the Product Rule. To find the derivative without the Product Rule, you can write

$$\begin{aligned} D_x[(3x - 2x^2)(5 + 4x)] &= D_x[-8x^3 + 2x^2 + 15x] \\ &= -24x^2 + 4x + 15. \end{aligned}$$

In the next example, you must use the Product Rule.

EXAMPLE 2 Using the Product Rule

Find the derivative of $y = 3x^2 \sin x$.

Solution

$$\begin{aligned} \frac{d}{dx}[3x^2 \sin x] &= 3x^2 \frac{d}{dx}[\sin x] + \sin x \frac{d}{dx}[3x^2] && \text{Apply Product Rule.} \\ &= 3x^2 \cos x + (\sin x)(6x) && \text{Find the derivatives.} \\ &= 3x^2 \cos x + 6x \sin x \\ &= 3x(x \cos x + 2 \sin x) && \text{Factor.} \end{aligned}$$

REMARK In Example 3, notice that you use the Product Rule when both factors of the product are variable, and you use the Constant Multiple Rule when one of the factors is a constant.

EXAMPLE 3 Using the Product Rule

Find the derivative of $y = 2x \cos x - 2 \sin x$.

Solution

$$\begin{aligned} \frac{dy}{dx} &= \overbrace{(2x)\left(\frac{d}{dx}[\cos x]\right) + (\cos x)\left(\frac{d}{dx}[2x]\right)}^{\text{Product Rule}} \overbrace{- 2\frac{d}{dx}[\sin x]}^{\text{Constant Multiple Rule}} \\ &= (2x)(-\sin x) + (\cos x)(2) - 2(\cos x) && \text{Find the derivatives.} \\ &= -2x \sin x && \text{Simplify.} \end{aligned}$$

The Quotient Rule

THEOREM 2.8 The Quotient Rule

The quotient f/g of two differentiable functions f and g is itself differentiable at all values of x for which $g(x) \neq 0$. Moreover, the derivative of f/g is given by the denominator times the derivative of the numerator minus the numerator times the derivative of the denominator, all divided by the square of the denominator.

$$\frac{d}{dx}\left[\frac{f(x)}{g(x)}\right] = \frac{g(x)f'(x) - f(x)g'(x)}{[g(x)]^2}, \quad g(x) \neq 0$$

REMARK From the Quotient Rule, note that the derivative of a quotient is not (in general) the quotient of the derivatives.

Proof As with the proof of Theorem 2.7, the key to this proof is subtracting and adding the same quantity. In this case, the quantity is $f(x)g(x)$.

$$\begin{aligned}
\frac{d}{dx}\left[\frac{f(x)}{g(x)}\right] &= \lim_{\Delta x \to 0} \frac{\dfrac{f(x+\Delta x)}{g(x+\Delta x)} - \dfrac{f(x)}{g(x)}}{\Delta x} && \text{Definition of derivative} \\
&= \lim_{\Delta x \to 0} \frac{g(x)f(x+\Delta x) - f(x)g(x+\Delta x)}{\Delta x g(x)g(x+\Delta x)} \\
&= \lim_{\Delta x \to 0} \frac{g(x)f(x+\Delta x) - f(x)g(x) + f(x)g(x) - f(x)g(x+\Delta x)}{\Delta x g(x)g(x+\Delta x)} \\
&= \frac{\lim_{\Delta x \to 0} \dfrac{g(x)[f(x+\Delta x) - f(x)]}{\Delta x} - \lim_{\Delta x \to 0} \dfrac{f(x)[g(x+\Delta x) - g(x)]}{\Delta x}}{\lim_{\Delta x \to 0}[g(x)g(x+\Delta x)]} \\
&= \frac{g(x)\overbrace{\left[\lim_{\Delta x \to 0} \frac{f(x+\Delta x) - f(x)}{\Delta x}\right]}^{\text{Definition of } f'(x)} - f(x)\overbrace{\left[\lim_{\Delta x \to 0} \frac{g(x+\Delta x) - g(x)}{\Delta x}\right]}^{\text{Definition of } g'(x)}}{\lim_{\Delta x \to 0}[g(x)g(x+\Delta x)]} \\
&= \frac{g(x)f'(x) - f(x)g'(x)}{[g(x)]^2}
\end{aligned}$$

In the last step, note that because g is differentiable at x, you know from Theorem 2.1 that g is continuous at x. So, $\lim_{\Delta x \to 0} g(x + \Delta x) = g(x)$. ■

EXAMPLE 4 Using the Quotient Rule

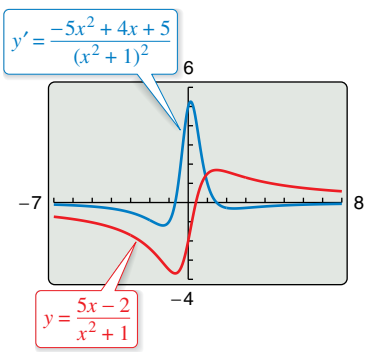
Find the derivative of $y = \dfrac{5x - 2}{x^2 + 1}$.

Solution

$$\begin{aligned}
\frac{d}{dx}\left[\frac{5x-2}{x^2+1}\right] &= \frac{(x^2+1)\dfrac{d}{dx}[5x-2] - (5x-2)\dfrac{d}{dx}[x^2+1]}{(x^2+1)^2} && \text{Apply Quotient Rule.} \\
&= \frac{(x^2+1)(5) - (5x-2)(2x)}{(x^2+1)^2} && \text{Find the derivatives.} \\
&= \frac{(5x^2+5) - (10x^2-4x)}{(x^2+1)^2} && \text{Multiply.} \\
&= \frac{-5x^2+4x+5}{(x^2+1)^2} && \text{Simplify.}
\end{aligned}$$

■

TECHNOLOGY A graphing utility can be used to compare the graph of a function with the graph of its derivative. For instance, in the figure below, the graph of the function in Example 4 appears to have two points that have horizontal tangent lines. What are the values of y' at these two points?



Graphical comparison of a function and its derivative

GO DIGITAL

Note the use of parentheses in Example 4. A liberal use of parentheses is recommended for *all* types of differentiation problems. For instance, with the Quotient Rule, it is a good idea to enclose all factors and derivatives in parentheses and to pay special attention to the subtraction required in the numerator.

When differentiation rules were introduced in the preceding section, the need for rewriting *before* differentiating was emphasized. The next example illustrates this point with the Quotient Rule.

EXAMPLE 5 Rewriting Before Differentiating

Find an equation of the tangent line to the graph of $f(x) = \dfrac{3 - (1/x)}{x + 5}$ at $(-1, 1)$.

Solution Begin by rewriting the function.

$$f(x) = \frac{3 - (1/x)}{x + 5}$$ Write original function.

$$= \frac{x\left(3 - \frac{1}{x}\right)}{x(x + 5)}$$ Multiply numerator and denominator by x.

$$= \frac{3x - 1}{x^2 + 5x}$$ Rewrite.

Next, apply the Quotient Rule.

$$f'(x) = \frac{(x^2 + 5x)(3) - (3x - 1)(2x + 5)}{(x^2 + 5x)^2}$$ Quotient Rule

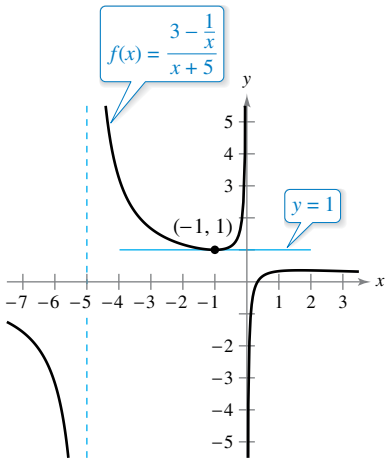
$$= \frac{(3x^2 + 15x) - (6x^2 + 13x - 5)}{(x^2 + 5x)^2}$$

$$= \frac{-3x^2 + 2x + 5}{(x^2 + 5x)^2}$$ Simplify.

To find the slope at $(-1, 1)$, evaluate $f'(-1)$.

$$f'(-1) = 0$$ Slope of graph at $(-1, 1)$

Then, using the point-slope form of the equation of a line, you can determine that the equation of the tangent line at $(-1, 1)$ is $y = 1$. See Figure 2.23.



The line $y = 1$ is tangent to the graph of f at the point $(-1, 1)$.
Figure 2.23

Not every quotient needs to be differentiated by the Quotient Rule. For instance, each quotient in the next example can be considered as the product of a constant times a function of x. In such cases, it is more convenient to use the Constant Multiple Rule.

EXAMPLE 6 Using the Constant Multiple Rule

	Original Function	Rewrite	Differentiate	Simplify
a.	$y = \dfrac{x^2 + 3x}{6}$	$y = \dfrac{1}{6}(x^2 + 3x)$	$y' = \dfrac{1}{6}(2x + 3)$	$y' = \dfrac{2x + 3}{6}$
b.	$y = \dfrac{5x^4}{8}$	$y = \dfrac{5}{8}x^4$	$y' = \dfrac{5}{8}(4x^3)$	$y' = \dfrac{5}{2}x^3$
c.	$y = \dfrac{-3(3x - 2x^{1/2})}{7x}$	$y = -\dfrac{3}{7}(3 - 2x^{-1/2})$	$y' = -\dfrac{3}{7}(x^{-3/2})$	$y' = -\dfrac{3}{7x^{3/2}}$
d.	$y = \dfrac{9}{5x^2}$	$y = \dfrac{9}{5}(x^{-2})$	$y' = \dfrac{9}{5}(-2x^{-3})$	$y' = -\dfrac{18}{5x^3}$

REMARK To see the benefit of using the Constant Multiple Rule for some quotients, use the Quotient Rule to differentiate the functions in Example 6. You should obtain the same results but with more work.

GO DIGITAL

In Section 2.2, the Power Rule was proved only for the case in which the exponent n is a positive integer greater than 1. The next example extends the proof to include negative integer exponents.

EXAMPLE 7 **Power Rule: Negative Integer Exponents**

If n is a negative integer, then there exists a positive integer k such that $n = -k$. So, by the Quotient Rule, you can write

$$\begin{aligned}
\frac{d}{dx}[x^n] &= \frac{d}{dx}\left[\frac{1}{x^k}\right] && x^n = x^{-k} = \frac{1}{x^k} \\
&= \frac{x^k(0) - (1)(kx^{k-1})}{(x^k)^2} && \text{Quotient Rule and Power Rule} \\
&= \frac{0 - kx^{k-1}}{x^{2k}} \\
&= -kx^{-k-1} && \frac{x^{k-1}}{x^{2k}} = x^{k-1-2k} = x^{-k-1} \\
&= nx^{n-1}. && n = -k
\end{aligned}$$

So, the Power Rule

$$\frac{d}{dx}[x^n] = nx^{n-1}$$ Power Rule

is valid for any integer n. In Exercise 73 in Section 2.5, you are asked to prove the case for which n is any rational number. ■

Derivatives of Trigonometric Functions

Knowing the derivatives of the sine and cosine functions, you can use the Quotient Rule to find the derivatives of the four remaining trigonometric functions.

THEOREM 2.9 Derivatives of Trigonometric Functions

$$\frac{d}{dx}[\tan x] = \sec^2 x \qquad \frac{d}{dx}[\cot x] = -\csc^2 x$$

$$\frac{d}{dx}[\sec x] = \sec x \tan x \qquad \frac{d}{dx}[\csc x] = -\csc x \cot x$$

Proof Considering $\tan x = (\sin x)/(\cos x)$ and applying the Quotient Rule, you obtain

$$\begin{aligned}
\frac{d}{dx}[\tan x] &= \frac{d}{dx}\left[\frac{\sin x}{\cos x}\right] \\
&= \frac{(\cos x)(\cos x) - (\sin x)(-\sin x)}{\cos^2 x} && \text{Apply Quotient Rule.} \\
&= \frac{\cos^2 x + \sin^2 x}{\cos^2 x} && \text{Multiply.} \\
&= \frac{1}{\cos^2 x} && \text{Pythagorean identity} \\
&= \sec^2 x. && \text{Reciprocal identity}
\end{aligned}$$

The proofs of the other three parts of the theorem are left as an exercise (see Exercise 89). ■

REMARK In the proof of Theorem 2.9, note the use of the trigonometric identities

$$\sin^2 x + \cos^2 x = 1$$

and

$$\sec x = \frac{1}{\cos x}.$$

These trigonometric identities and others are listed in Section P.4 and on the formula cards for this text.

GO DIGITAL

EXAMPLE 8 Differentiating Trigonometric Functions

See LarsonCalculus.com for an interactive version of this type of example.

Function	Derivative
a. $y = x - \tan x$	$\frac{dy}{dx} = 1 - \sec^2 x$
b. $y = x \sec x$	$y' = x(\sec x \tan x) + (\sec x)(1)$ $= (\sec x)(1 + x \tan x)$

REMARK Because of trigonometric identities, the derivative of a trigonometric function can take many forms. This presents a challenge when you are trying to match your answers to those given in the back of the text.

EXAMPLE 9 Different Forms of a Derivative

Differentiate both forms of

$$y = \frac{1 - \cos x}{\sin x} = \csc x - \cot x.$$

Solution

First form: $y = \dfrac{1 - \cos x}{\sin x}$ Write first form.

$$y' = \frac{(\sin x)(\sin x) - (1 - \cos x)(\cos x)}{\sin^2 x}$$ Quotient Rule

$$= \frac{\sin^2 x - \cos x + \cos^2 x}{\sin^2 x}$$ Multiply.

$$= \frac{1 - \cos x}{\sin^2 x}$$ $\sin^2 x + \cos^2 x = 1$

Second form: $y = \csc x - \cot x$ Write second form.

$y' = -\csc x \cot x + \csc^2 x$ Derivative with respect to x

To show that the two derivatives are equal, you can write

$$\frac{1 - \cos x}{\sin^2 x} = \frac{1}{\sin^2 x} - \frac{\cos x}{\sin^2 x}$$ Write as separate fractions.

$$= \frac{1}{\sin^2 x} - \left(\frac{1}{\sin x}\right)\left(\frac{\cos x}{\sin x}\right)$$ Product of fractions

$$= \csc^2 x - \csc x \cot x.$$ Reciprocal and quotient identities ■

The summary below shows that much of the work in obtaining a simplified form of a derivative occurs *after* differentiating. Note that two characteristics of a simplified form are the absence of negative exponents and the combining of like terms.

	$f'(x)$ After Differentiating	$f'(x)$ After Simplifying
Example 1	$(3x - 2x^2)(4) + (5 + 4x)(3 - 4x)$	$-24x^2 + 4x + 15$
Example 3	$(2x)(-\sin x) + (\cos x)(2) - 2(\cos x)$	$-2x \sin x$
Example 4	$\frac{(x^2 + 1)(5) - (5x - 2)(2x)}{(x^2 + 1)^2}$	$\frac{-5x^2 + 4x + 5}{(x^2 + 1)^2}$
Example 5	$\frac{(x^2 + 5x)(3) - (3x - 1)(2x + 5)}{(x^2 + 5x)^2}$	$\frac{-3x^2 + 2x + 5}{(x^2 + 5x)^2}$
Example 9	$\frac{(\sin x)(\sin x) - (1 - \cos x)(\cos x)}{\sin^2 x}$	$\frac{1 - \cos x}{\sin^2 x}$

Higher-Order Derivatives

Just as you can obtain a velocity function by differentiating a position function, you can obtain an **acceleration** function by differentiating a velocity function. Another way of looking at this is that you can obtain an acceleration function by differentiating a position function *twice*.

$$\begin{aligned} s(t) &\quad \text{Position function} \\ v(t) = s'(t) &\quad \text{Velocity function} \\ a(t) = v'(t) = s''(t) &\quad \text{Acceleration function} \end{aligned}$$

The function $a(t)$ is the **second derivative** of $s(t)$ and is denoted by $s''(t)$.

The second derivative is an example of a **higher-order derivative.** You can define derivatives of any positive integer order. For instance, the **third derivative** is the derivative of the second derivative. Higher-order derivatives are denoted as shown below.

First derivative:	y',	$f'(x)$,	$\frac{dy}{dx}$,	$\frac{d}{dx}[f(x)]$,	$D_x[y]$
Second derivative:	y'',	$f''(x)$,	$\frac{d^2y}{dx^2}$,	$\frac{d^2}{dx^2}[f(x)]$,	$D_x^2[y]$
Third derivative:	y''',	$f'''(x)$,	$\frac{d^3y}{dx^3}$,	$\frac{d^3}{dx^3}[f(x)]$,	$D_x^3[y]$
Fourth derivative:	$y^{(4)}$,	$f^{(4)}(x)$,	$\frac{d^4y}{dx^4}$,	$\frac{d^4}{dx^4}[f(x)]$,	$D_x^4[y]$
⋮					
nth derivative:	$y^{(n)}$,	$f^{(n)}(x)$,	$\frac{d^ny}{dx^n}$,	$\frac{d^n}{dx^n}[f(x)]$,	$D_x^n[y]$

REMARK The second derivative of a function is the derivative of the first derivative of the function.

Vadim Sadovski/Shutterstock.com

The moon's mass is 7.349×10^{22} kilograms, and Earth's mass is 5.976×10^{24} kilograms. The moon's radius is 1737 kilometers, and Earth's radius is 6378 kilometers. Because the gravitational force on the surface of a planet is directly proportional to its mass and inversely proportional to the square of its radius, the ratio of the gravitational force on Earth to the gravitational force on the moon is

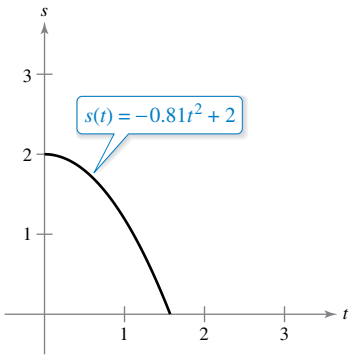
$$\frac{(5.976 \times 10^{24})/6378^2}{(7.349 \times 10^{22})/1737^2} \approx 6.0.$$

EXAMPLE 10 Finding the Acceleration Due to Gravity

Because the moon has no atmosphere, a falling object on the moon encounters no air resistance. In 1971, astronaut David Scott demonstrated that a feather and a hammer fall at the same rate on the moon. The position function for each of these falling objects is

$$s(t) = -0.81t^2 + 2$$

where $s(t)$ is the height in meters and t is the time in seconds, as shown in the figure at the right. What is the ratio of Earth's gravitational force to the moon's?



Solution To find the acceleration, differentiate the position function twice.

$$\begin{aligned} s(t) &= -0.81t^2 + 2 && \text{Position function} \\ s'(t) &= -1.62t && \text{Velocity function} \\ s''(t) &= -1.62 && \text{Acceleration function} \end{aligned}$$

Because $s''(t) = -g$, the acceleration due to gravity on the moon is $g = 1.62$ meters per second per second. The acceleration due to gravity on Earth is 9.8 meters per second per second, so the ratio of Earth's gravitational force to the moon's is

$$\begin{aligned} \frac{\text{Earth's gravitational force}}{\text{Moon's gravitational force}} &= \frac{9.8}{1.62} \\ &\approx 6.0. \end{aligned}$$

2.3 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain how to find the derivative of the product of two differentiable functions.
2. Explain how to find the derivative of the quotient of two differentiable functions.
3. Identify the derivatives of $\tan x$, $\cot x$, $\sec x$, and $\csc x$.
4. Explain how to find a higher-order derivative.

Using the Product Rule In Exercises 5–10, use the Product Rule to find the derivative of the function.

5. $g(x) = (2x - 3)(1 - 5x)$
6. $y = (3x - 4)(x^3 + 5)$
7. $h(t) = \sqrt{t}(1 - t^2)$
8. $g(s) = \sqrt{s}(s^2 + 8)$
9. $f(x) = x^3 \cos x$
10. $g(x) = \sqrt{x} \sin x$

Using the Quotient Rule In Exercises 11–16, use the Quotient Rule to find the derivative of the function.

11. $f(x) = \dfrac{x}{x - 5}$
12. $g(t) = \dfrac{3t^2 - 1}{2t + 5}$
13. $h(x) = \dfrac{\sqrt{x}}{x^3 + 1}$
14. $f(x) = \dfrac{x^2}{2\sqrt{x} + 1}$
15. $g(x) = \dfrac{\sin x}{x^2}$
16. $f(t) = \dfrac{\cos t}{t^3}$

Finding and Evaluating a Derivative In Exercises 17–22, find $f'(x)$ and $f'(c)$.

Function	Value of c
17. $f(x) = (x^3 + 4x)(3x^2 + 2x - 5)$	$c = 0$
18. $f(x) = (2x^2 - 3x)(9x + 4)$	$c = -1$
19. $f(x) = \dfrac{x^2 - 4}{x - 3}$	$c = 1$
20. $f(x) = \dfrac{x - 4}{x + 4}$	$c = 3$
21. $f(x) = x \cos x$	$c = \dfrac{\pi}{4}$
22. $f(x) = \dfrac{\sin x}{x}$	$c = \dfrac{\pi}{6}$

Using the Constant Multiple Rule In Exercises 23–28, complete the table to find the derivative of the function without using the Quotient Rule.

Function	Rewrite	Differentiate	Simplify
23. $y = \dfrac{x^3 + 6x}{3}$			
24. $y = \dfrac{5x^2 - 3}{4}$			
25. $y = \dfrac{6}{7x^2}$			
26. $y = \dfrac{10}{3x^3}$			
27. $y = \dfrac{4x^{3/2}}{x}$			
28. $y = \dfrac{2x}{x^{1/3}}$			

Finding a Derivative In Exercises 29–40, find the derivative of the algebraic function.

29. $f(x) = \dfrac{4 - 3x - x^2}{x^2 - 1}$
30. $f(x) = \dfrac{x^2 + 5x + 6}{x^2 - 4}$
31. $f(x) = x\left(1 - \dfrac{4}{x + 3}\right)$
32. $f(x) = x^4\left(1 - \dfrac{2}{x + 1}\right)$
33. $f(x) = \dfrac{3x - 1}{\sqrt{x}}$
34. $f(x) = \sqrt[3]{x}\left(\sqrt{x} + 3\right)$
35. $f(x) = \dfrac{2 - \dfrac{1}{x}}{x - 3}$
36. $h(x) = \dfrac{\dfrac{1}{x^2} + 5x}{x + 1}$
37. $g(s) = s^3\left(5 - \dfrac{s}{s + 2}\right)$
38. $g(x) = x^2\left(\dfrac{2}{x} - \dfrac{1}{x + 1}\right)$
39. $f(x) = (2x^3 + 5x)(x - 3)(x + 2)$
40. $f(x) = (x^3 - x)(x^2 + 2)(x^2 + x - 1)$

Finding a Derivative of a Trigonometric Function In Exercises 41–56, find the derivative of the trigonometric function.

41. $f(t) = t^2 \sin t$
42. $f(\theta) = (\theta + 1) \cos \theta$
43. $f(t) = \dfrac{\cos t}{t}$
44. $f(x) = \dfrac{\sin x}{x^3}$
45. $f(x) = -x + \tan x$
46. $y = x + \cot x$
47. $g(t) = \sqrt[4]{t} + 6 \csc t$
48. $h(x) = \dfrac{1}{x} - 12 \sec x$
49. $y = \dfrac{3(1 - \sin x)}{2 \cos x}$
50. $y = \dfrac{\sec x}{x}$
51. $y = -\csc x - \sin x$
52. $y = x \sin x + \cos x$
53. $f(x) = x^2 \tan x$
54. $f(x) = \sin x \cos x$
55. $y = 2x \sin x + x^2 \cos x$
56. $h(\theta) = 5\theta \sec \theta + \theta \tan \theta$

Finding a Derivative Using Technology In Exercises 57–60, use a computer algebra system to find the derivative of the function.

57. $g(x) = \left(\dfrac{x + 1}{x + 2}\right)(2x - 5)$
58. $f(x) = \left(\dfrac{x^2 - x - 3}{x^2 + 1}\right)(x^2 + x + 1)$
59. $g(\theta) = \dfrac{\theta}{1 - \sin \theta}$
60. $f(x) = \dfrac{\cos x}{1 - \sin x}$

Finding the Slope of a Graph **In Exercises 61–64, find the slope of the graph of the function at the given point. Use the *derivative* feature of a graphing utility to confirm your results.**

Function	Point
61. $y = \dfrac{1 + \csc x}{1 - \csc x}$	$\left(\dfrac{\pi}{6}, -3\right)$
62. $f(x) = \tan x \cot x$	$(1, 1)$
63. $h(t) = \dfrac{\sec t}{t}$	$\left(\pi, -\dfrac{1}{\pi}\right)$
64. $f(x) = (\sin x)(\sin x + \cos x)$	$\left(\dfrac{\pi}{4}, 1\right)$

Finding an Equation of a Tangent Line **In Exercises 65–70, (a) find an equation of the tangent line to the graph of f at the given point, (b) sketch a graph of the function and its tangent line at the point, and (c) use the *tangent* feature of a graphing utility to confirm your results.**

65. $f(x) = (x^3 + 4x - 1)(x - 2), \quad (1, -4)$

66. $f(x) = (x - 2)(x^2 + 4), \quad (1, -5)$

67. $f(x) = \dfrac{x}{x + 4}, \quad (-5, 5)$

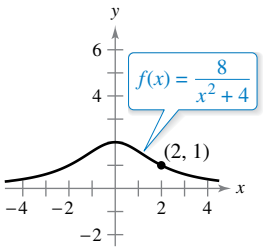
68. $f(x) = \dfrac{x + 3}{x - 3}, \quad (4, 7)$

69. $f(x) = \tan x, \quad \left(\dfrac{\pi}{4}, 1\right)$

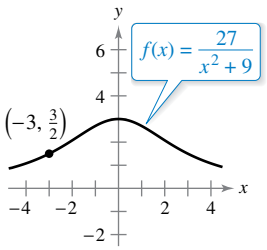
70. $f(x) = \sec x, \quad \left(\dfrac{\pi}{3}, 2\right)$

Famous Curves **In Exercises 71–74, find an equation of the tangent line to the graph at the given point. (The graphs in Exercises 71 and 72 are called *Witches of Agnesi*. The graphs in Exercises 73 and 74 are called *serpentines*.)**

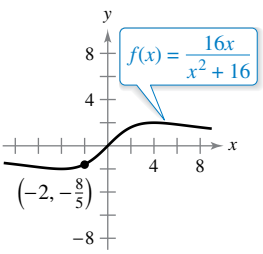
71.



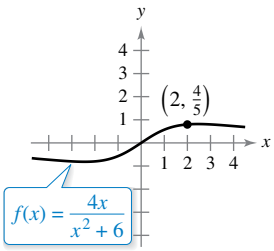
72.



73.



74.



Horizontal Tangent Line **In Exercises 75–78, determine the point(s) at which the graph of the function has a horizontal tangent line.**

75. $f(x) = \dfrac{2x - 1}{x^2}$

76. $f(x) = \dfrac{x^2}{x^2 + 1}$

77. $f(x) = \dfrac{x^2}{x - 1}$

78. $f(x) = \dfrac{x - 4}{x^2 - 7}$

79. Tangent Lines Find equations of the tangent lines to the graph of

$$f(x) = \frac{x + 1}{x - 1}$$

that are parallel to the line $2y + x = 6$. Then graph the function and the tangent lines.

80. Tangent Lines Find equations of the tangent lines to the graph of $f(x) = x/(x - 1)$ that pass through the point $(-1, 5)$. Then graph the function and the tangent lines.

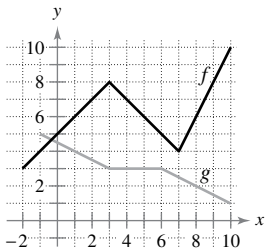
Exploring a Relationship **In Exercises 81 and 82, verify that $f'(x) = g'(x)$ and explain the relationship between f and g.**

81. $f(x) = \dfrac{3x}{x + 2}, \quad g(x) = \dfrac{5x + 4}{x + 2}$

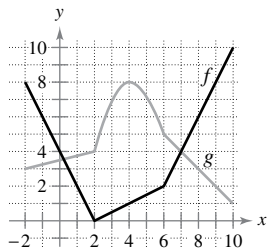
82. $f(x) = \dfrac{\sin x - 3x}{x}, \quad g(x) = \dfrac{\sin x + 2x}{x}$

Finding Derivatives **In Exercises 83 and 84, use the graphs of f and g. Let $p(x) = f(x)g(x)$ and $q(x) = f(x)/g(x)$.**

83. (a) Find $p'(1)$.
(b) Find $q'(4)$.



84. (a) Find $p'(4)$.
(b) Find $q'(7)$.



85. Area The length of a rectangle is given by $6t + 5$ and its height is $\sqrt{t}$, where t is time in seconds and the dimensions are in centimeters. Find the rate of change of the area with respect to time.

86. Volume The radius of a right circular cylinder is given by $\sqrt{t + 2}$ and its height is $\frac{1}{2}\sqrt{t}$, where t is time in seconds and the dimensions are in inches. Find the rate of change of the volume with respect to time.

87. Inventory Management The ordering and transportation cost C for the components used in manufacturing a product is

$$C = 100\left(\frac{200}{x^2} + \frac{x}{x + 30}\right), \quad x \geq 1$$

where C is measured in thousands of dollars and x is the order size in hundreds. Find the rate of change of C with respect to x when (a) $x = 10$, (b) $x = 15$, and (c) $x = 20$. What do these rates of change imply about increasing order size?

88. Biology A population of 500 bacteria is introduced into a culture and grows in number according to the equation

$$P(t) = 500\left(1 + \frac{4t}{50 + t^2}\right)$$

where t is measured in hours. Find the rate at which the population is growing when $t = 2$.

89. Proof Prove each differentiation rule.

(a) $\frac{d}{dx}[\sec x] = \sec x \tan x$

(b) $\frac{d}{dx}[\csc x] = -\csc x \cot x$

(c) $\frac{d}{dx}[\cot x] = -\csc^2 x$

90. Rate of Change Determine whether there exist any values of x in the interval $[0, 2\pi)$ such that the rate of change of $f(x) = \sec x$ and the rate of change of $g(x) = \csc x$ are equal.

91. Modeling Data The table shows the national health care expenditures h (in billions of dollars) in the United States and the population p (in millions) of the United States for the years 2014 through 2019. The year is represented by t, with $t = 14$ corresponding to 2014. *(Source: U.S. Centers for Medicare & Medicaid Services and U.S. Census Bureau)*

Year, t	14	15	16	17	18	19
h	3008	3178	3325	3466	3630	3795
p	319	321	323	326	327	328

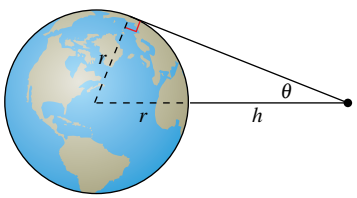
(a) Use a graphing utility to find linear models for the health care expenditures $h(t)$ and the population $p(t)$.

(b) Use a graphing utility to graph $h(t)$ and $p(t)$.

(c) Find $A = h(t)/p(t)$, then graph A using a graphing utility. What does this function represent?

(d) Find and interpret $A'(t)$ in the context of the problem.

92. Satellites When satellites observe Earth, they can scan only part of Earth's surface. Some satellites have sensors that can measure the angle θ shown in the figure. Let h represent the satellite's distance from Earth's surface, and let r represent Earth's radius.



(a) Show that $h = r(\csc \theta - 1)$.

(b) Find the rate at which h is changing with respect to θ when $\theta = 30°$. (Assume $r = 4000$ miles.)

Finding a Second Derivative **In Exercises 93–102, find the second derivative of the function.**

93. $f(x) = x^2 + 7x - 4$

94. $f(x) = 4x^5 - 2x^3 + 5x^2$

95. $f(x) = 4x^{3/2}$

96. $f(x) = x^2 + 3x^{-3}$

97. $f(x) = \frac{x}{x-1}$

98. $f(x) = \frac{x^2 + 3x}{x - 4}$

99. $f(x) = x \sin x$

100. $f(x) = x \cos x$

101. $f(x) = \csc x$

102. $f(x) = \sec x$

Finding a Higher-Order Derivative **In Exercises 103–106, find the indicated higher-order derivative.**

103. $f'(x) = x^3 - x^{2/5}, \quad f^{(3)}(x)$

104. $f^{(3)}(x) = \sqrt[5]{x^4}, \quad f^{(4)}(x)$

105. $f''(x) = -\sin x, \quad f^{(8)}(x)$

106. $f^{(4)}(t) = t \cos t, \quad f^{(5)}(t)$

Using Relationships **In Exercises 107–110, use the given information to find $f'(2)$.**

$g(2) = 3$ **and** $g'(2) = -2$

$h(2) = -1$ **and** $h'(2) = 4$

107. $f(x) = 2g(x) + h(x)$

108. $f(x) = 4 - h(x)$

109. $f(x) = \frac{g(x)}{h(x)}$

110. $f(x) = g(x)h(x)$

Exploring Concepts

111. Polynomials of what degree satisfy $f^{(n)} = 0$? Explain your reasoning.

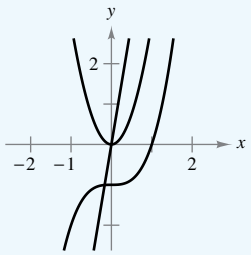
112. Describe how to differentiate a piecewise function. Use your approach to find the first and second derivatives of

$f(x) = x|x|$.

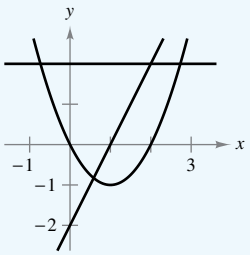
Explain why $f''(0)$ does not exist.

In Exercises 113 and 114, the graphs of f, f', and f'' are shown on the same set of coordinate axes. Identify each graph. Explain your reasoning. To print an enlarged copy of the graph, go to *MathGraphs.com*.

113.

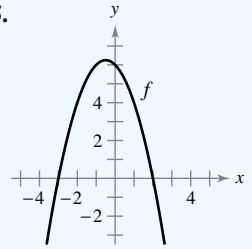


114.



In Exercises 115 and 116, the graph of f is shown. Sketch the graphs of f' and f''. To print an enlarged copy of the graph, go to *MathGraphs.com*.

115.



116.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

117. Sketching a Graph Sketch the graph of a differentiable function f such that $f(2) = 0$, $f' < 0$ for $-\infty < x < 2$, and $f' > 0$ for $2 < x < \infty$. Explain how you found your answer.

118. Sketching a Graph Sketch the graph of a differentiable function f such that $f > 0$ and $f' < 0$ for all real numbers x. Explain how you found your answer.

119. Acceleration The velocity of an object is

$$v(t) = 36 - t^2, \quad 0 \le t \le 6$$

where v is measured in meters per second and t is the time in seconds. Find the velocity and acceleration of the object when $t = 3$. What can be said about the speed of the object when the velocity and acceleration have opposite signs?

120. Acceleration The velocity of an automobile starting from rest is

$$v(t) = \frac{100t}{2t + 15}$$

where v is measured in feet per second and t is the time in seconds. Find the acceleration at (a) 5 seconds, (b) 10 seconds, and (c) 20 seconds.

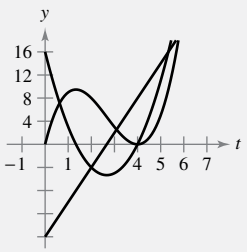
121. Stopping Distance A car is traveling at a rate of 66 feet per second (45 miles per hour) when the brakes are applied. The position function for the car is

$$s(t) = -8.25t^2 + 66t$$

where s is measured in feet and t is measured in seconds. Use this function to complete the table and find the average velocity during each time interval.

t	0	1	2	3	4
$s(t)$					
$v(t)$					
$a(t)$					

122. HOW DO YOU SEE IT? The figure shows the graphs of the position, velocity, and acceleration functions of a particle.



(a) Copy the graphs of the functions shown. Identify each graph. Explain your reasoning. To print an enlarged copy of the graph, go to *MathGraphs.com*.

(b) On your sketch, identify when the particle speeds up and when it slows down. Explain your reasoning.

Finding a Pattern **In Exercises 123 and 124, develop a general rule for $f^{(n)}(x)$ given $f(x)$.**

123. $f(x) = x^n$

124. $f(x) = \frac{1}{x}$

125. Finding a Pattern Consider the function $f(x) = g(x)h(x)$.

(a) Use the Product Rule to generate rules for finding $f''(x)$, $f'''(x)$, and $f^{(4)}(x)$.

(b) Use the results of part (a) to write a general rule for $f^{(n)}(x)$.

126. Finding a Pattern Develop a general rule for the nth derivative of $xf(x)$, where f is a differentiable function of x.

Finding a Pattern **In Exercises 127 and 128, find the derivatives of the function f for $n = 1$, 2, 3, and 4. Use the results to write a general rule for $f'(x)$ in terms of n.**

127. $f(x) = x^n \sin x$

128. $f(x) = \frac{\cos x}{x^n}$

Differential Equations **In Exercises 129–132, verify that the function satisfies the differential equation. (A *differential equation* in x and y is an equation that involves x, y, and derivatives of y.)**

	Function	Differential Equation
129.	$y = \frac{1}{x}, x > 0$	$x^3y'' + 2x^2y' = 0$
130.	$y = 2x^3 - 6x + 10$	$-y''' - xy'' - 2y' = -24x^2$
131.	$y = 2 \sin x + 3$	$y'' + y = 3$
132.	$y = 3 \cos x + \sin x$	$y'' + y = 0$

True or False? **In Exercises 133–138, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

133. If $h(x) = f(x)g(x)$, then $h'(x) = f'(x)g'(x)$.

134. If $h(x) = (x + 1)(x + 2)(x + 3)(x + 4)$, then $h^{(5)}(x) = 0$.

135. If $f'(c)$ and $g'(c)$ are zero and $h(x) = f(x)g(x)$, then $h'(c) = 0$.

136. If the position function of an object is linear, then its acceleration is zero.

137. The second derivative represents the rate of change of the first derivative.

138. The function $f(x) = \sin x + c$ satisfies $f^{(n)} = f^{(n+4)}$ for all integers $n \ge 1$.

139. Proof Use the Product Rule twice to prove that if f, g, and h are differentiable functions of x, then

$$\frac{d}{dx}[f(x)g(x)h(x)] = f'(x)g(x)h(x) + f(x)g'(x)h(x) + f(x)g(x)h'(x).$$

140. Think About It Let f and g be functions whose first and second derivatives exist on an interval I. Determine whether each formula is true.

(a) $fg'' - f''g = (fg' - f'g)'$

(b) $fg'' + f''g = (fg)''$

2.4 The Chain Rule

GO DIGITAL

- Find the derivative of a composite function using the Chain Rule.
- Find the derivative of a function using the General Power Rule.
- Simplify the derivative of a function using algebra.
- Find the derivative of a trigonometric function using the Chain Rule.

The Chain Rule

This text has yet to discuss one of the most powerful differentiation rules—the **Chain Rule.** This rule deals with composite functions and adds a surprising versatility to the rules discussed in the two preceding sections. For example, compare the functions shown below. Those on the left can be differentiated without the Chain Rule, and those on the right are best differentiated with the Chain Rule.

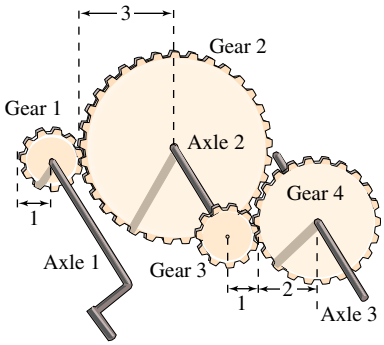
Without the Chain Rule	With the Chain Rule
$y = x^2 + 1$	$y = \sqrt{x^2 + 1}$
$y = \sin x$	$y = \sin 6x$
$y = 3x + 2$	$y = (3x + 2)^5$
$y = x + \tan x$	$y = x + \tan x^2$

Basically, the Chain Rule states that if y changes dy/du times as fast as u, and u changes du/dx times as fast as x, then y changes $(dy/du)(du/dx)$ times as fast as x.

EXAMPLE 1 The Derivative of a Composite Function

Figure 2.24 shows a set of gears. The second and third gears are on the same axle. As the first axle revolves, it drives the second axle, which in turn drives the third axle. Let y, u, and x represent the numbers of revolutions per minute of the first, second, and third axles, respectively. Find dy/du, du/dx, and dy/dx, and show that

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}.$$



Axle 1: y revolutions per minute
Axle 2: u revolutions per minute
Axle 3: x revolutions per minute
Figure 2.24

Solution Because the circumference of the second gear is three times that of the first, the first axle must make three revolutions to turn the second axle once. Similarly, the second axle must make two revolutions to turn the third axle once, so

$$\frac{dy}{du} = 3 \quad \text{and} \quad \frac{du}{dx} = 2.$$

Combining these two results, note that the first axle must make six revolutions to turn the third axle once. So, you can write

$$\begin{aligned} \frac{dy}{dx} &= \left[\begin{array}{l}\text{Rate of change of first axle}\\ \text{with respect to second axle}\end{array}\right] \cdot \left[\begin{array}{l}\text{Rate of change of second axle}\\ \text{with respect to third axle}\end{array}\right] \\ &= \frac{dy}{du} \cdot \frac{du}{dx} \\ &= 3 \cdot 2 \\ &= 6 \\ &= \left[\begin{array}{l}\text{Rate of change of first axle}\\ \text{with respect to third axle}\end{array}\right]. \end{aligned}$$

In other words, the rate of change of y with respect to x is the product of the rate of change of y with respect to u and the rate of change of u with respect to x. ■

Exploration

Using the Chain Rule Each function below can be differentiated using rules that you studied in Sections 2.2 and 2.3. For each function, find the derivative using those rules. Then find the derivative using the Chain Rule. Compare your results. Which method is simpler?

a. $y = \dfrac{2}{3x + 1}$

b. $y = (x + 2)^3$

c. $y = \sin 2x$

Example 1 illustrates a simple case of the Chain Rule. The general rule is stated in the next theorem.

THEOREM 2.10 The Chain Rule

If $y = f(u)$ is a differentiable function of u and $u = g(x)$ is a differentiable function of x, then $y = f(g(x))$ is a differentiable function of x and

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$$

or, equivalently,

$$\frac{d}{dx}[f(g(x))] = f'(g(x))g'(x).$$

Proof Let $h(x) = f(g(x))$. Then, using the alternative form of the derivative, you need to show that, for $x = c$,

$$h'(c) = f'(g(c))g'(c).$$

An important consideration in this proof is the behavior of g as x approaches c. A problem occurs when there are values of x, other than c, such that $g(x) = g(c)$. Appendix A shows how to use the differentiability of f and g to overcome this problem. For now, assume that $g(x) \neq g(c)$ for values of x other than c. In the proofs of the Product Rule and the Quotient Rule, the same quantity was added and subtracted to obtain the desired form. This proof uses a similar technique—multiplying and dividing by the same (nonzero) quantity. In this case, the quantity is $g(x) - g(c)$. Note that because g is differentiable, it is also continuous, and it follows that $g(x)$ approaches $g(c)$ as x approaches c.

$$\begin{aligned}
h'(c) &= \lim_{x \to c} \frac{f(g(x)) - f(g(c))}{x - c} && \text{Alternative form of derivative} \\
&= \lim_{x \to c} \left[\frac{f(g(x)) - f(g(c))}{x - c} \cdot \frac{g(x) - g(c)}{g(x) - g(c)} \right], \quad g(x) \neq g(c) \\
&= \lim_{x \to c} \left[\frac{f(g(x)) - f(g(c))}{g(x) - g(c)} \cdot \frac{g(x) - g(c)}{x - c} \right] \\
&= \left[\lim_{x \to c} \frac{f(g(x)) - f(g(c))}{g(x) - g(c)} \right] \left[\lim_{x \to c} \frac{g(x) - g(c)}{x - c} \right] \\
&\qquad \text{Definition of } f'(g(c)) \qquad \text{Definition of } g'(c) \\
&= f'(g(c))g'(c)
\end{aligned}$$

REMARK The alternative limit form of the derivative was given at the end of Section 2.1.

When applying the Chain Rule, it is helpful to think of the composite function $f \circ g$ as having two parts—an inner part and an outer part.

$$y = f(g(x)) = f(u)$$

Outer function

Inner function

The derivative of $y = f(u)$ is the derivative of the outer function (at the inner function u) *times* the derivative of the inner function.

$$y' = f'(u) \cdot u'$$

EXAMPLE 2 **Decomposition of a Composite Function**

	Original Function $y = f(g(x))$	Inner Function $u = g(x)$	Outer Function $y = f(u)$
a.	$y = \dfrac{1}{x+1}$	$u = x + 1$	$y = \dfrac{1}{u}$
b.	$y = \sin 2x$	$u = 2x$	$y = \sin u$
c.	$y = \sqrt{3x^2 - x + 1}$	$u = 3x^2 - x + 1$	$y = \sqrt{u}$
d.	$y = \tan^2 x$	$u = \tan x$	$y = u^2$

EXAMPLE 3 **Using the Chain Rule**

Find dy/dx for

$$y = (x^2 + 1)^3.$$

Solution For this function, let the inside function be $u = x^2 + 1$ and the outer function be $y = u^3$. By the Chain Rule, you obtain

$$\frac{dy}{dx} = \underbrace{3(x^2 + 1)^2}_{\frac{dy}{du}}\underbrace{(2x)}_{\frac{du}{dx}} = 6x(x^2 + 1)^2.$$

REMARK You could also solve the problem in Example 3 without using the Chain Rule by expanding the binomial to obtain

$$y = x^6 + 3x^4 + 3x^2 + 1$$

and then finding the derivative

$$y' = 6x^5 + 12x^3 + 6x.$$

Verify that this is the same as the derivative in Example 3. Which method would you use to find

$$\frac{d}{dx}[(x^2 + 1)^{50}]?$$

The General Power Rule

The function in Example 3 is an example of one of the most common types of composite functions, $y = [u(x)]^n$. The rule for differentiating such functions is called the **General Power Rule,** and it is a special case of the Chain Rule.

THEOREM 2.11 The General Power Rule

If $y = [u(x)]^n$, where u is a differentiable function of x and n is a rational number, then

$$\frac{dy}{dx} = n[u(x)]^{n-1}\frac{du}{dx}$$

or, equivalently,

$$\frac{d}{dx}[u^n] = nu^{n-1}u'.$$

Proof Because $y = [u(x)]^n = u^n$, you apply the Chain Rule to obtain

$$\frac{dy}{dx} = \left(\frac{dy}{du}\right)\left(\frac{du}{dx}\right) \quad \text{Apply Chain Rule.}$$

$$= \frac{d}{du}[u^n]\frac{du}{dx}.$$

By the (Simple) Power Rule in Section 2.2, you have $D_u[u^n] = nu^{n-1}$, and it follows that

$$\frac{dy}{dx} = nu^{n-1}\frac{du}{dx}. \quad \text{Apply (Simple) Power Rule.}$$

EXAMPLE 4 Applying the General Power Rule

Find the derivative of $f(x) = (3x - 2x^2)^3$.

Solution Let $u = 3x - 2x^2$. Then

$$f(x) = (3x - 2x^2)^3 = u^3$$

and, by the General Power Rule, the derivative is

$$f'(x) = \overbrace{3}^{n}\overbrace{(3x - 2x^2)^2}^{u^{n-1}}\overbrace{\frac{d}{dx}[3x - 2x^2]}^{u'} \qquad \text{Apply General Power Rule.}$$

$$= 3(3x - 2x^2)^2(3 - 4x). \qquad \text{Differentiate } 3x - 2x^2.$$

EXAMPLE 5 Differentiating a Function Involving a Radical

Find all points on the graph of

$$f(x) = \sqrt[3]{(x^2 - 1)^2}$$

for which $f'(x) = 0$ and those for which $f'(x)$ does not exist.

Solution Begin by rewriting the function in rational exponent form.

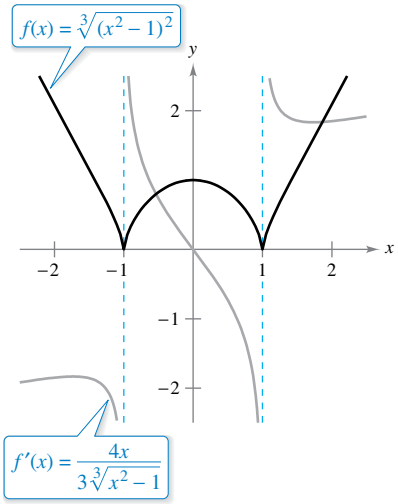
$$f(x) = (x^2 - 1)^{2/3} \qquad \text{Rewrite original function.}$$

Then, applying the General Power Rule (with $u = x^2 - 1$) produces

$$f'(x) = \overbrace{\frac{2}{3}}^{n}\overbrace{(x^2 - 1)^{-1/3}}^{u^{n-1}}\overbrace{(2x)}^{u'} \qquad \text{Apply General Power Rule.}$$

$$= \frac{4x}{3\sqrt[3]{x^2 - 1}}. \qquad \text{Write in radical form.}$$

So, $f'(x) = 0$ when $x = 0$, and $f'(x)$ does not exist when $x = \pm 1$, as shown in Figure 2.25.



The derivative of f is 0 at $x = 0$ and is undefined at $x = \pm 1$.
Figure 2.25

EXAMPLE 6 Differentiating a Quotient: Constant Numerator

Differentiate the function

$$g(t) = \frac{-7}{(2t - 3)^2}.$$

Solution Begin by rewriting the function with a negative exponent.

$$g(t) = -7(2t - 3)^{-2} \qquad \text{Rewrite original function.}$$

Then, applying the General Power Rule (with $u = 2t - 3$) produces

$$g'(t) = \underbrace{(-7)}_{\substack{\text{Constant}\\ \text{Multiple Rule}}}\overbrace{(-2)}^{n}\overbrace{(2t - 3)^{-3}}^{u^{n-1}}\overbrace{(2)}^{u'} \qquad \text{Apply General Power Rule.}$$

$$= 28(2t - 3)^{-3} \qquad \text{Simplify.}$$

$$= \frac{28}{(2t - 3)^3}. \qquad \text{Write with positive exponent.}$$

REMARK Try differentiating the function in Example 6 using the Quotient Rule. You should obtain the same result, but using the Quotient Rule is less efficient than using the General Power Rule.

Simplifying Derivatives

The next three examples demonstrate techniques for simplifying the "raw derivatives" of functions involving products, quotients, and composites.

EXAMPLE 7 Simplifying by Factoring Out the Least Power

Find the derivative of $f(x) = x^2\sqrt{1 - x^2}$.

Solution

$$f(x) = x^2\sqrt{1 - x^2}$$ Write original function.

$$= x^2(1 - x^2)^{1/2}$$ Rewrite.

$$f'(x) = x^2\frac{d}{dx}[(1 - x^2)^{1/2}] + (1 - x^2)^{1/2}\frac{d}{dx}[x^2]$$ Product Rule

$$= x^2\left[\frac{1}{2}(1 - x^2)^{-1/2}(-2x)\right] + (1 - x^2)^{1/2}(2x)$$ General Power Rule

$$= -x^3(1 - x^2)^{-1/2} + 2x(1 - x^2)^{1/2}$$ Simplify.

$$= x(1 - x^2)^{-1/2}[-x^2(1) + 2(1 - x^2)]$$ Factor.

$$= x(1 - x^2)^{-1/2}(2 - 3x^2)$$ Simplify.

$$= \frac{x(2 - 3x^2)}{\sqrt{1 - x^2}}$$ Write in radical form.

REMARK In Example 7, note that you subtract exponents when factoring. That is, when $(1 - x^2)^{-1/2}$ is factored out of $(1 - x^2)^{1/2}$, the *remaining* factor has an exponent of $\frac{1}{2} - \left(-\frac{1}{2}\right) = 1$. So, $(1 - x^2)^{1/2}$ is equal to the product of $(1 - x^2)^{-1/2}$ and $(1 - x^2)^1$.

EXAMPLE 8 Simplifying the Derivative of a Quotient

$$f(x) = \frac{x}{\sqrt[3]{x^2 + 4}}$$ Original function

$$= \frac{x}{(x^2 + 4)^{1/3}}$$ Rewrite.

$$f'(x) = \frac{(x^2 + 4)^{1/3}(1) - x(1/3)(x^2 + 4)^{-2/3}(2x)}{(x^2 + 4)^{2/3}}$$ Quotient Rule

$$= \frac{1}{3}(x^2 + 4)^{-2/3}\left[\frac{3(x^2 + 4) - (2x^2)(1)}{(x^2 + 4)^{2/3}}\right]$$ Factor.

$$= \frac{x^2 + 12}{3(x^2 + 4)^{4/3}}$$ Simplify.

TECHNOLOGY Some graphing utilities are capable of differentiating very complicated functions. Often, however, the result is given in unsimplified form. If you have access to such a utility, use it to find the derivatives of the functions given in Examples 7, 8, and 9. Then compare the results with those given in these examples.

EXAMPLE 9 Simplifying the Derivative of a Power

See LarsonCalculus.com for an interactive version of this type of example.

$$y = \left(\frac{3x - 1}{x^2 + 3}\right)^2$$ Original function

$$y' = \overset{n}{2}\overbrace{\left(\frac{3x - 1}{x^2 + 3}\right)}^{u^{n-1}}\overbrace{\frac{d}{dx}\left[\frac{3x - 1}{x^2 + 3}\right]}^{u'}$$ General Power Rule

$$= \left[\frac{2(3x - 1)}{x^2 + 3}\right]\left[\frac{(x^2 + 3)(3) - (3x - 1)(2x)}{(x^2 + 3)^2}\right]$$ Quotient Rule

$$= \frac{2(3x - 1)(3x^2 + 9 - 6x^2 + 2x)}{(x^2 + 3)^3}$$ Multiply.

$$= \frac{2(3x - 1)(-3x^2 + 2x + 9)}{(x^2 + 3)^3}$$ Simplify.

Trigonometric Functions and the Chain Rule

The "Chain Rule versions" of the derivatives of the six trigonometric functions are shown below.

$$\frac{d}{dx}[\sin u] = (\cos u)u' \qquad \frac{d}{dx}[\cos u] = -(\sin u)u'$$

$$\frac{d}{dx}[\tan u] = (\sec^2 u)u' \qquad \frac{d}{dx}[\cot u] = -(\csc^2 u)u'$$

$$\frac{d}{dx}[\sec u] = (\sec u \tan u)u' \qquad \frac{d}{dx}[\csc u] = -(\csc u \cot u)u'$$

EXAMPLE 10 The Chain Rule and Trigonometric Functions

a. $y = \sin 2x$ $\qquad y' = \cos 2x \dfrac{d}{dx}[2x] = (\cos 2x)(2) = 2\cos 2x$

b. $y = \cos(x - 1)$ $\qquad y' = -\sin(x - 1)\dfrac{d}{dx}[x - 1] = -\sin(x - 1)$

c. $y = \tan 3x$ $\qquad y' = \sec^2 3x \dfrac{d}{dx}[3x] = (\sec^2 3x)(3) = 3\sec^2 3x$

Be sure you understand the mathematical conventions regarding parentheses and trigonometric functions. For instance, in Example 10(a), $\sin 2x$ is written to mean $\sin(2x)$.

EXAMPLE 11 Parentheses and Trigonometric Functions

a. $y = \cos 3x^2 = \cos(3x^2)$ $\qquad y' = (-\sin 3x^2)(6x) = -6x \sin 3x^2$

b. $y = (\cos 3)x^2$ $\qquad y' = (\cos 3)(2x) = 2x \cos 3$

c. $y = \cos(3x)^2 = \cos(9x^2)$ $\qquad y' = (-\sin 9x^2)(18x) = -18x \sin 9x^2$

d. $y = \cos^2 x = (\cos x)^2$ $\qquad y' = 2(\cos x)(-\sin x) = -2\cos x \sin x$

e. $y = \sqrt{\cos x} = (\cos x)^{1/2}$ $\qquad y' = \dfrac{1}{2}(\cos x)^{-1/2}(-\sin x) = -\dfrac{\sin x}{2\sqrt{\cos x}}$

REMARK Another way to write the derivative in Example 11(d) is to use the double angle identity, $2 \sin x \cos x = \sin 2x$. Applying this identity, the result is

$$\begin{aligned} y' &= -2 \cos x \sin x \\ &= -(2 \sin x \cos x) \\ &= -\sin 2x. \end{aligned}$$

To find the derivative of a function of the form $k(x) = f(g(h(x)))$, you need to apply the Chain Rule twice, as shown in Example 12.

EXAMPLE 12 Repeated Application of the Chain Rule

$$\begin{aligned} f(t) &= \sin^3 4t && \text{Original function} \\ &= (\sin 4t)^3 && \text{Rewrite.} \\ f'(t) &= 3(\sin 4t)^2 \frac{d}{dt}[\sin 4t] && \text{Apply Chain Rule once.} \\ &= 3(\sin 4t)^2(\cos 4t)\frac{d}{dt}[4t] && \text{Apply Chain Rule a second time.} \\ &= 3(\sin 4t)^2(\cos 4t)(4) \\ &= 12 \sin^2 4t \cos 4t && \text{Simplify.} \end{aligned}$$

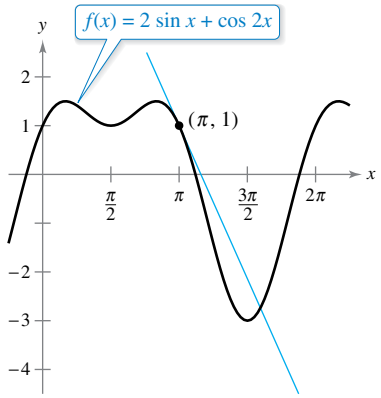

Figure 2.26

EXAMPLE 13 Tangent Line of a Trigonometric Function

Find an equation of the tangent line to the graph of $f(x) = 2 \sin x + \cos 2x$ at the point $(\pi, 1)$, as shown in Figure 2.26. Then determine all values of x in the interval $(0, 2\pi)$ at which the graph of f has a horizontal tangent.

Solution Begin by finding $f'(x)$.

$$f(x) = 2 \sin x + \cos 2x \qquad \text{Write original function.}$$
$$f'(x) = 2 \cos x + (-\sin 2x)(2) \qquad \text{Apply Chain Rule to } \cos 2x.$$
$$= 2 \cos x - 2 \sin 2x \qquad \text{Simplify.}$$

To find the slope of the tangent line at $(\pi, 1)$, evaluate $f'(\pi)$.

$$f'(\pi) = 2 \cos \pi - 2 \sin 2\pi \qquad \text{Substitute.}$$
$$= -2 \qquad \text{Slope of tangent line at } (\pi, 1)$$

Now, use the point-slope form of the equation of a line to write

$$y - y_1 = m(x - x_1) \qquad \text{Point-slope form}$$
$$y - 1 = -2(x - \pi) \qquad \text{Substitute for } y_1, m, \text{ and } x_1.$$
$$y = -2x + 1 + 2\pi. \qquad \text{Equation of tangent line at } (\pi, 1)$$

Note that $f'(x) = 0$ in the interval $(0, 2\pi)$ when $x = \pi/6, \pi/2, 5\pi/6$, and $3\pi/2$. So, the graph of f has horizontal tangents at $x = \pi/6, \pi/2, 5\pi/6$, and $3\pi/2$. ■

GO DIGITAL

This section concludes with a summary of the differentiation rules studied so far. To become skilled at differentiation, you should learn each rule in words, not symbols. As an aid to memorization, note that the cofunctions (cosine, cotangent, and cosecant) require a negative sign as part of their derivatives.

Summary of Differentiation Rules

General Differentiation Rules

Let c be a real number, let n be a rational number, let u and v be differentiable functions of x, and let f be a differentiable function of u.

Constant Rule:

$$\frac{d}{dx}[c] = 0$$

(Simple) Power Rule:

$$\frac{d}{dx}[x^n] = nx^{n-1}, \quad \frac{d}{dx}[x] = 1$$

Constant Multiple Rule:

$$\frac{d}{dx}[cu] = cu'$$

Sum or Difference Rule:

$$\frac{d}{dx}[u \pm v] = u' \pm v'$$

Product Rule:

$$\frac{d}{dx}[uv] = uv' + vu'$$

Quotient Rule:

$$\frac{d}{dx}\left[\frac{u}{v}\right] = \frac{vu' - uv'}{v^2}$$

Chain Rule:

$$\frac{d}{dx}[f(u)] = f'(u)u'$$

General Power Rule:

$$\frac{d}{dx}[u^n] = nu^{n-1}u'$$

Derivatives of Trigonometric Functions

$$\frac{d}{dx}[\sin x] = \cos x \qquad \frac{d}{dx}[\tan x] = \sec^2 x \qquad \frac{d}{dx}[\sec x] = \sec x \tan x$$

$$\frac{d}{dx}[\cos x] = -\sin x \qquad \frac{d}{dx}[\cot x] = -\csc^2 x \qquad \frac{d}{dx}[\csc x] = -\csc x \cot x$$

2.4 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain how to find the derivative of the composition of two differentiable functions.
2. Explain the difference between the (Simple) Power Rule and the General Power Rule.

Decomposition of a Composite Function

In Exercises 3–8, complete the table.

$y = f(g(x))$	$u = g(x)$	$y = f(u)$
3. $y = (6x - 5)^4$		
4. $y = \sqrt[3]{4x + 3}$		
5. $y = \dfrac{1}{3x + 5}$		
6. $y = \dfrac{2}{\sqrt{x^2 + 10}}$		
7. $y = \csc^3 x$		
8. $y = \sin\dfrac{5x}{2}$		

Finding a Derivative

In Exercises 9–34, find the derivative of the function.

9. $y = (2x - 7)^3$
10. $y = 5(2 - x^3)^4$
11. $g(x) = 3(4 - 9x)^{5/6}$
12. $f(t) = (9t + 2)^{2/3}$
13. $h(s) = -2\sqrt{5s^2 + 3}$
14. $g(x) = \sqrt{4 - 3x^2}$
15. $y = \sqrt[3]{6x^2 + 1}$
16. $y = 2\sqrt[4]{9 - x^2}$
17. $y = \dfrac{1}{x - 2}$
18. $s(t) = \dfrac{1}{4 - 5t - t^2}$
19. $g(s) = \dfrac{6}{(s^3 - 2)^3}$
20. $y = -\dfrac{3}{(t - 2)^4}$
21. $y = \dfrac{1}{\sqrt{3x + 5}}$
22. $g(t) = \dfrac{1}{\sqrt{t^2 - 2}}$
23. $f(x) = x^2(x - 2)^7$
24. $f(x) = x(2x - 5)^3$
25. $y = x\sqrt{1 - x^2}$
26. $y = x^2\sqrt{16 - x^2}$
27. $y = \dfrac{x}{\sqrt{x^2 + 1}}$
28. $y = \dfrac{x}{\sqrt{x^4 + 4}}$
29. $g(x) = \left(\dfrac{x + 5}{x^2 + 2}\right)^2$
30. $h(t) = \left(\dfrac{t^2}{t^3 + 2}\right)^2$
31. $s(t) = \left(\dfrac{1 + t}{t + 3}\right)^4$
32. $g(x) = \left(\dfrac{3x^2 - 2}{2x + 3}\right)^{-2}$
33. $f(x) = ((x^2 + 3)^5 + x)^2$
34. $g(x) = (2 + (x^2 + 1)^4)^3$

Finding a Derivative of a Trigonometric Function

In Exercises 35–54, find the derivative of the trigonometric function.

35. $y = \cos 4x$
36. $y = \sin \pi x$
37. $g(x) = 5 \tan 3x$
38. $h(x) = \sec 6x$
39. $y = \sin(\pi x)^2$
40. $y = \csc(1 - 2x)^2$
41. $h(x) = \sin 2x \cos 2x$
42. $g(\theta) = \sec\left(\frac{1}{2}\theta\right)\tan\left(\frac{1}{2}\theta\right)$
43. $f(x) = \dfrac{\cot x}{\sin x}$
44. $g(v) = \dfrac{\cos v}{\csc v}$
45. $y = 4 \sec^2 x$
46. $g(t) = 5 \cos^2 \pi t$
47. $f(\theta) = \frac{1}{4}\sin^2 2\theta$
48. $h(t) = 2 \cot^2(\pi t + 2)$
49. $f(t) = 3 \sec(\pi t - 1)^2$
50. $y = 5 \cos(\pi x)^2$
51. $y = \sin(3x^2 + \cos x)$
52. $y = \cos(5x + \csc x)$
53. $y = \sin\sqrt{\cot 3\pi x}$
54. $y = \cos\sqrt{\sin(\tan \pi x)}$

Finding a Derivative Using Technology

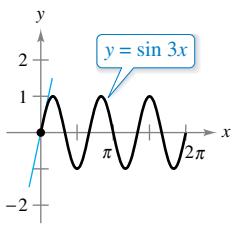
In Exercises 55–58, use a computer algebra system to find the derivative of the function. Then use the utility to graph the function and its derivative on the same set of coordinate axes. Describe the behavior of the function that corresponds to any zeros of the graph of the derivative.

55. $y = \dfrac{\sqrt{x} + 1}{x^2 + 1}$
56. $y = \sqrt{\dfrac{2x}{x + 1}}$
57. $y = \dfrac{\cos \pi x + 1}{x}$
58. $y = x^2 \tan\dfrac{1}{x}$

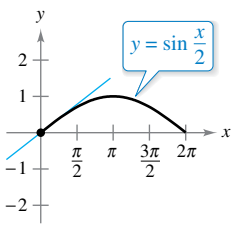
Slope of a Tangent Line

In Exercises 59 and 60, find the slope of the tangent line to the sine function at the origin. Compare this value with the number of complete cycles in the interval $[0, 2\pi]$.

59.



60.



Finding the Slope of a Graph

In Exercises 61–68, find the slope of the graph of the function at the given point. Use the *derivative* feature of a graphing utility to confirm your results.

61. $y = \sqrt{x^2 + 8x}$, $(1, 3)$
62. $y = \sqrt[5]{3x^3 + 4x}$, $(2, 2)$
63. $f(x) = 5(x^3 - 2)^{-1}$, $\left(-2, -\frac{1}{2}\right)$
64. $f(x) = \dfrac{1}{(x^2 - 3x)^2}$, $\left(4, \dfrac{1}{16}\right)$
65. $y = \dfrac{4}{(x + 2)^2}$, $(0, 1)$
66. $y = \dfrac{4}{(x^2 - 2x)^3}$, $(1, -4)$
67. $y = 26 - \sec^3 4x$, $(0, 25)$
68. $y = \dfrac{1}{x} + \sqrt{\cos x}$, $\left(\dfrac{\pi}{2}, \dfrac{2}{\pi}\right)$

Finding an Equation of a Tangent Line **In Exercises 69–76, (a) find an equation of the tangent line to the graph of the function at the given point, (b) sketch a graph of the function and its tangent line at the point, and (c) use the *tangent* feature of a graphing utility to confirm your results.**

69. $f(x) = \sqrt{2x^2 - 7}$, $(4, 5)$

70. $f(x) = \frac{1}{3}x\sqrt{x^2 + 5}$, $(2, 2)$

71. $y = (4x^3 + 3)^2$, $(-1, 1)$

72. $f(x) = (9 - x^2)^{2/3}$, $(1, 4)$

73. $f(x) = \sin 8x$, $(\pi, 0)$

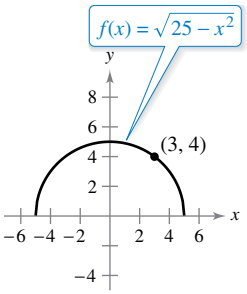
74. $y = \cos 3x$, $\left(\frac{\pi}{4}, -\frac{\sqrt{2}}{2}\right)$

75. $f(x) = \tan^2 x$, $\left(\frac{\pi}{4}, 1\right)$

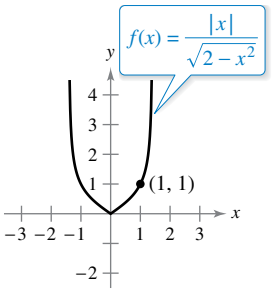
76. $y = 2\tan^3 x$, $\left(\frac{\pi}{4}, 2\right)$

Famous Curves **In Exercises 77 and 78, find an equation of the tangent line to the graph at the given point. Then use a graphing utility to graph the function and its tangent line at the point in the same viewing window.**

77. Semicircle



78. Bullet-nose curve



79. Horizontal Tangent Line Determine the point(s) in the interval $(0, 2\pi)$ at which the graph of $f(x) = 2\cos x + \sin 2x$ has a horizontal tangent.

80. Horizontal Tangent Line Determine the point(s) at which the graph of

$$f(x) = \frac{-4x}{\sqrt{2x - 1}}$$

has a horizontal tangent.

Finding a Second Derivative **In Exercises 81–86, find the second derivative of the function.**

81. $f(x) = 5(2 - 7x)^4$

82. $f(x) = 6(x^3 + 4)^3$

83. $f(x) = \frac{1}{11x - 6}$

84. $f(x) = \frac{8}{(x - 2)^2}$

85. $f(x) = \sin x^2$

86. $f(x) = \sec^2 \pi x$

Evaluating a Second Derivative **In Exercises 87–92, evaluate the second derivative of the function at the given point. Use a computer algebra system to verify your result.**

87. $h(x) = \frac{1}{9}(3x + 1)^3$, $\left(1, \frac{64}{9}\right)$

88. $h(t) = (2t^3 + 3)^2$, $(1, 25)$

89. $g(x) = 3\sqrt{2x + 7}$, $(-3, 3)$

90. $f(x) = \frac{1}{\sqrt{x + 4}}$, $\left(0, \frac{1}{2}\right)$

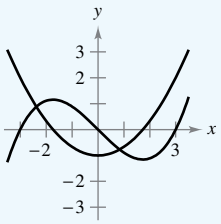
91. $f(x) = \cos x^2$, $(0, 1)$

92. $g(t) = \tan 2t$, $\left(\frac{\pi}{6}, \sqrt{3}\right)$

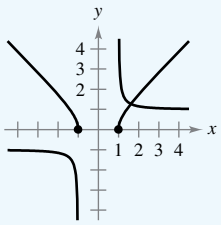
Exploring Checks

In Exercises 93 and 94, the graphs of a function f and its derivative f' are shown. Label the graphs as f or f' and write a short paragraph stating the criteria you used in making your selection. To print an enlarged copy of the graph, go to *MathGraphs.com*.

93.



94.



95. The relationship between f and g is given. Describe the relationship between f' and g'.

(a) $g(x) = f(3x)$ (b) $g(x) = f(x^2)$

96. Consider the function

$$r(x) = \frac{2x - 5}{(3x + 1)^2}.$$

(a) In general, how do you find the derivative of $h(x) = \frac{f(x)}{g(x)}$ using the Product Rule, where g is a composite function?

(b) Find $r'(x)$ using the Product Rule.

(c) Find $r'(x)$ using the Quotient Rule.

(d) Which method do you prefer? Explain.

97. Think About It The table shows some values of the derivative of an unknown function f. Complete the table by finding the derivative of each transformation of f, if possible.

(a) $g(x) = f(x) - 2$ (b) $h(x) = 2f(x)$

(c) $r(x) = f(-3x)$ (d) $s(x) = f(x + 2)$

x	-2	-1	0	1	2	3
$f'(x)$	4	$\frac{2}{3}$	$-\frac{1}{3}$	-1	-2	-4
$g'(x)$						
$h'(x)$						
$r'(x)$						
$s'(x)$						

98. Using Relationships Given that $g(5) = -3$, $g'(5) = 6$, $h(5) = 3$, and $h'(5) = -2$, find $f'(5)$ for each of the following, if possible. If it is not possible, state what additional information is required.

(a) $f(x) = g(x)h(x)$ (b) $f(x) = g(h(x))$

(c) $f(x) = \frac{g(x)}{h(x)}$ (d) $f(x) = [g(x)]^3$

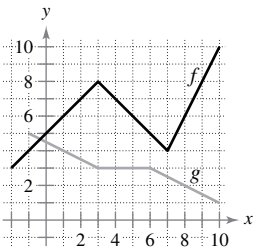
Finding Derivatives **In Exercises 99 and 100, the graphs of f and g are shown. Let $h(x) = f(g(x))$ and $s(x) = g(f(x))$. Find each derivative, if it exists. If the derivative does not exist, explain why.**

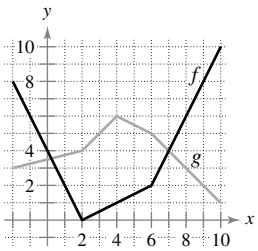
99. (a) Find $h'(1)$.

(b) Find $s'(5)$.



100. (a) Find $h'(3)$.

(b) Find $s'(9)$.



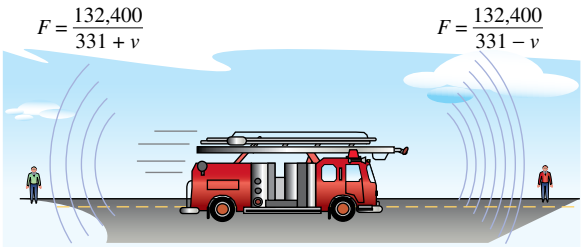
101. Doppler Effect The frequency F of a fire truck siren heard by a stationary observer is

$$F = \frac{132{,}400}{331 \pm v}$$

where $\pm v$ represents the velocity of the accelerating fire truck in meters per second (see figure). Find the rate of change of F with respect to v when

(a) the fire truck is approaching at a velocity of 30 meters per second (use $-v$).

(b) the fire truck is moving away at a velocity of 30 meters per second (use $+ v$).



102. Harmonic Motion The displacement from equilibrium of an object in harmonic motion on the end of a spring is

$$y = \frac{1}{3}\cos 12t - \frac{1}{4}\sin 12t$$

where y is measured in feet and t is the time in seconds. Determine the position and velocity of the object when $t = \pi/8$.

103. Pendulum A 15-centimeter pendulum moves according to the equation $\theta = 0.2 \cos 8t$, where θ is the angular displacement from the vertical in radians and t is the time in seconds. Determine the maximum angular displacement and the rate of change of θ when $t = 3$ seconds.

104. Wave Motion A buoy oscillates in simple harmonic motion $y = A \cos \omega t$ as waves move past it. The buoy moves a total of 3.5 feet (vertically) from its low point to its high point. It returns to its high point every 10 seconds.

(a) Write an equation describing the motion of the buoy when it is at its high point at $t = 0$.

(b) Determine the velocity of the buoy as a function of t.

105. Modeling Data The normal daily maximum temperatures T (in degrees Fahrenheit) for Chicago, Illinois, are shown in the table. *(Source: National Oceanic and Atmospheric Administration)*

Month	Jan	Feb	Mar	Apr
Temperature	31.0	35.3	46.6	59.0

Month	May	Jun	Jul	Aug
Temperature	70.0	79.7	84.1	81.9

Month	Sep	Oct	Nov	Dec
Temperature	74.8	62.3	48.2	34.8

(a) Use a graphing utility to plot the data and find a model for the data of the form

$$T(t) = a + b \sin(ct - d)$$

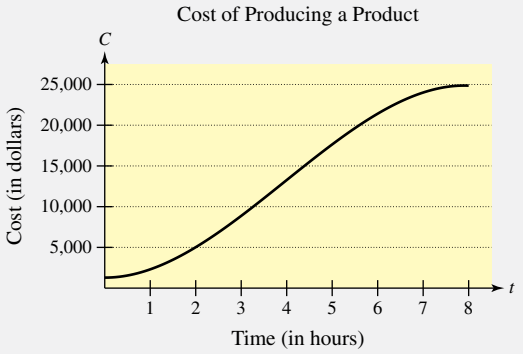
where T is the temperature and t is the time in months, with $t = 1$ corresponding to January.

(b) Use a graphing utility to graph the model. How well does the model fit the data?

(c) Find T' and use a graphing utility to graph T'.

(d) Based on the graph of T', during what times does the temperature change most rapidly? Most slowly? Do your answers agree with your observations of the temperature changes? Explain.

106. HOW DO YOU SEE IT? The cost C (in dollars) of producing x units of a product is $C = 60x + 1350$. For one week, management determined that the number of units produced x at the end of t hours can be modeled by $x = -1.6t^3 + 19t^2 - 0.5t - 1$. The graph shows the cost C in terms of the time t.



(a) Using the graph, which is greater, the rate of change of the cost after 1 hour or the rate of change of the cost after 4 hours?

(b) Explain why the cost function is not increasing at a constant rate during the eight-hour shift.

107. Biology

The number N of bacteria in a culture after t days is modeled by

$$N = 400\left[1 - \frac{3}{(t^2 + 2)^2}\right].$$

Find the rate of change of N with respect to t when (a) $t = 0$, (b) $t = 1$, (c) $t = 2$, (d) $t = 3$, and (e) $t = 4$. (f) What can you conclude?

Lotus_studio/Shutterstock.com

108. Depreciation The value V of a machine t years after it is purchased is inversely proportional to the square root of $t + 1$. The initial value of the machine is \$10,000.

(a) Write V as a function of t.

(b) Find the rate of depreciation when $t = 1$.

(c) Find the rate of depreciation when $t = 3$.

109. Finding a Pattern Consider the function $f(x) = \sin \beta x$, where β is a constant.

(a) Find the first-, second-, third-, and fourth-order derivatives of the function.

(b) Verify that the function and its second derivative satisfy the equation $f''(x) + \beta^2 f(x) = 0$.

(c) Use the results of part (a) to write general rules for the even- and odd-order derivatives $f^{(2k)}(x)$ and $f^{(2k-1)}(x)$.

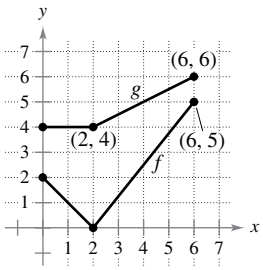
[*Hint:* $(-1)^k$ is positive if k is even and negative if k is odd.]

110. Think About It Let f be a differentiable function of period p.

(a) Is the function f' periodic? Verify your answer.

(b) Consider the function $g(x) = f(2x)$. Is the function $g'(x)$ periodic? Verify your answer.

111. Think About It Let $r(x) = f(g(x))$ and $s(x) = g(f(x))$, where f and g are shown in the figure. Find (a) $r'(1)$ and (b) $s'(4)$.



112. Using Trigonometric Functions

(a) Find the derivative of the function $g(x) = \sin^2 x + \cos^2 x$ in two ways.

(b) For $f(x) = \sec^2 x$ and $g(x) = \tan^2 x$, show that

$$f'(x) = g'(x).$$

113. Even and Odd Functions

(a) Show that the derivative of an odd function is even. That is, if $f(-x) = -f(x)$, then $f'(-x) = f'(x)$.

(b) Show that the derivative of an even function is odd. That is, if $f(-x) = f(x)$, then $f'(-x) = -f'(x)$.

114. Proof Let u be a differentiable function of x. Use the fact that $|u| = \sqrt{u^2}$ to prove that

$$\frac{d}{dx}[|u|] = u'\frac{u}{|u|}, \quad u \neq 0.$$

Using Absolute Value **In Exercises 115–118, use the result of Exercise 114 to find the derivative of the function.**

115. $g(x) = |3x - 5|$ **116.** $f(x) = |x^2 - 9|$

117. $h(x) = |x| \cos x$ **118.** $f(x) = |\sin x|$

Linear and Quadratic Approximations **The linear and quadratic approximations of a function f at $x = a$ are**

$$P_1(x) = f'(a)(x - a) + f(a) \quad \text{and}$$
$$P_2(x) = \tfrac{1}{2}f''(a)(x - a)^2 + f'(a)(x - a) + f(a).$$

In Exercises 119 and 120, (a) find the specified linear and quadratic approximations of f, (b) use a graphing utility to graph f and the approximations, (c) determine whether P_1 or P_2 is the better approximation, and (d) state how the accuracy changes as you move farther from $x = a$.

119. $f(x) = \tan x; \quad a = \frac{\pi}{4}$ **120.** $f(x) = \sec x; \quad a = \frac{\pi}{6}$

True or False? **In Exercises 121–124, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

121. The slope of the function $f(x) = \sin ax$ at the origin is a.

122. The slope of the function $f(x) = \cos bx$ at the origin is $-b$.

123. If y is a differentiable function of u, and u is a differentiable function of x, then y is a differentiable function of x.

124. If y is a differentiable function of u, u is a differentiable function of v, and v is a differentiable function of x, then

$$\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dv}\frac{dv}{dx}.$$

PUTNAM EXAM CHALLENGE

125. Let $f(x) = a_1 \sin x + a_2 \sin 2x + \cdots + a_n \sin nx$, where $a_1, a_2, \ldots, a_n$ are real numbers and where n is a positive integer. Given that $|f(x)| \leq |\sin x|$ for all real x, prove that $|a_1 + 2a_2 + \cdots + na_n| \leq 1$.

126. Let k be a fixed positive integer. The nth derivative of $\frac{1}{x^k - 1}$ has the form $\frac{P_n(x)}{(x^k - 1)^{n+1}}$ where $P_n(x)$ is a polynomial. Find $P_n(1)$.

2.5 Implicit Differentiation

GO DIGITAL

- **Distinguish between functions written in implicit form and explicit form.**
- **Use implicit differentiation to find the derivative of a function.**

Implicit and Explicit Functions

Up to this point in the text, most functions have been expressed in **explicit form.** For example, in the equation $y = 3x^2 - 5$, the variable y is explicitly written as a function of x. Some functions, however, are only implied by an equation. For instance, the function $y = 1/x$ is defined **implicitly** by the equation

$$xy = 1. \qquad \text{Implicit form}$$

To find dy/dx for this equation, you can write y explicitly as a function of x and then differentiate.

Implicit Form	Explicit Form	Derivative
$xy = 1$	$y = \frac{1}{x} = x^{-1}$	$\frac{dy}{dx} = -x^{-2} = -\frac{1}{x^2}$

This strategy works whenever you can solve for the function explicitly. You cannot, however, use this procedure when you are unable to solve for y as a function of x. For instance, how would you find dy/dx for the equation

$$x^2 - 2y^3 + 4y = 2?$$

For this equation, it is difficult to express y as a function of x explicitly. To find dy/dx, you can use **implicit differentiation.**

To understand how to find dy/dx implicitly, you must realize that the differentiation is taking place *with respect to* x. This means that when you differentiate terms involving x alone, you can differentiate as usual. However, when you differentiate terms involving y, you must apply the Chain Rule, because you are assuming that y is defined implicitly as a differentiable function of x.

REMARK When finding a derivative implicitly, you may find it helpful to write the Leibniz notation before each term. So, for Example 1(c), you could write

$$\frac{d}{dx}[x + 3y] = \frac{d}{dx}[x] + \frac{d}{dx}[3y]$$
$$= 1 + 3\frac{dy}{dx}.$$

Note how this technique is used in Example 2.

EXAMPLE 1 Differentiating with Respect to x

a. $\frac{d}{dx}[x^3] = 3x^2$ — Variables agree: use Simple Power Rule.

Variables agree

b. $\frac{d}{dx}[y^3] = \overbrace{3y^2}^{nu^{n-1}}\overbrace{\frac{dy}{dx}}^{u'}$ — Variables disagree: use Chain Rule.

Variables disagree

c. $\frac{d}{dx}[x + 3y] = 1 + 3\frac{dy}{dx}$ — Chain Rule: $\frac{d}{dx}[3y] = 3y'$

d. $\frac{d}{dx}[xy^2] = x\frac{d}{dx}[y^2] + y^2\frac{d}{dx}[x]$ — Product Rule

$= x\left(2y\frac{dy}{dx}\right) + y^2(1)$ — Chain Rule

$= 2xy\frac{dy}{dx} + y^2$ — Simplify.

GO DIGITAL

Implicit Differentiation

Guidelines for Implicit Differentiation

1. Differentiate each side of the equation *with respect to* x.
2. Collect all terms involving dy/dx on the left side of the equation and move all other terms to the right side of the equation.
3. Factor dy/dx out of the left side of the equation.
4. Solve for dy/dx.

In Example 2, note that implicit differentiation can produce an expression for dy/dx that contains both x and y.

EXAMPLE 2 **Implicit Differentiation**

Find dy/dx given that $y^3 + y^2 - 5y - x^2 = -4$.

Solution

1. Differentiate each side of the equation with respect to x.

$$\frac{d}{dx}[y^3 + y^2 - 5y - x^2] = \frac{d}{dx}[-4]$$

$$\frac{d}{dx}[y^3] + \frac{d}{dx}[y^2] - \frac{d}{dx}[5y] - \frac{d}{dx}[x^2] = \frac{d}{dx}[-4]$$

$$3y^2\frac{dy}{dx} + 2y\frac{dy}{dx} - 5\frac{dy}{dx} - 2x = 0$$

2. Collect the dy/dx terms on the left side of the equation and move all other terms to the right side of the equation.

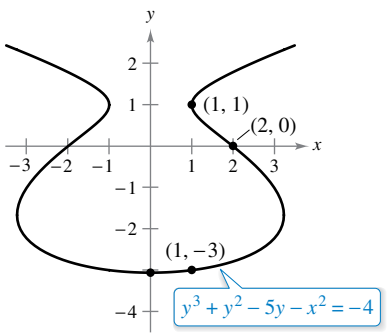
$$3y^2\frac{dy}{dx} + 2y\frac{dy}{dx} - 5\frac{dy}{dx} = 2x$$

3. Factor dy/dx out of the left side of the equation.

$$\frac{dy}{dx}(3y^2 + 2y - 5) = 2x$$

4. Solve for dy/dx by dividing by $(3y^2 + 2y - 5)$.

$$\frac{dy}{dx} = \frac{2x}{3y^2 + 2y - 5}$$



Point on Graph	Slope of Graph
$(2, 0)$	$-\frac{4}{5}$
$(1, -3)$	$\frac{1}{8}$
$x = 0$	0
$(1, 1)$	Undefined

The implicit equation

$$y^3 + y^2 - 5y - x^2 = -4$$

has the derivative

$$\frac{dy}{dx} = \frac{2x}{3y^2 + 2y - 5}.$$

Figure 2.27

To see how you can use an *implicit derivative*, consider the graph shown in Figure 2.27. From the graph, you can see that y is not a function of x. Even so, the derivative found in Example 2 gives a formula for the slope of the tangent line at a point on this graph. The slopes at several points on the graph are shown below the graph.

TECHNOLOGY Most graphing utilities can graph an equation that explicitly represents y as a function of x. Graphing other equations, however, may take some ingenuity. For instance, to graph the equation given in Example 2, use a graphing utility, set in *parametric* mode, to graph the parametric representations $x = \sqrt{t^3 + t^2 - 5t + 4}$, $y = t$, and $x = -\sqrt{t^3 + t^2 - 5t + 4}$, $y = t$, for $-5 \le t \le 5$. How does the result compare with the graph shown in Figure 2.27? (You will learn more about this type of representation when you study parametric equations in Section 10.2.)

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

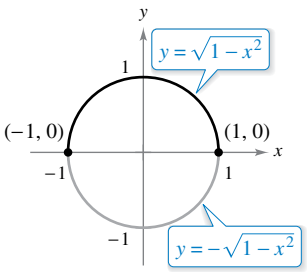
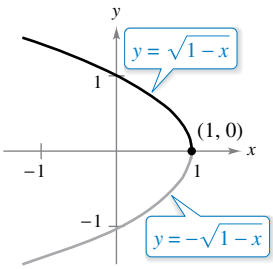
(a)



(b)



(c)

Some graph segments can be represented by differentiable functions.

Figure 2.28

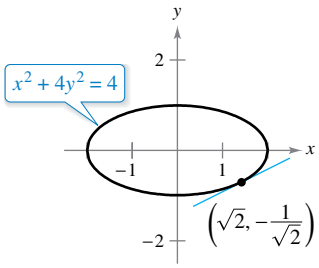


Figure 2.29

It is meaningless to solve for dy/dx in an equation that has no solution points. (For example, $x^2 + y^2 = -4$ has no solution points.) If, however, a segment of a graph can be represented by a differentiable function, then dy/dx will have meaning as the slope at each point on the segment. Recall that a function is not differentiable at (a) points with vertical tangents and (b) points at which the function is not continuous.

EXAMPLE 3 Graphs and Differentiable Functions

If possible, represent y as a differentiable function of x.

a. $x^2 + y^2 = 0$ **b.** $x^2 + y^2 = 1$ **c.** $x + y^2 = 1$

Solution

a. The graph of this equation is a single point. So, it does not define y as a differentiable function of x. See Figure 2.28(a).

b. The graph of this equation is the unit circle centered at $(0, 0)$. The upper semicircle is given by the differentiable function

$$y = \sqrt{1 - x^2}, \quad -1 < x < 1$$

and the lower semicircle is given by the differentiable function

$$y = -\sqrt{1 - x^2}, \quad -1 < x < 1.$$

At the points $(-1, 0)$ and $(1, 0)$, the slope of the graph is undefined. See Figure 2.28(b).

c. The upper half of this parabola is given by the differentiable function

$$y = \sqrt{1 - x}, \quad x < 1$$

and the lower half of this parabola is given by the differentiable function

$$y = -\sqrt{1 - x}, \quad x < 1.$$

At the point $(1, 0)$, the slope of the graph is undefined. See Figure 2.28(c).

EXAMPLE 4 Finding the Slope of a Graph Implicitly

See LarsonCalculus.com for an interactive version of this type of example.

Determine the slope of the tangent line to the graph of $x^2 + 4y^2 = 4$ at the point $\left(\sqrt{2}, -1/\sqrt{2}\right)$. See Figure 2.29.

Solution

$$x^2 + 4y^2 = 4 \qquad \text{Write original equation.}$$

$$2x + 8y\frac{dy}{dx} = 0 \qquad \text{Differentiate with respect to } x.$$

$$\frac{dy}{dx} = \frac{-2x}{8y} \qquad \text{Solve for } \frac{dy}{dx}.$$

$$= \frac{-x}{4y} \qquad \text{Simplify.}$$

So, at $\left(\sqrt{2}, -1/\sqrt{2}\right)$, the slope is

$$\frac{dy}{dx} = \frac{-\sqrt{2}}{-4/\sqrt{2}} = \frac{1}{2}. \qquad \text{Evaluate } \frac{dy}{dx} \text{ when } x = \sqrt{2} \text{ and } y = -\frac{1}{\sqrt{2}}.$$

GO DIGITAL

To see the benefit of implicit differentiation, try doing Example 4 using the explicit function $y = -\frac{1}{2}\sqrt{4 - x^2}$.

EXAMPLE 5 Finding the Slope of a Graph Implicitly

Determine the slope of the graph of $3(x^2 + y^2)^2 = 100xy$ at the point $(3, 1)$.

Solution

$$3(x^2 + y^2)^2 = 100xy$$ Write original equation.

$$\frac{d}{dx}[3(x^2 + y^2)^2] = \frac{d}{dx}[100xy]$$ Differentiate with respect to x.

$$3(2)(x^2 + y^2)\left(2x + 2y\frac{dy}{dx}\right) = 100\left[x\frac{dy}{dx} + y(1)\right]$$

$$12y(x^2 + y^2)\frac{dy}{dx} - 100x\frac{dy}{dx} = 100y - 12x(x^2 + y^2)$$ Collect terms.

$$[12y(x^2 + y^2) - 100x]\frac{dy}{dx} = 100y - 12x(x^2 + y^2)$$ Factor out $\frac{dy}{dx}$.

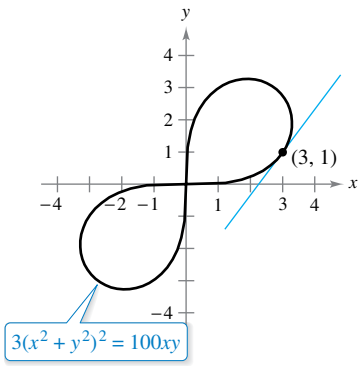
$$\frac{dy}{dx} = \frac{100y - 12x(x^2 + y^2)}{-100x + 12y(x^2 + y^2)}$$ Solve for $\frac{dy}{dx}$.

$$= \frac{25y - 3x(x^2 + y^2)}{-25x + 3y(x^2 + y^2)}$$

At the point $(3, 1)$, the slope of the graph is

$$\frac{dy}{dx} = \frac{25(1) - 3(3)(3^2 + 1^2)}{-25(3) + 3(1)(3^2 + 1^2)} = \frac{25 - 90}{-75 + 30} = \frac{-65}{-45} = \frac{13}{9}$$

as shown in Figure 2.30. This graph is called a **lemniscate.**



Lemniscate
Figure 2.30

EXAMPLE 6 Determining a Differentiable Function

Find dy/dx implicitly for the equation $\sin y = x$. Then find the largest interval of the form $-a < y < a$ on which y is a differentiable function of x (see Figure 2.31).

Solution

$$\sin y = x$$ Write original equation.

$$\frac{d}{dx}[\sin y] = \frac{d}{dx}[x]$$ Differentiate with respect to x.

$$\cos y\frac{dy}{dx} = 1$$

$$\frac{dy}{dx} = \frac{1}{\cos y}$$ Solve for $\frac{dy}{dx}$.

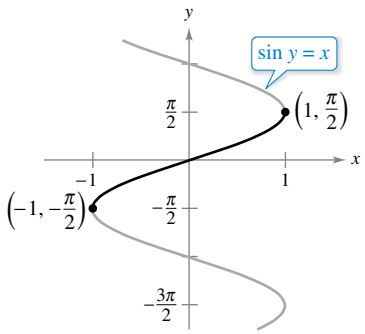
The largest interval about the origin for which y is a differentiable function of x is $-\pi/2 < y < \pi/2$. To see this, note that $\cos y$ is positive for all y in this interval and is 0 at the endpoints. When you restrict y to the interval $-\pi/2 < y < \pi/2$, you should be able to write dy/dx explicitly as a function of x. To do this, use the Pythagorean identity $\sin^2 y + \cos^2 y = 1$ in radical form. Because $\cos y$ is positive on $-\pi/2 < y < \pi/2$, you can write

$$\cos y = \sqrt{1 - \sin^2 y} = \sqrt{1 - x^2}, -\frac{\pi}{2} < y < \frac{\pi}{2}.$$ $\sin y = x$

So, you can conclude that y is differentiable on $-\pi/2 < y < \pi/2$, where

$$\frac{dy}{dx} = \frac{1}{\sqrt{1 - x^2}}.$$

You will study this example further when inverse trigonometric functions are defined in Section 5.7.



The derivative is $\frac{dy}{dx} = \frac{1}{\sqrt{1 - x^2}}$.

ISAAC BARROW (1630–1677)

The graph in Figure 2.32 is called the **kappa curve** because it resembles the Greek letter kappa, κ. The general solution for the tangent line to this curve was discovered by the English mathematician Isaac Barrow. Newton was Barrow's student, and they corresponded frequently regarding their work in the early development of calculus. *See LarsonCalculus.com to read more of this biography.*

With implicit differentiation, the form of the derivative often can be simplified (as in Example 6) by an appropriate use of the *original* equation. A similar technique can be used to find and simplify higher-order derivatives obtained implicitly.

EXAMPLE 7 Finding the Second Derivative Implicitly

Given $x^2 + y^2 = 25$, find $\dfrac{d^2y}{dx^2}$.

Solution Differentiating each term with respect to x produces

$$2x + 2y\frac{dy}{dx} = 0 \qquad \text{Differentiate with respect to } x.$$

$$2y\frac{dy}{dx} = -2x$$

$$\frac{dy}{dx} = \frac{-2x}{2y} \qquad \text{Solve for } \frac{dy}{dx}.$$

$$= -\frac{x}{y}.$$

Differentiating a second time with respect to x yields

$$\frac{d^2y}{dx^2} = -\frac{(y)(1) - (x)(dy/dx)}{y^2} \qquad \text{Quotient Rule}$$

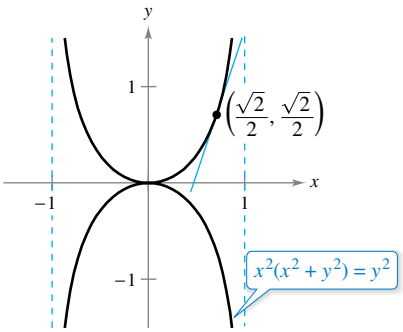
$$= -\frac{y - (x)(-x/y)}{y^2} \qquad \text{Substitute } -\frac{x}{y} \text{ for } \frac{dy}{dx}.$$

$$= -\frac{y^2 + x^2}{y^3} \qquad \text{Simplify.}$$

$$= -\frac{25}{y^3}. \qquad \text{Substitute 25 for } x^2 + y^2.$$

EXAMPLE 8 Finding a Tangent Line to a Graph

Find the tangent line to the graph of $x^2(x^2 + y^2) = y^2$ at the point $\left(\sqrt{2}/2, \sqrt{2}/2\right)$, as shown in Figure 2.32.



The kappa curve
Figure 2.32

Solution By rewriting and differentiating implicitly, you obtain

$$x^4 + x^2y^2 - y^2 = 0 \qquad \text{Rewrite original equation.}$$

$$4x^3 + x^2\left(2y\frac{dy}{dx}\right) + 2xy^2 - 2y\frac{dy}{dx} = 0 \qquad \text{Differentiate with respect to } x.$$

$$2x^2y\frac{dy}{dx} - 2y\frac{dy}{dx} = -4x^3 - 2xy^2 \qquad \text{Collect terms.}$$

$$2y(x^2 - 1)\frac{dy}{dx} = -2x(2x^2 + y^2) \qquad \text{Factor.}$$

$$\frac{dy}{dx} = \frac{x(2x^2 + y^2)}{y(1 - x^2)}. \qquad \text{Solve for } \frac{dy}{dx}.$$

At the point $\left(\sqrt{2}/2, \sqrt{2}/2\right)$, the slope is

$$\frac{dy}{dx} = \frac{\left(\sqrt{2}/2\right)[2(1/2) + (1/2)]}{\left(\sqrt{2}/2\right)[1 - (1/2)]} = \frac{3/2}{1/2} = 3$$

and the equation of the tangent line at this point is

$$y - \frac{\sqrt{2}}{2} = 3\left(x - \frac{\sqrt{2}}{2}\right) \quad \text{or} \quad y = 3x - \sqrt{2}.$$

GO DIGITAL

Concept Check

1. Describe the difference between the explicit form of a function and an implicit equation. Give an example of each.
2. State the guidelines for implicit differentiation.
3. Explain when implicit differentiation is required to find a derivative.
4. How is the Chain Rule applied when finding dy/dx implicitly?

Finding a Derivative **In Exercises 5–20, find dy/dx by implicit differentiation.**

5. $x^2 + y^2 = 9$
6. $x^2 - y^2 = 25$
7. $x^5 + y^5 = 16$
8. $2x^3 + 3y^3 = 64$
9. $x^3 - xy + y^2 = 7$
10. $x^2y + y^2x = -2$
11. $x^3y^3 - y = x$
12. $\sqrt{xy} = x^2y + 1$
13. $x^3 - 3x^2y + 2xy^2 = 12$
14. $x^4y - 8xy + 3xy^2 = 9$
15. $\sin x + 2\cos 2y = 1$
16. $(\sin \pi x + \cos \pi y)^2 = 2$
17. $\csc x = x(1 + \tan y)$
18. $\cot y = x - y$
19. $y = \sin xy$
20. $x = \sec \dfrac{1}{y}$

Finding Derivatives Implicitly and Explicitly **In Exercises 21–24, (a) find two explicit functions by solving the equation for y in terms of x, (b) sketch the graph of the equation and label the parts given by the corresponding explicit functions, (c) differentiate the explicit functions, and (d) find dy/dx implicitly and show that the result is equivalent to that of part (c).**

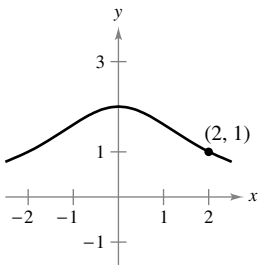
21. $x^2 + y^2 = 64$
22. $25x^2 + 36y^2 = 300$
23. $16y^2 - x^2 = 16$
24. $x^2 + y^2 - 4x + 6y + 9 = 0$

Finding the Slope of a Graph **In Exercises 25–32, find dy/dx by implicit differentiation. Then find the slope of the graph at the given point.**

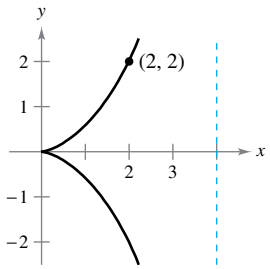
25. $xy = 6, \quad (-6, -1)$
26. $3x^3y = 6, \quad (1, 2)$
27. $y^2 = \dfrac{x^2 - 49}{x^2 + 49}, \quad (7, 0)$
28. $4y^3 = \dfrac{x^2 - 36}{x^3 + 36}, \quad (6, 0)$
29. $(x + y)^3 = x^3 + y^3, \quad (-1, 1)$
30. $x^3 + y^3 = 6xy - 1, \quad (2, 3)$
31. $\tan(x + y) = x, \quad (0, 0)$
32. $x\cos y = 1, \quad \left(2, \dfrac{\pi}{3}\right)$

Famous Curves **In Exercises 33–36, find the slope of the tangent line to the graph at the given point.**

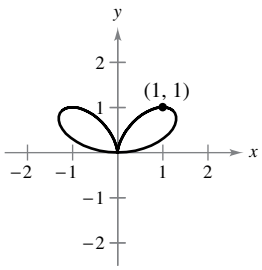
33. Witch of Agnesi: $(x^2 + 4)y = 8$



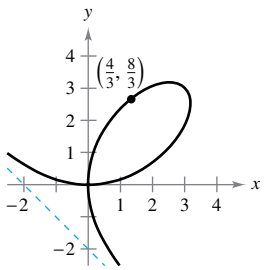
34. Cissoid of Diocles: $(4 - x)y^2 = x^3$



35. Bifolium: $(x^2 + y^2)^2 = 4x^2y$

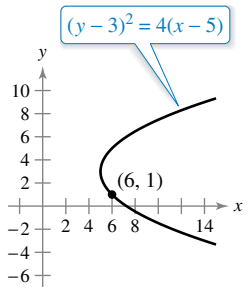


36. Folium of Descartes: $x^3 + y^3 - 6xy = 0$

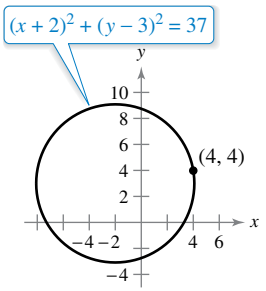


Famous Curves **In Exercises 37–42, find an equation of the tangent line to the graph at the given point. To print an enlarged copy of the graph, go to *MathGraphs.com*.**

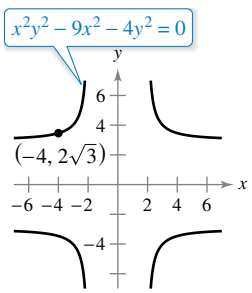
37. Parabola



38. Circle



39. Cruciform



40. Astroid

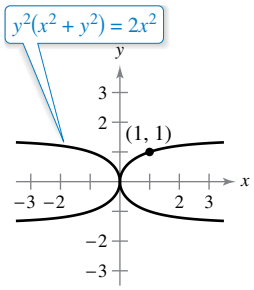
42. Kappa curve



Exploring Concepts

43. Write two different equations in implicit form that you can write in explicit form. Then write two different equations in implicit form that you cannot write in explicit form.

44. Write an explicit function for which dy/dx does not have meaning. Explain.

45. Ellipse

(a) Use implicit differentiation to find an equation of the tangent line to the ellipse $\frac{x^2}{2} + \frac{y^2}{8} = 1$ at $(1, 2)$.

(b) Show that the equation of the tangent line to the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ at (x_0, y_0) is $\frac{x_0 x}{a^2} + \frac{y_0 y}{b^2} = 1$.

46. Hyperbola

(a) Use implicit differentiation to find an equation of the tangent line to the hyperbola $\frac{x^2}{6} - \frac{y^2}{8} = 1$ at $(3, -2)$.

(b) Show that the equation of the tangent line to the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ at (x_0, y_0) is $\frac{x_0 x}{a^2} - \frac{y_0 y}{b^2} = 1$.

Determining a Differentiable Function **In Exercises 47 and 48, find dy/dx implicitly and find the largest interval of the form $-a < y < a$ or $0 < y < a$ such that y is a differentiable function of x. Write dy/dx as a function of x.**

47. $\tan y = x$

48. $\cos y = x$

Finding a Second Derivative **In Exercises 49–54, find d^2y/dx^2 implicitly in terms of x and y.**

49. $x^2 + y^2 = 4$

50. $x^2y - 4x = 5$

51. $x^2y - 2 = 5x + y$

52. $xy - 1 = 2x + y^2$

53. $7xy + \sin x = 2$

54. $3xy - 4\cos x = -6$

Finding an Equation of a Tangent Line **In Exercises 55 and 56, use a graphing utility to graph the equation. Find an equation of the tangent line to the graph at the given point and graph the tangent line in the same viewing window.**

55. $\sqrt{x} + \sqrt{y} = 5, \quad (9, 4)$

56. $y^2 = \frac{x - 1}{x^2 + 1}, \quad \left(2, \frac{\sqrt{5}}{5}\right)$

Tangent Lines and Normal Lines **In Exercises 57 and 58, find equations for the tangent line and normal line to the circle at each given point. (The *normal line* at a point is perpendicular to the tangent line at the point.) Use a graphing utility to graph the circle, the tangent lines, and the normal lines.**

57. $x^2 + y^2 = 25$
$(4, 3), (-3, 4)$

58. $x^2 + y^2 = 36$
$(6, 0), \left(5, \sqrt{11}\right)$

59. Normal Lines Show that the normal line at any point on the circle $x^2 + y^2 = r^2$ passes through the origin.

60. Circles Two circles of radius 4 are tangent to the graph of $y^2 = 4x$ at the point $(1, 2)$. Find equations of these two circles.

Vertical and Horizontal Tangent Lines **In Exercises 61 and 62, find the points at which the graph of the equation has a vertical or horizontal tangent line.**

61. $25x^2 + 16y^2 + 200x - 160y + 400 = 0$

62. $4x^2 + y^2 - 8x + 4y + 4 = 0$

Orthogonal Trajectories **In Exercises 63–66, use a graphing utility to sketch the intersecting graphs of the equations and show that they are orthogonal. [Two graphs are *orthogonal* if at their point(s) of intersection, their tangent lines are perpendicular to each other.]**

63. $2x^2 + y^2 = 6$
$y^2 = 4x$

64. $y^2 = x^3$
$2x^2 + 3y^2 = 5$

65. $x + y = 0$
$x = \sin y$

66. $x^3 = 3(y - 1)$
$x(3y - 29) = 3$

Orthogonal Trajectories **In Exercises 67 and 68, verify that the two families of curves are orthogonal, where C and K are real numbers. Use a graphing utility to graph the two families for two values of C and two values of K.**

67. $xy = C, \quad x^2 - y^2 = K$

68. $x^2 + y^2 = C^2, \quad y = Kx$

69. Orthogonal Trajectories The figure below shows the topographic map carried by a group of hikers. The hikers are in a wooded area on top of the hill shown on the map, and they decide to follow the path of steepest descent (orthogonal trajectories to the contours on the map). Draw their routes when they start from point A and when they start from point B. Their goal is to reach the road along the top of the map. Which starting point should they use? To print an enlarged copy of the map, go to *MathGraphs.com*.

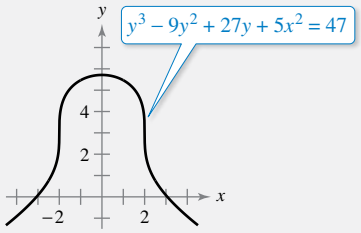
70. HOW DO YOU SEE IT? Use the graph to answer the questions.



(a) Which is greater, the slope of the tangent line at $x = -3$ or the slope of the tangent line at $x = -1$?

(b) Estimate the point(s) where the graph has a vertical tangent line.

(c) Estimate the point(s) where the graph has a horizontal tangent line.

71. Finding Equations of Tangent Lines Consider the equation $x^4 = 4(4x^2 - y^2)$.

(a) Use a graphing utility to graph the equation.

(b) Find and graph the four tangent lines to the curve for $y = 3$.

(c) Find the exact coordinates of the point of intersection of the two tangent lines in the first quadrant.

72. Tangent Lines and Intercepts Let L be any tangent line to the curve

$$\sqrt{x} + \sqrt{y} = \sqrt{c}.$$

Show that the sum of the x- and y-intercepts of L is c.

73. Proof Prove (Theorem 2.3) that

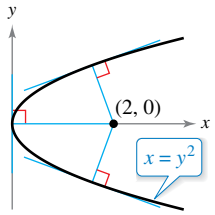
$$\frac{d}{dx}[x^n] = nx^{n-1}$$

for the case in which n is a rational number. (*Hint:* Write $y = x^{p/q}$ in the form $y^q = x^p$ and differentiate implicitly. Assume that p and q are integers, where $q > 0$.)

74. Slope Find all points on the circle $x^2 + y^2 = 100$ where the slope is $\frac{3}{4}$.

75. Tangent Lines Find equations of both tangent lines to the graph of the ellipse $\frac{x^2}{4} + \frac{y^2}{9} = 1$ that pass through the point $(4, 0)$ not on the graph.

76. Normals to a Parabola The graph shows the normal lines from the point $(2, 0)$ to the graph of the parabola $x = y^2$. How many normal lines are there from the point $(x_0, 0)$ to the graph of the parabola when (a) $x_0 = \frac{1}{4}$, (b) $x_0 = \frac{1}{2}$, and (c) $x_0 = 1$? (d) For what value of x_0 are two of the normal lines perpendicular to each other?



77. Normal Lines (a) Find an equation of the normal line to the ellipse $\frac{x^2}{32} + \frac{y^2}{8} = 1$ at the point $(4, 2)$. (b) Use a graphing utility to graph the ellipse and the normal line. (c) At what other point does the normal line intersect the ellipse?

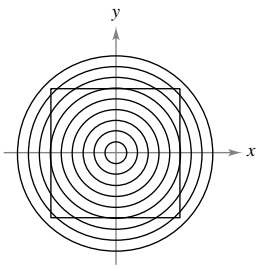
SECTION PROJECT

Optical Illusions

In each graph below, an optical illusion is created by having lines intersect a family of curves. In each case, the lines appear to be curved. Find the value of dy/dx for the given values.

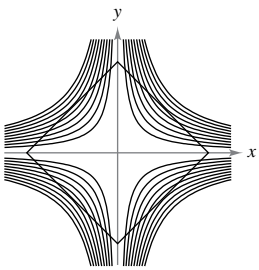
(a) Circles: $x^2 + y^2 = C^2$

$x = 3, y = 4, C = 5$



(b) Hyperbolas: $xy = C$

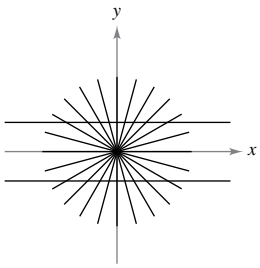
$x = 1, y = 4, C = 4$



(c) Lines: $ax = by$

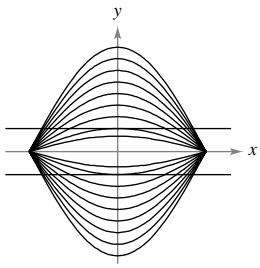
$x = \sqrt{3}, y = 3,$

$a = \sqrt{3}, b = 1$



(d) Cosine curves: $y = C\cos x$

$x = \frac{\pi}{3}, y = \frac{1}{3}, C = \frac{2}{3}$



FOR FURTHER INFORMATION For more information on the mathematics of optical illusions, see the article "Descriptive Models for Perception of Optical Illusions" by David A. Smith in *The UMAP Journal*.

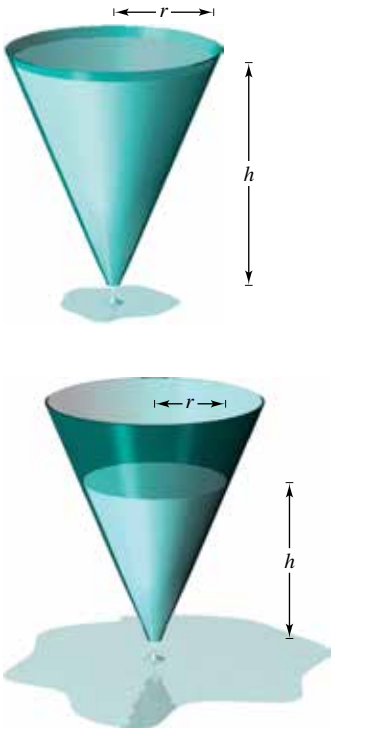
2.6 Related Rates

- **Find a related rate.**
- **Use related rates to solve real-life problems.**



Volume is related to radius and height.
Figure 2.33

Finding Related Rates

You have seen how the Chain Rule can be used to find dy/dx implicitly. Another important use of the Chain Rule is to find the rates of change of two or more related variables that are changing with respect to *time*.

For example, when water is drained out of a conical tank (see Figure 2.33), the volume V, the radius r, and the height h of the water level are all functions of time t. Because these variables are related by the formula for the volume of a right circular cone

$$V = \frac{\pi}{3} r^2 h \qquad \text{Original equation}$$

you can differentiate implicitly with respect to t to obtain the **related-rate** equation

$$\begin{aligned} \frac{d}{dt}[V] &= \frac{d}{dt}\left[\frac{\pi}{3} r^2 h\right] \\ \frac{dV}{dt} &= \frac{\pi}{3}\left[r^2 \frac{dh}{dt} + h\left(2r \frac{dr}{dt}\right)\right] \qquad \text{Differentiate with respect to } t. \\ &= \frac{\pi}{3}\left(r^2 \frac{dh}{dt} + 2rh \frac{dr}{dt}\right). \end{aligned}$$

From this equation, you can see that the rate of change of V is related to the rates of change of both h and r.

Exploration

Finding a Related Rate In the conical tank shown in Figure 2.33, the height of the water level is changing at a rate of -0.2 foot per minute and the radius is changing at a rate of -0.1 foot per minute. What is the rate of change of the volume when the radius is $r = 1$ foot and the height is $h = 2$ feet? Does the rate of change of the volume depend on the values of r and h? Explain.

EXAMPLE 1 Two Rates That Are Related

The variables x and y are both differentiable functions of t and are related by the equation $y = x^2 + 3$. Find dy/dt when $x = 1$, given that $dx/dt = 2$ when $x = 1$.

Solution Use the Chain Rule to differentiate each side of the equation with respect to t.

$$\begin{aligned} y &= x^2 + 3 && \text{Write original equation.} \\ \frac{d}{dt}[y] &= \frac{d}{dt}[x^2 + 3] && \text{Differentiate with respect to } t. \\ \frac{dy}{dt} &= 2x \frac{dx}{dt} && \text{Chain Rule} \end{aligned}$$

When $x = 1$ and $dx/dt = 2$, you have

$$\frac{dy}{dt} = 2(1)(2) = 4.$$

GO DIGITAL

Problem Solving with Related Rates

In Example 1, you were *given* an equation that related the variables x and y and were asked to find the rate of change of y when $x = 1$.

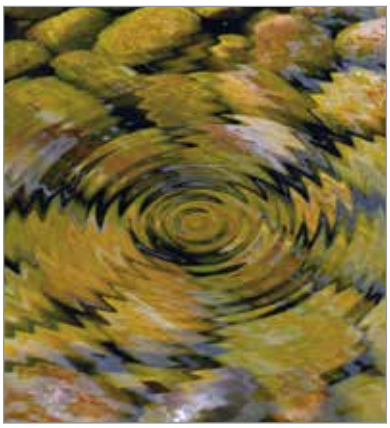
Equation: $y = x^2 + 3$

Given rate: $\frac{dx}{dt} = 2$ when $x = 1$

Find: $\frac{dy}{dt}$ when $x = 1$

In each of the remaining examples in this section, you must *create* a mathematical model from a verbal description.

EXAMPLE 2 A Changing Area



Total area increases as the outer radius increases.
Figure 2.34

A pebble is dropped into a calm pond, causing ripples in the form of concentric circles, as shown in Figure 2.34. The radius r of the outer ripple is increasing at a constant rate of 1 foot per second. When the radius is 4 feet, at what rate is the total area A of the disturbed water changing?

Solution The variables r and A are related by the equation for the area of a circle, $A = \pi r^2$. The rate of change of the radius r is constant at 1 foot per second. So, $dr/dt = 1$.

Equation: $A = \pi r^2$ Area of a circle

Given rate: $\frac{dr}{dt} = 1$ foot per second (constant rate)

Find: $\frac{dA}{dt}$ when $r = 4$ feet

With this information, differentiate each side of the equation with respect to t and find dA/dt.

$$\frac{d}{dt}[A] = \frac{d}{dt}[\pi r^2]$$ Differentiate with respect to t.

$$\frac{dA}{dt} = 2\pi r \frac{dr}{dt}$$ Chain Rule

$$= 2\pi(4)(1)$$ Substitute 4 for r and 1 for $\frac{dr}{dt}$.

$$= 8\pi \text{ square feet per second}$$ Simplify.

When the radius is 4 feet, the area is changing at a rate of 8π square feet per second. ■

REMARK When using these guidelines, be sure you perform Step 3 before Step 4. Substituting the known values of the variables before differentiating will produce an inappropriate derivative.

Guidelines for Solving Related-Rate Problems

1. Identify all *given* quantities and quantities *to be determined*. Make a sketch and label the quantities.
2. Write an equation involving the variables whose rates of change either are given or are to be determined.
3. Using the Chain Rule, implicitly differentiate each side of the equation *with respect to time t*.
4. *After* completing Step 3, substitute into the resulting equation all known values for the variables and their rates of change. Then solve for the required rate of change.

FOR FURTHER INFORMATION
To learn more about the history of related-rate problems, see the article "The Lengthening Shadow: The Story of Related Rates" by Bill Austin, Don Barry, and David Berman in *Mathematics Magazine*. To view this article, go to *MathArticles.com*.

The table below lists examples of mathematical models involving rates of change. For instance, the rate of change in the first example is the velocity of a car.

Verbal Statement	Mathematical Model
The velocity of a car after traveling for 1 hour is 50 miles per hour.	$x =$ distance traveled $\frac{dx}{dt} = 50$ mi/h when $t = 1$
Water is being pumped into a swimming pool at a rate of 10 cubic meters per hour.	$V =$ volume of water in pool $\frac{dV}{dt} = 10\ \text{m}^3/\text{h}$
A gear is revolving at a rate of 25 revolutions per minute (1 revolution $= 2\pi$ rad).	$\theta =$ angle of revolution $\frac{d\theta}{dt} = 25(2\pi)$ rad/min
A population of bacteria is increasing at a rate of 2000 per hour.	$x =$ number in population $\frac{dx}{dt} = 2000$ bacteria per hour

EXAMPLE 3 An Inflating Balloon

Air is being pumped into a spherical balloon at a rate of 4.5 cubic feet per minute. Find the rate of change of the radius when the radius is 2 feet.

Solution Let V be the volume of the balloon, and let r be its radius. Because the volume is increasing at a rate of 4.5 cubic feet per minute, you know that at time t the rate of change of the volume is $dV/dt = \frac{9}{2}$. So, the problem can be stated as shown.

Given rate: $\frac{dV}{dt} = \frac{9}{2}$ cubic feet per minute (constant rate)

Find: $\frac{dr}{dt}$ when $r = 2$ feet

To find the rate of change of the radius, write an equation that relates the radius r to the volume V. To do this, use the formula for the volume of a sphere.

Equation: $V = \frac{4}{3}\pi r^3$ Volume of a sphere

REMARK The formula for the volume of a sphere and other formulas from geometry are listed on the formula cards for this text.

Differentiating each side of the equation with respect to t produces

$$\frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$$ Differentiate with respect to t.

$$\frac{dr}{dt} = \frac{1}{4\pi r^2}\left(\frac{dV}{dt}\right).$$ Solve for $\frac{dr}{dt}$.

Finally, when $r = 2$, the rate of change of the radius is

$$\frac{dr}{dt} = \frac{1}{4\pi(2)^2}\left(\frac{9}{2}\right) \approx 0.09 \text{ foot per minute.}$$ ■

In Example 3, note that the volume is increasing at a *constant* rate, but the radius is increasing at a *variable* rate. Just because two rates are related does not mean that they are proportional. In this particular case, the radius is growing more and more slowly as t increases. Do you understand why?

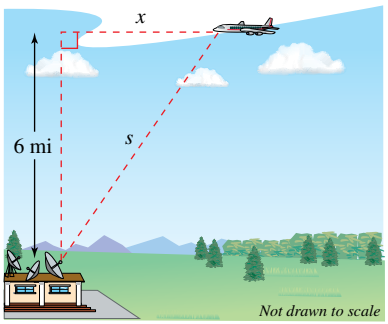
EXAMPLE 4 The Speed of an Airplane Tracked by Radar

See LarsonCalculus.com for an interactive version of this type of example.

An airplane is flying on a flight path that will take it directly over a radar tracking station, as shown in Figure 2.35. The distance s is decreasing at a rate of 400 miles per hour when $s = 10$ miles. What is the speed of the plane?



An airplane is flying at an altitude of 6 miles, s miles from the station.
Figure 2.35

Solution Let x be the horizontal distance from the station, as shown in Figure 2.35. Notice that when $s = 10$, $x = \sqrt{10^2 - 6^2} = 8$. Also, ds/dt is negative because s represents a distance that is decreasing.

Given rate: $ds/dt = -400$ miles per hour when $s = 10$ miles
Find: dx/dt when $s = 10$ miles and $x = 8$ miles

In Figure 2.35, note that the distances 6, x, and s are the sides of a right triangle. So, use the Pythagorean Theorem to write an equation that relates these quantities.

Equation: $x^2 + 6^2 = s^2$ Pythagorean Theorem

$$2x\frac{dx}{dt} = 2s\frac{ds}{dt}$$ Differentiate with respect to t.

$$\frac{dx}{dt} = \frac{s}{x}\left(\frac{ds}{dt}\right)$$ Solve for $\frac{dx}{dt}$.

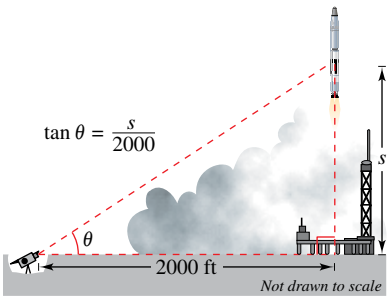
$$= \frac{10}{8}(-400)$$ Substitute for s, x, and $\frac{ds}{dt}$.

$$= -500 \text{ miles per hour}$$ Simplify.

Because the velocity is -500 miles per hour, the *speed* is 500 miles per hour. (Note that the velocity is negative because x represents a distance that is decreasing.)

EXAMPLE 5 A Changing Angle of Elevation

Find the rate of change in the angle of elevation of the camera shown in Figure 2.36 at 10 seconds after liftoff.



A television camera at ground level is filming the liftoff of a rocket that is rising vertically according to the position equation $s = 50t^2$, where s is measured in feet and t is measured in seconds. The camera is 2000 feet from the launch pad.
Figure 2.36

Solution Let θ be the angle of elevation, as shown in Figure 2.36. When $t = 10$, the height s of the rocket is $s = 50t^2 = 50(10)^2 = 5000$ feet.

Given rate: $ds/dt = 100t =$ velocity of rocket (in feet per second)
Find: $d\theta/dt$ when $t = 10$ seconds and $s = 5000$ feet

Using Figure 2.36, you can relate s and θ by the equation $\tan\theta = s/2000$.

Equation: $\tan\theta = \frac{s}{2000}$ See Figure 2.36.

$$(\sec^2\theta)\frac{d\theta}{dt} = \frac{1}{2000}\left(\frac{ds}{dt}\right)$$ Differentiate with respect to t.

$$\frac{d\theta}{dt} = \cos^2\theta\,\frac{100t}{2000}$$ Substitute $100t$ for $\frac{ds}{dt}$.

$$= \left(\frac{2000}{\sqrt{s^2 + 2000^2}}\right)^2 \frac{100t}{2000}$$ $\cos\theta = \frac{2000}{\sqrt{s^2 + 2000^2}}$

When $t = 10$ and $s = 5000$, you have

$$\frac{d\theta}{dt} = \frac{2000(100)(10)}{5000^2 + 2000^2} = \frac{2}{29} \text{ radian per second.}$$

So, when $t = 10$, θ is changing at a rate of $\frac{2}{29}$ radian per second.

GO DIGITAL

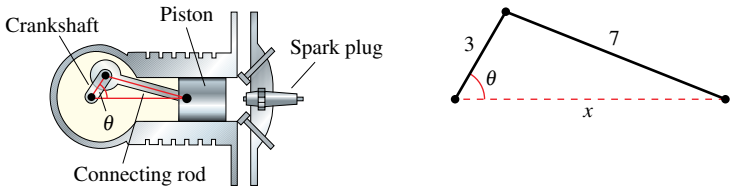
EXAMPLE 6 The Velocity of a Piston

In the engine shown in Figure 2.37, a seven-inch connecting rod is fastened to a crank of radius 3 inches. The crankshaft rotates counterclockwise at a constant rate of 200 revolutions per minute. Find the velocity of the piston when $\theta = \pi/3$.

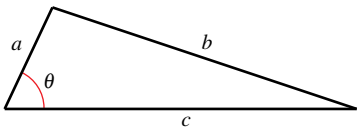


The velocity of a piston is related to the angle of the crankshaft.
Figure 2.37

Solution Label the distances as shown in Figure 2.37. Because a complete revolution corresponds to 2π radians, it follows that $d\theta/dt = 200(2\pi) = 400\pi$ radians per minute.

Given rate: $\dfrac{d\theta}{dt} = 400\pi$ radians per minute (constant rate)

Find: $\dfrac{dx}{dt}$ when $\theta = \dfrac{\pi}{3}$



Law of Cosines:
$b^2 = a^2 + c^2 - 2ac\cos\theta$
Figure 2.38

Use the Law of Cosines (see Figure 2.38) with $a = 3$, $b = 7$, and $c = x$, to write an equation that relates x and θ.

Equation:

$$7^2 = 3^2 + x^2 - 2(3)(x)\cos\theta$$

$$0 = 2x\frac{dx}{dt} - 6\left(-x\sin\theta\frac{d\theta}{dt} + \cos\theta\frac{dx}{dt}\right)$$

$$(6\cos\theta - 2x)\frac{dx}{dt} = 6x\sin\theta\frac{d\theta}{dt}$$

$$\frac{dx}{dt} = \frac{6x\sin\theta}{6\cos\theta - 2x}\left(\frac{d\theta}{dt}\right)$$

When $\theta = \pi/3$, you can solve for x as shown.

$$7^2 = 3^2 + x^2 - 2(3)(x)\cos\frac{\pi}{3} \qquad \text{Substitute } \pi/3 \text{ for } \theta.$$

$$49 = 9 + x^2 - 6x\left(\frac{1}{2}\right)$$

$$0 = x^2 - 3x - 40 \qquad \text{Write in general form.}$$

$$0 = (x - 8)(x + 5) \qquad \text{Factor.}$$

$$x = 8 \text{ inches} \qquad \text{Choose positive solution.}$$

When $x = 8$ and $\theta = \pi/3$, you have

$$\frac{dx}{dt} = \frac{6(8)\left(\sqrt{3}/2\right)}{6(1/2) - 16}(400\pi)$$

$$= \frac{9600\pi\sqrt{3}}{-13}$$

$$\approx -4018 \text{ inches per minute.}$$

So, when $\theta = \pi/3$, the velocity of the piston is decreasing at a rate of 4018 inches per minute. (Note that the velocity is negative because x represents a distance that is decreasing.)

2.6 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. What is a related-rate equation?
2. State the guidelines for solving real-life related-rate problems.

Using Related Rates **In Exercises 3–6, assume that x and y are both differentiable functions of t. Find the required values of dy/dt and dx/dt.**

	Equation	Find	Given
3.	$y = \sqrt{x}$	(a) $\frac{dy}{dt}$ when $x = 4$	$\frac{dx}{dt} = 3$
		(b) $\frac{dx}{dt}$ when $x = 25$	$\frac{dy}{dt} = 2$
4.	$y = 3x^2 - 5x$	(a) $\frac{dy}{dt}$ when $x = 3$	$\frac{dx}{dt} = 2$
		(b) $\frac{dx}{dt}$ when $x = 2$	$\frac{dy}{dt} = 4$
5.	$xy = 4$	(a) $\frac{dy}{dt}$ when $x = 8$	$\frac{dx}{dt} = 10$
		(b) $\frac{dx}{dt}$ when $x = 1$	$\frac{dy}{dt} = -6$
6.	$x^2 + y^2 = 25$	(a) $\frac{dy}{dt}$ when $x = 3, y = 4$	$\frac{dx}{dt} = 8$
		(b) $\frac{dx}{dt}$ when $x = 4, y = 3$	$\frac{dy}{dt} = -2$

Moving Point **In Exercises 7–10, a point is moving along the graph of the given function at the rate dx/dt. Find dy/dt for the indicated given values of x.**

7. $y = 2x^2 + 1$; $\frac{dx}{dt} = 2$ centimeters per second

   (a) $x = -1$ (b) $x = 0$ (c) $x = 1$

8. $y = \frac{1}{1 + x^2}$; $\frac{dx}{dt} = 6$ inches per second

   (a) $x = -2$ (b) $x = 0$ (c) $x = 2$

9. $y = \tan x$; $\frac{dx}{dt} = 3$ feet per second

   (a) $x = -\frac{\pi}{3}$ (b) $x = -\frac{\pi}{4}$ (c) $x = 0$

10. $y = \cos x$; $\frac{dx}{dt} = 4$ centimeters per second

    (a) $x = \frac{\pi}{6}$ (b) $x = \frac{\pi}{4}$ (c) $x = \frac{\pi}{3}$

11. **Area** The radius r of a circle is increasing at a rate of 4 centimeters per minute. Find the rates of change of the area when $r = 37$ centimeters.

12. **Area** The length s of each side of an equilateral triangle is increasing at a rate of 13 feet per hour. Find the rate of change of the area when $s = 41$ feet. (*Hint:* The formula for the area of an equilateral triangle is $A = \frac{s^2\sqrt{3}}{4}$.)

13. **Volume** The radius r of a sphere is increasing at a rate of 3 inches per minute.

    (a) Find the rate of change of the volume when $r = 9$ inches and when $r = 36$ inches.

    (b) Explain why the rate of change of the volume of the sphere is not constant even though dr/dt is constant.

14. **Radius** A spherical balloon is inflated with gas at a rate of 800 cubic centimeters per minute.

    (a) Find the rate of change of the radius when $r = 30$ centimeters and when $r = 85$ centimeters.

    (b) Explain why the rate of change of the radius of the sphere is not constant even though dV/dt is constant.

15. **Volume** All edges of a cube are expanding at a rate of 6 centimeters per second. How fast is the volume changing when each edge is (a) 2 centimeters and (b) 10 centimeters?

16. **Surface Area** All edges of a cube are expanding at a rate of 6 centimeters per second. How fast is the surface area changing when each edge is (a) 2 centimeters and (b) 10 centimeters?

17. **Height** At a sand and gravel plant, sand is falling off a conveyor and onto a conical pile at a rate of 10 cubic feet per minute. The diameter of the base of the cone is approximately three times the altitude. At what rate is the height of the pile changing when the pile is 15 feet high? (*Hint:* The formula for the volume of a cone is $V = \frac{1}{3}\pi r^2 h$.)

18. **Height** The volume of oil in a cylindrical container is increasing at a rate of 150 cubic inches per second. The height of the cylinder is approximately ten times the radius. At what rate is the height of the oil changing when the oil is 35 inches high? (*Hint:* The formula for the volume of a cylinder is $V = \pi r^2 h$.)

19. **Depth** A swimming pool is 12 meters long, 6 meters wide, 1 meter deep at the shallow end, and 3 meters deep at the deep end (see figure). Water is being pumped into the pool at a rate of $\frac{1}{4}$ cubic meter per minute, and there is 1 meter of water at the deep end.

    (a) What percent of the pool is filled?

    (b) At what rate is the water level rising?

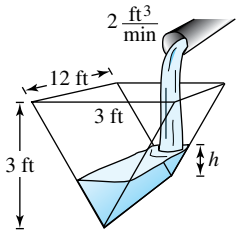
20. Depth A trough is 12 feet long and 3 feet across the top (see figure). Its ends are isosceles triangles with altitudes of 3 feet.



(a) Water is being pumped into the trough at a rate of 2 cubic feet per minute. How fast is the water level rising when the depth h is 1 foot?

(b) The water is rising at a rate of $\frac{3}{8}$ inch per minute when $h = 2$ feet. Determine the rate at which water is being pumped into the trough.

21. Moving Ladder A ladder 25 feet long is leaning against the wall of a house (see figure). The base of the ladder is pulled away from the wall at a rate of 2 feet per second.

(a) How fast is the top of the ladder moving down the wall when its base is 7 feet, 15 feet, and 24 feet from the wall?

(b) Consider the triangle formed by the side of the house, the ladder, and the ground. Find the rate at which the area of the triangle is changing when the base of the ladder is 7 feet from the wall.

(c) Find the rate at which the angle between the ladder and the wall of the house is changing when the base of the ladder is 7 feet from the wall.

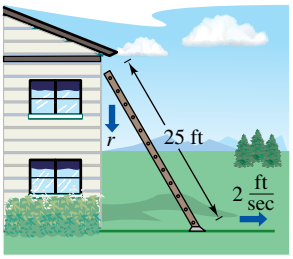


Figure for 21

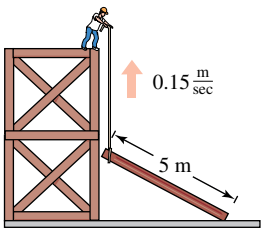

Figure for 22

FOR FURTHER INFORMATION For more information on the mathematics of moving ladders, see the article "The Falling Ladder Paradox" by Paul Scholten and Andrew Simoson in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

22. Construction A construction worker pulls a five-meter plank up the side of a building under construction by means of a rope tied to one end of the plank (see figure). Assume the opposite end of the plank follows a path perpendicular to the wall of the building and the worker pulls the rope at a rate of 0.15 meter per second. How fast is the end of the plank sliding along the ground when it is 2.5 meters from the wall of the building?

23. Construction A winch at the top of a 12-meter building pulls a pipe of the same length to a vertical position, as shown in the figure. The winch pulls in rope at a rate of -0.2 meter per second. Find the rate of vertical change and the rate of horizontal change at the end of the pipe when $y = 6$ meters.

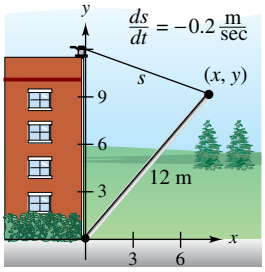

Figure for 23

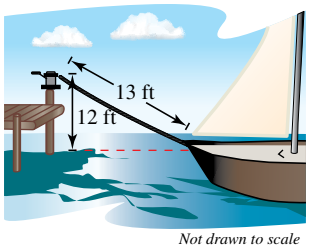

Figure for 24

24. Boating A boat is pulled into a dock by means of a winch 12 feet above the deck of the boat (see figure).

(a) The winch pulls in rope at a rate of 4 feet per second. Determine the speed of the boat when there is 13 feet of rope out. What happens to the speed of the boat as it gets closer to the dock?

(b) Suppose the boat is moving at a constant rate of 4 feet per second. Determine the speed at which the winch pulls in rope when there is a total of 13 feet of rope out. What happens to the speed at which the winch pulls in rope as the boat gets closer to the dock?

25. Air Traffic Control An air traffic controller spots two planes at the same altitude converging on a point as they fly at right angles to each other (see figure). One plane is 225 miles from the point, moving at 450 miles per hour. The other plane is 300 miles from the point, moving at 600 miles per hour.

(a) At what rate is the distance s between the planes decreasing?

(b) How much time does the air traffic controller have to get one of the planes on a different flight path?

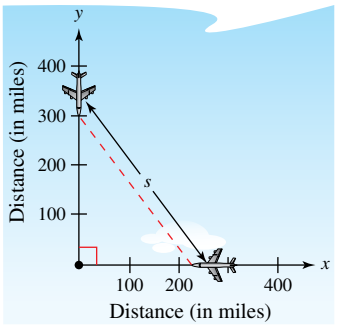

Figure for 25

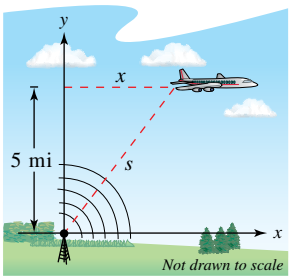

Figure for 26

26. Air Traffic Control An airplane is flying at an altitude of 5 miles and passes directly over a radar antenna (see figure). When the plane is 10 miles away ($s = 10$), the radar detects that the distance s is changing at a rate of 240 miles per hour. What is the speed of the plane?

27. Sports A baseball diamond has the shape of a square with sides 90 feet long (see figure). A player running from second base to third base at a speed of 25 feet per second is 20 feet from third base. At what rate is the player's distance from home plate changing?

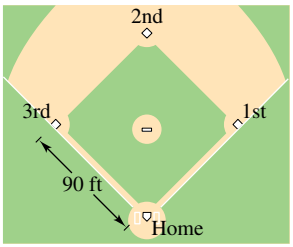

Figure for 27 and 28

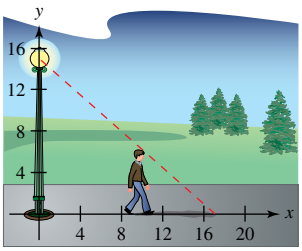

Figure for 29

28. Sports For the baseball diamond in Exercise 27, suppose the player is running from first base to second base at a speed of 25 feet per second. Find the rate at which the distance from home plate is changing when the player is 20 feet from second base.

29. Shadow Length A 6-foot-tall student walks at a rate of 5 feet per second away from a light that is 15 feet above the ground (see figure).

(a) When the student is 10 feet from the base of the light, at what rate is the tip of their shadow moving?

(b) When the student is 10 feet from the base of the light, at what rate is the length of their shadow changing?

30. Shadow Length Repeat Exercise 29 for a 6-foot-tall student walking at a rate of 5 feet per second *toward* a light that is 20 feet above the ground (see figure).

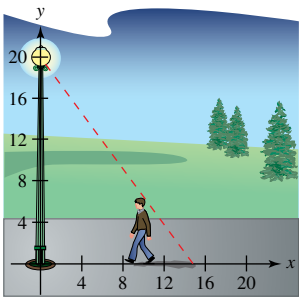

Figure for 30

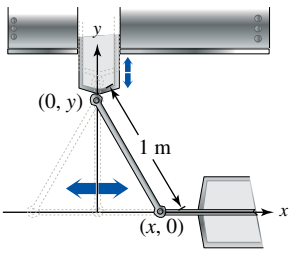

Figure for 31

31. Machine Design The endpoints of a movable rod of length 1 meter have coordinates $(x, 0)$ and $(0, y)$ (see figure). The position of the end on the x-axis is

$$x(t) = \frac{1}{2}\sin\frac{\pi t}{6}$$

where t is the time in seconds.

(a) Find the time of one complete cycle of the rod.

(b) What is the lowest point reached by the end of the rod on the y-axis?

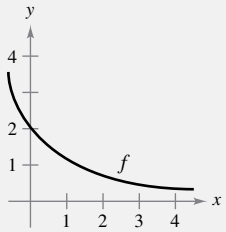
(c) Find the speed of the y-axis endpoint when the x-axis endpoint is $\left(\frac{1}{4}, 0\right)$.

32. Machine Design Repeat Exercise 31 for a position function of $x(t) = \frac{3}{5}\sin \pi t$. Use the point $\left(\frac{3}{10}, 0\right)$ for part (c).

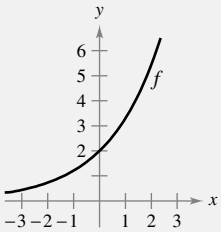
33. Evaporation As a spherical raindrop falls, it reaches a layer of dry air and begins to evaporate at a rate that is proportional to its surface area ($S = 4\pi r^2$). Show that the radius of the raindrop decreases at a constant rate.

34. HOW DO YOU SEE IT? Using the graph of f, (a) determine whether dy/dt is positive or negative given that dx/dt is negative, and (b) determine whether dx/dt is positive or negative given that dy/dt is positive. Explain.

(i)



(ii)



Exploring Concepts

35. Describe the relationship between the rate of change of y and the rate of change of x in each expression. Assume all variables and derivatives are positive.

(a) $\frac{dy}{dt} = 3\frac{dx}{dt}$ (b) $\frac{dy}{dt} = x(L - x)\frac{dx}{dt}$, $0 \le x \le L$

36. Let V be the volume of a cube of side length s that is changing with respect to time. If ds/dt is constant, how does dV/dt change? Explain.

37. Electricity The combined electrical resistance R of two resistors R_1 and R_2, connected in parallel, is

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}$$

where R, R_1, and R_2 are measured in ohms. R_1 and R_2 are increasing at rates of 1 and 1.5 ohms per second, respectively. At what rate is R changing when $R_1 = 50$ ohms and $R_2 = 75$ ohms?

38. Electrical Circuit The voltage V in volts of an electrical circuit is $V = IR$, where R is the resistance in ohms and I is the current in amperes. R is increasing at a rate of 2 ohms per second, and V is increasing at a rate of 3 volts per second. At what rate is I changing when $V = 12$ volts and $R = 4$ ohms?

39. Flight Control An airplane is flying in still air with an airspeed of 275 miles per hour. The plane is climbing at an angle of 18°. Find the rate at which the plane is gaining altitude.

40. Angle of Elevation A balloon rises at a rate of 4 meters per second from a point on the ground 50 meters from an observer. Find the rate of change of the angle of elevation of the balloon from the observer when the balloon is 50 meters above the ground.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

41. Angle of Elevation A fish is reeled in along the water's surface at a rate of 1 foot per second from a point 10 feet above the surface (see figure). At what rate is the angle θ between the line and the water changing when there is a total of 25 feet of line from the end of the rod to the water?

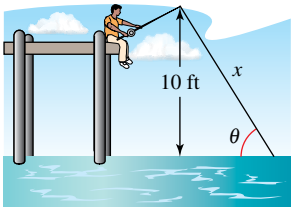

Figure for 41

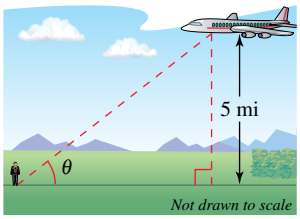

Figure for 42

42. Angle of Elevation An airplane flies at an altitude of 5 miles toward a point directly over an observer (see figure). The speed of the plane is 600 miles per hour. Find the rates at which the angle of elevation θ is changing when the angle is (a) $\theta = 30°$, (b) $\theta = 60°$, and (c) $\theta = 75°$.

43. Linear vs. Angular Speed A patrol car is parked 50 feet from a long warehouse (see figure). The revolving light on top of the car turns at a rate of 30 revolutions per minute. How fast is the light beam moving along the wall when the beam makes angles of (a) $\theta = 30°$, (b) $\theta = 60°$, and (c) $\theta = 70°$ with the perpendicular line from the light to the wall?

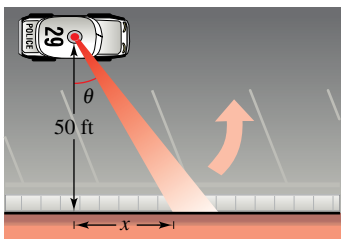

Figure for 43

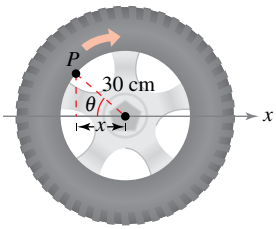

Figure for 44

44. Linear vs. Angular Speed A wheel of radius 30 centimeters revolves at a rate of 10 revolutions per second. A dot is painted at a point P on the rim of the wheel (see figure).

(a) Find dx/dt as a function of θ.

(b) Use a graphing utility to graph the function in part (a).

(c) When is the absolute value of the rate of change of x greatest? When is it least?

(d) Find dx/dt when $\theta = 30°$ and $\theta = 60°$.

45. Area The included angle of the two sides of constant equal length s of an isosceles triangle is θ.

(a) Show that the area of the triangle is given by $A = \frac{1}{2}s^2 \sin\theta$.

(b) The angle θ is increasing at the rate of $\frac{1}{2}$ radian per minute. Find the rates of change of the area when $\theta = \pi/6$ and $\theta = \pi/3$.

46. Security Camera A security camera centered 50 feet above the floor pans back and forth along the length of a 100-foot hallway (see figure). A variable rate of rotation must be used to change the center of focus along the hallway floor at a constant rate. Find a model for the variable rate of rotation when $|dx/dt| = 2$ feet per second.

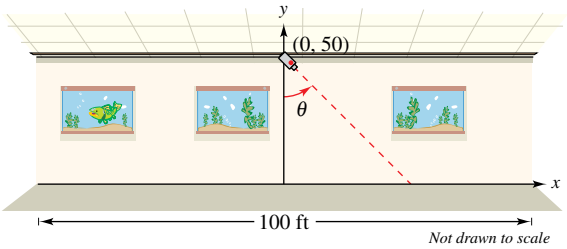

Figure for 46

47. Modeling Data The table shows the numbers (in millions) of participants in the free lunch program f and the reduced price lunch program r in the United States for the years 2013 through 2020. (*Source: U.S. Department of Agriculture*)

Year	2013	2014	2015	2016
f	18.9	19.2	19.8	20.1
r	2.6	2.5	2.2	2.0

Year	2017	2018	2019	2020
f	20.0	20.2	20.1	16.0
r	2.0	1.8	1.7	1.2

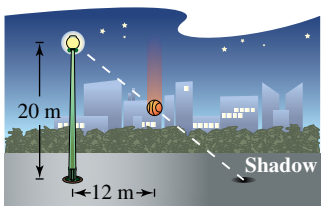
(a) Use the regression capabilities of a graphing utility to find a model of the form

$$r(f) = af^3 + bf^2 + cf + d$$

for the data, where t is the time in years, with $t = 13$ corresponding to 2013.

(b) Find dr/dt. Then use the model to estimate dr/dt for $t = 18$ when it is predicted that the number of participants in the free lunch program will increase at the rate of 0.25 million participants per year.

48. Moving Shadow A ball is dropped from a height of 20 meters, 12 meters away from the top of a 20-meter lamppost (see figure). The ball's shadow, caused by the light at the top of the lamppost, is moving along the level ground. How fast is the shadow moving 1 second after the ball is released? *(Submitted by Dennis Gittinger, St. Philips College, San Antonio, TX)*



Acceleration **In Exercises 49 and 50, find the acceleration of the specified object. (*Hint:* Recall that if a variable is changing at a constant rate, then its acceleration is zero.)**

49. Find the acceleration of the top of the ladder described in Exercise 21 when the base of the ladder is 7 feet from the wall.

50. Find the acceleration of the boat in Exercise 24(a) when there is a total of 13 feet of rope out.

Review Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Exploring Concepts

In this chapter, you learned that the limit used to define the slope of a tangent line is also used to define one of the big ideas of calculus—differentiation. The derivative of f at x is

$$f'(x) = \lim_{\Delta x \to 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$$

provided that the limit exists. Note how this definition allows you to do more than you can with precalculus. With precalculus, you can find the average change between $t = a$ and $t = b$. With the derivative, you can now find the instantaneous rate of change at $t = a$. The chapter also developed rules for finding derivatives, such as the product and chain rules.

1. Consider a car moving according to the position function $s(t) = -16t^2 + 64t + 80$.

(a) Determine the position at $t = 0$, $t = 2$, and $t = 4$.

(b) Calculate the average velocity between $s(2)$ and $s(4)$. Did you need to use calculus?

(c) Calculate the instantaneous velocity of the car when $t = 4$. Did you need calculus?

(d) Describe how you could use limits to find the instantaneous velocity of the car.

2. Sketch the graph of $f(x) = -16x^2 + 64x + 80$.

(a) Calculate the slope of the secant line through $f(2)$ and $f(4)$. Did you need calculus?

(b) Calculate the slope of the tangent line at the point $f(4)$. Did you need calculus?

(c) Explain how to use secant lines and limits to find the slope of a graph at a particular point.

(d) How does this exercise compare to Exercise 1?

3. Sketch a graph of a function whose derivative is always positive. Explain how you found your answer.

4. Find a second-degree polynomial

$$f(x) = ax^2 + bx + c$$

such that its graph has a tangent line with slope 10 at the point $(2, 7)$ and an x-intercept at $(1, 0)$.

5. Choose a differentiable function $p(x)$, a point $(c, p(c))$, and a nearby point $(c + h, p(c + h))$. Write equations for the tangent line to the graph of p at $(c, p(c))$ and the secant line passing through $(c, p(c))$ and $(c + h, p(c + h))$.

(a) Use a graphing utility to graph p, the tangent line, and the secant line.

(b) Find a function $D(x)$ for the difference between the tangent line and the secant line. Use a graphing utility to graph D. What do you notice about $D(x)$?

(c) Choose another function for p. What do you observe?

6. Let $f(x) = ax^3 + bx^2 + cx + d$, where $a \neq 0$. Determine conditions for a, b, c, and d when the graph of f has (a) no horizontal tangents, (b) exactly one horizontal tangent, and (c) exactly two horizontal tangents. Give an example for each case.

Finding the Derivative by the Limit Process

In Exercises 7–10, find the derivative of the function by the limit process.

7. $f(x) = 12$

8. $f(x) = 5x - 4$

9. $f(x) = x^3 - 2x + 1$

10. $f(x) = \dfrac{6}{x}$

Using the Alternative Form of the Derivative

In Exercises 11 and 12, use the alternative form of the derivative to find the derivative at $x = c$, if it exists.

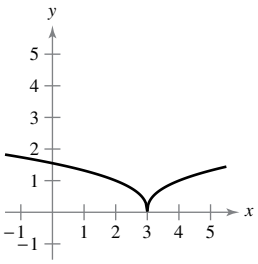
11. $g(x) = 2x^2 - 3x, \quad c = 2$

12. $f(x) = \dfrac{1}{x + 4}, \quad c = 3$

Determining Differentiability

In Exercises 13 and 14, describe the x-values at which f is differentiable.

13. $f(x) = (x - 3)^{2/5}$



14. $f(x) = \dfrac{3x}{x + 1}$

Finding a Derivative **In Exercises 15–26, use differentiation rules to find the derivative of the function.**

15. $y = 25$

16. $f(t) = \pi/6$

17. $f(x) = x^3 - 11x^2$

18. $g(s) = 3s^5 - 2s^4$

19. $h(x) = 6\sqrt{x} + 3\sqrt[3]{x}$

20. $f(x) = x^{1/2} - x^{-5/6}$

21. $g(t) = \dfrac{2}{3t^2}$

22. $h(x) = \dfrac{8}{5x^4}$

23. $f(\theta) = 4\theta - 5\sin\theta$

24. $g(\alpha) = 4\cos\alpha + 6$

25. $f(\theta) = 3\cos\theta - \dfrac{\sin\theta}{4}$

26. $g(\alpha) = \dfrac{5\sin\alpha}{3} - 2\alpha$

Finding the Slope of a Graph **In Exercises 27–30, find the slope of the graph of the function at the given point.**

27. $f(x) = \dfrac{27}{x^3}, \quad (3, 1)$

28. $f(x) = 3x^2 - 4x, \quad (1, -1)$

29. $f(x) = 4x^5 + 3x - \sin x, \quad (0, 0)$

30. $f(x) = 5\cos x - 9x, \quad (0, 5)$

31. Vibrating String When a guitar string is plucked, it vibrates with a frequency of $F = 200\sqrt{T}$, where F is measured in vibrations per second and the tension T is measured in pounds. Find the rates of change of the frequency when (a) $T = 4$ pounds and (b) $T = 9$ pounds.

32. Surface Area The surface area of a cube with sides of length x is given by $S = 6x^2$. Find the rate of change of the surface area with respect to x when $x = 4$ inches.

Vertical Motion **In Exercises 33 and 34, use the position function $s(t) = -16t^2 + v_0t + s_0$ for free-falling objects.**

33. A ball is thrown straight down from the top of a 600-foot building with an initial velocity of -30 feet per second.

(a) Determine the position and velocity functions for the ball.

(b) Determine the average velocity on the interval $[1, 3]$.

(c) Find the instantaneous velocities when $t = 1$ and $t = 3$.

(d) Find the time required for the ball to reach ground level.

(e) Find the velocity of the ball at impact.

34. A block is dropped from the top of a 450-foot platform. What is its velocity after 2 seconds? After 5 seconds?

Finding a Derivative **In Exercises 35–46, use the Product Rule or the Quotient Rule to find the derivative of the function.**

35. $f(x) = (5x^2 + 8)(x^2 - 4x - 6)$

36. $g(x) = (2x^3 + 5x)(3x - 4)$

37. $f(x) = (9x - 1)\sin x$

38. $f(t) = 2t^5\cos t$

39. $f(x) = \dfrac{x^2 + x - 1}{x^2 - 1}$

40. $f(x) = \dfrac{2x + 7}{x^2 + 4}$

41. $y = \dfrac{x^4}{\cos x}$

42. $y = \dfrac{\sin x}{x^4}$

43. $y = 3x^2\sec x$

44. $y = -x^2\tan x$

45. $y = x\cos x - \sin x$

46. $g(x) = x^4\cot x + 3x\cos x$

Finding an Equation of a Tangent Line **In Exercises 47–50, find an equation of the tangent line to the graph of f at the given point.**

47. $f(x) = (x + 2)(x^2 + 5), \quad (-1, 6)$

48. $f(x) = (x - 4)(x^2 + 6x - 1), \quad (0, 4)$

49. $f(x) = \dfrac{x + 1}{x - 1}, \quad \left(\dfrac{1}{2}, -3\right)$

50. $f(x) = \dfrac{1 + \cos x}{1 - \cos x}, \quad \left(\dfrac{\pi}{2}, 1\right)$

Finding a Second Derivative **In Exercises 51–58, find the second derivative of the function.**

51. $g(t) = -8t^3 - 5t + 12$

52. $h(x) = 6x^{-2} + 7x^2$

53. $f(x) = 15x^{5/2}$

54. $f(x) = 20\sqrt[5]{x}$

55. $f(\theta) = 3\tan\theta$

56. $h(t) = 10\cos t - 15\sin t$

57. $g(x) = 4\cot x$

58. $h(t) = -12\csc t$

59. Acceleration The velocity of an object is $v(t) = 20 - t^2$, $0 \le t \le 6$, where v is measured in meters per second and t is the time in seconds. Find the velocity and acceleration of the object when $t = 3$.

60. Acceleration The velocity of an automobile starting from rest is

$$v(t) = \frac{90t}{4t + 10}$$

where v is measured in feet per second and t is the time in seconds. Find the acceleration at (a) 1 second, (b) 5 seconds, and (c) 10 seconds.

Finding a Derivative **In Exercises 61–72, find the derivative of the function.**

61. $y = (7x + 3)^4$

62. $y = (x^2 - 6)^3$

63. $y = \dfrac{1}{(x^2 + 5)^3}$

64. $f(x) = \dfrac{1}{(5x + 1)^2}$

65. $y = 5\cos(9x + 1)$

66. $y = -6\sin 3x^4$

67. $y = \dfrac{x}{2} - \dfrac{\sin 2x}{4}$

68. $y = \dfrac{\sec^7 x}{7} - \dfrac{\sec^5 x}{5}$

69. $y = x(6x + 1)^5$

70. $f(s) = (s^2 - 1)^{5/2}(s^3 + 5)$

71. $f(x) = \left(\dfrac{x}{\sqrt{x + 5}}\right)^3$

72. $h(x) = \left(\dfrac{x + 5}{x^2 + 3}\right)^2$

Finding the Slope of a Graph **In Exercises 73–78, find the slope of the graph of the function at the given point.**

73. $f(x) = \sqrt{1 - x^3}, \quad (-2, 3)$

74. $f(x) = \sqrt[3]{x^2 - 1}, \quad (3, 2)$

75. $f(x) = \dfrac{x + 8}{\sqrt{3x + 1}}, \quad (0, 8)$

76. $f(x) = \dfrac{3x + 1}{(4x - 3)^3}, \quad (1, 4)$

77. $y = \dfrac{1}{2}\csc 2x, \quad \left(\dfrac{\pi}{4}, \dfrac{1}{2}\right)$

78. $y = \csc 3x + \cot 3x, \quad \left(\dfrac{\pi}{6}, 1\right)$

Finding a Second Derivative **In Exercises 79–82, find the second derivative of the function.**

79. $y = (8x + 5)^3$

80. $y = \dfrac{1}{5x + 1}$

81. $f(x) = \cot x$

82. $y = x \sin^2 x$

83. Refrigeration The temperature T (in degrees Fahrenheit) of food in a freezer is

$$T = \frac{700}{t^2 + 4t + 10}$$

where t is the time in hours. Find the rate of change of T with respect to t at each of the following times.

(a) $t = 1$ (b) $t = 3$ (c) $t = 5$ (d) $t = 10$

84. Harmonic Motion The displacement from equilibrium of an object in harmonic motion on the end of a spring is

$$y = \frac{1}{4}\cos 8t - \frac{1}{4}\sin 8t$$

where y is measured in feet and t is the time in seconds. Determine the position and velocity of the object when $t = \pi/4$.

Finding a Derivative **In Exercises 85–90, find dy/dx by implicit differentiation.**

85. $x^2 + y^2 = 49$

86. $x^2 + 4xy - y^3 = 6$

87. $x^3y - xy^3 = 4$

88. $\sqrt{xy} = x - 4y$

89. $x \sin y = y \cos x$

90. $\cos(x + y) = x$

Tangent Lines and Normal Lines **In Exercises 91 and 92, find equations for the tangent line and the normal line to the graph of the equation at the given point. (The *normal line* at a point is perpendicular to the tangent line at the point.) Use a graphing utility to graph the equation, the tangent line, and the normal line.**

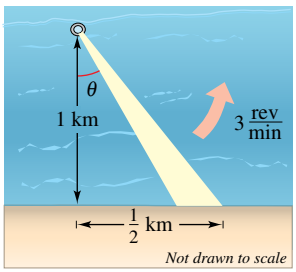
91. $x^2 + y^2 = 10$, $(3, 1)$

92. $x^2 - y^2 = 20$, $(6, 4)$

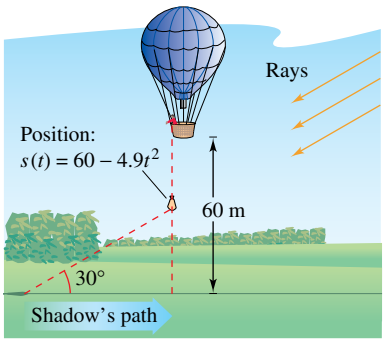
93. Rate of Change A point moves along the curve $y = \sqrt{x}$ in such a way that the y-component of the position of the point is increasing at a rate of 2 units per second. At what rate is the x-component changing when $x = 1/2$, 1, and 4?

94. Surface Area All edges of a cube are expanding at a rate of 8 centimeters per second. How fast is the surface area changing when each edge is 6.5 centimeters?

95. Linear vs. Angular Speed A rotating beacon is located 1 kilometer off a straight shoreline (see figure). The beacon rotates at a rate of 3 revolutions per minute. How fast (in kilometers per hour) does the beam of light appear to be moving to a viewer who is $\frac{1}{2}$ kilometer down the shoreline?



96. Moving Shadow A sandbag is dropped from a balloon at a height of 60 meters when the angle of elevation to the sun is 30° (see figure). The position of the sandbag is $s(t) = 60 - 4.9t^2$. Find the rate at which the shadow of the sandbag is traveling along the ground when the sandbag is at a height of 35 meters.



Building on Concepts

97. If a is the acceleration of an object, then the **jerk** j is defined by $j(t) = a'(t)$.

(a) Use this definition to give a physical interpretation of j.

(b) Find j for the slowing vehicle in Exercise 121 in Section 2.3 and interpret the result.

98. The movement of an elevator is given by the piecewise functions shown in the figure.

(a) Identify the position, velocity, acceleration, and jerk functions. (For a definition of jerk, see Exercise 97.)

(b) Which functions appear to be differentiable at $x = 3/4$?

(c) Describe how each form of movement might feel to a passenger. What are the implications of the non-differentiable parts of the graphs?

P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Finding Equations of Circles Consider the graph of the parabola $y = x^2$.

(a) Find the radius r of the largest possible circle centered on the y-axis that is tangent to the parabola at the origin, as shown in the figure. This circle is called the **circle of curvature.** Find the equation of this circle. Use a graphing utility to graph the circle and parabola in the same viewing window to verify your answer.

(b) Find the center $(0, b)$ of the circle of radius 1 centered on the y-axis that is tangent to the parabola at two points, as shown in the figure. Find the equation of this circle. Use a graphing utility to graph the circle and parabola in the same viewing window to verify your answer.

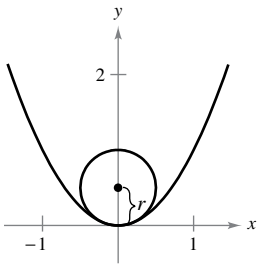

Figure for 1(a)

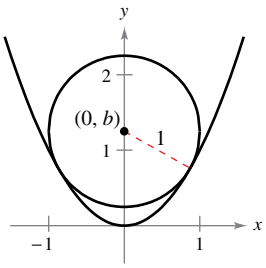

Figure for 1(b)

2. Finding Equations of Tangent Lines Graph the two parabolas $y = x^2$ and $y = -x^2 + 2x - 5$ in the same coordinate plane. Find equations of the two lines that are simultaneously tangent to both parabolas.

3. Finding a Polynomial Find a third-degree polynomial $p(x)$ that is tangent to the line $y = 14x - 13$ at the point $(1, 1)$, and tangent to the line $y = -2x - 5$ at the point $(-1, -3)$.

4. Tangent Lines and Normal Lines

(a) Find an equation of the tangent line to the parabola $y = x^2$ at the point $(2, 4)$.

(b) Find an equation of the normal line to $y = x^2$ at the point $(2, 4)$. (The *normal line* at a point is perpendicular to the tangent line at the point.) Where does this line intersect the parabola a second time?

(c) Find equations of the tangent line and normal line to $y = x^2$ at the point $(0, 0)$.

(d) Prove that for any point $(a, b) \neq (0, 0)$ on the parabola $y = x^2$, the normal line intersects the graph a second time.

5. Projectile Motion An astronaut standing on the moon throws a rock upward. The height of the rock is

$$s = -\frac{27}{10}t^2 + 27t + 6$$

where s is measured in feet and t is measured in seconds.

(a) Find expressions for the velocity and acceleration of the rock.

(b) Find the time when the rock is at its highest point. What is the height of the rock at this time?

(c) How does the acceleration of the rock compare with the acceleration due to gravity on Earth?

6. Finding Polynomials

(a) Find the polynomial $P_1(x) = a_0 + a_1x$ whose value and slope agree with the value and slope of $f(x) = \cos x$ at the point $x = 0$.

(b) Find the polynomial $P_2(x) = a_0 + a_1x + a_2x^2$ whose value and first two derivatives agree with the value and first two derivatives of $f(x) = \cos x$ at the point $x = 0$. This polynomial is called the second-degree **Taylor polynomial** of $f(x) = \cos x$ at $x = 0$.

(c) Complete the table comparing the values of $f(x) = \cos x$ and $P_2(x)$. What do you observe?

x	-1.0	-0.1	-0.001	0	0.001	0.1	1.0
$\cos x$							
$P_2(x)$							

(d) Find the third-degree Taylor polynomial of $f(x) = \sin x$ at $x = 0$.

7. Famous Curve Consider the graph of the **eight curve** $x^4 = a^2(x^2 - y^2)$, $a \neq 0$, which is shown below.

(a) Explain how you could use a graphing utility to graph this curve.

(b) Use a graphing utility to graph the curve for various values of the constant a. Describe how a affects the shape of the curve.

(c) Determine the points on the curve at which the tangent line is horizontal.

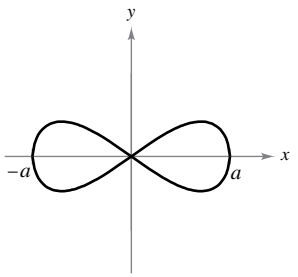

Figure for 7

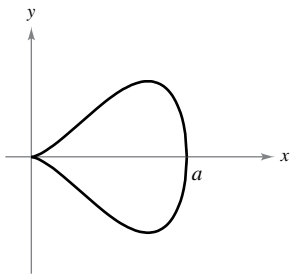

Figure for 8

8. Famous Curve Consider the graph of the **pear-shaped quartic** $b^2y^2 = x^3(a - x)$, $a, b > 0$, which is shown above.

(a) Explain how you could use a graphing utility to graph this curve.

(b) Use a graphing utility to graph the curve for various values of the constants a and b. Describe how a and b affect the shape of the curve.

(c) Determine the points on the curve at which the tangent line is horizontal.

9. Proof Let L be a differentiable function for all x. Prove that if $L(a + b) = L(a) + L(b)$ for all a and b, then $L'(x) = L'(0)$ for all x. What does the graph of L look like?

3.1 Extrema on an Interval

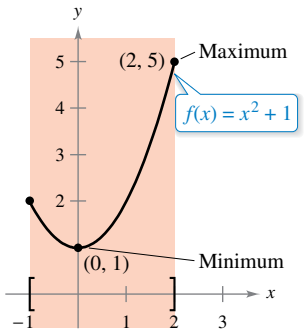
GO DIGITAL

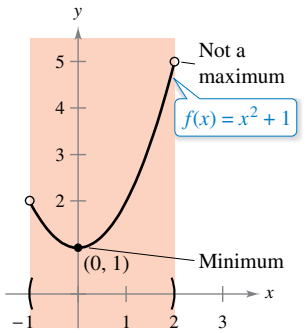
- **Define extrema of a function on an interval.**
- **Define relative extrema of a function on an open interval.**
- **Find extrema on a closed interval.**

Extrema of a Function

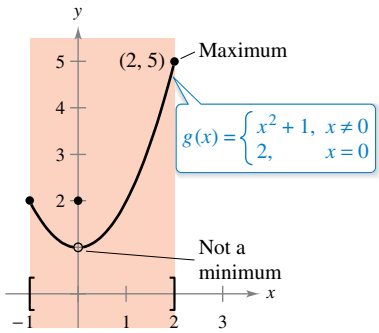
In calculus, much effort is devoted to determining the behavior of a function f on an interval I. Does f have a maximum value on I? Does it have a minimum value? Where is the function increasing? Where is it decreasing? In this chapter, you will learn how derivatives can be used to answer these questions. You will also see why these questions are important in real-life applications.



(a) f is continuous; $[-1, 2]$ is closed.



(b) f is continuous; $(-1, 2)$ is open.



(c) g is not continuous; $[-1, 2]$ is closed.

Figure 3.1

Definition of Extrema

Let a function f be defined on an interval I containing c.

1. $f(c)$ is the **minimum of f on I** when $f(c) \leq f(x)$ for all x in I.
2. $f(c)$ is the **maximum of f on I** when $f(c) \geq f(x)$ for all x in I.

The minimum and maximum of a function on an interval are the **extreme values,** or **extrema** (the singular form of extrema is extremum), of the function on the interval. The minimum and maximum of a function on an interval are also called the **absolute minimum** and **absolute maximum,** or the **global minimum** and **global maximum,** on the interval. Extrema can occur at interior points or endpoints of an interval (see Figure 3.1). Extrema that occur at the endpoints are called **endpoint extrema.**

A function need not have a minimum or a maximum on an interval. For instance, in Figures 3.1(a) and (b), you can see that the function $f(x) = x^2 + 1$ has both a minimum and a maximum on the closed interval $[-1, 2]$ but does not have a maximum on the open interval $(-1, 2)$. Moreover, in Figure 3.1(c), you can see that continuity (or the lack of it) can affect the existence of an extremum on the interval. This suggests the theorem below. (Although the Extreme Value Theorem is intuitively plausible, a proof of this theorem is not within the scope of this text.)

THEOREM 3.1 The Extreme Value Theorem

If a function f is continuous on a closed interval $[a, b]$, then f has both a minimum and a maximum on the interval.

Exploration

Finding Minimum and Maximum Values The Extreme Value Theorem (like the Intermediate Value Theorem) is an *existence theorem* because it tells of the existence of minimum and maximum values but does not show how to find these values. Use the *minimum* and *maximum* features of a graphing utility to find the extrema of each function. In each case, do you think the x-values are exact or approximate? Explain your reasoning.

a. $f(x) = x^2 - 4x + 5$ on the closed interval $[-1, 3]$

b. $f(x) = x^3 - 2x^2 - 3x - 2$ on the closed interval $[-1, 3]$

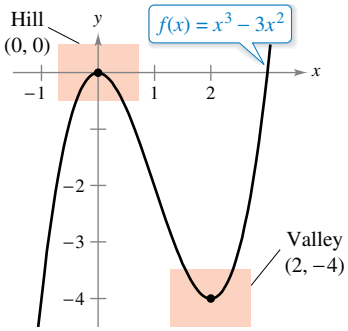
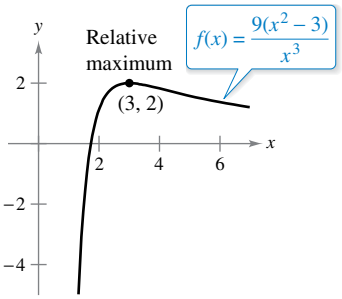
Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



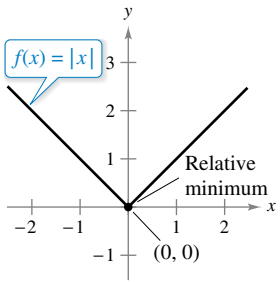
f has a relative maximum at $(0, 0)$ and a relative minimum at $(2, -4)$.

Figure 3.2

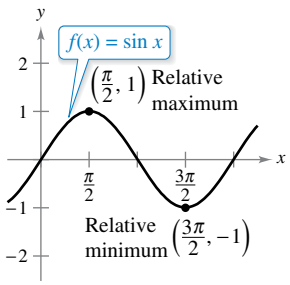
GO DIGITAL



(a) $f'(3) = 0$



(b) $f'(0)$ does not exist.



(c) $f'\left(\frac{\pi}{2}\right) = 0$; $f'\left(\frac{3\pi}{2}\right) = 0$

Figure 3.3

Relative Extrema and Critical Numbers

In Figure 3.2, the graph of $f(x) = x^3 - 3x^2$ has a **relative maximum** at the point $(0, 0)$ and a **relative minimum** at the point $(2, -4)$. Informally, for a continuous function, you can think of a relative maximum as occurring on a "hill" on the graph, and a relative minimum as occurring in a "valley" on the graph. Such a hill and valley can occur in two ways. When the hill (or valley) is smooth and rounded, the graph has a horizontal tangent line at the high point (or low point). When the hill (or valley) is sharp and peaked, the graph represents a function that is not differentiable at the high point (or low point).

Definition of Relative Extrema

1. If there is an open interval containing c on which $f(c)$ is a maximum, then $f(c)$ is called a **relative maximum** of f, or you can say that f has a **relative maximum at $(c, f(c))$.**
2. If there is an open interval containing c on which $f(c)$ is a minimum, then $f(c)$ is called a **relative minimum** of f, or you can say that f has a **relative minimum at $(c, f(c))$.**

The plural of relative maximum is relative maxima, and the plural of relative minimum is relative minima. A relative maximum is sometimes called a **local maximum,** and a relative minimum is sometimes called a **local minimum.**

Example 1 examines the derivatives of functions at *given* relative extrema. (Much more is said about *finding* the relative extrema of a function in Section 3.3.)

EXAMPLE 1 The Value of the Derivative at Relative Extrema

Find the value of the derivative at each relative extremum shown in Figure 3.3.

Solution

a. The derivative of $f(x) = \frac{9(x^2 - 3)}{x^3}$ is

$$f'(x) = \frac{x^3(18x) - (9)(x^2 - 3)(3x^2)}{(x^3)^2}$$ Differentiate using Quotient Rule.

$$= \frac{9x^2[2x^2 - 3(x^2 - 3)]}{x^6}$$ Factor.

$$= \frac{9(9 - x^2)}{x^4}.$$ Divide out common factor and combine like terms.

At the point $(3, 2)$, the value of the derivative is $f'(3) = 0$. [See Figure 3.3(a).]

b. At $x = 0$, the derivative of $f(x) = |x|$ *does not exist* because the following one-sided limits differ. [See Figure 3.3(b).]

$$\lim_{x \to 0^-} \frac{f(x) - f(0)}{x - 0} = \lim_{x \to 0^-} \frac{|x|}{x} = -1$$ Limit from the left

$$\lim_{x \to 0^+} \frac{f(x) - f(0)}{x - 0} = \lim_{x \to 0^+} \frac{|x|}{x} = 1$$ Limit from the right

c. The derivative of $f(x) = \sin x$ is $f'(x) = \cos x$. At the point $(\pi/2, 1)$, the value of the derivative is $f'(\pi/2) = \cos(\pi/2) = 0$. At the point $(3\pi/2, -1)$, the value of the derivative is $f'(3\pi/2) = \cos(3\pi/2) = 0$. [See Figure 3.3(c).] ■

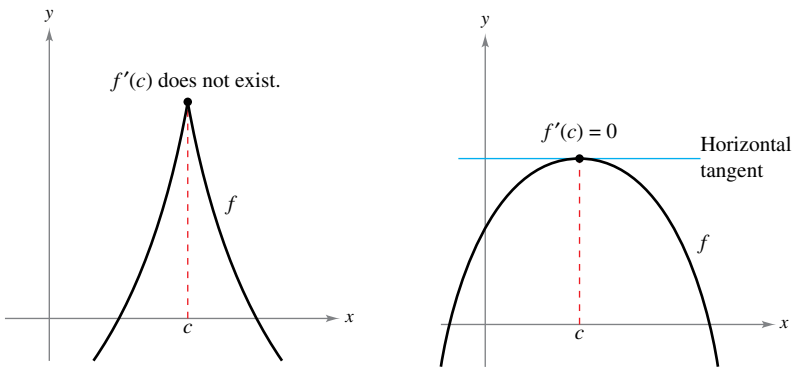
GO DIGITAL

Note in Example 1 that at each relative extremum, the derivative either is zero or does not exist. The x-values at these special points are called **critical numbers.** Figure 3.4 illustrates the two types of critical numbers. Notice in the definition that the critical number c has to be in the domain of f, but c does not have to be in the domain of f'.

REMARK Critical numbers are sometimes referred to as *critical values*.

Definition of a Critical Number

Let f be defined at c. If $f'(c) = 0$ or if f is not differentiable at c, then c is a **critical number** of f.



c is a critical number of f.
Figure 3.4

PIERRE DE FERMAT (1601–1665)

For Fermat, who was trained as a lawyer, mathematics was more of a hobby than a profession. Nevertheless, Fermat made many contributions to analytic geometry, number theory, calculus, and probability. In letters to friends, he wrote of many of the fundamental ideas of calculus, long before Newton or Leibniz. For instance, Theorem 3.2 is sometimes attributed to Fermat.

See LarsonCalculus.com to read more of this biography.

THEOREM 3.2 Relative Extrema Occur Only at Critical Numbers

If f has a relative minimum or relative maximum at $x = c$, then c is a critical number of f.

Proof

Case 1: If f is *not* differentiable at $x = c$, then, by definition, c is a critical number of f and the theorem is valid.

Case 2: If f is differentiable at $x = c$, then $f'(c)$ must be positive, negative, or 0. Suppose $f'(c)$ is positive. Then

$$f'(c) = \lim_{x \to c} \frac{f(x) - f(c)}{x - c} > 0$$

which implies that there exists an interval (a, b) containing c such that

$$\frac{f(x) - f(c)}{x - c} > 0, \text{ for all } x \neq c \text{ in } (a, b).$$ See Exercise 88(b), Section 1.2.

Because this quotient is positive, the signs of the denominator and numerator must agree. This produces the following inequalities for x-values in the interval (a, b).

Left of c: $x < c$ and $f(x) < f(c)$ ⇨ $f(c)$ is not a relative minimum.

Right of c: $x > c$ and $f(x) > f(c)$ ⇨ $f(c)$ is not a relative maximum.

So, the assumption that $f'(c) > 0$ contradicts the hypothesis that $f(c)$ is a relative extremum. Assuming that $f'(c) < 0$ produces a similar contradiction, you are left with only one possibility—namely, $f'(c) = 0$. So, by definition, c is a critical number of f and the theorem is valid. ■

GO DIGITAL

Big Ideas of Calculus

In this chapter, you will study some of the applications of the derivative. These applications include graphical analysis and optimization. Additionally, you will see how the derivative is used in the Mean Value Theorem, one of the most important theorems in calculus.

Finding Extrema on a Closed Interval

Theorem 3.2 states that the relative extrema of a function can occur *only* at the critical numbers of the function. Knowing this, you can use these guidelines to find extrema on a closed interval.

Guidelines for Finding Extrema on a Closed Interval

To find the extrema of a continuous function f on a closed interval $[a, b]$, use these steps.

1. Find the critical numbers of f in (a, b).
2. Evaluate f at each critical number in (a, b).
3. Evaluate f at each endpoint of $[a, b]$.
4. The least of these values is the minimum. The greatest is the maximum.

The next three examples show how to apply these guidelines. Be sure you see that finding the critical numbers of the function is only part of the procedure. Evaluating the function at the critical numbers *and* the endpoints is the other part.

EXAMPLE 2 **Finding Extrema on a Closed Interval**

Find the extrema of

$$f(x) = 3x^4 - 4x^3$$

on the interval $[-1, 2]$.

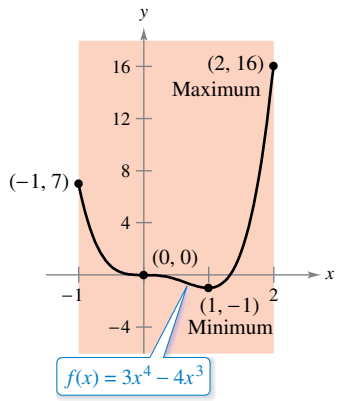
Solution Begin by differentiating the function.

$$f(x) = 3x^4 - 4x^3 \qquad \text{Write original function.}$$
$$f'(x) = 12x^3 - 12x^2 \qquad \text{Differentiate.}$$

To find the critical numbers of f in the interval $(-1, 2)$, you must find all x-values for which $f'(x) = 0$ and all x-values for which $f'(x)$ does not exist.

$$12x^3 - 12x^2 = 0 \qquad \text{Set } f'(x) \text{ equal to 0.}$$
$$12x^2(x - 1) = 0 \qquad \text{Factor.}$$
$$12x^2 = 0 \Rightarrow x = 0 \qquad \text{Set first factor equal to 0.}$$
$$x - 1 = 0 \Rightarrow x = 1 \qquad \text{Set second factor equal to 0.}$$

Because f' is defined for all x, you can conclude that $x = 0$ and $x = 1$ are the only critical numbers of f. By evaluating f at these two critical numbers and at the endpoints of $[-1, 2]$, you can determine that the maximum is $f(2) = 16$ and the minimum is $f(1) = -1$, as shown in the table. The graph of f is shown in Figure 3.5.



On the closed interval $[-1, 2]$, f has a minimum at $(1, -1)$ and a maximum at $(2, 16)$.

Figure 3.5

Left Endpoint	Critical Number	Critical Number	Right Endpoint
$f(-1) = 7$	$f(0) = 0$	$f(1) = -1$ Minimum	$f(2) = 16$ Maximum

In Figure 3.5, note that the critical number $x = 0$ does not yield a relative minimum or a relative maximum. This tells you that the converse of Theorem 3.2 is not true. In other words, *the critical numbers of a function need not produce relative extrema.*

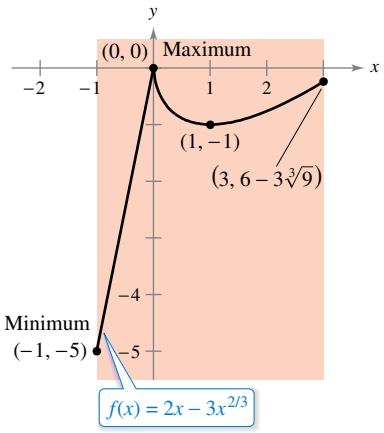
Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



On the closed interval $[-1, 3]$, f has a minimum at $(-1, -5)$ and a maximum at $(0, 0)$.

Figure 3.6

EXAMPLE 3 Finding Extrema on a Closed Interval

Find the extrema of $f(x) = 2x - 3x^{2/3}$ on the interval $[-1, 3]$.

Solution Begin by differentiating the function.

$$f(x) = 2x - 3x^{2/3}$$ Write original function.

$$f'(x) = 2 - \frac{2}{x^{1/3}}$$ Differentiate.

$$= 2\left(\frac{x^{1/3} - 1}{x^{1/3}}\right)$$ Simplify.

From this derivative, you can see that the function has two critical numbers in the interval $(-1, 3)$. The number 1 is a critical number because $f'(1) = 0$, and the number 0 is a critical number because $f'(0)$ does not exist. By evaluating f at these two numbers and at the endpoints of the interval, you can conclude that the minimum is $f(-1) = -5$ and the maximum is $f(0) = 0$, as shown in the table. The graph of f is shown in Figure 3.6.

Left Endpoint	Critical Number	Critical Number	Right Endpoint
$f(-1) = -5$ Minimum	$f(0) = 0$ Maximum	$f(1) = -1$	$f(3) = 6 - 3\sqrt[3]{9} \approx -0.24$

EXAMPLE 4 Finding Extrema on a Closed Interval

See LarsonCalculus.com for an interactive version of this type of example.

Find the extrema of

$$f(x) = 2 \sin x - \cos 2x$$

on the interval $[0, 2\pi]$.

Solution Begin by differentiating the function.

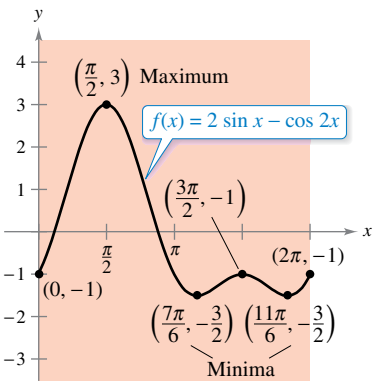
$$f(x) = 2 \sin x - \cos 2x$$ Write original function.

$$f'(x) = 2 \cos x + 2 \sin 2x$$ Differentiate.

$$= 2 \cos x + 4 \cos x \sin x$$ $\sin 2x = 2 \cos x \sin x$

$$= 2(\cos x)(1 + 2 \sin x)$$ Factor.

Because f is differentiable for all real x, you can find all critical numbers of f by finding the zeros of its derivative. Considering $2(\cos x)(1 + 2 \sin x) = 0$ in the interval $(0, 2\pi)$, the factor $\cos x$ is zero when $x = \pi/2$ and when $x = 3\pi/2$. The factor $(1 + 2 \sin x)$ is zero when $x = 7\pi/6$ and when $x = 11\pi/6$. By evaluating f at these four critical numbers and at the endpoints of the interval, you can conclude that the maximum is $f(\pi/2) = 3$ and the minimum occurs at *two* points, $f(7\pi/6) = -3/2$ and $f(11\pi/6) = -3/2$, as shown in the table. The graph is shown in Figure 3.7.



On the closed interval $[0, 2\pi]$, f has two minima at $(7\pi/6, -3/2)$ and $(11\pi/6, -3/2)$ and a maximum at $(\pi/2, 3)$.

Figure 3.7

Left Endpoint	Critical Number	Critical Number	Critical Number	Critical Number	Right Endpoint
$f(0) = -1$	$f\left(\frac{\pi}{2}\right) = 3$ Maximum	$f\left(\frac{7\pi}{6}\right) = -\frac{3}{2}$ Minimum	$f\left(\frac{3\pi}{2}\right) = -1$	$f\left(\frac{11\pi}{6}\right) = -\frac{3}{2}$ Minimum	$f(2\pi) = -1$

3.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

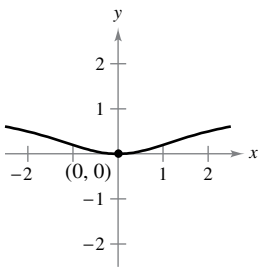
Concept Check

1. Explain what it means to say that $f(c)$ is the minimum of f on an interval I.
2. Describe the Extreme Value Theorem.
3. Explain the difference between a relative maximum and an absolute maximum on an interval I.
4. Give the definition of a critical number.
5. Explain how to find the critical numbers of a function.
6. Explain how to find the extrema of a continuous function on a closed interval $[a, b]$.

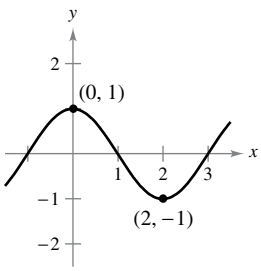
The Value of the Derivative at Relative Extrema

In Exercises 7–12, find the value of the derivative (if it exists) at each indicated extremum.

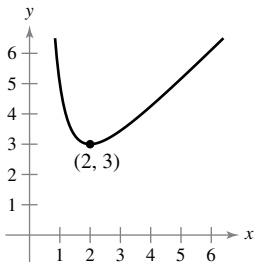
7. $f(x) = \dfrac{x^2}{x^2 + 4}$



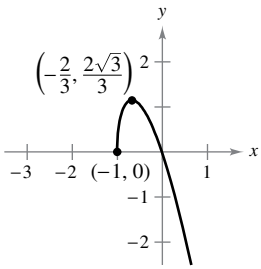
8. $f(x) = \cos\dfrac{\pi x}{2}$



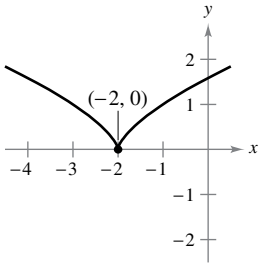
9. $g(x) = x + \dfrac{4}{x^2}$



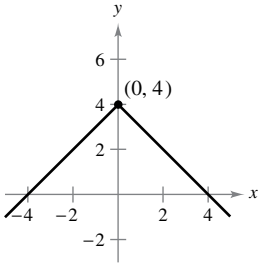
10. $f(x) = -3x\sqrt{x + 1}$



11. $f(x) = (x + 2)^{2/3}$



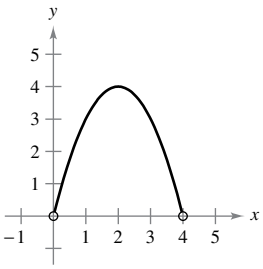
12. $f(x) = 4 - |x|$



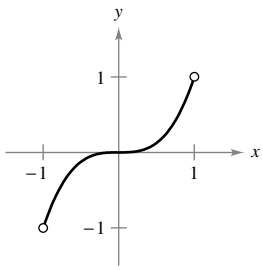
Approximating Critical Numbers

In Exercises 13–16, approximate the critical numbers of the function shown in the graph. Determine whether the function has a relative maximum, a relative minimum, an absolute maximum, an absolute minimum, or none of these at each critical number on the interval shown.

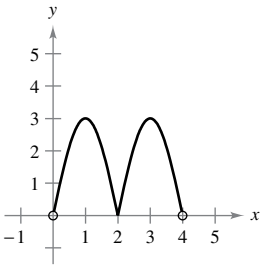
13.



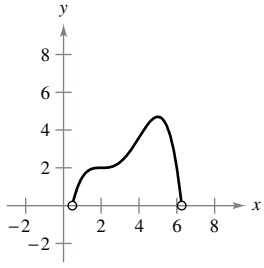
14.



15.



16.



Finding Critical Numbers

In Exercises 17–22, find the critical numbers of the function.

17. $f(x) = 4x^2 - 6x$
18. $g(x) = x - \sqrt{x}$
19. $g(t) = t\sqrt{4 - t}, \; t < 3$
20. $f(x) = \dfrac{4x}{x^2 + 1}$
21. $h(x) = \sin^2 x + \cos x, \quad 0 < x < 2\pi$
22. $f(\theta) = 2\sec\theta + \tan\theta, \quad 0 < \theta < 2\pi$

Finding Extrema on a Closed Interval

In Exercises 23–40, find the absolute extrema of the function on the closed interval.

23. $f(x) = 3 - x, \; [-1, 2]$
24. $f(x) = \dfrac{3}{4}x + 2, \; [0, 4]$
25. $h(x) = 5 - 2x^2, \; [-3, 1]$
26. $f(x) = 7x^2 + 1, \; [-1, 2]$
27. $f(x) = x^3 - \dfrac{3}{2}x^2, \; [-1, 2]$
28. $f(x) = 2x^3 - 6x, \; [0, 3]$
29. $y = 3x^{2/3} - 2x, \; [-1, 1]$
30. $g(x) = \sqrt[3]{x}, \; [-8, 8]$
31. $g(x) = \dfrac{6x^2}{x - 2}, \; [-2, 1]$
32. $h(t) = \dfrac{t}{t + 3}, \; [-1, 6]$
33. $y = 3 - |t - 3|, \; [-1, 5]$
34. $g(x) = |x + 4|, \; [-7, 1]$
35. $f(x) = [\![x]\!], \; [-2, 2]$
36. $h(x) = [\![2 - x]\!], \; [-2, 2]$
37. $f(x) = \sin x, \; \left[\dfrac{5\pi}{6}, \dfrac{11\pi}{6}\right]$
38. $g(x) = \sec x, \; \left[-\dfrac{\pi}{6}, \dfrac{\pi}{3}\right]$
39. $y = 3\cos x, \; [0, 2\pi]$
40. $y = \tan\dfrac{\pi x}{8}, \; [0, 2]$

Finding Extrema on an Interval **In Exercises 41–44, find the absolute extrema of the function (if any exist) on each interval.**

41. $f(x) = 2x - 3$

(a) $[0, 2]$ (b) $[0, 2)$

(c) $(0, 2]$ (d) $(0, 2)$

42. $f(x) = 5 - x$

(a) $[1, 4]$ (b) $[1, 4)$

(c) $(1, 4]$ (d) $(1, 4)$

43. $f(x) = x^2 - 2x$

(a) $[-1, 2]$ (b) $(1, 3]$

(c) $(0, 2)$ (d) $[1, 4)$

44. $f(x) = \sqrt{4 - x^2}$

(a) $[-2, 2]$ (b) $[-2, 0)$

(c) $(-2, 2)$ (d) $[1, 2)$

Finding Absolute Extrema Using Technology **In Exercises 45–48, use a graphing utility to graph the function and find the absolute extrema of the function on the given interval.**

45. $f(x) = \dfrac{3}{x - 1}, \quad (1, 4]$

46. $f(x) = \dfrac{2}{2 - x}, \quad [0, 2)$

47. $f(x) = \sqrt{x} + \dfrac{\sin x}{3}, \quad [0, \pi]$

48. $f(x) = -x + \cos 3\pi x, \quad \left[0, \dfrac{\pi}{6}\right]$

Finding Extrema Using Technology **In Exercises 49 and 50, (a) use a computer algebra system to graph the function and approximate any absolute extrema on the given interval. (b) Use the utility to find any critical numbers, and use them to identify any absolute extrema not located at the endpoints. Compare the results with those in part (a).**

49. $f(x) = 3.2x^5 + 5x^3 - 3.5x, \quad [0, 1]$

50. $f(x) = \dfrac{4}{3}x\sqrt{3 - x}, \quad [0, 3]$

Finding Maximum Values Using Technology **In Exercises 51 and 52, use a computer algebra system to find the maximum value of $|f''(x)|$ on the closed interval. (This value is used in the error estimate for the Trapezoidal Rule, as discussed in Section 8.6.)**

51. $f(x) = \sqrt{1 + x^3}, \quad [0, 2]$

52. $f(x) = \dfrac{1}{x^2 + 1}, \quad \left[\dfrac{1}{2}, 3\right]$

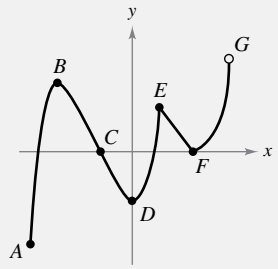
Finding Maximum Values Using Technology **In Exercises 53 and 54, use a computer algebra system to find the maximum value of $|f^{(4)}(x)|$ on the closed interval. (This value is used in the error estimate for Simpson's Rule, as discussed in Section 8.6.)**

53. $f(x) = (x + 1)^{2/3}, \quad [0, 2]$

54. $f(x) = \dfrac{1}{x^2 + 1}, \quad [-1, 1]$

55. Writing Write a short paragraph explaining why a continuous function on an open interval may not have a maximum or minimum. Illustrate your explanation with a sketch of the graph of such a function.

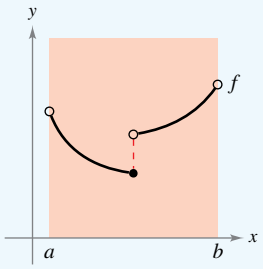
56. HOW DO YOU SEE IT? Determine whether each labeled point is an absolute maximum or minimum, a relative maximum or minimum, or none of these.

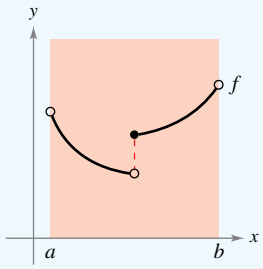


Exploring Concepts

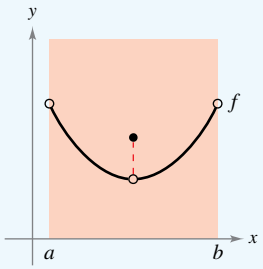
In Exercises 57 and 58, determine from the graph whether f has a minimum in the open interval (a, b). Explain your reasoning.

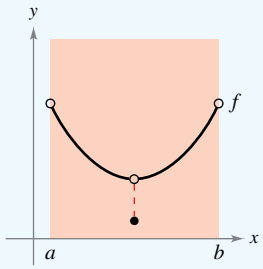
57. (a) (b)





58. (a) (b)





59. Consider the function

$$f(x) = \frac{x - 4}{x + 2}.$$

Is $x = -2$ a critical number of f? Why or why not?

60. Graph a function on the interval $[-2, 5]$ having the given characteristics.

Relative minimum at $x = -1$

Critical number (but no extremum) at $x = 0$

Absolute maximum at $x = 2$

Absolute minimum at $x = 5$

61. Power The formula for the power output P of a battery is

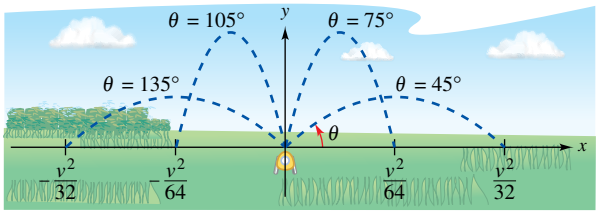
$$P = VI - RI^2$$

where V is the electromotive force in volts, R is the resistance in ohms, and I is the current in amperes. Find the current that corresponds to a maximum value of P in a battery for which $V = 12$ volts and $R = 0.5$ ohm. Assume that a 15-ampere fuse bounds the output in the interval $0 \le I \le 15$. Could the power output be increased by replacing the 15-ampere fuse with a 20-ampere fuse? Explain.

62. Lawn Sprinkler A lawn sprinkler is constructed in such a way that $d\theta/dt$ is constant, where θ ranges between 45° and 135° (see figure). The distance the water travels horizontally is

$$x = \frac{v^2 \sin 2\theta}{32}, \quad 45° \le \theta \le 135°$$

where v is the speed of the water. Find dx/dt and explain why this lawn sprinkler does not water evenly. What part of the lawn receives the most water?



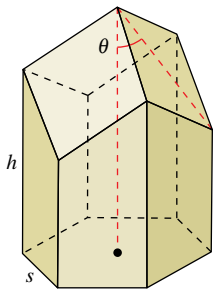
Water sprinkler: $45° \le \theta \le 135°$

FOR FURTHER INFORMATION For more information on the "calculus of lawn sprinklers," see the article "Design of an Oscillating Sprinkler" by Bart Braden in *Mathematics Magazine*. To view this article, go to *MathArticles.com*.

63. Honeycomb The surface area of a cell in a honeycomb is

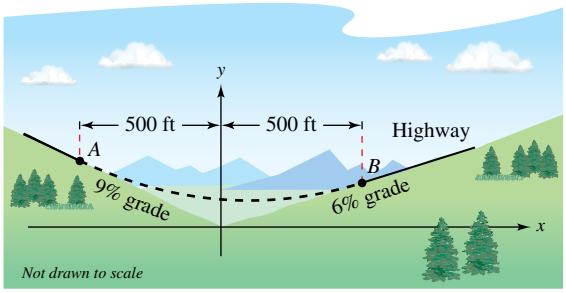
$$S = 6hs + \frac{3s^2}{2}\left(\frac{\sqrt{3} - \cos\theta}{\sin\theta}\right)$$

where h and s are positive constants and θ is the angle at which the upper faces meet the altitude of the cell (see figure). Find the angle θ $(\pi/6 \le \theta \le \pi/2)$ that minimizes the surface area S.



FOR FURTHER INFORMATION For more information on the geometric structure of a honeycomb cell, see the article "The Design of Honeycombs" by Anthony L. Peressini in UMAP Module 502, published by COMAP, Inc., Suite 210, 57 Bedford Street, Lexington, MA.

64. Highway Design In order to build a highway, it is necessary to fill a section of a valley where the grades (slopes) of the sides are 9% and 6% (see figure). The top of the filled region will have the shape of a parabolic arc that is tangent to the two slopes at the points A and B. The horizontal distances from A to the y-axis and from B to the y-axis are both 500 feet.



(a) Find the coordinates of A and B.

(b) Find a quadratic function $y = ax^2 + bx + c$ for $-500 \le x \le 500$ that describes the top of the filled region.

(c) Construct a table giving the depths d of the fill for $x = -500, -400, -300, -200, -100, 0, 100, 200, 300, 400$, and 500.

(d) What will be the lowest point on the completed highway? Will it be directly over the point where the two hillsides come together?

True or False? **In Exercises 65–68, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

65. The maximum of $y = x^2$ on the open interval $(-3, 3)$ is 9.

66. If a function is continuous on a closed interval, then it must have a minimum on the interval.

67. If $x = c$ is a critical number of the function f, then it is also a critical number of the function $g(x) = f(x) + k$, where k is a constant.

68. If $x = c$ is a critical number of the function f, then it is also a critical number of the function $g(x) = f(x - k)$, where k is a constant.

69. Functions Let the function f be differentiable on an interval I containing c. Show that if f has a maximum value at $x = c$, then $-f$ has a minimum value at $x = c$.

70. Critical Numbers Consider the cubic function $f(x) = ax^3 + bx^2 + cx + d$, where $a \ne 0$. Show that f can have zero, one, or two critical numbers and give an example of each case.

PUTNAM EXAM CHALLENGE

71. Determine all real numbers $a > 0$ for which there exists a nonnegative continuous function $f(x)$ defined on $[0, a]$ with the property that the region $R = \{(x, y); 0 \le x \le a, 0 \le y \le f(x)\}$ has perimeter k units and area k square units for some real number k.

3.2 Rolle's Theorem and the Mean Value Theorem

- **Describe and use Rolle's Theorem.**
- **Describe and use the Mean Value Theorem.**

Exploration

Extreme Values on a Closed Interval Sketch a rectangular coordinate plane on a piece of paper. Label the points (1, 3) and (5, 3). Using a pencil or pen, draw the graph of a differentiable function f that starts at (1, 3) and ends at (5, 3). Is there at least one point on the graph for which the derivative is zero? Would it be possible to draw the graph so that there is *not* a point for which the derivative is zero? Explain your reasoning.

Rolle's Theorem

The Extreme Value Theorem (see Section 3.1) states that a continuous function on a closed interval $[a, b]$ must have both a minimum and a maximum on the interval. Both of these values, however, can occur at the endpoints. **Rolle's Theorem,** named after the French mathematician Michel Rolle (1652–1719), gives conditions that guarantee the existence of an extreme value in the *interior* of a closed interval.

THEOREM 3.3 Rolle's Theorem

Let f be continuous on the closed interval $[a, b]$ and differentiable on the open interval (a, b). If $f(a) = f(b)$, then there is at least one number c in (a, b) such that $f'(c) = 0$.

Proof Let $f(a) = d = f(b)$.

Case 1: If $f(x) = d$ for all x in $[a, b]$, then f is constant on the interval and, by Theorem 2.2, $f'(x) = 0$ for all x in (a, b).

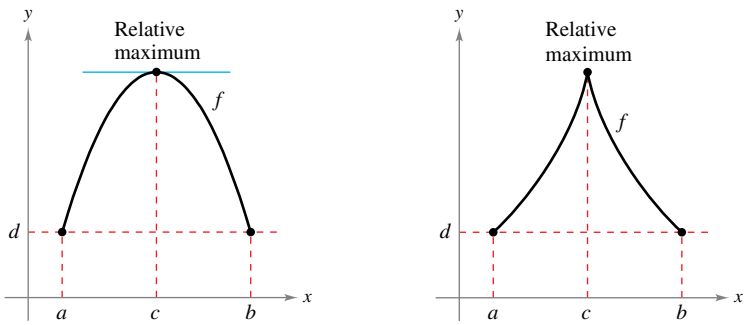
Case 2: Consider $f(x) > d$ for some x in (a, b). By the Extreme Value Theorem, f has a maximum at some c in the interval. Moreover, because $f(c) > d$, this maximum does not occur at either endpoint. So, f has a maximum in the *open* interval (a, b). This implies that $f(c)$ is a *relative* maximum and, by Theorem 3.2, c is a critical number of f. Finally, because f is differentiable at c, you can conclude that $f'(c) = 0$.

Case 3: When $f(x) < d$ for some x in (a, b), you can use an argument similar to that in Case 2 but involving the minimum instead of the maximum. ∎

ROLLE'S THEOREM

French mathematician Michel Rolle first published the theorem that bears his name in 1691. Before this time, however, Rolle was one of the most vocal critics of calculus, stating that it gave erroneous results and was based on unsound reasoning. Later in life, Rolle came to see the usefulness of calculus.

According to Rolle's Theorem, if a function f is continuous on $[a, b]$ and differentiable on (a, b), and if $f(a) = f(b)$, then there must be at least one x-value between a and b at which the graph of f has a horizontal tangent [See Figure 3.8(a)]. When the differentiability requirement is dropped from Rolle's Theorem, f will still have a critical number in (a, b), but it may not yield a horizontal tangent. Such a case is shown in Figure 3.8(b).



(a) f is continuous on $[a, b]$ and differentiable on (a, b).

(b) f is continuous on $[a, b]$ but *not* differentiable on (a, b).

Figure 3.8

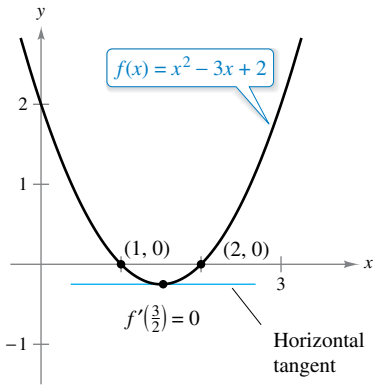
Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



The x-value for which $f'(x) = 0$ is between the two x-intercepts.
Figure 3.9

EXAMPLE 1 Illustrating Rolle's Theorem

Find the two x-intercepts of

$$f(x) = x^2 - 3x + 2$$

and show that $f'(x) = 0$ at some point between the two x-intercepts.

Solution Note that f is differentiable on the entire real number line. Setting $f(x)$ equal to 0 produces

$$x^2 - 3x + 2 = 0 \qquad \text{Set } f(x) \text{ equal to 0.}$$
$$(x - 1)(x - 2) = 0 \qquad \text{Factor.}$$
$$x = 1, 2. \qquad \text{Solve for } x.$$

So, $f(1) = f(2) = 0$, and from Rolle's Theorem you know that there *exists* at least one c in the interval $(1, 2)$ such that $f'(c) = 0$. To *find* such a c, differentiate f to obtain

$$f'(x) = 2x - 3 \qquad \text{Differentiate.}$$

and then determine that $f'(x) = 0$ when $x = \frac{3}{2}$. Note that this x-value lies in the open interval $(1, 2)$, as shown in Figure 3.9. ■

GO DIGITAL

Rolle's Theorem states that when f satisfies the conditions of the theorem, there must be *at least* one point between a and b at which the derivative is 0. There may, of course, be more than one such point, as shown in the next example.

EXAMPLE 2 Illustrating Rolle's Theorem

Let $f(x) = x^4 - 2x^2$. Find all values of c in the interval $(-2, 2)$ such that $f'(c) = 0$.

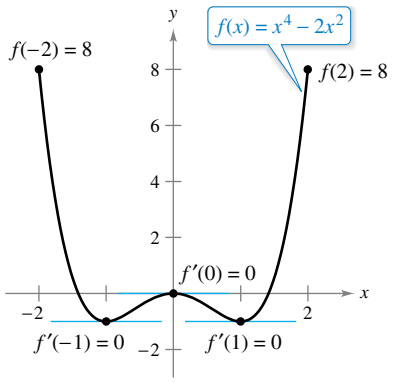
Solution To begin, note that the function satisfies the conditions of Rolle's Theorem. That is, f is continuous on the interval $[-2, 2]$ and differentiable on the interval $(-2, 2)$. Moreover, because $f(-2) = f(2) = 8$, you can conclude that there exists at least one c in $(-2, 2)$ such that $f'(c) = 0$. Because

$$f'(x) = 4x^3 - 4x \qquad \text{Differentiate.}$$

setting the derivative equal to 0 produces

$$4x^3 - 4x = 0 \qquad \text{Set } f'(x) \text{ equal to 0.}$$
$$4x(x - 1)(x + 1) = 0 \qquad \text{Factor.}$$
$$x = 0, 1, -1. \qquad x\text{-values for which } f'(x) = 0$$

So, in the interval $(-2, 2)$, the derivative is zero when $x = -1$, 0, and 1, as shown in Figure 3.10. ■



$f'(x) = 0$ for more than one x-value in the interval $(-2, 2)$.
Figure 3.10

TECHNOLOGY PITFALL A graphing utility can be used to indicate whether the points on the graphs in Examples 1 and 2 are relative minima or relative maxima of the functions. When using a graphing utility, however, you should keep in mind that it can give misleading graphs. For example, use a graphing utility to graph

$$f(x) = 1 - (x - 1)^2 - \frac{1}{1000(x - 1)^{1/7} + 1}.$$

With most viewing windows, it appears that the function has a maximum of 1 when $x = 1$, as shown in Figure 3.11. Evaluating the function at $x = 1$, however, produces $f(1) = 0$. To determine the behavior of this function near $x = 1$, you need to examine the graph analytically to get the complete picture.

GO DIGITAL

The Mean Value Theorem

Rolle's Theorem can be used to prove another theorem—the **Mean Value Theorem.**

REMARK The "mean" in the Mean Value Theorem refers to the mean (or average) rate of change of f on the interval $[a, b]$.

THEOREM 3.4 The Mean Value Theorem

If f is continuous on the closed interval $[a, b]$ and differentiable on the open interval (a, b), then there exists a number c in (a, b) such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}.$$

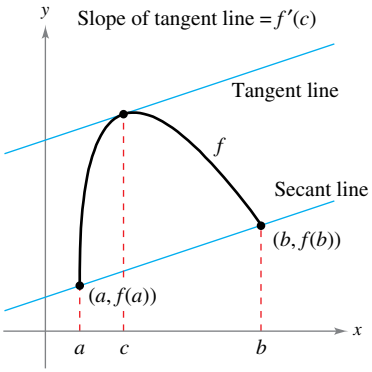

Figure 3.12

Proof Refer to Figure 3.12. The equation of the secant line that passes through the points $(a, f(a))$ and $(b, f(b))$ is

$$y = \overbrace{\left[\frac{f(b) - f(a)}{b - a}\right]}^{\text{Slope of secant line}}(x - a) + f(a). \qquad \text{Secant line through } (a, f(a)) \text{ and } (b, f(b))$$

Let $g(x)$ be the difference between $f(x)$ and y. Then

$$\begin{aligned} g(x) &= f(x) - y \\ &= f(x) - \left[\frac{f(b) - f(a)}{b - a}\right](x - a) - f(a). \qquad \text{Substitute for } y. \end{aligned}$$

Evaluating g at a and b shows that

$$g(a) = 0 = g(b).$$

Because f is continuous on $[a, b]$, it follows that g is also continuous on $[a, b]$. Furthermore, because f is differentiable, g is also differentiable, and you can apply Rolle's Theorem to the function g. So, there exists a number c in (a, b) such that $g'(c) = 0$, which implies that

$$\begin{aligned} g'(c) &= 0 \qquad \text{Set } g'(c) \text{ equal to 0.} \\ f'(c) - \frac{f(b) - f(a)}{b - a} &= 0. \qquad \text{Derivative of } g \end{aligned}$$

So, there exists a number c in (a, b) such that

$$f'(c) = \frac{f(b) - f(a)}{b - a}. \qquad \text{Solve for } f'(c).$$

Although the Mean Value Theorem can be used directly in problem solving, it is used more often to prove other theorems. In fact, some people consider this to be the most important theorem in calculus—it is closely related to the Fundamental Theorem of Calculus discussed in Section 4.4. For now, you can get an idea of the versatility of the Mean Value Theorem by looking at the results stated in Exercises 79–83 in this section.

The Mean Value Theorem has implications for both basic interpretations of the derivative. Geometrically, the theorem guarantees the existence of a tangent line that is parallel to the secant line through the points

$$(a, f(a)) \quad \text{and} \quad (b, f(b))$$

as shown in Figure 3.12. Example 3 illustrates this geometric interpretation of the Mean Value Theorem. In terms of rates of change, the Mean Value Theorem implies that there must be a point in the open interval (a, b) at which the instantaneous rate of change is equal to the average rate of change over the interval $[a, b]$. This is illustrated in Example 4.

JOSEPH-LOUIS LAGRANGE (1736–1813)

The Mean Value Theorem was first proved by the famous mathematician Joseph-Louis Lagrange. Born in Italy, Lagrange held a position in the court of Frederick the Great in Berlin for 20 years.

The tangent line at (2, 3) is parallel to the secant line through (1, 1) and (4, 4).

Figure 3.13

EXAMPLE 3 Finding a Tangent Line

See LarsonCalculus.com for an interactive version of this type of example.

For $f(x) = 5 - (4/x)$, find all values of c in the open interval $(1, 4)$ such that

$$f'(c) = \frac{f(4) - f(1)}{4 - 1}.$$

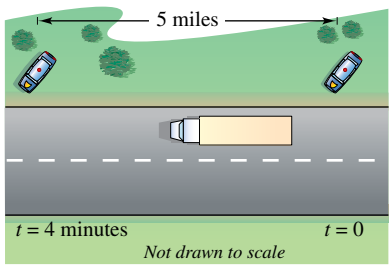
Solution The slope of the secant line through $(1, f(1))$ and $(4, f(4))$ is

$$\frac{f(4) - f(1)}{4 - 1} = \frac{4 - 1}{4 - 1} = 1.$$ Slope of secant line

Note that f satisfies the conditions of the Mean Value Theorem. That is, f is continuous on the interval $[1, 4]$ and differentiable on the interval $(1, 4)$. So, there exists at least one number c in $(1, 4)$ such that $f'(c) = 1$. Solving the equation $f'(x) = 1$ yields

$$\frac{4}{x^2} = 1$$ Set $f'(x)$ equal to 1.

which implies that $x = \pm 2$. So, in the interval $(1, 4)$, you can conclude that $c = 2$. Figure 3.13 shows the graphs of f, the secant line passing through the points $(1, 1)$ and $(4, 4)$, and the tangent line at $x = 2$. Note that the tangent line is parallel to the secant line because both lines have the same slope.



At some time t, the instantaneous velocity is equal to the average velocity over 4 minutes.

Figure 3.14

EXAMPLE 4 Finding an Instantaneous Rate of Change

Two stationary patrol cars equipped with radar are 5 miles apart on a highway, as shown in Figure 3.14. As a truck passes the first patrol car, its speed is clocked at 55 miles per hour. Four minutes later, when the truck passes the second patrol car, its speed is clocked at 50 miles per hour. Prove that the truck must have exceeded the speed limit (of 55 miles per hour) at some time during the 4 minutes.

Solution Let $t = 0$ be the time (in hours) when the truck passes the first patrol car. The time when the truck passes the second patrol car is

$$t = \frac{4}{60} = \frac{1}{15} \text{ hour.}$$

By letting $s(t)$ represent the distance (in miles) traveled by the truck, you have $s(0) = 0$ and $s\left(\frac{1}{15}\right) = 5$. So, the average velocity of the truck over the five-mile stretch of highway is

$$\text{Average velocity} = \frac{s(1/15) - s(0)}{(1/15) - 0} = \frac{5}{1/15} = 75 \text{ miles per hour.}$$

Assuming that the position function is differentiable, you can apply the Mean Value Theorem to conclude that the truck must have been traveling at a rate of 75 miles per hour sometime during the 4 minutes. ■

A useful alternative form of the Mean Value Theorem is: If f is continuous on $[a, b]$ and differentiable on (a, b), then there exists a number c in (a, b) such that

$$f(b) = f(a) + (b - a)f'(c).$$ Alternative form of Mean Value Theorem

When doing the exercises for this section, keep in mind that polynomial functions, rational functions, and trigonometric functions are differentiable at all points in their domains.

GO DIGITAL

Concept Check

1. Explain Rolle's Theorem.
2. Explain the Mean Value Theorem.

Writing **In Exercises 3–6, explain why Rolle's Theorem does not apply to the function even though there exist a and b such that $f(a) = f(b)$.**

3. $f(x) = \left|\frac{1}{x}\right|, [-1, 1]$
4. $f(x) = \cot\frac{x}{2}, [\pi, 3\pi]$
5. $f(x) = 1 - |x - 1|, [0, 2]$
6. $f(x) = \sqrt{(2 - x^{2/3})^3}, [-1, 1]$

Using Rolle's Theorem **In Exercises 7–10, find the two x-intercepts of the function f and show that $f'(x) = 0$ at some point between the two x-intercepts.**

7. $f(x) = x^2 - x - 2$
8. $f(x) = x^2 + 6x$
9. $f(x) = x\sqrt{x + 4}$
10. $f(x) = -3x\sqrt{x + 1}$

Using Rolle's Theorem **In Exercises 11–24, determine whether Rolle's Theorem can be applied to f on the closed interval $[a, b]$. If Rolle's Theorem can be applied, find all values of c in the open interval (a, b) such that $f'(c) = 0$. If Rolle's Theorem cannot be applied, explain why not.**

11. $f(x) = -x^2 + 3x, [0, 3]$
12. $f(x) = x^2 - 8x + 5, [2, 6]$
13. $f(x) = (x - 1)(x - 2)(x - 3), [1, 3]$
14. $f(x) = (x - 4)(x + 2)^2, [-2, 4]$
15. $f(x) = x^{2/3} - 1, [-8, 8]$
16. $f(x) = 3 - |x - 3|, [0, 6]$
17. $f(x) = \frac{x^2 - 2x - 3}{x + 2}, [-1, 3]$
18. $f(x) = \frac{x^2 - 4}{x - 1}, [-2, 2]$
19. $f(x) = \sin x, [0, 2\pi]$
20. $f(x) = \cos x, [\pi, 3\pi]$
21. $f(x) = \cos \pi x, [0, 2]$
22. $f(x) = \sin 3x, \left[\frac{\pi}{2}, \frac{7\pi}{6}\right]$
23. $f(x) = \tan x, [0, \pi]$
24. $f(x) = \sec x, [\pi, 2\pi]$

Using Rolle's Theorem **In Exercises 25–28, use a graphing utility to graph the function on the closed interval $[a, b]$. Determine whether Rolle's Theorem can be applied to f on the interval and, if so, find all values of c in the open interval (a, b) such that $f'(c) = 0$.**

25. $f(x) = |x| - 1, [-1, 1]$
26. $f(x) = x - x^{1/3}, [0, 1]$
27. $f(x) = \frac{x}{2} - \sin\frac{\pi x}{6}, [-1, 0]$
28. $f(x) = x - \tan \pi x, \left[-\frac{1}{4}, \frac{1}{4}\right]$

29. **Vertical Motion** The height of a ball t seconds after it is thrown upward from a height of 6 feet and with an initial velocity of 48 feet per second is

$$f(t) = -16t^2 + 48t + 6.$$

(a) Verify that $f(1) = f(2)$.

(b) According to Rolle's Theorem, what must the velocity be at some time in the interval $(1, 2)$? Find that time.

30. **Reorder Costs** The ordering and transportation cost C for components used in a manufacturing process is approximated by

$$C(x) = 10\left(\frac{1}{x} + \frac{x}{x + 3}\right)$$

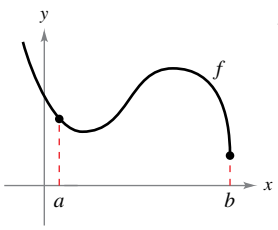
where C is measured in thousands of dollars and x is the order size in hundreds.

(a) Verify that $C(3) = C(6)$.

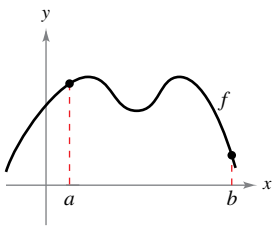
(b) According to Rolle's Theorem, the rate of change of the cost must be 0 for some order size in the interval $(3, 6)$. Find that order size.

Mean Value Theorem **In Exercises 31 and 32, copy the graph and sketch the secant line to the graph through the points $(a, f(a))$ and $(b, f(b))$. Then sketch any tangent lines to the graph for each value of c guaranteed by the Mean Value Theorem. To print an enlarged copy of the graph, go to *MathGraphs.com*.**

31.

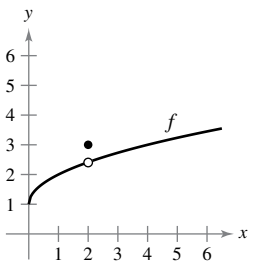


32.

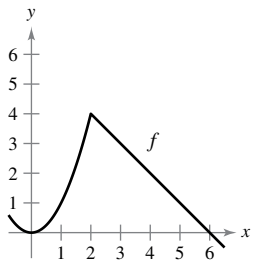


Writing **In Exercises 33–36, explain why the Mean Value Theorem does not apply to the function f on the interval $[0, 6]$.**

33.



34.



35. $f(x) = \frac{1}{x - 3}$
36. $f(x) = |x - 3|$

37. Mean Value Theorem Consider the graph of the function $f(x) = -x^2 + 5$ (see figure).

(a) Find the equation of the secant line joining the points $(-1, 4)$ and $(2, 1)$.

(b) Use the Mean Value Theorem to determine a point c in the interval $(-1, 2)$ such that the tangent line at c is parallel to the secant line.

(c) Find the equation of the tangent line through c.

(d) Use a graphing utility to graph f, the secant line, and the tangent line.

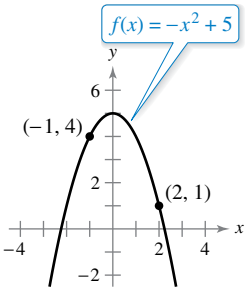

Figure for 37

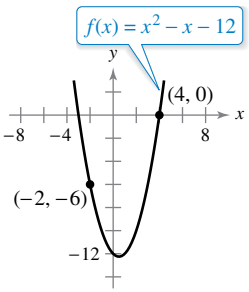

Figure for 38

38. Mean Value Theorem Consider the graph of the function $f(x) = x^2 - x - 12$ (see figure).

(a) Find the equation of the secant line joining the points $(-2, -6)$ and $(4, 0)$.

(b) Use the Mean Value Theorem to determine a point c in the interval $(-2, 4)$ such that the tangent line at c is parallel to the secant line.

(c) Find the equation of the tangent line through c.

(d) Use a graphing utility to graph f, the secant line, and the tangent line.

Using the Mean Value Theorem **In Exercises 39–48, determine whether the Mean Value Theorem can be applied to f on the closed interval $[a, b]$. If the Mean Value Theorem can be applied, find all values of c in the open interval (a, b) such that**

$$f'(c) = \frac{f(b) - f(a)}{b - a}.$$

If the Mean Value Theorem cannot be applied, explain why not.

39. $f(x) = 6x^3, \quad [1, 2]$

40. $f(x) = x^6, \quad [-1, 1]$

41. $f(x) = x^3 + 2x + 4, \quad [-1, 0]$

42. $f(x) = x^3 - 3x^2 + 9x + 5, \quad [0, 1]$

43. $f(x) = \dfrac{x + 2}{x - 1}, \quad [-3, 3]$

44. $f(x) = \dfrac{x}{x - 5}, \quad [1, 4]$

45. $f(x) = |2x + 1|, \quad [-1, 3]$

46. $f(x) = \sqrt{2 - x}, \quad [-7, 2]$

47. $f(x) = \sin x, \quad [0, \pi]$

48. $f(x) = \cos x + \tan x, \quad [0, \pi]$

Using the Mean Value Theorem **In Exercises 49–52, use a graphing utility to (a) graph the function f on the given interval, (b) find and graph the secant line through points on the graph of f at the endpoints of the given interval, and (c) find and graph any tangent lines to the graph of f that are parallel to the secant line.**

49. $f(x) = \dfrac{x}{x + 1}, \quad \left[-\dfrac{1}{2}, 2\right]$

50. $f(x) = x - 2 \sin x, \quad [-\pi, \pi]$

51. $f(x) = \sqrt{x}, \quad [1, 9]$

52. $f(x) = x^4 - 2x^3 + x^2, \quad [0, 6]$

53. Vertical Motion The height of an object t seconds after it is dropped from a height of 300 meters is

$$s(t) = -4.9t^2 + 300.$$

(a) Find the average velocity of the object during the first 3 seconds.

(b) Use the Mean Value Theorem to verify that at some time during the first 3 seconds of fall, the instantaneous velocity equals the average velocity. Find that time.

54. Sales A company introduces a new product for which the number of units sold S is

$$S(t) = 200\left(5 - \frac{9}{2 + t}\right)$$

where t is the time in months.

(a) Find the average rate of change of S during the first year.

(b) During what month of the first year does $S'(t)$ equal the average rate of change?

Exploring Concepts

55. Let f be continuous on $[a, b]$ and differentiable on (a, b). If there exists c in (a, b) such that $f'(c) = 0$, does it follow that $f(a) = f(b)$? Explain.

56. Let f be continuous on $[a, b]$ and differentiable on (a, b). Also, suppose that $f(a) = f(b)$ and that c is a real number in the interval (a, b) such that $f'(c) = 0$. Find an interval for the function g over which Rolle's Theorem can be applied, and find the corresponding critical number of g, where k is a constant.

(a) $g(x) = f(x) + k$ (b) $g(x) = f(x - k)$

(c) $g(x) = f(kx)$

57. The function

$$f(x) = \begin{cases} 0, & x = 0 \\ 1 - x, & 0 < x \le 1 \end{cases}$$

is differentiable on $(0, 1)$ and satisfies $f(0) = f(1)$. However, its derivative is never zero on $(0, 1)$. Does this contradict Rolle's Theorem? Explain.

58. Can you find a function f such that $f(-2) = -2$, $f(2) = 6$, and $f'(x) < 1$ for all x? Why or why not?

59. Speed

A plane begins its takeoff at 2:00 P.M. on a 2500-mile flight. After 5.5 hours, the plane arrives at its destination. Explain why there are at least two times during the flight when the speed of the plane is 400 miles per hour.

Denis Belitsky/Shutterstock.com

60. Temperature When an object is removed from a furnace and placed in an environment with a constant temperature of 90°F, its core temperature is 1500°F. Five hours later, the core temperature is 390°F. Explain why there must exist a time in the interval $(0, 5)$ when the temperature is decreasing at a rate of 222°F per hour.

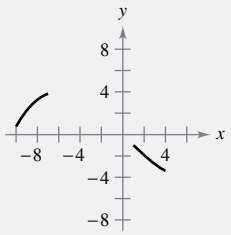
61. Velocity Two bicyclists begin a race at 8:00 A.M. They both finish the race 2 hours and 15 minutes later. Prove that at some time during the race, the bicyclists are traveling at the same velocity.

62. Acceleration At 9:13 A.M., a sports car is traveling 35 miles per hour. Two minutes later, the car is traveling 85 miles per hour. Prove that at some time during this two-minute interval, the car's acceleration is exactly 1500 miles per hour squared.

63. Think About It Sketch the graph of an arbitrary function f that satisfies the given condition but does not satisfy the conditions of the Mean Value Theorem on the interval $[-5, 5]$.

(a) f is continuous. (b) f is not continuous.

64. HOW DO YOU SEE IT? The figure shows two parts of the graph of a continuous differentiable function f on $[-10, 4]$. The derivative f' is also continuous. To print an enlarged copy of the graph, go to *MathGraphs.com*.



(a) Explain why f must have at least one zero in $[-10, 4]$.

(b) Explain why f' must also have at least one zero in the interval $[-10, 4]$. What are these zeros called?

(c) Make a possible sketch of the function, where f' has one zero on the interval $[-10, 4]$.

Finding a Solution **In Exercises 65–68, prove that the equation has exactly one real solution.**

65. $x^5 + x^3 + x + 1 = 0$ **66.** $2x^5 + 7x - 1 = 0$

67. $3x + 1 - \sin x = 0$ **68.** $2x - 2 - \cos x = 0$

Using a Derivative **In Exercises 69–72, find a function f that has the derivative $f'(x)$ and whose graph passes through the given point. Explain your reasoning.**

69. $f'(x) = 0, \quad (2, 5)$ **70.** $f'(x) = 4, \quad (0, 1)$

71. $f'(x) = 2x, \quad (1, 0)$ **72.** $f'(x) = 6x - 1, \quad (2, 7)$

True or False? **In Exercises 73–76, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

73. The Mean Value Theorem can be applied to $f(x) = 1/x$ on the interval $[-1, 1]$.

74. If the graph of a function has three x-intercepts, then it must have at least two points at which its tangent line is horizontal.

75. If the graph of a polynomial function has three x-intercepts, then it must have at least two points at which its tangent line is horizontal.

76. The Mean Value Theorem can be applied to $f(x) = \tan x$ on the interval $[0, \pi/4]$.

77. Proof Prove that if $a > 0$ and n is any positive integer, then the polynomial function $p(x) = x^{2n+1} + ax + b$ cannot have two real roots.

78. Tangent Lines

(a) Let $f(x) = x^2$ and $g(x) = -x^3 + x^2 + 3x + 2$. Then $f(-1) = g(-1)$ and $f(2) = g(2)$. Show that there is at least one value c in the interval $(-1, 2)$ where the tangent line to f at $(c, f(c))$ is parallel to the tangent line to g at $(c, g(c))$. Identify c.

(b) Let f and g be differentiable functions on $[a, b]$, where $f(a) = g(a)$ and $f(b) = g(b)$. Show that there is at least one value c in the interval (a, b) where the tangent line to f at $(c, f(c))$ is parallel to the tangent line to g at $(c, g(c))$.

79. Proof Let $p(x) = Ax^2 + Bx + C$. Prove that for any interval $[a, b]$, the value c guaranteed by the Mean Value Theorem is the midpoint of the interval.

80. Proof Prove that if $f'(x) = 0$ for all x in an interval (a, b), then f is constant on (a, b).

81. Proof Prove that $|\cos a - \cos b| \leq |a - b|$ for all a and b.

82. Proof Prove that $|\sin a - \sin b| \leq |a - b|$ for all a and b.

83. Using the Mean Value Theorem Let $0 < a < b$. Use the Mean Value Theorem to show that

$$\sqrt{b} - \sqrt{a} < \frac{b - a}{2\sqrt{a}}.$$

PUTNAM EXAM CHALLENGE

84. Let f be a three times differentiable function (defined on $\mathbb{R}$ and real-valued) such that f has at least five distinct real zeros. Prove that

$$f + 6f' + 12f'' + 8f'''$$

has at least two distinct real zeros.

3.3 Increasing and Decreasing Functions and the First Derivative Test

GO DIGITAL

- **Determine intervals on which a function is increasing or decreasing.**
- **Apply the First Derivative Test to find relative extrema of a function.**

Increasing and Decreasing Functions

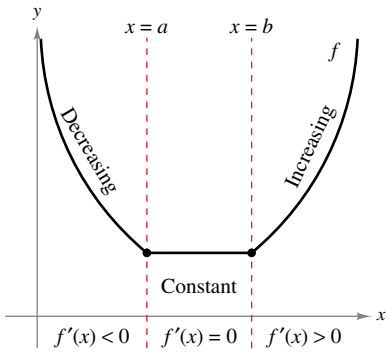
In this section, you will learn how derivatives can be used to *classify* relative extrema as either relative minima or relative maxima. First, it is important to define increasing and decreasing functions.

Definitions of Increasing and Decreasing Functions

A function f is **increasing** on an interval when, for any two numbers x_1 and x_2 in the interval, $x_1 < x_2$ implies $f(x_1) < f(x_2)$.

A function f is **decreasing** on an interval when, for any two numbers x_1 and x_2 in the interval, $x_1 < x_2$ implies $f(x_1) > f(x_2)$.

A function is increasing when, *as x moves to the right*, its graph moves up, and is decreasing when its graph moves down. For example, the function in Figure 3.15 is decreasing on the interval $(-\infty, a)$, is constant on the interval (a, b), and is increasing on the interval (b, ∞). As shown in Theorem 3.5 below, a positive derivative implies that the function is increasing, a negative derivative implies that the function is decreasing, and a zero derivative on an entire interval implies that the function is constant on that interval.



The derivative is related to the slope of a function.

Figure 3.15

REMARK The conclusions in the first two cases of Theorem 3.5 are valid even when $f'(x) = 0$ at a finite number of x-values in (a, b).

THEOREM 3.5 Test for Increasing and Decreasing Functions

Let f be a function that is continuous on the closed interval $[a, b]$ and differentiable on the open interval (a, b).

1. If $f'(x) > 0$ for all x in (a, b), then f is increasing on $[a, b]$.
2. If $f'(x) < 0$ for all x in (a, b), then f is decreasing on $[a, b]$.
3. If $f'(x) = 0$ for all x in (a, b), then f is constant on $[a, b]$.

Proof To prove the first case, assume that $f'(x) > 0$ for all x in the interval (a, b) and let $x_1 < x_2$ be any two points in the interval $[a, b]$. By the Mean Value Theorem, you know that there exists a number c such that $x_1 < c < x_2$, and

$$f'(c) = \frac{f(x_2) - f(x_1)}{x_2 - x_1}.$$

Because $f'(c) > 0$ and $x_2 - x_1 > 0$, you know that $f(x_2) - f(x_1) > 0$, which implies that $f(x_1) < f(x_2)$. So, f is increasing on the interval. The second case has a similar proof (see Exercise 97), and the third case is a consequence of Exercise 80 in Section 3.2. ∎

GO DIGITAL

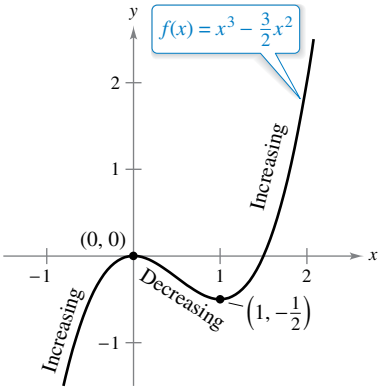

Figure 3.16

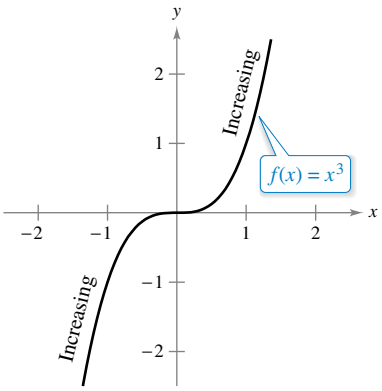
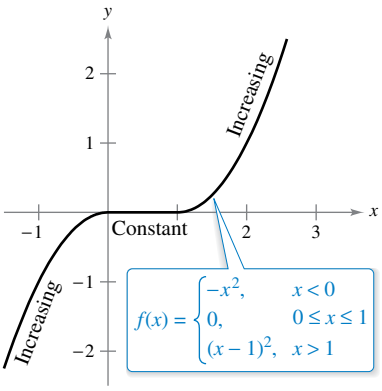


(a) Strictly monotonic function



(b) Not strictly monotonic

Figure 3.17

EXAMPLE 1 Intervals on Which *f* Is Increasing or Decreasing

Find the open intervals on which $f(x) = x^3 - \frac{3}{2}x^2$ is increasing or decreasing.

Solution Note that f is differentiable on the entire real number line and the derivative of f is

$$f(x) = x^3 - \tfrac{3}{2}x^2 \qquad \text{Write original function.}$$
$$f'(x) = 3x^2 - 3x. \qquad \text{Differentiate.}$$

To determine the critical numbers of f, set $f'(x)$ equal to zero.

$$3x^2 - 3x = 0 \qquad \text{Set } f'(x) \text{ equal to 0.}$$
$$3(x)(x - 1) = 0 \qquad \text{Factor.}$$
$$x = 0, 1 \qquad \text{Critical numbers}$$

Because there are no points for which f' does not exist, you can conclude that $x = 0$ and $x = 1$ are the only critical numbers. The table summarizes the testing of the three intervals determined by these two critical numbers.

Interval	$-\infty < x < 0$	$0 < x < 1$	$1 < x < \infty$
Test Value	$x = -1$	$x = \frac{1}{2}$	$x = 2$
Sign of $f'(x)$	$f'(-1) = 6 > 0$	$f'\left(\frac{1}{2}\right) = -\frac{3}{4} < 0$	$f'(2) = 6 > 0$
Conclusion	Increasing	Decreasing	Increasing

By Theorem 3.5, f is increasing on the intervals $(-\infty, 0)$ and $(1, \infty)$ and decreasing on the interval $(0, 1)$, as shown in Figure 3.16. ■

Example 1 gives you one instance of how to find intervals on which a function is increasing or decreasing. The guidelines below summarize the steps followed in that example.

Guidelines for Finding Intervals on Which a Function Is Increasing or Decreasing

Let f be continuous on the interval (a, b). To find the open intervals on which f is increasing or decreasing, use the following steps.

1. Locate the critical numbers of f in (a, b), and use these numbers to determine test intervals.
2. Determine the sign of $f'(x)$ at one test value in each of the intervals.
3. Use Theorem 3.5 to determine whether f is increasing or decreasing on each interval.

These guidelines are also valid when the interval (a, b) is replaced by an interval of the form $(-\infty, b)$, (a, ∞), or $(-\infty, \infty)$.

A function is **strictly monotonic** on an interval when it is either increasing on the entire interval or decreasing on the entire interval. For instance, the function $f(x) = x^3$ is strictly monotonic on the entire real number line because it is increasing on the entire real number line, as shown in Figure 3.17(a). The function shown in Figure 3.17(b) is not strictly monotonic on the entire real number line because it is constant on the interval $[0, 1]$.

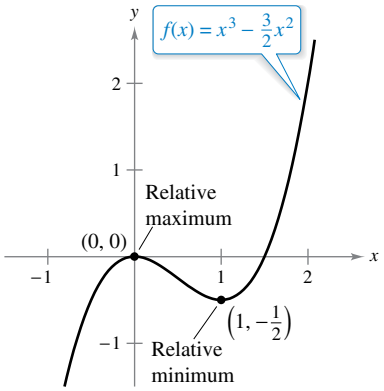
GO DIGITAL

The First Derivative Test

After determining the intervals on which a function is increasing or decreasing, it is not difficult to locate the relative extrema of the function. For instance, in Figure 3.18 (from Example 1), the function

$$f(x) = x^3 - \frac{3}{2}x^2$$

has a relative maximum at the point $(0, 0)$ because f is increasing immediately to the left of $x = 0$ and decreasing immediately to the right of $x = 0$. Similarly, f has a relative minimum at the point $\left(1, -\frac{1}{2}\right)$ because f is decreasing immediately to the left of $x = 1$ and increasing immediately to the right of $x = 1$. The next theorem makes this more explicit.



Relative extrema of f
Figure 3.18

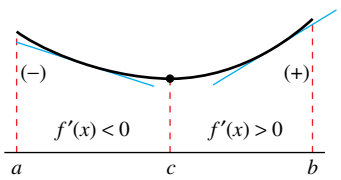
REMARK The guidelines below may help you to apply the First Derivative Test.

1. Find the derivative of f.
2. Locate the critical numbers of f and use these numbers to determine the test intervals.
3. Determine the sign of $f'(x)$ at an arbitrary number in each of the test intervals.
4. For each critical number c, use the First Derivative Test to decide whether $f(c)$ is a relative minimum, a relative maximum, or neither.

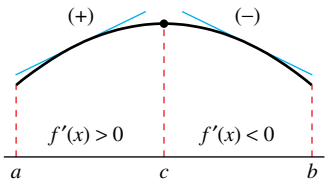
THEOREM 3.6 The First Derivative Test

Let c be a critical number of a function f that is continuous on an open interval I containing c. If f is differentiable on the interval, except possibly at c, then $f(c)$ can be classified as follows.

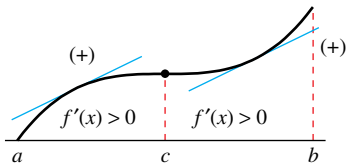
1. If $f'(x)$ changes from negative to positive at c, then f has a *relative minimum* at $(c, f(c))$.
2. If $f'(x)$ changes from positive to negative at c, then f has a *relative maximum* at $(c, f(c))$.
3. If $f'(x)$ is positive on both sides of c or negative on both sides of c, then $f(c)$ is neither a relative minimum nor a relative maximum.

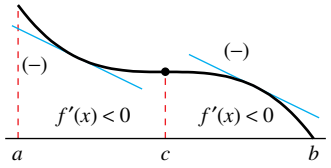


Relative minimum



Relative maximum





Neither relative minimum nor relative maximum

Proof Assume that $f'(x)$ changes from negative to positive at c. Then there exist a and b in I such that

$$f'(x) < 0 \text{ for all } x \text{ in } (a, c) \quad \text{and} \quad f'(x) > 0 \text{ for all } x \text{ in } (c, b).$$

By Theorem 3.5, f is decreasing on $[a, c]$ and increasing on $[c, b]$. So, $f(c)$ is a minimum of f on the open interval (a, b) and, consequently, a relative minimum of f. This proves the first case of the theorem. The second case can be proved in a similar way (see Exercise 98).

EXAMPLE 2 Applying the First Derivative Test

Find the relative extrema of $f(x) = \frac{1}{2}x - \sin x$ in the interval $(0, 2\pi)$.

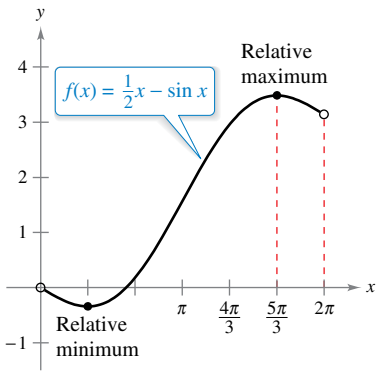
Solution Note that f is continuous on the interval $(0, 2\pi)$. The derivative of f is $f'(x) = \frac{1}{2} - \cos x$. To determine the critical numbers of f in this interval, set $f'(x)$ equal to 0.

$$\frac{1}{2} - \cos x = 0 \qquad \text{Set } f'(x) \text{ equal to 0.}$$

$$\cos x = \frac{1}{2} \qquad \text{Isolate } x\text{-term on the left and multiply each side by } -1.$$

$$x = \frac{\pi}{3}, \frac{5\pi}{3} \qquad \text{Critical numbers in the interval } (0, 2\pi)$$

Because there are no points for which f' does not exist, you can conclude that $x = \pi/3$ and $x = 5\pi/3$ are the only critical numbers. The table summarizes the testing of the three intervals determined by these two critical numbers. By applying the First Derivative Test, you can conclude that f has a relative minimum at the point where $x = \pi/3$ and a relative maximum at the point where $x = 5\pi/3$, as shown in Figure 3.19.



A relative minimum occurs where f changes from decreasing to increasing, and a relative maximum occurs where f changes from increasing to decreasing.
Figure 3.19

Interval	$0 < x < \frac{\pi}{3}$	$\frac{\pi}{3} < x < \frac{5\pi}{3}$	$\frac{5\pi}{3} < x < 2\pi$
Test Value	$x = \frac{\pi}{4}$	$x = \pi$	$x = \frac{7\pi}{4}$
Sign of $f'(x)$	$f'\left(\frac{\pi}{4}\right) < 0$	$f'(\pi) > 0$	$f'\left(\frac{7\pi}{4}\right) < 0$
Conclusion	Decreasing	Increasing	Decreasing

EXAMPLE 3 Applying the First Derivative Test

Find the relative extrema of $f(x) = (x^2 - 4)^{2/3}$.

Solution Begin by noting that f is continuous on the entire real number line. The derivative of f

$$f'(x) = \frac{2}{3}(x^2 - 4)^{-1/3}(2x) \qquad \text{General Power Rule}$$

$$= \frac{4x}{3(x^2 - 4)^{1/3}} \qquad \text{Simplify.}$$

is 0 when $x = 0$ and does not exist when $x = \pm 2$. So, the critical numbers are $x = -2$, $x = 0$, and $x = 2$. The table summarizes the testing of the four intervals determined by these three critical numbers. By applying the First Derivative Test, you can conclude that f has a relative minimum at the point $(-2, 0)$, a relative maximum at the point $(0, \sqrt[3]{16})$, and another relative minimum at the point $(2, 0)$, as shown in Figure 3.20.

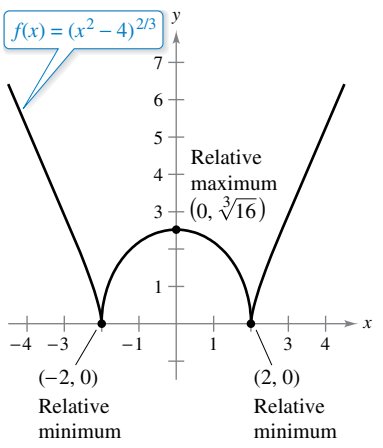


Figure 3.20

Interval	$-\infty < x < -2$	$-2 < x < 0$	$0 < x < 2$	$2 < x < \infty$
Test Value	$x = -3$	$x = -1$	$x = 1$	$x = 3$
Sign of $f'(x)$	$f'(-3) < 0$	$f'(-1) > 0$	$f'(1) < 0$	$f'(3) > 0$
Conclusion	Decreasing	Increasing	Decreasing	Increasing

Note that in Examples 1 and 2, the given functions are differentiable on the entire real number line. For such functions, the only critical numbers are those for which $f'(x) = 0$. Example 3 concerns a function that has two types of critical numbers—those for which $f'(x) = 0$ and those for which f is not differentiable.

When using the First Derivative Test, be sure to consider the domain of the function. For instance, in the next example, the function

$$f(x) = \frac{x^4 + 1}{x^2}$$

is not defined when $x = 0$. This x-value must be used with the critical numbers to determine the test intervals.

EXAMPLE 4 Applying the First Derivative Test

See LarsonCalculus.com for an interactive version of this type of example.

Find the relative extrema of $f(x) = \frac{x^4 + 1}{x^2}$.

Solution Note that f is not defined when $x = 0$.

$$f(x) = x^2 + x^{-2}$$ Rewrite original function.

$$f'(x) = 2x - 2x^{-3}$$ Differentiate.

$$= 2x - \frac{2}{x^3}$$ Rewrite with positive exponent.

$$= \frac{2(x^4 - 1)}{x^3}$$ Simplify.

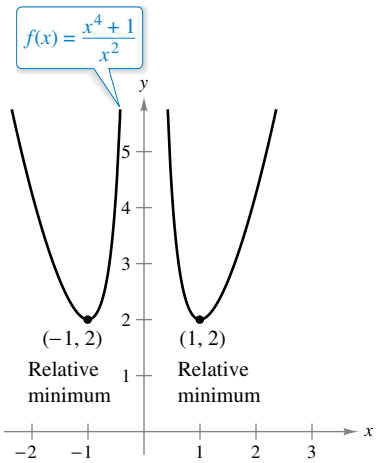
$$= \frac{2(x^2 + 1)(x - 1)(x + 1)}{x^3}$$ Factor.

So, $f'(x)$ is zero at $x = \pm 1$. Moreover, because $x = 0$ is not in the domain of f, you should use this x-value along with the critical numbers to determine the test intervals.

$x = \pm 1$ Critical numbers, $f'(\pm 1) = 0$

$x = 0$ 0 is not in the domain of f.

The table summarizes the testing of the four intervals determined by these three x-values. By applying the First Derivative Test, you can conclude that f has one relative minimum at the point $(-1, 2)$ and another at the point $(1, 2)$, as shown in Figure 3.21.



x-values that are not in the domain of f, as well as critical numbers, determine test intervals for f'.

Figure 3.21

Interval	$-\infty < x < -1$	$-1 < x < 0$	$0 < x < 1$	$1 < x < \infty$
Test Value	$x = -2$	$x = -\frac{1}{2}$	$x = \frac{1}{2}$	$x = 2$
Sign of $f'(x)$	$f'(-2) < 0$	$f'\left(-\frac{1}{2}\right) > 0$	$f'\left(\frac{1}{2}\right) < 0$	$f'(2) > 0$
Conclusion	Decreasing	Increasing	Decreasing	Increasing

TECHNOLOGY The most difficult step in applying the First Derivative Test is finding the values for which the derivative is equal to 0. For instance, the values of x for which the derivative of

$$f(x) = \frac{x^4 + 1}{x^2 + 1}$$

is equal to zero are $x = 0$ and $x = \pm\sqrt{\sqrt{2} - 1}$. If you have access to technology that can perform symbolic differentiation and solve equations, use it to apply the First Derivative Test to this function.

REMARK When a projectile is propelled from ground level and air resistance is neglected, the object will travel farthest with an initial angle of 45°. When, as in Example 5, a projectile is propelled from a point above ground level, the angle that yields a maximum horizontal distance is not 45°.

EXAMPLE 5 The Path of a Projectile

Neglecting air resistance, the path of a projectile that is propelled at an angle θ is

$$y = -\frac{g \sec^2 \theta}{2v_0^2}x^2 + (\tan \theta)x + h, \quad 0 \le \theta \le \frac{\pi}{2}$$

where y is the height, x is the horizontal distance, g is the acceleration due to gravity, v_0 is the initial velocity, and h is the initial height. (This equation is derived in Section 12.3.) Let $g = 32$ feet per second per second, $v_0 = 24$ feet per second, and $h = 9$ feet. What value of θ will produce a maximum horizontal distance?

Solution To find the distance the projectile travels, let $y = 0$, $g = 32$, $v_0 = 24$, and $h = 9$. Then substitute these values in the given equation as shown.

$$-\frac{g \sec^2 \theta}{2v_0^2}x^2 + (\tan \theta)x + h = y \qquad \text{Write original equation.}$$

$$-\frac{32 \sec^2 \theta}{2(24^2)}x^2 + (\tan \theta)x + 9 = 0 \qquad \text{Substitute.}$$

$$-\frac{\sec^2 \theta}{36}x^2 + (\tan \theta)x + 9 = 0 \qquad \text{Simplify.}$$

Next, solve for x using the Quadratic Formula with $a = (-\sec^2 \theta)/36$, $b = \tan \theta$, and $c = 9$.

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \qquad \text{Quadratic Formula}$$

$$x = \frac{-\tan \theta \pm \sqrt{(\tan \theta)^2 - 4[(-\sec^2 \theta)/36](9)}}{2[(-\sec^2 \theta)/36]} \qquad \text{Substitute.}$$

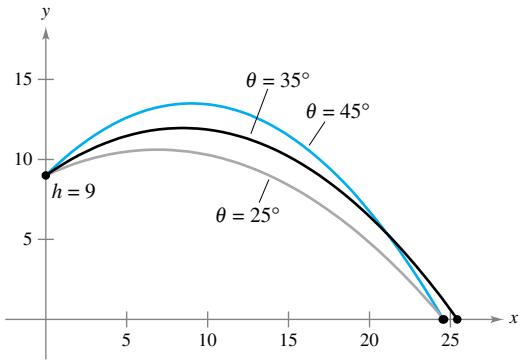
$$x = \frac{-\tan \theta \pm \sqrt{\tan^2 \theta + \sec^2 \theta}}{(-\sec^2 \theta)/18}$$

$$x = 18(\cos \theta)\left(\sin \theta + \sqrt{\sin^2 \theta + 1}\right), \quad x \ge 0$$

At this point, you need to find the value of θ that produces a maximum value of x. Applying the First Derivative Test without using technology would be very tedious. Using technology to solve the equation $dx/d\theta = 0$, however, eliminates most of the messy computations. The result is that the maximum value of x occurs when

$$\theta \approx 0.61548 \text{ radian}, \quad \text{or} \quad \theta \approx 35.3°.$$

This conclusion is reinforced by sketching the path of the projectile for different values of θ, as shown in Figure 3.22. Of the three paths shown, note that the distance traveled is greatest for $\theta = 35°$.



The path of a projectile with initial angle θ

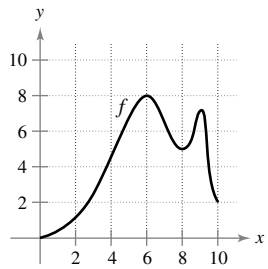
Concept Check

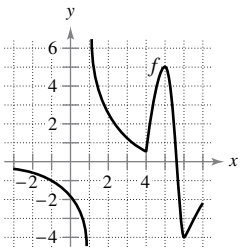
1. Describe the Test for Increasing and Decreasing Functions.
2. Explain the First Derivative Test.

Using a Graph In Exercises 3 and 4, use the graph of f to find (a) the largest open interval on which f is increasing and (b) the largest open interval on which f is decreasing.

3.

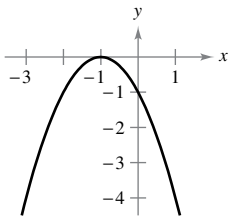


4.

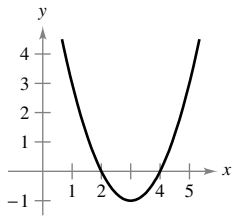


Using a Graph In Exercises 5–10, use the graph to estimate the open intervals on which the function is increasing or decreasing. Then find the open intervals analytically.

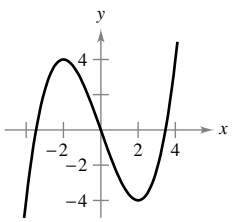
5. $y = -(x + 1)^2$



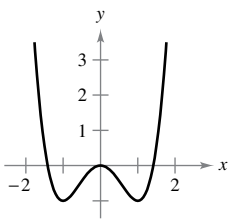
6. $f(x) = x^2 - 6x + 8$



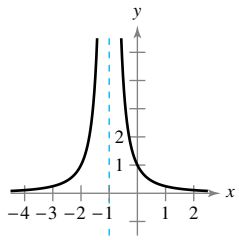
7. $y = \frac{x^3}{4} - 3x$



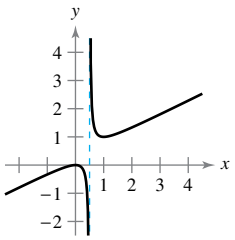
8. $f(x) = x^4 - 2x^2$



9. $f(x) = \frac{1}{(x + 1)^2}$



10. $y = \frac{x^2}{2x - 1}$



Intervals on Which a Function Is Increasing or Decreasing In Exercises 11–18, find the open intervals on which the function is increasing or decreasing.

11. $g(x) = x^2 - 2x - 8$
12. $h(x) = 12x - x^3$
13. $y = x\sqrt{16 - x^2}$
14. $y = x + \frac{9}{x}$
15. $f(x) = \sin x - 1, \quad 0 < x < 2\pi$
16. $f(x) = \cos\frac{3x}{2}, \quad 0 < x < 2\pi$
17. $y = x - 2\cos x, \quad 0 < x < 2\pi$
18. $f(x) = \sin^2 x + \sin x, \quad 0 < x < 2\pi$

Applying the First Derivative Test In Exercises 19–40, (a) find the critical numbers of f, if any, (b) find the open intervals on which the function is increasing or decreasing, (c) apply the First Derivative Test to identify all relative extrema, and (d) use a graphing utility to confirm your results.

19. $f(x) = x^2 - 8x$
20. $f(x) = x^2 + 6x + 10$
21. $f(x) = -2x^2 + 4x + 3$
22. $f(x) = -3x^2 - 4x - 2$
23. $f(x) = -7x^3 + 21x + 3$
24. $f(x) = x^3 - 6x^2 + 15$
25. $f(x) = (x - 1)^2(x + 3)$
26. $f(x) = (8 - x)(x + 1)^2$
27. $f(x) = \frac{x^5 - 5x}{5}$
28. $f(x) = \frac{-x^6 + 6x}{10}$
29. $f(x) = x^{1/3} + 1$
30. $f(x) = x^{2/3} - 4$
31. $f(x) = (x + 2)^{2/3}$
32. $f(x) = (x - 3)^{1/3}$
33. $f(x) = 5 - |x - 5|$
34. $f(x) = |x + 3| - 1$
35. $f(x) = 2x + \frac{1}{x}$
36. $f(x) = \frac{x}{x - 5}$
37. $f(x) = \frac{x^2}{x^2 - 9}$
38. $f(x) = \frac{x^2 - 2x + 1}{x + 1}$
39. $f(x) = \begin{cases} 4 - x^2, & x \le 0 \\ -2x, & x > 0 \end{cases}$
40. $f(x) = \begin{cases} 2x + 1, & x \le -1 \\ x^2 - 2, & x > -1 \end{cases}$

Applying the First Derivative Test In Exercises 41–48, consider the function on the interval $(0, 2\pi)$. (a) Find the open intervals on which the function is increasing or decreasing. (b) Apply the First Derivative Test to identify all relative extrema. (c) Use a graphing utility to confirm your results.

41. $f(x) = x - 2\sin x$
42. $f(x) = \sin x \cos x + 5$
43. $f(x) = \sin x + \cos x$
44. $f(x) = \frac{x}{2} + \cos x$
45. $f(x) = \cos^2(2x)$
46. $f(x) = \sin x - \sqrt{3}\cos x$
47. $f(x) = \sin^2 x + \sin x$
48. $f(x) = \frac{\sin x}{1 + \cos^2 x}$

Finding and Analyzing Derivatives Using Technology **In Exercises 49–54, (a) use a computer algebra system to differentiate the function, (b) sketch the graphs of f and f' on the same set of coordinate axes over the given interval, (c) find the critical numbers of f in the open interval, and (d) find the interval(s) on which f' is positive and the interval(s) on which f' is negative. Compare the behavior of f and the sign of f'.**

49. $f(x) = 2x\sqrt{9 - x^2}, \quad [-3, 3]$

50. $f(x) = 10\left(5 - \sqrt{x^2 - 3x + 16}\right), \quad [0, 5]$

51. $f(t) = t^2 \sin t, \quad [0, 2\pi]$

52. $f(x) = \frac{x}{2} + \cos\frac{x}{2}, \quad [0, 4\pi]$

53. $f(x) = -3 \sin\frac{x}{3}, \quad [0, 6\pi]$

54. $f(x) = 2 \sin 3x + 4 \cos 3x, \quad [0, \pi]$

Comparing Functions **In Exercises 55 and 56, use symmetry, extrema, and zeros to sketch the graph of f. How do the functions f and g differ?**

55. $f(x) = \frac{x^5 - 4x^3 + 3x}{x^2 - 1}$

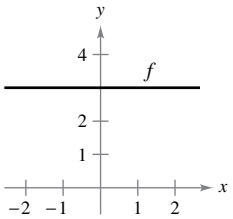
$g(x) = x(x^2 - 3)$

56. $f(t) = \cos^2 t - \sin^2 t$

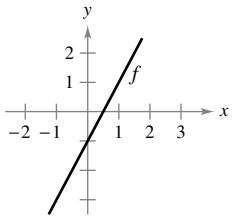
$g(t) = 1 - 2 \sin^2 t$

Think About It **In Exercises 57–62, the graph of f is shown in the figure. Sketch a graph of the derivative of f. To print an enlarged copy of the graph, go to *MathGraphs.com*.**

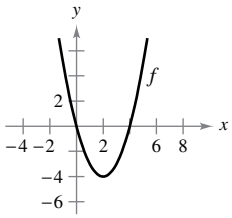
57.



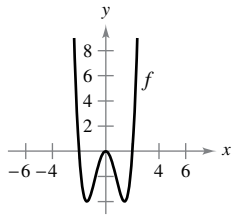
58.



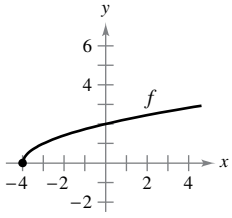
59.



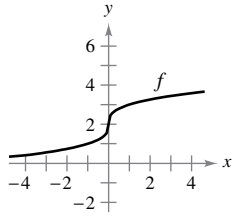
60.



61.



62.



Exploring Concepts

In Exercises 63–66, assume that f is differentiable for all x. The signs of f' are as follows.

$f'(x) > 0$ on $(-\infty, -4)$

$f'(x) < 0$ on $(-4, 6)$

$f'(x) > 0$ on $(6, \infty)$

Supply the appropriate inequality sign for the indicated value of c.

Function	Sign of $g'(c)$
63. $g(x) = f(x) + 5$	$g'(0)$ ____ 0
64. $g(x) = 3f(x) - 3$	$g'(-5)$ ____ 0
65. $g(x) = -f(x)$	$g'(-6)$ ____ 0
66. $g(x) = f(x - 10)$	$g'(0)$ ____ 0

67. Sketch the graph of the arbitrary function f such that

$$f'(x)\begin{cases} > 0, & x < 4 \\ \text{undefined}, & x = 4 \\ < 0, & x > 4 \end{cases}.$$

68. Is the sum of two increasing functions always increasing? Explain.

69. Is the product of two increasing functions always increasing? Explain.

70. **HOW DO YOU SEE IT?** Use the graph of f' to (a) identify the critical numbers of f, (b) identify the open intervals on which f is increasing or decreasing, and (c) determine whether f has a relative maximum, a relative minimum, or neither at each critical number.

71. Analyzing a Critical Number A differentiable function f has one critical number at $x = 5$. Identify the relative extrema of f at the critical number when $f'(4) = -2.5$ and $f'(6) = 3$.

72. Analyzing a Critical Number A differentiable function f has one critical number at $x = 2$. Identify the relative extrema of f at the critical number when $f'(1) = 2$ and $f'(3) = 6$.

Think About It **In Exercises 73 and 74, the function f is differentiable on the indicated interval. The table shows $f'(x)$ for selected values of x. (a) Sketch the graph of f, (b) approximate the critical numbers, and (c) identify the relative extrema.**

73. f is differentiable on $[-1, 1]$.

x	-1	-0.75	-0.50	-0.25	0
$f'(x)$	-10	-3.2	-0.5	0.8	5.6

x	0.25	0.50	0.75	1
$f'(x)$	3.6	-0.2	-6.7	-20.1

74. f is differentiable on $[0, \pi]$.

x	0	$\pi/6$	$\pi/4$	$\pi/3$	$\pi/2$
$f'(x)$	3.14	-0.23	-2.45	-3.11	0.69

x	$2\pi/3$	$3\pi/4$	$5\pi/6$	π
$f'(x)$	3.00	1.37	-1.14	-2.84

75. Rolling a Ball Bearing A ball bearing is placed on an inclined plane and begins to roll. The angle of elevation of the plane is θ. The distance (in meters) the ball bearing rolls in t seconds is $s(t) = 4.9(\sin\theta)t^2$.

(a) Determine the speed of the ball bearing after t seconds.

(b) Complete the table and use it to determine the value of θ that produces the maximum speed at a particular time.

θ	0	$\pi/4$	$\pi/3$	$\pi/2$	$2\pi/3$	$3\pi/4$	π
$s'(t)$							

76. Modeling Data The total expenditures of an account in the Supplementary Medical Insurance Trust Fund (in billions of dollars) for the years 2011 through 2019 are shown.

2011: 67.1 2012: 66.9 2013: 69.7
2014: 78.1 2015: 89.8 2016: 99.9
2017: 100.0 2018: 95.2 2019: 97.6

(Source: U.S. Centers for Medicare and Medicaid Services)

(a) Use the regression capabilities of a graphing utility to find a model of the form $M = at^3 + bt^2 + ct + d$ for the data. Let $t = 11$ represent 2011.

(b) Use a graphing utility to plot the data and graph the model.

(c) Find the maximum value of the model and compare the result with the actual data.

77. Numerical, Graphical, and Analytic Analysis The concentration C of a chemical in the bloodstream t hours after injection into muscle tissue is

$$C(t) = \frac{3t}{27 + t^3}, \quad t \geq 0.$$

(a) Complete the table and use it to approximate the time when the concentration is greatest.

t	0	0.5	1	1.5	2	2.5	3
$C(t)$							

(b) Use a graphing utility to graph the concentration function and use the graph to approximate the time when the concentration is greatest.

(c) Use calculus to determine analytically the time when the concentration is greatest.

78. Numerical, Graphical, and Analytic Analysis Consider the functions $f(x) = x$ and $g(x) = \sin x$ on the interval $(0, \pi)$.

(a) Complete the table and make a conjecture about which is the greater function on the interval $(0, \pi)$.

x	0.5	1	1.5	2	2.5	3
$f(x)$						
$g(x)$						

(b) Use a graphing utility to graph the functions and use the graphs to make a conjecture about which is the greater function on the interval $(0, \pi)$.

(c) Prove that $f(x) > g(x)$ on the interval $(0, \pi)$. [*Hint*: Show that $h'(x) > 0$, where $h = f - g$.]

79. Trachea Contraction Coughing forces the trachea (windpipe) to contract, which affects the velocity v of the air passing through the trachea. The velocity of the air during coughing is

$$v = k(R - r)r^2, \quad 0 \leq r < R$$

where k is a constant, R is the normal radius of the trachea, and r is the radius during coughing. What radius will produce the maximum air velocity?

80. Electrical Resistance The resistance R of a certain type of resistor is

$$R = \sqrt{0.001T^4 - 4T + 100}$$

where R is measured in ohms and the temperature T is measured in degrees Celsius.

(a) Use a computer algebra system to find dR/dT and the critical number of the function. Determine the minimum resistance for this type of resistor.

(b) Use a graphing utility to graph the function R and use the graph to approximate the minimum resistance for this type of resistor.

Motion Along a Line **In Exercises 81–84, the function $s(t)$ describes the motion of a particle along a line. (a) Find the velocity function of the particle at any time $t \geq 0$. (b) Identify the time interval(s) on which the particle is moving in a positive direction. (c) Identify the time interval(s) on which the particle is moving in a negative direction. (d) Identify the time(s) at which the particle changes direction.**

81. $s(t) = 6t - t^2$

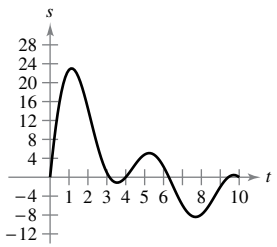
82. $s(t) = t^2 - 10t + 29$

83. $s(t) = t^3 - 5t^2 + 4t$

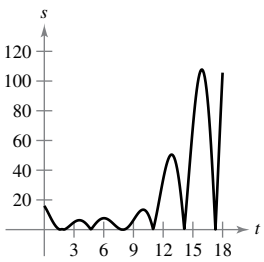
84. $s(t) = t^3 - 20t^2 + 128t - 280$

Motion Along a Line **In Exercises 85 and 86, the graph shows the position of a particle moving along a line. Describe how the position of the particle changes with respect to time.**

85.



86.



Finding Polynomial Functions **In Exercises 87–90, find a polynomial function**

$$f(x) = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

that has only the specified extrema. (a) Determine the minimum degree of the function and give the criteria you used in determining the degree. (b) Using the fact that the coordinates of the extrema are solution points of the function, and that the x-coordinates are critical numbers, determine a system of linear equations whose solution yields the coefficients of the required function. (c) Use a graphing utility to solve the system of equations and determine the function. (d) Use a graphing utility to confirm your result graphically.

87. Relative minimum: $(0, 0)$; Relative maximum: $(2, 2)$

88. Relative minimum: $(0, 0)$; Relative maximum: $(4, 1000)$

89. Relative minima: $(0, 0)$, $(4, 0)$; Relative maximum: $(2, 4)$

90. Relative minimum: $(1, 2)$; Relative maxima: $(-1, 4)$, $(3, 4)$

True or False? **In Exercises 91–96, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

91. There is no function with an infinite number of critical points.

92. The function $f(x) = x$ has no extrema on any open interval.

93. Every nth-degree polynomial has $(n - 1)$ critical numbers.

94. An nth-degree polynomial has at most $(n - 1)$ critical numbers.

95. There is a relative extremum at each critical number.

96. The relative maxima of the function f are $f(1) = 4$ and $f(3) = 10$. So, f has at least one minimum for some x in the interval $(1, 3)$.

97. Proof Prove the second case of Theorem 3.5.

98. Proof Prove the second case of Theorem 3.6.

99. Proof Use the definitions of increasing and decreasing functions to prove that

$$f(x) = x^3$$

is increasing on $(-\infty, \infty)$.

100. Proof Use the definitions of increasing and decreasing functions to prove that

$$f(x) = \frac{1}{x}$$

is decreasing on $(0, \infty)$.

PUTNAM EXAM CHALLENGE

101. Find the minimum value of

$$|\sin x + \cos x + \tan x + \cot x + \sec x + \csc x|$$

for real numbers x.

This problem was composed by the Committee on the Putnam Prize Competition.

SECTION PROJECT

Even Polynomial Functions of Fourth Degree

(a) Graph each of the fourth-degree polynomials below. Then find the critical numbers, the open intervals on which the function is increasing or decreasing, and the relative extrema.

(i) $f(x) = x^4 + 1$

(ii) $f(x) = x^4 + 2x^2 + 1$

(iii) $f(x) = x^4 - 2x^2 + 1$

(b) Consider the fourth-degree polynomial

$$f(x) = x^4 + ax^2 + b.$$

(i) Show that there is one critical number when $a = 0$. Then find the open intervals on which the function is increasing or decreasing.

(ii) Show that there is one critical number when $a > 0$. Then find the open intervals on which the function is increasing or decreasing.

(iii) Show that there are three critical numbers when $a < 0$. Then find the open intervals on which the function is increasing or decreasing.

(iv) Show that there are no real zeros when

$$a^2 < 4b.$$

(v) Determine the possible number of zeros when

$$a^2 \geq 4b.$$

Explain your reasoning.

3.4 Concavity and the Second Derivative Test

GO DIGITAL

- **Determine intervals on which a function is concave upward or concave downward.**
- **Find any points of inflection of the graph of a function.**
- **Apply the Second Derivative Test to find relative extrema of a function.**

Concavity

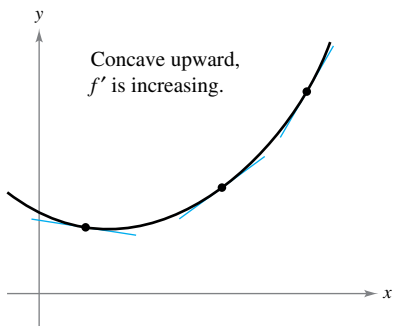
You have already seen that locating the intervals on which a function f increases or decreases helps to describe its graph. In this section, you will see how locating the intervals on which f' increases or decreases can be used to determine where the graph of f is *curving upward* or *curving downward*.

Definition of Concavity

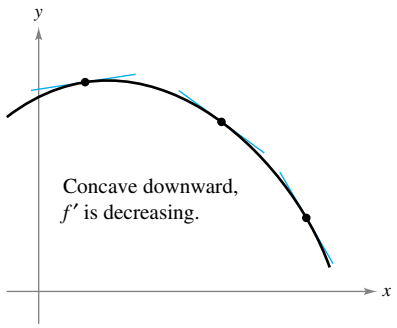
Let f be differentiable on an open interval I. The graph of f is **concave upward** on I when f' is increasing on the interval and **concave downward** on I when f' is decreasing on the interval.

The next two statements and Figure 3.23 give a useful graphical interpretation of concavity (see Appendix A for a proof of these results).

1. Let f be differentiable on an open interval I. If the graph of f is concave *upward* on I, then the graph of f lies *above* all of its tangent lines on I. [See Figure 3.23(a).]
2. Let f be differentiable on an open interval I. If the graph of f is concave *downward* on I, then the graph of f lies *below* all of its tangent lines on I. [See Figure 3.23(b).]

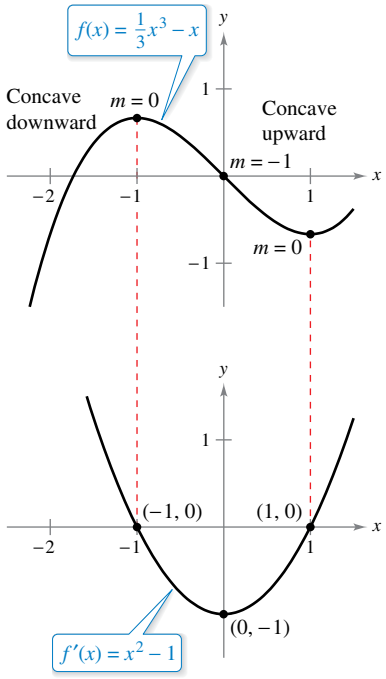


(a) The graph of f lies above its tangent lines.



(b) The graph of f lies below its tangent lines.

Figure 3.23



f' is decreasing. f' is increasing.

The concavity of f is related to the slope of the derivative.

Figure 3.24

To find the open intervals on which the graph of a function f is concave upward or concave downward, you need to find the intervals on which f' is increasing or decreasing. For instance, the graph of

$$f(x) = \frac{1}{3}x^3 - x \qquad \text{Original function}$$

is concave downward on the open interval $(-\infty, 0)$ because

$$f'(x) = x^2 - 1 \qquad \text{First derivative}$$

is decreasing there. (See Figure 3.24.) Similarly, the graph of f is concave upward on the interval $(0, \infty)$ because f' is increasing on $(0, \infty)$.

GO DIGITAL

The next theorem shows how to use the *second* derivative of a function f to determine intervals on which the graph of f is concave upward or concave downward. A proof of this theorem follows directly from Theorem 3.5 and the definition of concavity.

THEOREM 3.7 Test for Concavity

Let f be a function whose second derivative exists on an open interval I.

1. If $f''(x) > 0$ for all x in I, then the graph of f is concave upward on I.
2. If $f''(x) < 0$ for all x in I, then the graph of f is concave downward on I.

A proof of this theorem is given in Appendix A.

REMARK A third case of Theorem 3.7 could be that if $f''(x) = 0$ for all x in I, then f is linear. Note, however, that concavity is not defined for a line. In other words, a straight line is neither concave upward nor concave downward.

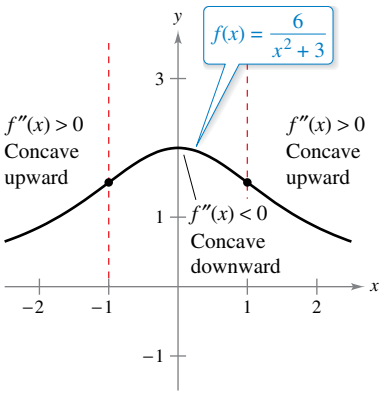
To apply Theorem 3.7, locate the x-values at which $f''(x) = 0$ or $f''(x)$ does not exist. Use these x-values to determine test intervals. Finally, test the sign of $f''(x)$ in each of the test intervals.

EXAMPLE 1 Determining Concavity

Determine the open intervals on which the graph of

$$f(x) = \frac{6}{x^2 + 3}$$

is concave upward or concave downward.



From the sign of $f''(x)$, you can determine the concavity of the graph of f.

Figure 3.25

Solution Begin by observing that f is continuous on the entire real number line. Next, find the second derivative of f.

$$f(x) = 6(x^2 + 3)^{-1}$$ Rewrite original function.

$$f'(x) = (-6)(x^2 + 3)^{-2}(2x)$$ Differentiate.

$$= \frac{-12x}{(x^2 + 3)^2}$$ First derivative

$$f''(x) = \frac{(x^2 + 3)^2(-12) - (-12x)(2)(x^2 + 3)(2x)}{(x^2 + 3)^4}$$ Differentiate.

$$= \frac{36(x^2 - 1)}{(x^2 + 3)^3}$$ Second derivative

Because $f''(x) = 0$ when $x = \pm 1$ and f'' is defined on the entire real number line, you should test f'' in the intervals $(-\infty, -1)$, $(-1, 1)$, and $(1, \infty)$. The results are shown in the table and in Figure 3.25.

Interval	$-\infty < x < -1$	$-1 < x < 1$	$1 < x < \infty$
Test Value	$x = -2$	$x = 0$	$x = 2$
Sign of $f''(x)$	$f''(-2) > 0$	$f''(0) < 0$	$f''(2) > 0$
Conclusion	Concave upward	Concave downward	Concave upward

The function given in Example 1 is continuous on the entire real number line. When there are x-values at which a function is not continuous, these values should be used, along with the points at which $f''(x) = 0$ or $f''(x)$ does not exist, to form the test intervals.

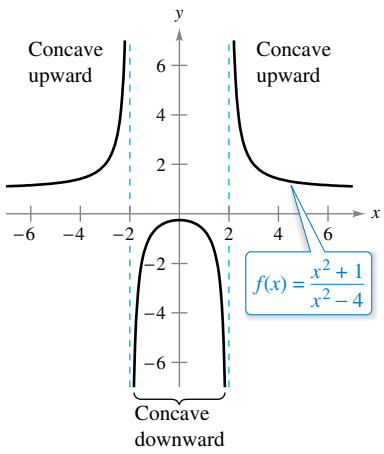

Figure 3.26

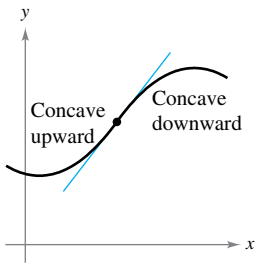

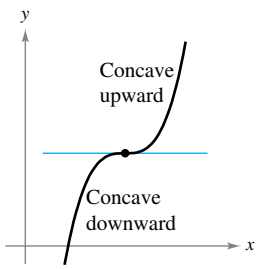

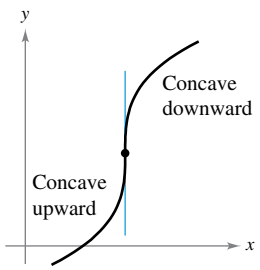

The concavity of f changes at a point of inflection. Note that the graph crosses its tangent line at a point of inflection.

Figure 3.27

EXAMPLE 2 Determining Concavity

Determine the open intervals on which the graph of

$$f(x) = \frac{x^2 + 1}{x^2 - 4}$$

is concave upward or concave downward.

Solution Differentiating twice produces the following.

$$f(x) = \frac{x^2 + 1}{x^2 - 4}$$ Write original function.

$$f'(x) = \frac{(x^2 - 4)(2x) - (x^2 + 1)(2x)}{(x^2 - 4)^2}$$ Differentiate.

$$= \frac{-10x}{(x^2 - 4)^2}$$ First derivative

$$f''(x) = \frac{(x^2 - 4)^2(-10) - (-10x)(2)(x^2 - 4)(2x)}{(x^2 - 4)^4}$$ Differentiate.

$$= \frac{10(3x^2 + 4)}{(x^2 - 4)^3}$$ Second derivative

There are no points at which $f''(x) = 0$, but at $x = \pm 2$, the function f is not continuous. So, test for concavity in the intervals $(-\infty, -2)$, $(-2, 2)$, and $(2, \infty)$, as shown in the table. The graph of f is shown in Figure 3.26.

Interval	$-\infty < x < -2$	$-2 < x < 2$	$2 < x < \infty$
Test Value	$x = -3$	$x = 0$	$x = 3$
Sign of $f''(x)$	$f''(-3) > 0$	$f''(0) < 0$	$f''(3) > 0$
Conclusion	Concave upward	Concave downward	Concave upward

Points of Inflection

The graph in Figure 3.25 has two points at which the concavity changes. If the tangent line to the graph exists at such a point, then that point is a **point of inflection.** Three types of points of inflection are shown in Figure 3.27.

Definition of Point of Inflection

Let f be a function that is continuous on an open interval, and let c be a point in the interval. If the graph of f has a tangent line at the point $(c, f(c))$, then this point is a **point of inflection** of the graph of f when the concavity of f changes from upward to downward (or downward to upward) at the point.

The definition of *point of inflection* requires that the tangent line exists at the point of inflection. Some calculus texts do not require this. For instance, after applying the definition above to the function

$$f(x) = \begin{cases} x^3, & x < 0 \\ x^2 + 2x, & x \geq 0 \end{cases}$$ Graph of f does not have a tangent line at $(0, 0)$.

you would conclude that f does *not* have a point of inflection at the origin, even though the concavity of the graph changes from concave downward to concave upward.

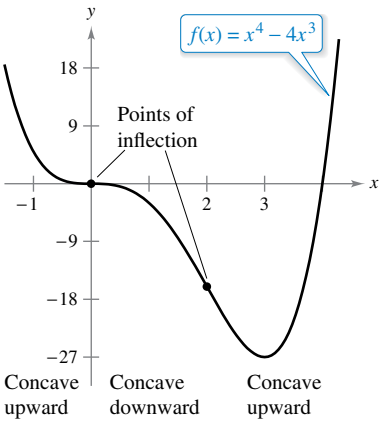
GO DIGITAL

To locate *possible* points of inflection, determine the values of x for which $f''(x) = 0$ or $f''(x)$ does not exist. This is similar to the procedure for locating relative extrema of f.

THEOREM 3.8 Points of Inflection

If $(c, f(c))$ is a point of inflection of the graph of f, then either $f''(c) = 0$ or $f''(c)$ does not exist.



Points of inflection can occur where $f''(x) = 0$ or $f''(x)$ does not exist.
Figure 3.28

EXAMPLE 3 Finding Points of Inflection

Determine the points of inflection and discuss the concavity of the graph of

$$f(x) = x^4 - 4x^3.$$

Solution Differentiating twice produces the following.

$$f(x) = x^4 - 4x^3 \qquad \text{Write original function.}$$
$$f'(x) = 4x^3 - 12x^2 \qquad \text{Find first derivative.}$$
$$f''(x) = 12x^2 - 24x = 12x(x - 2) \qquad \text{Find second derivative.}$$

Setting $f''(x) = 0$, you can determine that the possible points of inflection occur at $x = 0$ and $x = 2$. By testing the intervals determined by these x-values, you can conclude that they both yield points of inflection, one at $(0, 0)$ and the other at $(2, -16)$. A summary of this testing is shown in the table, and the graph of f is shown in Figure 3.28.

Interval	$-\infty < x < 0$	$0 < x < 2$	$2 < x < \infty$
Test Value	$x = -1$	$x = 1$	$x = 3$
Sign of $f''(x)$	$f''(-1) > 0$	$f''(1) < 0$	$f''(3) > 0$
Conclusion	Concave upward	Concave downward	Concave upward

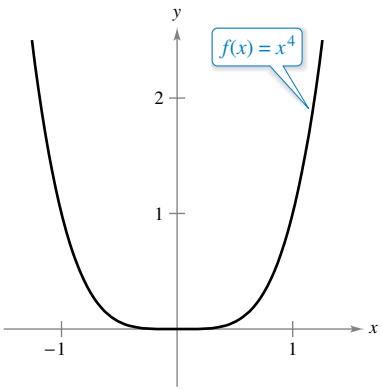
Exploration

Consider a general cubic function of the form

$$f(x) = ax^3 + bx^2 + cx + d.$$

You know that the value of d has a bearing on the location of the graph but has no bearing on the value of the first derivative at given values of x. Graphically, this is true because changes in the value of d shift the graph up or down but do not change its basic shape. Use a graphing utility to graph several cubic functions with different values of c. Then give a graphical explanation of why changes in c do not affect the values of the second derivative.

The converse of Theorem 3.8 is not generally true. That is, it is possible for the second derivative to be 0 at a point that is *not* a point of inflection. For instance, the graph of $f(x) = x^4$ is shown in Figure 3.29. The second derivative is 0 when $x = 0$, but the point $(0, 0)$ is not a point of inflection because the graph of f is concave upward on the intervals $-\infty < x < 0$ and $0 < x < \infty$.



$f''(x) = 0$, but $(0, 0)$ is not a point of inflection.

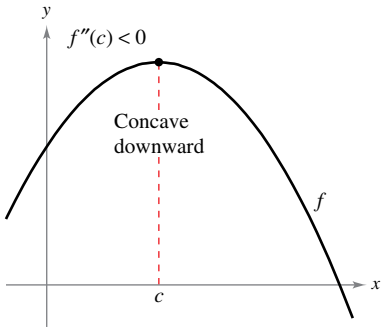
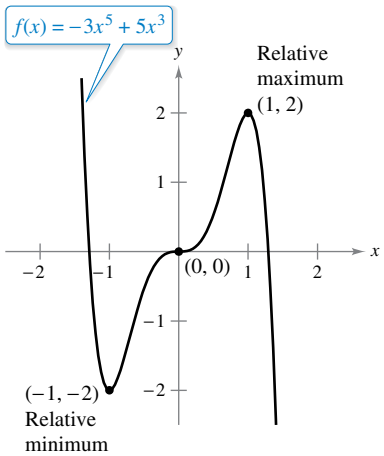
If $f'(c) = 0$ and $f''(c) > 0$, then $f(c)$ is a relative minimum.



If $f'(c) = 0$ and $f''(c) < 0$, then $f(c)$ is a relative maximum.

Figure 3.30

GO DIGITAL



(0, 0) is neither a relative minimum nor a relative maximum.

Figure 3.31

The Second Derivative Test

In addition to testing for concavity, the second derivative can be used to perform a simple test for relative maxima and minima. The test is based on the fact that if the graph of a function f is concave upward on an open interval containing c, and $f'(c) = 0$, then $f(c)$ must be a relative minimum of f. Similarly, if the graph of a function f is concave downward on an open interval containing c, and $f'(c) = 0$, then $f(c)$ must be a relative maximum of f. (See Figure 3.30.)

THEOREM 3.9 Second Derivative Test

Let f be a function such that $f'(c) = 0$ and the second derivative of f exists on an open interval containing c.

1. If $f''(c) > 0$, then f has a relative minimum at $(c, f(c))$.
2. If $f''(c) < 0$, then f has a relative maximum at $(c, f(c))$.

If $f''(c) = 0$, then the test fails. That is, f may have a relative maximum, a relative minimum, or neither. In such cases, use the First Derivative Test.

Proof Consider the first case where $f''(c) > 0$. Because

$$f''(c) = \lim_{x \to c} \frac{f'(x) - f'(c)}{x - c} > 0$$ Use limit definition of second derivative.

and $f'(c) = 0$, there exists an open interval I containing c for which

$$\frac{f'(x) - f'(c)}{x - c} = \frac{f'(x)}{x - c} > 0$$ See Exercise 88(b), Section 1.2.

for all $x \neq c$ in I. If $x < c$, then $x - c < 0$ and $f'(x) < 0$. Also, if $x > c$, then $x - c > 0$ and $f'(x) > 0$. So, $f'(x)$ changes from negative to positive at c, and the First Derivative Test implies that $f(c)$ is a relative minimum. A proof of the second case is left to you. ■

EXAMPLE 4 Using the Second Derivative Test

See LarsonCalculus.com for an interactive version of this type of example.

Find the relative extrema of $f(x) = -3x^5 + 5x^3$.

Solution The first derivative is $f'(x) = -15x^4 + 15x^2 = 15x^2(1 - x^2)$. From this derivative, you can see that $x = -1$, 0, and 1 are the only critical numbers of f. By finding the second derivative

$$f''(x) = -60x^3 + 30x = 30x(1 - 2x^2)$$

you can apply the Second Derivative Test as shown below.

Point	$(-1, -2)$	$(0, 0)$	$(1, 2)$
Sign of $f''(x)$	$f''(-1) > 0$	$f''(0) = 0$	$f''(1) < 0$
Conclusion	Relative minimum	Test fails	Relative maximum

Because the Second Derivative Test fails at $(0, 0)$, you can use the First Derivative Test and observe that f increases to the left and right of $x = 0$. So, $(0, 0)$ is neither a relative minimum nor a relative maximum (even though the graph has a horizontal tangent line at this point). The graph of f is shown in Figure 3.31. ■

3.4 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

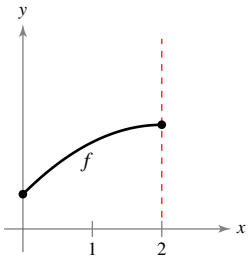
GO DIGITAL

Concept Check

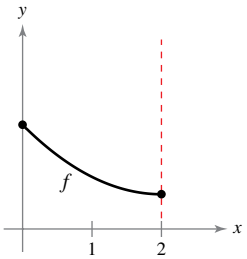
1. Describe the Test for Concavity.
2. Describe the Second Derivative Test.

Using a Graph In Exercises 3 and 4, the graph of f is shown. State the signs of f' and f'' on the interval $(0, 2)$.

3.



4.



Determining Concavity In Exercises 5–16, determine the open intervals on which the graph of the function is concave upward or concave downward.

5. $f(x) = x^2 - 4x + 8$
6. $g(x) = 3x^2 - x^3$
7. $f(x) = x^4 - 3x^3$
8. $h(x) = x^5 - 5x + 2$
9. $f(x) = \dfrac{24}{x^2 + 12}$
10. $f(x) = \dfrac{2x^2}{3x^2 + 1}$
11. $f(x) = \dfrac{x - 2}{6x + 1}$
12. $f(x) = \dfrac{x + 8}{x - 7}$
13. $f(x) = \dfrac{x^2 + 1}{x^2 - 1}$
14. $h(x) = \dfrac{x^2 - 1}{2x - 1}$
15. $y = 2x - \tan x, \quad \left(-\dfrac{\pi}{2}, \dfrac{\pi}{2}\right)$
16. $y = x + \dfrac{2}{\sin x}, \quad (-\pi, \pi)$

Finding Points of Inflection In Exercises 17–32, find any points of inflection and discuss the concavity of the graph of the function.

17. $f(x) = x^3 - 9x^2 + 24x - 18$
18. $f(x) = -x^3 + 6x^2 - 5$
19. $f(x) = 2 - 7x^4$
20. $f(x) = 4 - x - 3x^4$
21. $f(x) = x(x - 4)^3$
22. $f(x) = (x - 2)^3(x - 1)$
23. $f(x) = x\sqrt{x + 3}$
24. $f(x) = x\sqrt{9 - x}$
25. $f(x) = \dfrac{6 - x}{\sqrt{x}}$
26. $f(x) = \dfrac{x + 3}{\sqrt{x}}$
27. $f(x) = \sin\dfrac{x}{2}, \quad [0, 4\pi]$
28. $f(x) = 2\csc\dfrac{3x}{2}, \quad (0, 2\pi)$
29. $f(x) = \sec\left(x - \dfrac{\pi}{2}\right), \quad (0, 4\pi)$
30. $f(x) = \sin x + \cos x, \quad [0, 2\pi]$
31. $f(x) = 2\sin x + \sin 2x, \quad [0, 2\pi]$
32. $f(x) = x + 2\cos x, \quad [0, 2\pi]$

Using the Second Derivative Test In Exercises 33–44, find all relative extrema of the function. Use the Second Derivative Test where applicable.

33. $f(x) = 6x - x^2$
34. $f(x) = x^2 + 3x - 8$
35. $f(x) = x^3 - 3x^2 + 3$
36. $f(x) = -x^3 + 7x^2 - 15x$
37. $f(x) = x^4 - 4x^3 + 2$
38. $f(x) = -x^4 + 2x^3 + 8x$
39. $f(x) = x^{2/3} - 3$
40. $f(x) = \sqrt{x^2 + 1}$
41. $f(x) = x + \dfrac{4}{x}$
42. $f(x) = \dfrac{9x - 1}{x + 5}$
43. $f(x) = \cos x - x, \quad [0, 4\pi]$
44. $f(x) = 2\sin x + \cos 2x, \quad [0, 2\pi]$

Finding Extrema and Points of Inflection Using Technology In Exercises 45–48, use a computer algebra system to analyze the function over the given interval. (a) Find the first and second derivatives of the function. (b) Find any relative extrema and points of inflection. (c) Graph f, f', and f'' on the same set of coordinate axes and state the relationship between the behavior of f and the signs of f' and f''.

45. $f(x) = 0.2x^2(x - 3)^3, \quad [-1, 4]$
46. $f(x) = x^2\sqrt{6 - x^2}, \quad \left[-\sqrt{6}, \sqrt{6}\right]$
47. $f(x) = \sin x - \frac{1}{3}\sin 3x + \frac{1}{5}\sin 5x, \quad [0, \pi]$
48. $f(x) = \sqrt{2x}\sin x, \quad [0, 2\pi]$

Exploring Concepts

49. Consider a function f such that f' is increasing. Sketch graphs of f for (a) $f' < 0$ and (b) $f' > 0$.
50. S represents weekly sales of a product. What can be said of S' and S'' for each of the following statements?
    (a) The rate of change of sales is increasing.
    (b) The rate of change of sales is constant.
    (c) Sales are steady.
    (d) Sales are declining but at a slower rate.
    (e) Sales have bottomed out and have started to rise.

Sketching Graphs In Exercises 51 and 52, the graph of f is shown. Graph f, f', and f'' on the same set of coordinate axes. To print an enlarged copy of the graph, go to *MathGraphs.com*.

Think About It **In Exercises 53–56, sketch the graph of a function f having the given characteristics.**

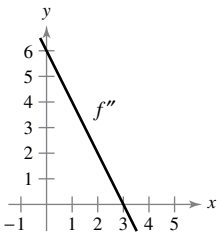
53. $f(0) = f(2) = 0$
$f'(x) > 0$ for $x < 1$
$f'(1) = 0$
$f'(x) < 0$ for $x > 1$
$f''(x) < 0$

54. $f(0) = f(2) = 0$
$f'(x) < 0$ for $x < 1$
$f'(1) = 0$
$f'(x) > 0$ for $x > 1$
$f''(x) > 0$

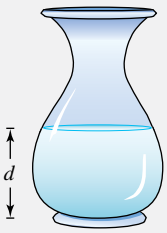
55. $f(2) = f(4) = 0$
$f'(x) < 0$ for $x < 3$
$f'(3)$ does not exist.
$f'(x) > 0$ for $x > 3$
$f''(x) < 0, x \neq 3$

56. $f(1) = f(3) = 0$
$f'(x) > 0$ for $x < 2$
$f'(2)$ does not exist.
$f'(x) < 0$ for $x > 2$
$f''(x) > 0, x \neq 2$

57. Think About It The figure shows the graph of f''. Sketch a graph of f. (The answer is not unique.) To print an enlarged copy of the graph, go to *MathGraphs.com*.



58. HOW DO YOU SEE IT? Water is running into the vase shown in the figure at a constant rate.



(a) Graph the depth d of water in the vase as a function of time.

(b) Does the function have any extrema? Explain.

(c) Interpret the inflection points of the graph of d.

59. Conjecture Consider the function

$$f(x) = (x - 2)^n.$$

(a) Use a graphing utility to graph f for $n = 1, 2, 3$, and 4. Use the graphs to make a conjecture about the relationship between n and any inflection points of the graph of f.

(b) Verify your conjecture in part (a).

60. Inflection Point Consider the function $f(x) = \sqrt[3]{x}$.

(a) Graph the function and identify the inflection point.

(b) Does f'' exist at the inflection point? Explain.

Finding a Cubic Function **In Exercises 61 and 62, find a, b, c, and d such that the cubic function**

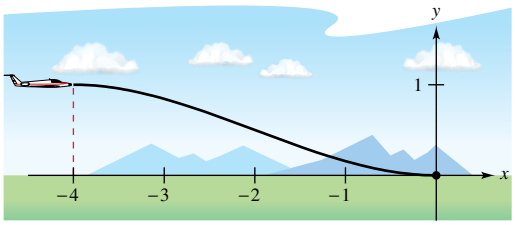
$$f(x) = ax^3 + bx^2 + cx + d$$

satisfies the given conditions.

61. Relative maximum: $(3, 3)$
Relative minimum: $(5, 1)$
Inflection point: $(4, 2)$

62. Relative maximum: $(2, 4)$
Relative minimum: $(4, 2)$
Inflection point: $(3, 3)$

63. Aircraft Glide Path A small aircraft starts its descent 4 miles west of the runway from an altitude of 1 mile (see figure).

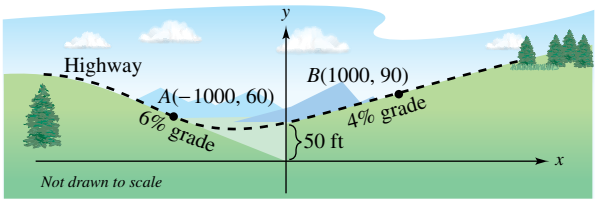


(a) Find the cubic function $f(x) = ax^3 + bx^2 + cx + d$ on the interval $[-4, 0]$ that describes a smooth glide path for the landing.

(b) The function in part (a) models the glide path of the plane. When would the plane be descending at the greatest rate?

FOR FURTHER INFORMATION For more information on this type of modeling, see the article "How Not to Land at Lake Tahoe!" by Richard Barshinger in *The American Mathematical Monthly*. To view this article, go to *MathArticles.com*.

64. Highway Design A section of highway connecting two hillsides with grades of 6% and 4% is to be built between two points that are separated by a horizontal distance of 2000 feet (see figure). At the point where the two hillsides come together, there is a 50-foot difference in elevation.



(a) Find the cubic function

$$f(x) = ax^3 + bx^2 + cx + d, \quad -1000 \leq x \leq 1000$$

that describes the section of highway connecting the hillsides. At points A and B, the slope of the model must match the grade of the hillside.

(b) Use a graphing utility to graph the model.

(c) Use a graphing utility to graph the derivative of the model.

(d) Determine the grade at the steepest part of the transitional section of the highway.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

65. Average Cost A manufacturer has determined that the total cost C of operating a factory is

$$C = 0.5x^2 + 15x + 5000$$

where x is the number of units produced. At what level of production will the average cost per unit be minimized? (The average cost per unit is C/x.)

66. Specific Gravity A model for the specific gravity of water S is

$$S = \frac{5.755}{10^8}T^3 - \frac{8.521}{10^6}T^2 + \frac{6.540}{10^5}T + 0.99987, \quad 0 < T < 25$$

where T is the water temperature in degrees Celsius.

(a) Use the second derivative to determine the concavity of S.

(b) Use a computer algebra system to find the coordinates of the maximum value of the function.

(c) Use a graphing utility to graph the function over the specified domain. (Use a setting in which $0.996 \le S \le 1.001$.)

(d) Estimate the specific gravity of water when $T = 20°$.

67. Sales Growth The annual sales S of a new product are given by

$$S = \frac{5000t^2}{8 + t^2}, \quad 0 \le t \le 3$$

where t is time in years.

(a) Complete the table. Then use it to estimate when the annual sales are increasing at the greatest rate.

t	0.5	1	1.5	2	2.5	3
S						

(b) Use a graphing utility to graph the function S. Then use the graph to estimate when the annual sales are increasing at the greatest rate.

(c) Find the exact time when the annual sales are increasing at the greatest rate.

68. Modeling Data The average typing speeds S (in words per minute) of a typing student after t weeks of lessons are shown in the table.

t	5	10	15	20	25	30
S	28	56	79	90	93	94

A model for the data is

$$S = \frac{100t^2}{65 + t^2}, \quad t > 0.$$

(a) Use a graphing utility to plot the data and graph the model.

(b) Use the second derivative to determine the concavity of S. Compare the result with the graph in part (a).

(c) What is the sign of the first derivative for $t > 0$? By combining this information with the concavity of the model, what inferences can be made about the typing speed as t increases?

Linear and Quadratic Approximations **In Exercises 69–72, use a graphing utility to graph the function. Then graph the linear and quadratic approximations**

$$P_1(x) = f(a) + f'(a)(x - a)$$

and

$$P_2(x) = f(a) + f'(a)(x - a) + \tfrac{1}{2}f''(a)(x - a)^2$$

in the same viewing window. Compare the values of f, P_1, and P_2 and their first derivatives at $x = a$. How do the approximations change as you move farther away from $x = a$?

	Function	Value of a
69.	$f(x) = 2(\sin x + \cos x)$	$a = \frac{\pi}{4}$
70.	$f(x) = 2(\sin x + \cos x)$	$a = 0$
71.	$f(x) = \sqrt{1 - x}$	$a = 0$
72.	$f(x) = \frac{\sqrt{x}}{x - 1}$	$a = 2$

73. Point of Inflection and Extrema Consider the function

$$f(x) = \frac{\sin x}{x}, \quad x > 0.$$

(a) Show that the relative extrema of f lie on the curve $y^2(1 + x^2) = 1$.

(b) Show that the points of inflection of f lie on the curve $y^2(4 + x^4) = 4$.

74. Point of Inflection and Extrema Show that the point of inflection of

$$f(x) = x(x - 6)^2$$

lies midway between the relative extrema of f.

True or False? **In Exercises 75–78, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

75. The graph of every cubic polynomial has precisely one point of inflection.

76. The graph of

$$f(x) = \frac{1}{x}$$

is concave downward for $x < 0$ and concave upward for $x > 0$, and thus it has a point of inflection at $x = 0$.

77. If $f'(c) > 0$, then f is concave upward at $x = c$.

78. If $f''(2) = 0$, then the graph of f must have a point of inflection at $x = 2$.

Proof **In Exercises 79 and 80, let f and g represent differentiable functions such that $f'' \neq 0$ and $g'' \neq 0$.**

79. Show that if f and g are concave upward on the interval (a, b), then $f + g$ is also concave upward on (a, b).

80. Prove that if f and g are positive, increasing, and concave upward on the interval (a, b), then fg is also concave upward on (a, b).

3.5 Limits at Infinity

GO DIGITAL

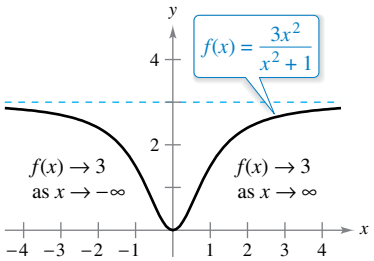
- **Determine (finite) limits at infinity.**
- **Determine the horizontal asymptotes, if any, of the graph of a function.**
- **Determine infinite limits at infinity.**

Limits at Infinity

This section discusses the "end behavior" of a function on an *infinite* interval. Consider the graph of

$$f(x) = \frac{3x^2}{x^2 + 1}$$

as shown in Figure 3.32. Graphically, $f(x)$ appears to approach 3 as x increases without bound or decreases without bound. A numerical approach supports this conclusion, as shown in the table.



The limit of $f(x)$ as x approaches $-\infty$ or ∞ is 3.

Figure 3.32

x decreases without bound. | x increases without bound.

x	$-\infty\leftarrow$	-100	-10	-1	0	1	10	100	$\rightarrow\infty$
$f(x)$	$3\leftarrow$	2.9997	2.9703	1.5	0	1.5	2.9703	2.9997	$\rightarrow 3$

$f(x)$ approaches 3. | $f(x)$ approaches 3.

The table suggests that $f(x)$ approaches 3 as x increases without bound ($x \to \infty$). Similarly, $f(x)$ approaches 3 as x decreases without bound ($x \to -\infty$). These **limits at infinity** are denoted by

$$\lim_{x\to-\infty} f(x) = 3 \qquad \text{Limit at negative infinity}$$

and

$$\lim_{x\to\infty} f(x) = 3. \qquad \text{Limit at positive infinity}$$

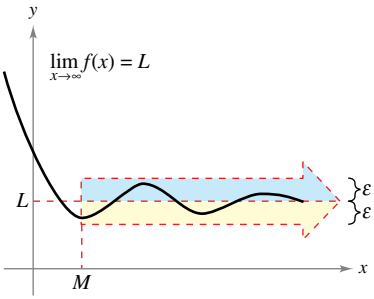
To say that a statement is true as x increases *without bound* means that for some (large) real number M, the statement is true for *all* x in the interval $\{x: x > M\}$. The next definition uses this concept.

REMARK The statement $\lim_{x\to-\infty} f(x) = L$ or $\lim_{x\to\infty} f(x) = L$ means that the limit exists *and* the limit is equal to L.

Definition of Limits at Infinity

Let L be a real number.

1. The statement $\lim_{x\to\infty} f(x) = L$ means that for each $\varepsilon > 0$ there exists an $M > 0$ such that $|f(x) - L| < \varepsilon$ whenever $x > M$.
2. The statement $\lim_{x\to-\infty} f(x) = L$ means that for each $\varepsilon > 0$ there exists an $N < 0$ such that $|f(x) - L| < \varepsilon$ whenever $x < N$.



$f(x)$ is within ε units of L as $x \to \infty$.

Figure 3.33

The definition of a limit at infinity is shown in Figure 3.33. In this figure, note that for a given positive number ε, there exists a positive number M such that, for $x > M$, the graph of f will lie between the horizontal lines

$$y = L + \varepsilon \quad \text{and} \quad y = L - \varepsilon.$$

Exploration

Use a graphing utility to graph

$$f(x) = \frac{2x^2 + 4x - 6}{3x^2 + 2x - 16}.$$

Describe all the important features of the graph. Can you find a single viewing window that shows all of these features clearly? Explain your reasoning.

What are the horizontal asymptotes of the graph? How far to the right do you have to move on the graph so that the graph is within 0.001 unit of its horizontal asymptote? Explain your reasoning.

GO DIGITAL

Horizontal Asymptotes

In Figure 3.33, the graph of f approaches the line $y = L$ as x increases without bound. The line $y = L$ is called a **horizontal asymptote** of the graph of f.

Definition of a Horizontal Asymptote

The line $y = L$ is a **horizontal asymptote** of the graph of f when

$$\lim_{x \to -\infty} f(x) = L \quad \text{or} \quad \lim_{x \to \infty} f(x) = L.$$

Note that from this definition, it follows that the graph of a *function* of x can have at most two horizontal asymptotes—one to the right and one to the left.

Limits at infinity have many of the same properties of limits discussed in Section 1.3. For example, if $\lim_{x \to \infty} f(x)$ and $\lim_{x \to \infty} g(x)$ both exist, then

$$\lim_{x \to \infty} [f(x) + g(x)] = \lim_{x \to \infty} f(x) + \lim_{x \to \infty} g(x)$$ Property 2, Theorem 1.2

and

$$\lim_{x \to \infty} [f(x)g(x)] = \left[\lim_{x \to \infty} f(x)\right]\left[\lim_{x \to \infty} g(x)\right].$$ Property 4, Theorem 1.2

Similar properties hold for limits at $-\infty$.

When evaluating limits at infinity, the next theorem is helpful.

THEOREM 3.10 Limits at Infinity

If r is a positive rational number and c is any real number, then

$$\lim_{x \to \infty} \frac{c}{x^r} = 0.$$

Furthermore, if x^r is defined when $x < 0$, then

$$\lim_{x \to -\infty} \frac{c}{x^r} = 0.$$

A proof of this theorem is given in Appendix A.

EXAMPLE 1 Finding a Limit at Infinity

Find the limit: $\lim_{x \to \infty} \left(5 - \frac{2}{x^2}\right)$.

Solution Using several properties of limits, you can write

$$\lim_{x \to \infty} \left(5 - \frac{2}{x^2}\right) = \lim_{x \to \infty} 5 - \lim_{x \to \infty} \frac{2}{x^2}$$ Property 3, Theorem 1.2

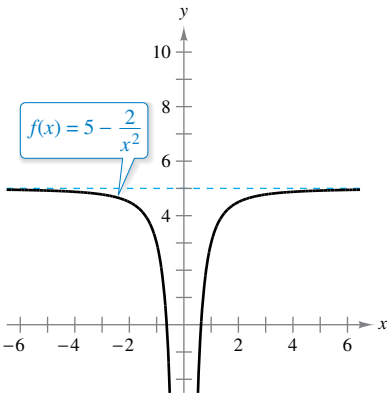
$$= 5 - 0$$ Property 1, Theorem 1.1, and Theorem 3.10

$$= 5.$$

So, the line $y = 5$ is a horizontal asymptote to the right. Note that as $x \to -\infty$,

$$\lim_{x \to -\infty} \left(5 - \frac{2}{x^2}\right) = \lim_{x \to -\infty} 5 - \lim_{x \to -\infty} \frac{2}{x^2} = 5 - 0 = 5.$$

So, $y = 5$ is also a horizontal asymptote to the left. The graph of the function $f(x) = 5 - (2/x^2)$ is shown in Figure 3.34. (In Figure 3.34, the horizontal asymptote $y = 5$ is shown as a dashed line.)



$y = 5$ is a horizontal asymptote.

GO DIGITAL

EXAMPLE 2 Finding a Limit at Infinity

Find the limit: $\lim_{x\to\infty} \frac{2x-1}{x+1}$.

Solution Note that both the numerator and the denominator approach infinity as x approaches infinity.

$$\lim_{x\to\infty} \frac{2x-1}{x+1} \quad \begin{cases} \lim_{x\to\infty} (2x-1) = \infty \\ \lim_{x\to\infty} (x+1) = \infty \end{cases}$$

This results in ∞/∞, an **indeterminate form.** To resolve this problem, divide both the numerator and the denominator by x. After dividing, the limit may be found as shown.

$$\lim_{x\to\infty} \frac{2x-1}{x+1} = \lim_{x\to\infty} \frac{\frac{2x-1}{x}}{\frac{x+1}{x}} \qquad \text{Divide numerator and denominator by } x.$$

$$= \lim_{x\to\infty} \frac{2-\frac{1}{x}}{1+\frac{1}{x}} \qquad \text{Simplify.}$$

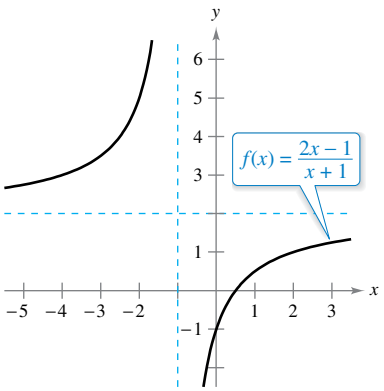
$$= \frac{\lim_{x\to\infty} 2 - \lim_{x\to\infty} \frac{1}{x}}{\lim_{x\to\infty} 1 + \lim_{x\to\infty} \frac{1}{x}} \qquad \text{Properties 2, 3, and 5, Theorem 1.2}$$

$$= \frac{2-0}{1+0} \qquad \text{Property 1, Theorem 1.1, and Theorem 3.10}$$

$$= 2$$

So, the line $y = 2$ is a horizontal asymptote to the right. By taking the limit as $x \to -\infty$, you can see that $y = 2$ is also a horizontal asymptote to the left. Figure 3.35 shows the graph of $f(x) = (2x-1)/(x+1)$ and its horizontal asymptote, $y = 2$. (Note that the vertical asymptote, $x = -1$, is also shown.)

REMARK When you encounter an indeterminate form such as the one in Example 2, you should divide the numerator and denominator by the highest power of x in the *denominator*.



$y = 2$ is a horizontal asymptote.
Figure 3.35

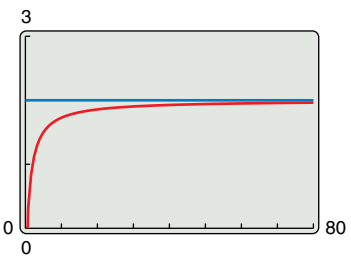
TECHNOLOGY To test the reasonableness of the limit found in Example 2, evaluate $f(x)$ for a few large positive values of x. For instance,

$f(100) \approx 1.9703$, $f(1000) \approx 1.9970$, and $f(10{,}000) \approx 1.9997$.

Another way to test the reasonableness of the limit is to use a graphing utility. For instance, in Figure 3.36, the graph of

$$f(x) = \frac{2x-1}{x+1}$$

is shown with the horizontal line $y = 2$. Note that as x increases, the graph of f moves closer and closer to its horizontal asymptote.



As x increases, the graph of f moves closer and closer to the line $y = 2$.

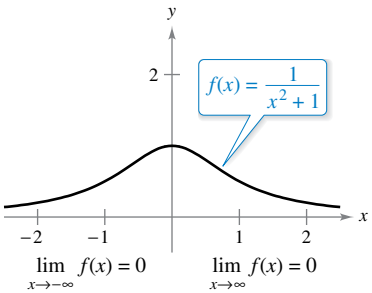
MARIA GAETANA AGNESI (1718–1799)

Agnesi was one of a handful of women to receive credit for significant contributions to mathematics before the twentieth century. In her early twenties, she wrote the first text that included both differential and integral calculus. By age 30, she was an honorary member of the faculty at the University of Bologna.

See LarsonCalculus.com to read more of this biography.

FOR FURTHER INFORMATION

For more information on the contributions of women to mathematics, see the article "Why Women Succeed in Mathematics" by Mona Fabricant, Sylvia Svitak, and Patricia Clark Kenschaft in *Mathematics Teacher*. To view this article, go to *MathArticles.com*.



f has a horizontal asymptote at $y = 0$.
Figure 3.37

EXAMPLE 3 A Comparison of Three Rational Functions

See LarsonCalculus.com for an interactive version of this type of example.

Find each limit.

a. $\lim_{x\to\infty} \frac{2x + 5}{3x^2 + 1}$ **b.** $\lim_{x\to\infty} \frac{2x^2 + 5}{3x^2 + 1}$

c. $\lim_{x\to\infty} \frac{2x^3 + 5}{3x^2 + 1}$

Solution In each case, attempting to evaluate the limit produces the indeterminate form ∞/∞. Note that the highest power of x in the *denominator* of each fraction is x^2. So, to find each limit, divide both the numerator and the denominator by x^2.

a. $\lim_{x\to\infty} \frac{2x + 5}{3x^2 + 1} = \lim_{x\to\infty} \frac{(2/x) + (5/x^2)}{3 + (1/x^2)} = \frac{0 + 0}{3 + 0} = \frac{0}{3} = 0$

b. $\lim_{x\to\infty} \frac{2x^2 + 5}{3x^2 + 1} = \lim_{x\to\infty} \frac{2 + (5/x^2)}{3 + (1/x^2)} = \frac{2 + 0}{3 + 0} = \frac{2}{3}$

c. $\lim_{x\to\infty} \frac{2x^3 + 5}{3x^2 + 1} = \lim_{x\to\infty} \frac{2x + (5/x^2)}{3 + (1/x^2)} = \frac{\infty}{3}$ Limit does not exist

This limit *does not exist* because the numerator increases without bound while the denominator approaches 3. ■

Example 3 suggests the guidelines below for finding limits at infinity of rational functions. Use these guidelines to check the results in Example 3.

Guidelines for Finding Limits at $\pm\infty$ of Rational Functions

1. If the degree of the numerator is *less than* the degree of the denominator, then the limit of the rational function is 0.
2. If the degree of the numerator is *equal to* the degree of the denominator, then the limit of the rational function is the ratio of the leading coefficients.
3. If the degree of the numerator is *greater than* the degree of the denominator, then the limit of the rational function does not exist.

The guidelines for finding limits at infinity of rational functions seem reasonable when you consider that for large values of x, the highest-power term of the rational function is the most "influential" in determining the limit. For instance,

$\lim_{x\to\infty} \frac{1}{x^2 + 1}$ ← Degree of numerator is 0. ← Degree of denominator is 2.

is 0 because the denominator overpowers the numerator as x increases or decreases without bound, as shown in Figure 3.37.

The function shown in Figure 3.37 is a special case of a type of curve studied by the Italian mathematician Maria Gaetana Agnesi. The general form of this function is

$$f(x) = \frac{8a^3}{x^2 + 4a^2}$$ Witch of Agnesi

and, through a mistranslation of the Italian word *vertéré*, the curve has come to be known as the Witch of Agnesi. Agnesi's work with this curve first appeared in a comprehensive text on calculus that was published in 1748.

GO DIGITAL

In Figure 3.37, notice that the graph of $f(x) = 1/(x^2 + 1)$ approaches the same horizontal asymptote to the right and to the left. This is always true of rational functions. Functions that are not rational, however, may approach different horizontal asymptotes to the right and to the left. This is demonstrated in Example 4.

EXAMPLE 4 A Function with Two Horizontal Asymptotes

Find each limit.

a. $\lim_{x\to\infty} \dfrac{3x - 2}{\sqrt{2x^2 + 1}}$ **b.** $\lim_{x\to-\infty} \dfrac{3x - 2}{\sqrt{2x^2 + 1}}$

Solution

a. For $x > 0$, you can write $x = \sqrt{x^2}$. So, dividing both the numerator and the denominator by x produces

$$\frac{3x - 2}{\sqrt{2x^2 + 1}} = \frac{\frac{3x - 2}{x}}{\frac{\sqrt{2x^2 + 1}}{\sqrt{x^2}}} = \frac{3 - \frac{2}{x}}{\sqrt{\frac{2x^2 + 1}{x^2}}} = \frac{3 - \frac{2}{x}}{\sqrt{2 + \frac{1}{x^2}}}$$

and you can take the limit as follows.

$$\lim_{x\to\infty} \frac{3x - 2}{\sqrt{2x^2 + 1}} = \lim_{x\to\infty} \frac{3 - \frac{2}{x}}{\sqrt{2 + \frac{1}{x^2}}} = \frac{3 - 0}{\sqrt{2 + 0}} = \frac{3}{\sqrt{2}}$$

b. For $x < 0$, you can write $x = -\sqrt{x^2}$. So, dividing both the numerator and the denominator by x produces

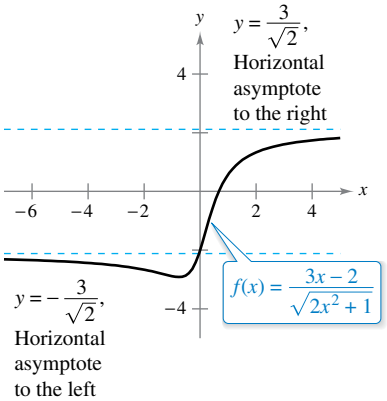
$$\frac{3x - 2}{\sqrt{2x^2 + 1}} = \frac{\frac{3x - 2}{x}}{\frac{\sqrt{2x^2 + 1}}{-\sqrt{x^2}}} = \frac{3 - \frac{2}{x}}{-\sqrt{\frac{2x^2 + 1}{x^2}}} = \frac{3 - \frac{2}{x}}{-\sqrt{2 + \frac{1}{x^2}}}$$

and you can take the limit as follows.

$$\lim_{x\to-\infty} \frac{3x - 2}{\sqrt{2x^2 + 1}} = \lim_{x\to-\infty} \frac{3 - \frac{2}{x}}{-\sqrt{2 + \frac{1}{x^2}}} = \frac{3 - 0}{-\sqrt{2 + 0}} = -\frac{3}{\sqrt{2}}$$

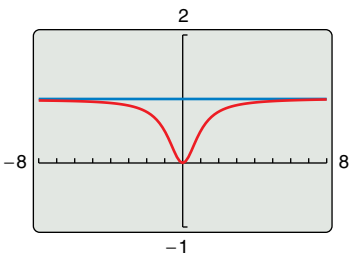
The graph of $f(x) = (3x - 2)/\sqrt{2x^2 + 1}$ is shown in Figure 3.38. In the figure, notice that the line $y = 3/\sqrt{2}$ is a horizontal asymptote to the right, and the line $y = -3/\sqrt{2}$ is a horizontal asymptote to the left. ■

REMARK Be sure you understand that the guidelines on the preceding page *do not* apply to limits of functions that "look rational," such as those in Example 4. Remember, a rational function is the quotient of two *polynomials* (see Section P.3).



Functions that are not rational may have different right and left horizontal asymptotes.

Figure 3.38



The horizontal asymptote appears to be the line $y = 1$, but it is actually the line $y = 2$.

Figure 3.39

TECHNOLOGY PITFALL If you use a graphing utility to estimate a limit, be sure that you also confirm the estimate analytically—the graphs shown by a graphing utility can be misleading. For instance, Figure 3.39 shows one view of the graph of

$$y = \frac{2x^3 + 1000x^2 + x}{x^3 + 1000x^2 + x + 1000}.$$

From this view, it appears that the line $y = 1$ is a horizontal asymptote. An analytical approach shows that the horizontal asymptote is actually $y = 2$. Confirm this by adjusting the viewing window on the graphing utility.

GO DIGITAL

In Section 1.4, Example 7(c), you used the Squeeze Theorem to evaluate a limit involving a trigonometric function. The Squeeze Theorem is also valid for limits at infinity.

EXAMPLE 5 Limits Involving Trigonometric Functions

Find each limit.

a. $\lim_{x\to\infty} \sin x$ **b.** $\lim_{x\to\infty} \frac{\sin x}{x}$

Solution

a. As x approaches infinity, the sine function oscillates between 1 and -1. So, this limit does not exist.

b. Because $-1 \le \sin x \le 1$, it follows that for $x > 0$,

$$-\frac{1}{x} \le \frac{\sin x}{x} \le \frac{1}{x}$$

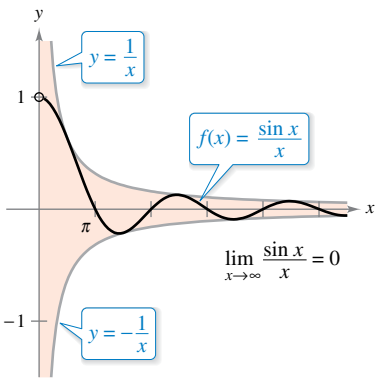
where

$$\lim_{x\to\infty}\left(-\frac{1}{x}\right) = 0 \quad \text{and} \quad \lim_{x\to\infty}\frac{1}{x} = 0.$$

So, by the Squeeze Theorem, you obtain

$$\lim_{x\to\infty}\frac{\sin x}{x} = 0$$

as shown in Figure 3.40.



As x increases without bound, $f(x)$ approaches 0.
Figure 3.40

EXAMPLE 6 Oxygen Level in a Pond

Let $f(t)$ measure the level of oxygen in a pond, where $f(t) = 1$ is the normal (unpolluted) level and the time t is measured in weeks. When $t = 0$, organic waste is dumped into the pond, and as the waste material oxidizes, the level of oxygen in the pond is

$$f(t) = \frac{t^2 - t + 1}{t^2 + 1}.$$

What percent of the normal level of oxygen exists in the pond after 1 week? After 2 weeks? After 10 weeks? What is the limit as t approaches infinity?

Solution

When $t = 1$, 2, and 10, the levels of oxygen are as shown.

$$f(1) = \frac{1^2 - 1 + 1}{1^2 + 1} = \frac{1}{2} = 50\% \qquad \text{1 week}$$

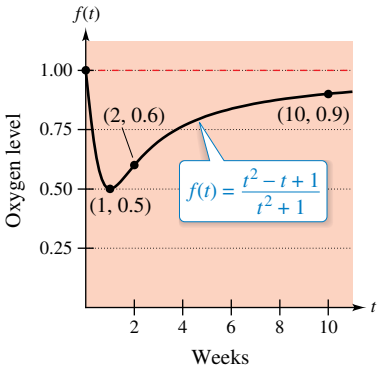
$$f(2) = \frac{2^2 - 2 + 1}{2^2 + 1} = \frac{3}{5} = 60\% \qquad \text{2 weeks}$$

$$f(10) = \frac{10^2 - 10 + 1}{10^2 + 1} = \frac{91}{101} \approx 90.1\% \qquad \text{10 weeks}$$

To find the limit as t approaches infinity, you can use the guidelines on page 202, or you can divide the numerator and the denominator by t^2 to obtain

$$\lim_{t\to\infty}\frac{t^2 - t + 1}{t^2 + 1} = \lim_{t\to\infty}\frac{1 - (1/t) + (1/t^2)}{1 + (1/t^2)} = \frac{1 - 0 + 0}{1 + 0} = 1 = 100\%.$$

See Figure 3.41.



The level of oxygen in a pond approaches the normal level of 1 as t approaches ∞.

Infinite Limits at Infinity

Many functions do not approach a finite limit as x increases (or decreases) without bound. For instance, no polynomial function has a finite limit at infinity. The next definition is used to describe the behavior of polynomial and other functions at infinity.

REMARK Determining whether a function has an infinite limit at infinity is useful in analyzing the "end behavior" of its graph. You will see examples of this in Section 3.6 on curve sketching.

Definition of Infinite Limits at Infinity

Let f be a function defined on the interval (a, ∞).

1. The statement $\lim_{x\to\infty} f(x) = \infty$ means that for each positive number M, there is a corresponding number $N > 0$ such that $f(x) > M$ whenever $x > N$.
2. The statement $\lim_{x\to\infty} f(x) = -\infty$ means that for each negative number M, there is a corresponding number $N > 0$ such that $f(x) < M$ whenever $x > N$.

Similar definitions can be given for the statements

$$\lim_{x\to-\infty} f(x) = \infty \quad \text{and} \quad \lim_{x\to-\infty} f(x) = -\infty.$$

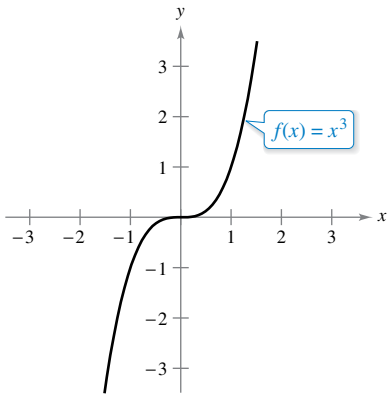

Figure 3.42

EXAMPLE 7 Finding Infinite Limits at Infinity

Find each limit.

a. $\lim_{x\to\infty} x^3$ **b.** $\lim_{x\to-\infty} x^3$

Solution

a. As x increases without bound, x^3 also increases without bound. So,

$$\lim_{x\to\infty} x^3 = \infty.$$

b. As x decreases without bound, x^3 also decreases without bound. So,

$$\lim_{x\to-\infty} x^3 = -\infty.$$

The graph of $f(x) = x^3$ in Figure 3.42 illustrates these two results. These results agree with the Leading Coefficient Test for polynomial functions as described in Section P.3.

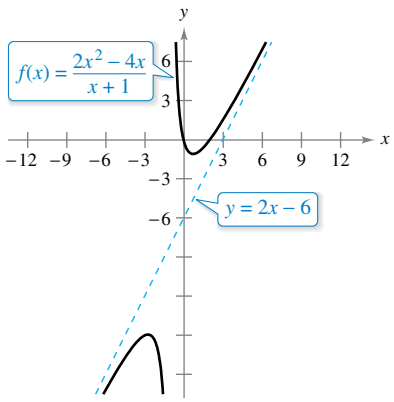

Figure 3.43

EXAMPLE 8 Finding Infinite Limits at Infinity

Find each limit.

a. $\lim_{x\to\infty} \dfrac{2x^2 - 4x}{x + 1}$ **b.** $\lim_{x\to-\infty} \dfrac{2x^2 - 4x}{x + 1}$

Solution One way to evaluate each of these limits is to use long division to rewrite the improper rational function as the sum of a polynomial and a rational function.

a. $\lim_{x\to\infty} \dfrac{2x^2 - 4x}{x + 1} = \lim_{x\to\infty} \left(2x - 6 + \dfrac{6}{x + 1}\right) = \infty$

b. $\lim_{x\to-\infty} \dfrac{2x^2 - 4x}{x + 1} = \lim_{x\to-\infty} \left(2x - 6 + \dfrac{6}{x + 1}\right) = -\infty$

The statements above can be interpreted as saying that as x approaches $\pm\infty$, the function $f(x) = (2x^2 - 4x)/(x + 1)$ behaves like the function $g(x) = 2x - 6$. In Section 3.6, you will see that this is graphically described by saying that the line $y = 2x - 6$ is a *slant asymptote* of the graph of f, as shown in Figure 3.43.

3.5 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

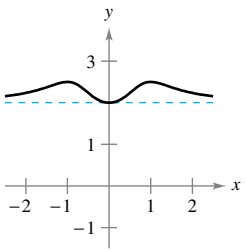
GO DIGITAL

Concept Check

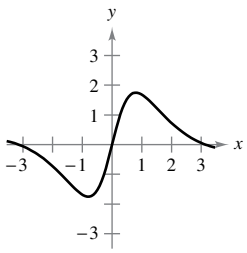
1. Describe what each statement means.
   (a) $\lim_{x\to\infty} f(x) = -5$
   (b) $\lim_{x\to-\infty} f(x) = 3$
2. Explain what it means for the graph of a function to have a horizontal asymptote.
3. A graph can have a maximum of how many horizontal asymptotes? Explain.
4. Summarize the guidelines for finding limits at infinity of rational functions.

Matching **In Exercises 5–10, match the function with its graph using horizontal asymptotes as an aid. [The graphs are labeled (a), (b), (c), (d), (e), and (f).]**

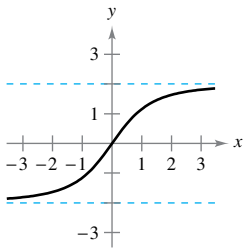
(a)



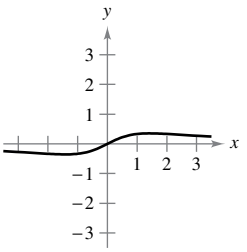
(b)



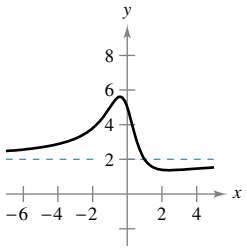
(c)



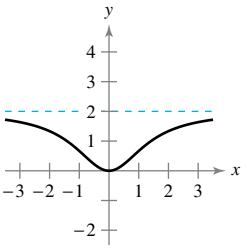
(d)



(e)



(f)



5. $f(x) = \dfrac{2x^2}{x^2+2}$
6. $f(x) = \dfrac{2x}{\sqrt{x^2+2}}$
7. $f(x) = \dfrac{x}{x^2+2}$
8. $f(x) = 2 + \dfrac{x^2}{x^4+1}$
9. $f(x) = \dfrac{4\sin x}{x^2+1}$
10. $f(x) = \dfrac{2x^2-3x+5}{x^2+1}$

Finding Limits at Infinity **In Exercises 11 and 12, find $\lim_{x\to\infty} h(x)$, if it exists.**

11. $f(x) = 5x^3 - 3$
    (a) $h(x) = \dfrac{f(x)}{x^2}$
    (b) $h(x) = \dfrac{f(x)}{x^3}$
    (c) $h(x) = \dfrac{f(x)}{x^4}$
12. $f(x) = -4x^2 + 2x - 5$
    (a) $h(x) = \dfrac{f(x)}{x}$
    (b) $h(x) = \dfrac{f(x)}{x^2}$
    (c) $h(x) = \dfrac{f(x)}{x^3}$

Finding Limits at Infinity **In Exercises 13–16, find each limit, if it exists.**

13. (a) $\lim_{x\to\infty} \dfrac{x^2+2}{x^3-1}$
    (b) $\lim_{x\to\infty} \dfrac{x^2+2}{x^2-1}$
    (c) $\lim_{x\to\infty} \dfrac{x^2+2}{x-1}$
14. (a) $\lim_{x\to\infty} \dfrac{3-2x}{3x^3-1}$
    (b) $\lim_{x\to\infty} \dfrac{3-2x}{3x-1}$
    (c) $\lim_{x\to\infty} \dfrac{3-2x^2}{3x-1}$
15. (a) $\lim_{x\to\infty} \dfrac{5-2x^{3/2}}{3x^2-4}$
    (b) $\lim_{x\to\infty} \dfrac{5-2x^{3/2}}{3x^{3/2}-4}$
    (c) $\lim_{x\to\infty} \dfrac{5-2x^{3/2}}{3x-4}$
16. (a) $\lim_{x\to\infty} \dfrac{5x^{3/2}}{4x^2+1}$
    (b) $\lim_{x\to\infty} \dfrac{5x^{3/2}}{4x^{3/2}+1}$
    (c) $\lim_{x\to\infty} \dfrac{5x^{3/2}}{4\sqrt{x}+1}$

Finding a Limit **In Exercises 17–36, find the limit, if it exists.**

17. $\lim_{x\to\infty} \left(4 + \dfrac{3}{x}\right)$
18. $\lim_{x\to-\infty} \left(\dfrac{5}{x} - \dfrac{x}{3}\right)$
19. $\lim_{x\to\infty} \dfrac{7x+6}{9x-4}$
20. $\lim_{x\to-\infty} \dfrac{4x^2+5}{x^2+3}$
21. $\lim_{x\to-\infty} \dfrac{2x^2+x}{6x^3+2x^2+x}$
22. $\lim_{x\to\infty} \dfrac{5x^3+1}{10x^3-3x^2+7}$
23. $\lim_{x\to-\infty} \dfrac{5x^2}{x+3}$
24. $\lim_{x\to-\infty} \dfrac{x^3-4}{x^2+1}$
25. $\lim_{x\to-\infty} \dfrac{x}{\sqrt{x^2-x}}$
26. $\lim_{x\to-\infty} \dfrac{x}{\sqrt{x^2+1}}$
27. $\lim_{x\to-\infty} \dfrac{2x+1}{\sqrt{x^2-x}}$
28. $\lim_{x\to\infty} \dfrac{5x^2+2}{\sqrt{x^2+3}}$
29. $\lim_{x\to\infty} \dfrac{\sqrt{x^2-1}}{2x-1}$
30. $\lim_{x\to-\infty} \dfrac{\sqrt{x^4-1}}{x^3-1}$
31. $\lim_{x\to\infty} \dfrac{x+1}{(x^2+1)^{1/3}}$
32. $\lim_{x\to-\infty} \dfrac{2x}{(x^6-1)^{1/3}}$
33. $\lim_{x\to\infty} \dfrac{1}{2x+\sin x}$
34. $\lim_{x\to\infty} \cos\dfrac{1}{x}$
35. $\lim_{x\to\infty} \dfrac{\sin 2x}{x}$
36. $\lim_{x\to\infty} \dfrac{x-\cos x}{x}$

Finding Horizontal Asymptotes Using Technology

In Exercises 37–40, use a graphing utility to graph the function and identify any horizontal asymptotes.

37. $f(x) = \dfrac{|x|}{x+1}$

38. $f(x) = \dfrac{|3x+2|}{x-2}$

39. $f(x) = \dfrac{3x}{\sqrt{x^2+2}}$

40. $f(x) = \dfrac{\sqrt{9x^2-2}}{2x+1}$

Finding a Limit

In Exercises 41 and 42, find the limit. (*Hint:* Let $x = 1/t$ and find the limit as $t \to 0^+$.)

41. $\lim_{x\to\infty} x \sin\dfrac{1}{x}$

42. $\lim_{x\to\infty} x \tan\dfrac{1}{x}$

Finding a Limit

In Exercises 43–46, find the limit. Use a graphing utility to verify your result. (*Hint*: Treat the expression as a fraction whose denominator is 1, and rationalize the numerator.)

43. $\lim_{x\to-\infty} \left(x + \sqrt{x^2+3}\right)$

44. $\lim_{x\to\infty} \left(x - \sqrt{x^2+x}\right)$

45. $\lim_{x\to-\infty} \left(3x + \sqrt{9x^2-x}\right)$

46. $\lim_{x\to\infty} \left(4x - \sqrt{16x^2-x}\right)$

Numerical, Graphical, and Analytic Analysis

In Exercises 47–50, use a graphing utility to complete the table and estimate the limit as x approaches infinity. Then use a graphing utility to graph the function and estimate the limit. Finally, find the limit analytically and compare your results with the estimates.

x	10^0	10^1	10^2	10^3	10^4	10^5	10^6
$f(x)$							

47. $f(x) = x - \sqrt{x(x-1)}$

48. $f(x) = x^2 - x\sqrt{x(x-1)}$

49. $f(x) = x \sin\dfrac{1}{2x}$

50. $f(x) = \dfrac{x+1}{x\sqrt{x}}$

51. Engine Efficiency

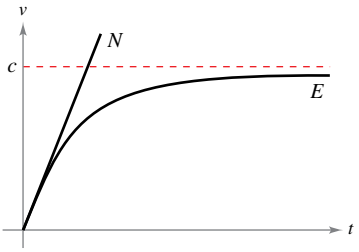
The efficiency (in percent) of an internal combustion engine is

$$\text{Efficiency} = 100\left[1 - \frac{1}{(v_1/v_2)^c}\right]$$

where v_1/v_2 is the ratio of the uncompressed gas to the compressed gas and c is a positive constant dependent on the engine design. Find the limit of the efficiency as the compression ratio approaches infinity.

Blanscape/Shutterstock.com

52. Physics Newton's First Law of Motion and Einstein's Special Theory of Relativity differ concerning the behavior of a particle as its velocity approaches the speed of light c. In the graph, functions N and E represent the velocity v, with respect to time t, of a particle accelerated by a constant force as predicted by Newton and Einstein, respectively. Write limit statements that describe these two theories.



Exploring Concepts

53. Explain the differences between limits at infinity and infinite limits.

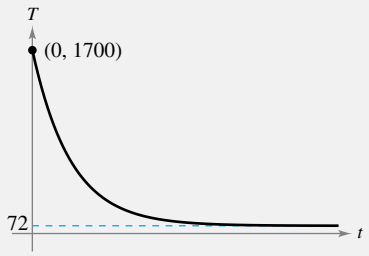
54. Can the graph of a function cross a horizontal asymptote? Explain.

55. If f is a continuous function such that $\lim_{x\to\infty} f(x) = 5$, find, if possible, $\lim_{x\to-\infty} f(x)$ for each specified condition.

(a) The graph of f is symmetric with respect to the y-axis.

(b) The graph of f is symmetric with respect to the origin.

56. HOW DO YOU SEE IT? The graph shows the temperature T, in degrees Fahrenheit, of molten glass t seconds after it is removed from a kiln.



(a) Find $\lim_{t\to0^+} T$. What does this limit represent?

(b) Find $\lim_{t\to\infty} T$. What does this limit represent?

57. Modeling Data The average typing speeds S (in words per minute) of a typing student after t weeks of lessons are shown in the table.

t	5	10	15	20	25	30
S	28	56	79	90	93	94

A model for the data is $S = \dfrac{100t^2}{65+t^2}$, $t > 0$.

(a) Use a graphing utility to plot the data and graph the model.

(b) Does there appear to be a limiting typing speed? Explain.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

58. Modeling Data A heat probe is attached to the heat exchanger of a heating system. The temperature T (in degrees Celsius) is recorded t seconds after the furnace is started. The results for the first 2 minutes are recorded in the table.

t	0	15	30	45	60
T	25.2	36.9	45.5	51.4	56.0

t	75	90	105	120
T	59.6	62.0	64.0	65.2

(a) Use the regression capabilities of a graphing utility to find a model of the form $T_1 = at^2 + bt + c$ for the data.

(b) Use a graphing utility to graph T_1.

(c) A rational model for the data is

$$T_2 = \frac{1451 + 86t}{58 + t}.$$

Use a graphing utility to graph T_2.

(d) Find $\lim_{t\to\infty} T_2$.

(e) Interpret the result in part (d) in the context of the problem. Is it possible to do this type of analysis using T_1? Explain.

59. Using the Definition of Limits at Infinity The graph of

$$f(x) = \frac{2x^2}{x^2 + 2}$$

is shown (see figure).

(a) Find $L = \lim_{x\to\infty} f(x)$.

(b) Determine x_1 and x_2 in terms of ε.

(c) Determine M, where $M > 0$, such that $|f(x) - L| < \varepsilon$ for $x > M$.

(d) Determine N, where $N < 0$, such that $|f(x) - L| < \varepsilon$ for $x < N$.

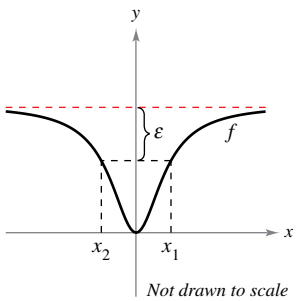

Figure for 59

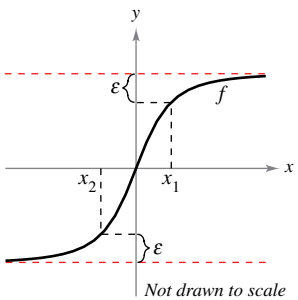

Figure for 60

60. Using the Definition of Limits at Infinity The graph of $f(x) = \dfrac{6x}{\sqrt{x^2 + 2}}$ is shown (see figure).

(a) Find $L = \lim_{x\to\infty} f(x)$ and $K = \lim_{x\to-\infty} f(x)$.

(b) Determine x_1 and x_2 in terms of ε.

(c) Determine M, where $M > 0$, such that $|f(x) - L| < \varepsilon$ for $x > M$.

(d) Determine N, where $N < 0$, such that $|f(x) - K| < \varepsilon$ for $x < N$.

61. Using the Definition of Limits at Infinity Consider

$$\lim_{x\to\infty} \frac{3x}{\sqrt{x^2 + 3}}.$$

(a) Use the definition of limits at infinity to find the value of M that corresponds to $\varepsilon = 0.5$.

(b) Use the definition of limits at infinity to find the value of M that corresponds to $\varepsilon = 0.1$.

62. Using the Definition of Limits at Infinity Consider

$$\lim_{x\to-\infty} \frac{3x}{\sqrt{x^2 + 3}}.$$

(a) Use the definition of limits at infinity to find the value of N that corresponds to $\varepsilon = 0.5$.

(b) Use the definition of limits at infinity to find the value of N that corresponds to $\varepsilon = 0.1$.

Proof **In Exercises 63–66, use the definition of limits at infinity to prove the limit.**

63. $\lim_{x\to\infty} \dfrac{1}{x^2} = 0$

64. $\lim_{x\to\infty} \dfrac{2}{\sqrt{x}} = 0$

65. $\lim_{x\to-\infty} \dfrac{1}{x^3} = 0$

66. $\lim_{x\to-\infty} \dfrac{1}{x - 2} = 0$

67. Distance A line with slope m passes through the point $(0, 4)$.

(a) Write the distance d between the line and the point $(3, 1)$ as a function of m. (*Hint:* See Section P.2, Exercise 77.)

(b) Use a graphing utility to graph the equation in part (a).

(c) Find $\lim_{m\to\infty} d(m)$ and $\lim_{m\to-\infty} d(m)$. Interpret the results geometrically.

68. Distance A line with slope m passes through the point $(0, -2)$.

(a) Write the distance d between the line and the point $(4, 2)$ as a function of m. (*Hint:* See Section P.2, Exercise 77.)

(b) Use a graphing utility to graph the equation in part (a).

(c) Find $\lim_{m\to\infty} d(m)$ and $\lim_{m\to-\infty} d(m)$. Interpret the results geometrically.

69. Proof Prove that if

$$p(x) = a_n x^n + \cdots + a_1 x + a_0$$

and

$$q(x) = b_m x^m + \cdots + b_1 x + b_0$$

where $a_n \neq 0$ and $b_m \neq 0$, then

$$\lim_{x\to\infty} \frac{p(x)}{q(x)} = \begin{cases} 0, & n < m \\ \dfrac{a_n}{b_m}, & n = m \\ \pm\infty, & n > m \end{cases}.$$

70. Proof Use the definition of infinite limits at infinity to prove that $\lim_{x\to\infty} x^3 = \infty$.

3.6 A Summary of Curve Sketching

GO DIGITAL

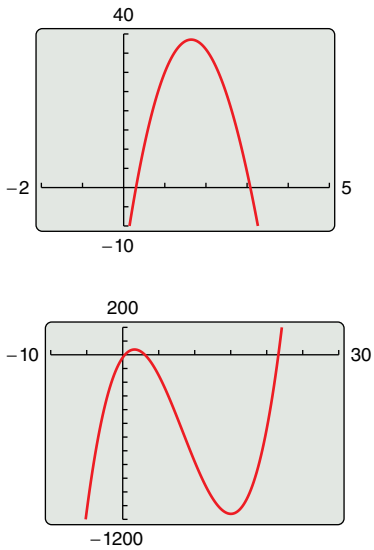
Analyze and sketch the graph of a function.

Analyzing the Graph of a Function

It would be difficult to overstate the importance of using graphs in mathematics. Descartes's introduction of analytic geometry contributed significantly to the rapid advances in calculus that began during the mid-seventeenth century. In the words of Lagrange, "As long as algebra and geometry traveled separate paths their advance was slow and their applications limited. But when these two sciences joined company, they drew from each other fresh vitality and thenceforth marched on at a rapid pace toward perfection."

So far, you have studied several concepts that are useful in analyzing the graph of a function.

- x-intercepts and y-intercepts (Section P.1)
- Symmetry (Section P.1)
- Domain and range (Section P.3)
- Continuity (Section 1.4)
- Vertical asymptotes (Section 1.5)
- Differentiability (Section 2.1)
- Relative extrema (Section 3.1)
- Increasing and decreasing functions (Section 3.3)
- Concavity (Section 3.4)
- Points of inflection (Section 3.4)
- Horizontal asymptotes (Section 3.5)
- Infinite limits at infinity (Section 3.5)



Different viewing windows for the graph of $f(x) = x^3 - 25x^2 + 74x - 20$

Figure 3.44

When you are graphing a function, either with or without a graphing utility, remember that normally you cannot show the *entire* graph. Deciding which part of the graph to show is often crucial. For instance, which of the viewing windows in Figure 3.44 better represents the graph of

$$f(x) = x^3 - 25x^2 + 74x - 20?$$

By seeing both views, it is clear that the second viewing window gives a more complete representation of the graph. But would a third viewing window reveal other interesting portions of the graph? To answer this, you need to use calculus to interpret the first and second derivatives. To determine a good viewing window for the graph of a function, use the guidelines below.

Guidelines for Analyzing the Graph of a Function

1. Determine the domain and range of the function.
2. Determine any intercepts, asymptotes, and symmetry of the graph.
3. Locate any x-values for which $f'(x)$ and $f''(x)$ either are zero or do not exist. Use the results to determine relative extrema and points of inflection.

In the guidelines above, note the importance of *algebra* (as well as calculus) for solving the equations $f(x) = 0$, $f'(x) = 0$, and $f''(x) = 0$.

GO DIGITAL

EXAMPLE 1 Sketching the Graph of a Rational Function

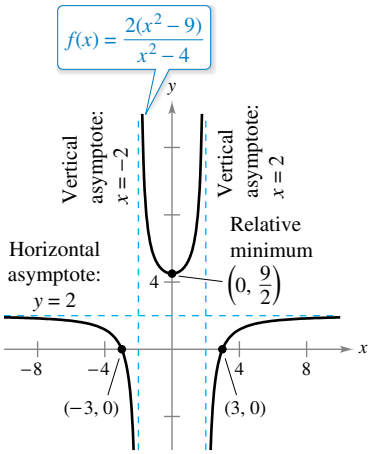
Analyze and sketch the graph of

$$f(x) = \frac{2(x^2 - 9)}{x^2 - 4}.$$

Solution

Domain:	All real numbers except $x = \pm 2$
Range:	$(-\infty, 2) \cup \left[\frac{9}{2}, \infty\right)$
x-intercepts:	$(-3, 0), (3, 0)$
y-intercept:	$\left(0, \frac{9}{2}\right)$
Vertical asymptotes:	$x = -2, x = 2$
Horizontal asymptote:	$y = 2$
Symmetry:	With respect to y-axis
First derivative:	$f'(x) = \frac{20x}{(x^2 - 4)^2}$
Second derivative:	$f''(x) = \frac{-20(3x^2 + 4)}{(x^2 - 4)^3}$
Critical number:	$x = 0$
Possible points of inflection:	None
Test intervals:	$(-\infty, -2), (-2, 0), (0, 2), (2, \infty)$

The table shows how the test intervals are used to determine several characteristics of the graph. The graph of f is shown in Figure 3.45.



Using calculus, you can be certain that you have determined all characteristics of the graph of f.
Figure 3.45

	$f(x)$	$f'(x)$	$f''(x)$	Characteristic of Graph
$-\infty < x < -2$		$-$	$-$	Decreasing, concave downward
$x = -2$	Undef.	Undef.	Undef.	Vertical asymptote
$-2 < x < 0$		$-$	$+$	Decreasing, concave upward
$x = 0$	$\frac{9}{2}$	0	$+$	Relative minimum
$0 < x < 2$		$+$	$+$	Increasing, concave upward
$x = 2$	Undef.	Undef.	Undef.	Vertical asymptote
$2 < x < \infty$		$+$	$-$	Increasing, concave downward

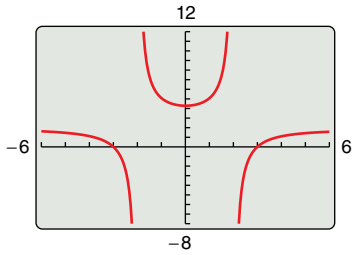
FOR FURTHER INFORMATION
For more information on the use of technology to graph rational functions, see the article "Graphs of Rational Functions for Computer Assisted Calculus" by Stan Byrd and Terry Walters in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

Be sure you understand all of the implications of creating a table such as that shown in Example 1. By using calculus, you can be *sure* that the graph has no relative extrema or points of inflection other than those shown in Figure 3.45.

TECHNOLOGY PITFALL Without using the type of analysis outlined in Example 1, it is easy to obtain an incomplete view of the basic characteristics of a graph. For instance, Figure 3.46 shows a view of the graph of

$$g(x) = \frac{2(x^2 - 9)(x - 20)}{(x^2 - 4)(x - 21)}.$$

From this view, it appears that the graph of g is about the same as the graph of f shown in Figure 3.45. The graphs of these two functions, however, differ significantly. Try adjusting the viewing window to see the differences.



By not using calculus, you may overlook important characteristics of the graph of g.

EXAMPLE 2 Sketching the Graph of a Rational Function

Analyze and sketch the graph of $f(x) = \dfrac{x^2 - 2x + 4}{x - 2}$.

Solution

Domain:	All real numbers except $x = 2$
Range:	$(-\infty, -2] \cup [6, \infty)$
x-intercepts:	None
y-intercept:	$(0, -2)$
Vertical asymptote:	$x = 2$
Horizontal asymptotes:	None
Symmetry:	None
End behavior:	$\lim_{x \to -\infty} f(x) = -\infty$, $\lim_{x \to \infty} f(x) = \infty$
First derivative:	$f'(x) = \dfrac{x(x - 4)}{(x - 2)^2}$
Second derivative:	$f''(x) = \dfrac{8}{(x - 2)^3}$
Critical numbers:	$x = 0, x = 4$
Possible points of inflection:	None
Test intervals:	$(-\infty, 0), (0, 2), (2, 4), (4, \infty)$

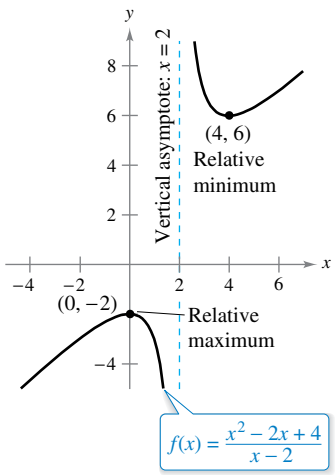

Figure 3.47

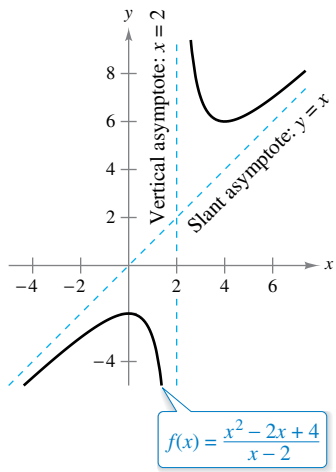
The analysis of the graph of f is shown in the table, and the graph is shown in Figure 3.47.

	$f(x)$	$f'(x)$	$f''(x)$	Characteristic of Graph
$-\infty < x < 0$		+	−	Increasing, concave downward
$x = 0$	-2	0	−	Relative maximum
$0 < x < 2$		−	−	Decreasing, concave downward
$x = 2$	Undef.	Undef.	Undef.	Vertical asymptote
$2 < x < 4$		−	+	Decreasing, concave upward
$x = 4$	6	0	+	Relative minimum
$4 < x < \infty$		+	+	Increasing, concave upward

Although the graph of the function in Example 2 has no horizontal asymptote, it does have a slant asymptote. The graph of a rational function (having no common factors and whose denominator is of degree 1 or greater) has a **slant asymptote** when the degree of the numerator exceeds the degree of the denominator by exactly 1. To find the slant asymptote, use long division to rewrite the rational function as the sum of a first-degree polynomial (the slant asymptote) and another rational function.

$$f(x) = \frac{x^2 - 2x + 4}{x - 2}$$ Write original function (see Example 2).

$$= x + \frac{4}{x - 2}$$ Rewrite using long division.



A slant asymptote

Figure 3.48

In Figure 3.48, note that the graph of f approaches the slant asymptote $y = x$ as x approaches $-\infty$ or ∞.

EXAMPLE 3 A Function Involving a Radical

Analyze and sketch the graph of $f(x) = \dfrac{x}{\sqrt{x^2 + 2}}$.

Solution

$$f'(x) = \frac{2}{(x^2 + 2)^{3/2}}$$ Find first derivative.

$$f''(x) = -\frac{6x}{(x^2 + 2)^{5/2}}$$ Find second derivative.

The graph has only one intercept, $(0, 0)$. It has no vertical asymptotes, but it has two horizontal asymptotes: $y = 1$ (to the right) and $y = -1$ (to the left). The function has no critical numbers and one possible point of inflection (at $x = 0$). The domain of the function is all real numbers, and the graph is symmetric with respect to the origin. The analysis of the graph of f is shown in the table, and the graph is shown in Figure 3.49.

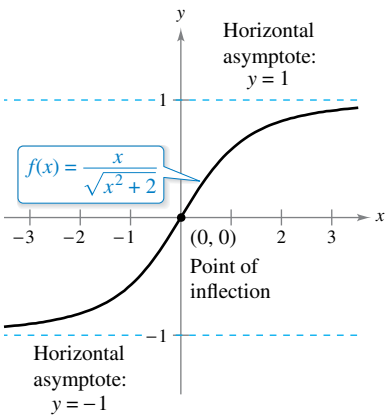

Figure 3.49

	$f(x)$	$f'(x)$	$f''(x)$	Characteristic of Graph
$-\infty < x < 0$		+	+	Increasing, concave upward
$x = 0$	0	+	0	Point of inflection
$0 < x < \infty$		+	−	Increasing, concave downward

EXAMPLE 4 A Function Involving Rational Exponents

Analyze and sketch the graph of $f(x) = 2x^{5/3} - 5x^{4/3}$.

Solution

$$f'(x) = \frac{10}{3}x^{1/3}(x^{1/3} - 2)$$ Find first derivative.

$$f''(x) = \frac{20(x^{1/3} - 1)}{9x^{2/3}}$$ Find second derivative.

The function has two intercepts: $(0, 0)$ and $\left(\frac{125}{8}, 0\right)$. There are no horizontal or vertical asymptotes. The function has two critical numbers ($x = 0$ and $x = 8$) and two possible points of inflection ($x = 0$ and $x = 1$). The domain is all real numbers. The analysis of the graph of f is shown in the table, and the graph is shown in Figure 3.50.

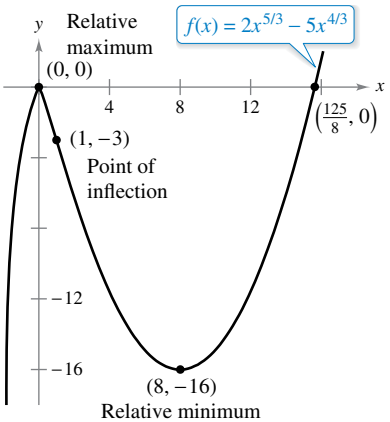

Figure 3.50

	$f(x)$	$f'(x)$	$f''(x)$	Characteristic of Graph
$-\infty < x < 0$		+	−	Increasing, concave downward
$x = 0$	0	0	Undef.	Relative maximum
$0 < x < 1$		−	−	Decreasing, concave downward
$x = 1$	−3	−	0	Point of inflection
$1 < x < 8$		−	+	Decreasing, concave upward
$x = 8$	−16	0	+	Relative minimum
$8 < x < \infty$		+	+	Increasing, concave upward

EXAMPLE 5 Sketching the Graph of a Polynomial Function

See LarsonCalculus.com for an interactive version of this type of example.

Analyze and sketch the graph of

$$f(x) = x^4 - 12x^3 + 48x^2 - 64x.$$

Solution Begin by factoring to obtain

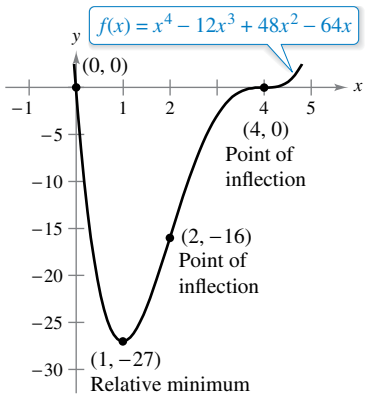
$$f(x) = x(x^3 - 12x^2 + 48x - 64) \quad \text{Factor out common factor.}$$
$$= x(x - 4)^3. \quad \text{Factored form}$$

Then, use the factored form of $f(x)$ to perform the analysis below.

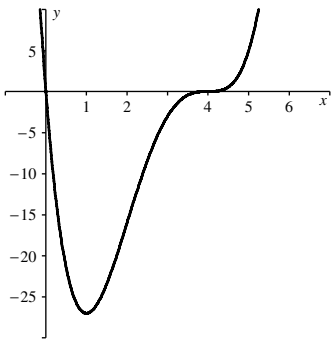
Domain:	All real numbers
Range:	$[-27, \infty)$
x-intercepts:	$(0, 0), (4, 0)$
y-intercept:	$(0, 0)$
Vertical asymptotes:	None
Horizontal asymptotes:	None
Symmetry:	None
End behavior:	$\lim_{x\to-\infty} f(x) = \infty, \lim_{x\to\infty} f(x) = \infty$
First derivative:	$f'(x) = 4(x - 1)(x - 4)^2$
Second derivative:	$f''(x) = 12(x - 4)(x - 2)$
Critical numbers:	$x = 1, x = 4$
Possible points of inflection:	$x = 2, x = 4$
Test intervals:	$(-\infty, 1), (1, 2), (2, 4), (4, \infty)$

The analysis of the graph of f is shown in the table, and the graph is shown in Figure 3.51(a). Use a graphing utility to check your work, as shown in Figure 3.51(b).

	$f(x)$	$f'(x)$	$f''(x)$	Characteristic of Graph
$-\infty < x < 1$		$-$	$+$	Decreasing, concave upward
$x = 1$	-27	0	$+$	Relative minimum
$1 < x < 2$		$+$	$+$	Increasing, concave upward
$x = 2$	-16	$+$	0	Point of inflection
$2 < x < 4$		$+$	$-$	Increasing, concave downward
$x = 4$	0	0	0	Point of inflection
$4 < x < \infty$		$+$	$+$	Increasing, concave upward



(a)
A polynomial function of even degree must have at least one relative extremum.



(b)
From the result shown by *Maple*, the sketch in Figure 3.51(a) appears to be correct.

Figure 3.51

The fourth-degree polynomial function in Example 5 has one relative minimum and no relative maxima. In general, a polynomial function of degree n can have *at most* $n - 1$ relative extrema and *at most* $n - 2$ points of inflection. Moreover, polynomial functions of even degree must have *at least* one relative extremum.

Remember from the Leading Coefficient Test described in Section P.3 that the "end behavior" of the graph of a polynomial function is determined by its leading coefficient and its degree. For instance, because the polynomial in Example 5 has a positive leading coefficient, the graph rises to the right. Moreover, because the degree is even, the graph also rises to the left.

EXAMPLE 6 A Function Involving Sine and Cosine

Analyze and sketch the graph of $f(x) = (\cos x)/(1 + \sin x)$.

Solution Because the function has a period of 2π, you can restrict the analysis of the graph to any interval of length 2π. For convenience, choose $[-\pi/2, 3\pi/2]$.

Domain:	All real numbers except $x = \frac{3 + 4n}{2}\pi$
Range:	All real numbers
Period:	2π
x-intercept:	$\left(\frac{\pi}{2}, 0\right)$
y-intercept:	$(0, 1)$
Vertical asymptotes:	$x = -\frac{\pi}{2}, x = \frac{3\pi}{2}$
Horizontal asymptotes:	None
Symmetry:	None
First derivative:	$f'(x) = -\frac{1}{1 + \sin x}$
Second derivative:	$f''(x) = \frac{\cos x}{(1 + \sin x)^2}$
Critical numbers:	None
Possible point of inflection:	$x = \frac{\pi}{2}$
Test intervals:	$\left(-\frac{\pi}{2}, \frac{\pi}{2}\right), \left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$

See Remark below.

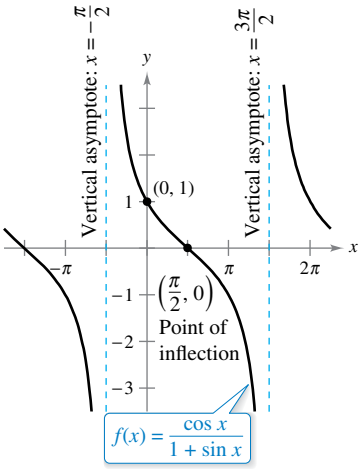

Figure 3.52

The analysis of the graph of f on the interval $[-\pi/2, 3\pi/2]$ is shown in the table, and the graph is shown in Figure 3.52.

	$f(x)$	$f'(x)$	$f''(x)$	Characteristic of Graph
$x = -\frac{\pi}{2}$	Undef.	Undef.	Undef.	Vertical asymptote
$-\frac{\pi}{2} < x < \frac{\pi}{2}$		$-$	$+$	Decreasing, concave upward
$x = \frac{\pi}{2}$	0	$-$	0	Point of inflection
$\frac{\pi}{2} < x < \frac{3\pi}{2}$		$-$	$-$	Decreasing, concave downward
$x = \frac{3\pi}{2}$	Undef.	Undef.	Undef.	Vertical asymptote

REMARK In Example 6, substituting $-\pi/2$ or $3\pi/2$ into f yields the indeterminate form $0/0$, which you will study in Section 5.6. To determine that f has vertical asymptotes at these two values, rewrite f as

$$f(x) = \frac{\cos x}{1 + \sin x} = \frac{(\cos x)(1 - \sin x)}{(1 + \sin x)(1 - \sin x)} = \frac{(\cos x)(1 - \sin x)}{\cos^2 x} = \frac{1 - \sin x}{\cos x}.$$

Next, use Theorem 1.14 to conclude that the graph of f has vertical asymptotes at $x = -\pi/2$ and $3\pi/2$.

3.6 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

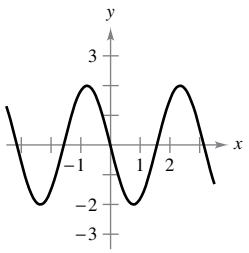
GO DIGITAL

Concept Check

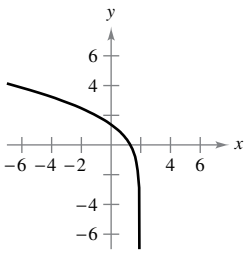
1. Explain the guidelines for analyzing the graph of a function.
2. Explain how to create a table to determine characteristics of a graph. What elements are included?
3. Describe the type of function that can have a slant asymptote. Explain how to determine the equation of a slant asymptote.
4. A fifth-degree polynomial can have a maximum of how many relative extrema and points of inflection? Explain.

Matching **In Exercises 5–8, match the graph of the function with the graph of its derivative. [The graphs of the derivatives are labeled (a), (b), (c), and (d).]**

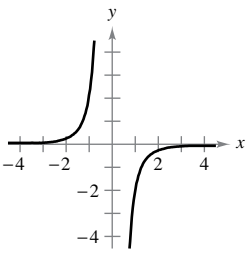
(a)



(b)



(c)



(d)

Analyzing the Graph of a Function **In Exercises 9–36, analyze and sketch a graph of the function. Label any intercepts, relative extrema, points of inflection, and asymptotes. Use a graphing utility to verify your results.**

9. $y = \frac{1}{x-2} - 3$
10. $y = \frac{x}{x^2+1}$
11. $y = \frac{x}{1-x}$
12. $y = \frac{x-4}{x-3}$
13. $y = \frac{x+1}{x^2-4}$
14. $y = \frac{2x}{9-x^2}$
15. $y = \frac{x^2}{x^2+3}$
16. $y = \frac{x^2+1}{x^2-4}$
17. $y = 3 + \frac{2}{x}$
18. $f(x) = \frac{x-3}{x}$
19. $f(x) = x + \frac{32}{x^2}$
20. $y = \frac{4}{x^2} + 1$
21. $y = \frac{3x}{x^2-1}$
22. $f(x) = \frac{x^3}{x^2-9}$
23. $y = \frac{x^2-6x+12}{x-4}$
24. $y = \frac{-x^2-4x-7}{x+3}$
25. $y = \frac{x^3}{\sqrt{x^2-4}}$
26. $y = \frac{x}{\sqrt{x^2-4}}$
27. $y = x\sqrt{4-x}$
28. $g(x) = x\sqrt{9-x^2}$
29. $y = 3x^{2/3} - 2x$
30. $y = (x+1)^2 - 3(x+1)^{2/3}$
31. $y = 2 - x - x^3$
32. $y = -\frac{1}{3}(x^3 - 3x + 2)$
33. $y = 3x^4 + 4x^3$
34. $y = -2x^4 + 3x^2$
35. $xy^2 = 9$
36. $x^2y = 9$

Analyzing the Graph of a Function **In Exercises 37–44, analyze and sketch a graph of the function over the given interval. Label any intercepts, relative extrema, points of inflection, and asymptotes. Use a graphing utility to verify your results.**

Function	Interval
37. $f(x) = 2x - 4\sin x$	$0 \le x \le 2\pi$
38. $f(x) = -x + 2\cos x$	$0 \le x \le 2\pi$
39. $y = \sin x - \frac{1}{18}\sin 3x$	$0 \le x \le 2\pi$
40. $y = 2(x-2) + \cot x$	$0 < x < \pi$
41. $y = 2(\csc x + \sec x)$	$0 < x < \frac{\pi}{2}$
42. $y = \sec^2\frac{\pi x}{8} - 2\tan\frac{\pi x}{8} - 1$	$-3 < x < 3$
43. $g(x) = x\tan x$	$-\frac{3\pi}{2} < x < \frac{3\pi}{2}$
44. $g(x) = x\cot x$	$-2\pi < x < 2\pi$

Analyzing the Graph of a Function Using Technology

In Exercises 45–50, use a computer algebra system to analyze and graph the function. Identify any relative extrema, points of inflection, and asymptotes.

45. $f(x) = \dfrac{20x}{x^2 + 1} - \dfrac{1}{x}$

46. $f(x) = x + \dfrac{4}{x^2 + 1}$

47. $f(x) = \dfrac{-2x}{\sqrt{x^2 + 7}}$

48. $f(x) = \dfrac{4x}{\sqrt{x^2 + 15}}$

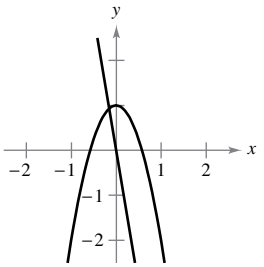
49. $y = \cos x - \frac{1}{4}\cos 2x, \quad 0 \le x \le 2\pi$

50. $y = 2x - \tan x, \quad -\dfrac{\pi}{2} < x < \dfrac{\pi}{2}$

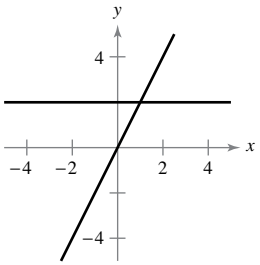
Identifying Graphs

In Exercises 51 and 52, the graphs of f' and f'' are shown on the same set of coordinate axes. Identify each graph, and then sketch the graph of f. Explain your reasoning. To print an enlarged copy of the graph, go to *MathGraphs.com*.

51.



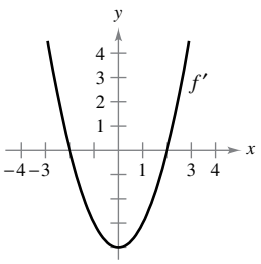
52.



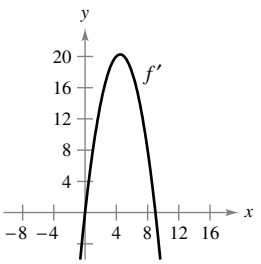
Graphical Reasoning

In Exercises 53–56, use the graph of f' to sketch a graph of f and the graph of f''. To print an enlarged copy of the graph, go to *MathGraphs.com*.

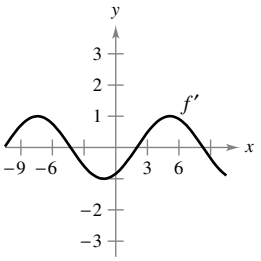
53.



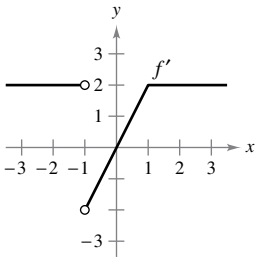
54.



55.



56.



(Submitted by Bill Fox, Moberly Area Community College, Moberly, MO)

Graphical Reasoning

57. Consider the function

$$f(x) = \frac{\cos^2 \pi x}{\sqrt{x^2 + 1}}, \quad 0 < x < 4.$$

(a) Use a computer algebra system to graph the function and use the graph to approximate the critical numbers visually.

(b) Use a computer algebra system to find f' and approximate the critical numbers. Are the results the same as the visual approximation in part (a)? Explain.

Graphical Reasoning

58. Consider the function

$$f(x) = \tan(\sin \pi x).$$

(a) Use a graphing utility to graph the function.

(b) Identify any symmetry of the graph.

(c) Is the function periodic? If so, what is the period?

(d) Identify any extrema on $(-1, 1)$.

(e) Use a graphing utility to determine the concavity of the graph on $(0, 1)$.

Exploring Concepts

59. Sketch a graph of a differentiable function f that satisfies the following conditions and has $x = 2$ as its only critical number.

$f'(x) < 0$ for $x < 2$

$f'(x) > 0$ for $x > 2$

$\lim_{x \to -\infty} f(x) = 6$

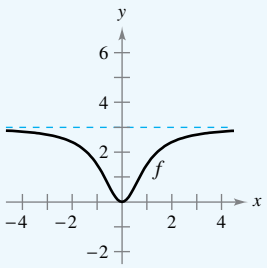
$\lim_{x \to \infty} f(x) = 6$

60. Is it possible to sketch a graph of a function that satisfies the conditions of Exercise 59 and has *no* points of inflection? Explain.

61. Let $f'(t) < 0$ for all t in the interval $(2, 8)$. Explain why $f(3) > f(5)$.

62. Let $f(0) = 3$ and $2 \le f'(x) \le 4$ for all x in the interval $[-5, 5]$. Determine the greatest and least possible values of $f(2)$.

63. The graph of a function f is shown below. To print an enlarged copy of the graph, go to *MathGraphs.com*.



(a) Sketch f'.

(b) Use the graph to estimate $\lim_{x \to \infty} f(x)$ and $\lim_{x \to \infty} f'(x)$.

(c) Explain the answers you gave in part (b).

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

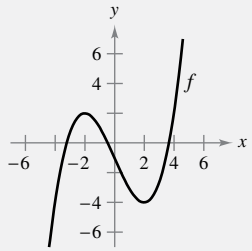
64. HOW DO YOU SEE IT? The graph of f is shown in the figure.



(a) For which values of x is $f'(x)$ zero? Positive? Negative? What do these values mean?

(b) For which values of x is $f''(x)$ zero? Positive? Negative? What do these values mean?

(c) On what open interval is f' an increasing function?

(d) For which value of x is $f'(x)$ minimum? For this value of x, how does the rate of change of f compare with the rates of change of f for other values of x? Explain.

Horizontal and Vertical Asymptotes **In Exercises 65–68, use a graphing utility to graph the function. Use the graph to determine whether it is possible for the graph of a function to cross its horizontal asymptote. Do you think it is possible for the graph of a function to cross its vertical asymptote? Why or why not?**

65. $f(x) = \dfrac{4(x-1)^2}{x^2-4x+5}$

66. $g(x) = \dfrac{3x^4-5x+3}{x^4+1}$

67. $h(x) = \dfrac{\sin 2x}{x}$

68. $f(x) = \dfrac{\cos 3x}{4x}$

Examining a Function **In Exercises 69 and 70, use a graphing utility to graph the function. Explain why there is no vertical asymptote when a superficial examination of the function may indicate that there should be one.**

69. $h(x) = \dfrac{6-2x}{3-x}$

70. $g(x) = \dfrac{x^2+x-2}{x-1}$

Slant Asymptote **In Exercises 71–76, use a graphing utility to graph the function and determine the slant asymptote of the graph analytically. Zoom out repeatedly and describe how the graph on the display appears to change. Why does this occur?**

71. $f(x) = -\dfrac{x^2-3x-1}{x-2}$

72. $g(x) = \dfrac{2x^2-8x-15}{x-5}$

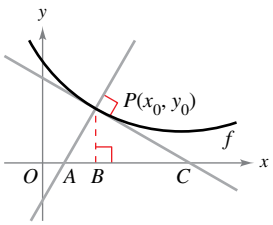
73. $f(x) = \dfrac{2x^3}{x^2+1}$

74. $h(x) = \dfrac{-x^3+x^2+4}{x^2}$

75. $f(x) = \dfrac{x^3-3x^2+2}{x(x-3)}$

76. $f(x) = -\dfrac{x^3-2x^2+2}{2x^2}$

77. Investigation Let $P(x_0, y_0)$ be an arbitrary point on the graph of f that $f'(x_0) \neq 0$, as shown in the figure. Verify each statement.



(a) The x-intercept of the tangent line is

$$\left(x_0 - \frac{f(x_0)}{f'(x_0)}, 0\right).$$

(b) The y-intercept of the tangent line is

$$(0, f(x_0) - x_0 f'(x_0)).$$

(c) The x-intercept of the normal line is

$$(x_0 + f(x_0)f'(x_0), 0).$$

(The *normal line* at a point is perpendicular to the tangent line at the point.)

(d) The y-intercept of the normal line is

$$\left(0, y_0 + \frac{x_0}{f'(x_0)}\right).$$

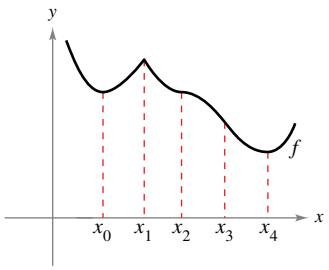
(e) $|BC| = \left|\dfrac{f(x_0)}{f'(x_0)}\right|$

(f) $|PC| = \left|\dfrac{f(x_0)\sqrt{1+[f'(x_0)]^2}}{f'(x_0)}\right|$

(g) $|AB| = |f(x_0)f'(x_0)|$

(h) $|AP| = |f(x_0)|\sqrt{1+[f'(x_0)]^2}$

78. Graphical Reasoning Identify the real numbers x_0, x_1, x_2, x_3, and x_4 in the figure such that each of the following is true.



(a) $f'(x) = 0$

(b) $f''(x) = 0$

(c) $f'(x)$ does not exist.

(d) f has a relative maximum.

(e) f has a point of inflection.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Think About It **In Exercises 79–82, create a function whose graph has the given characteristics. (There is more than one correct answer.)**

79. Vertical asymptote: $x = 3$

Horizontal asymptote: $y = 0$

80. Vertical asymptote: $x = -5$

Horizontal asymptote: None

81. Vertical asymptote: $x = 3$

Slant asymptote: $y = 3x + 2$

82. Vertical asymptote: $x = 2$

Slant asymptote: $y = -x$

True or False? **In Exercises 83–86, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

83. If $f'(x) > 0$ for all real numbers x, then f increases without bound.

84. If $f''(x) < 0$ for all real numbers x, then f decreases without bound.

85. Every rational function has a slant asymptote.

86. Every polynomial function has an absolute maximum and an absolute minimum on $(-\infty, \infty)$.

87. Graphical Reasoning The graph of the first derivative of a function f on the interval $[-7, 5]$ is shown. Use the graph to answer each question.

(a) On what interval(s) is f decreasing?

(b) On what interval(s) is the graph of f concave downward?

(c) At what x-value(s) does f have relative extrema?

(d) At what x-value(s) does the graph of f have a point of inflection?

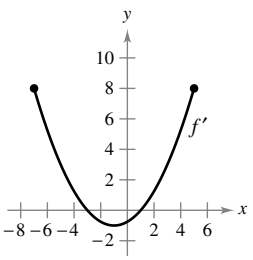

Figure for 87

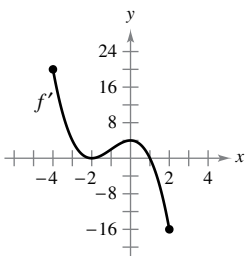

Figure for 88

88. Graphical Reasoning The graph of the first derivative of a function f on the interval $[-4, 2]$ is shown. Use the graph to answer each question.

(a) On what interval(s) is f increasing?

(b) On what interval(s) is the graph of f concave upward?

(c) At what x-value(s) does f have relative extrema?

(d) At what x-value(s) does the graph of f have a point of inflection?

89. Graphical Reasoning Consider the function

$$f(x) = \frac{ax}{(x - b)^2}.$$

Determine the effect on the graph of f as a and b are changed. Consider cases where a and b are both positive or both negative and cases where a and b have opposite signs.

90. Graphical Reasoning Consider the function

$$f(x) = \frac{1}{2}(ax)^2 - ax, \quad a \neq 0.$$

(a) Determine the changes (if any) in the intercepts, extrema, and concavity of the graph of f when a is varied.

(b) In the same viewing window, use a graphing utility to graph the function for four different values of a.

Slant Asymptotes **In Exercises 91 and 92, the graph of the function has two slant asymptotes. Identify each slant asymptote. Then graph the function and its asymptotes.**

91. $y = \sqrt{4 + 16x^2}$ **92.** $y = \sqrt{x^2 + 6x}$

93. Investigation Consider the function

$$f(x) = \frac{2x^n}{x^4 + 1}$$

for nonnegative integer values of n.

(a) Discuss the relationship between the value of n and the symmetry of the graph.

(b) For which values of n will the x-axis be the horizontal asymptote?

(c) For which value of n will $y = 2$ be the horizontal asymptote?

(d) What is the asymptote of the graph when $n = 5$?

(e) Use a graphing utility to graph f for the indicated values of n in the table. Use the graph to determine the number of extrema M and the number of inflection points N of the graph.

n	0	1	2	3	4	5
M						
N						

PUTNAM EXAM CHALLENGE

94. Let $f(x)$ be defined for $a \leq x \leq b$. Assuming appropriate properties of continuity and derivability, prove for $a < x < b$ that

$$\frac{\dfrac{f(x) - f(a)}{x - a} - \dfrac{f(b) - f(a)}{b - a}}{x - b} = \frac{1}{2}f''(\varepsilon),$$

where ε is some number between a and b.

This problem was composed by the Committee on the Putnam Prize Competition.

3.7 Optimization Problems

GO DIGITAL

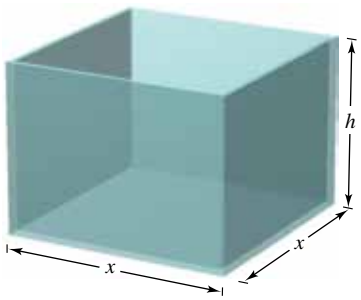
Solve applied minimum and maximum problems.

Applied Minimum and Maximum Problems

One of the most common applications of calculus involves determining minimum and maximum values. Consider how frequently you hear or read terms such as greatest profit, least cost, least time, greatest voltage, optimum size, least size, greatest strength, and greatest distance. Before outlining a general problem-solving strategy for such problems, consider the next example.

EXAMPLE 1 Finding Maximum Volume

A manufacturer wants to design an open box having a square base and a surface area of 108 square inches, as shown in Figure 3.53. What dimensions will produce a box with maximum volume?



Open box with square base:
$S = x^2 + 4xh = 108$
Figure 3.53

Solution Because the box has a square base, its volume is

$$V = x^2h. \qquad \text{Primary equation}$$

This equation is called the **primary equation** because it gives a formula for the quantity to be optimized. Because V is to be maximized, you want to write V as a function of one variable. To do this, note that the surface area of the box is

$$S = (\text{area of base}) + (\text{area of four sides})$$
$$108 = x^2 + 4xh. \qquad \text{Secondary equation}$$

Next, solve this equation for h to obtain $h = (108 - x^2)/(4x)$. Substituting into the primary equation produces

$$V = x^2h \qquad \text{Function of two variables}$$
$$= x^2\left(\frac{108 - x^2}{4x}\right) \qquad \text{Substitute for } h.$$
$$= 27x - \frac{x^3}{4}. \qquad \text{Function of one variable}$$

Before finding which x-value will yield a maximum value of V, you should determine the *feasible domain*. That is, what values of x make sense in this problem? You know that $V \geq 0$. You also know that x must be nonnegative and that the area of the base $(A = x^2)$ is at most 108. So, the feasible domain is

$$0 \leq x \leq \sqrt{108}. \qquad \text{Feasible domain}$$

To maximize V, find its critical numbers on the interval $\left(0, \sqrt{108}\right)$.

$$\frac{dV}{dx} = 27 - \frac{3x^2}{4} \qquad \text{Differentiate with respect to } x.$$
$$27 - \frac{3x^2}{4} = 0 \qquad \text{Set derivative equal to 0.}$$
$$3x^2 = 108 \qquad \text{Simplify.}$$
$$x = \pm 6 \qquad \text{Critical numbers}$$

So, the critical numbers are $x = \pm 6$. You do not need to consider $x = -6$ because it is outside the domain. Evaluating V at the critical number $x = 6$ and at the endpoints of the domain produces $V(0) = 0$, $V(6) = 108$, and $V\left(\sqrt{108}\right) = 0$. So, V is maximum when $x = 6$, and the dimensions of the box are 6 inches by 6 inches by 3 inches. ■

TECHNOLOGY To check the solution to Example 1 on a graphing utility, graph the volume function

$$V = 27x - \frac{x^3}{4}.$$

Use a viewing window with $0 \leq x \leq \sqrt{108} \approx 10.4$ and $0 \leq y \leq 120$. Then use the *maximum* or *trace* feature to determine the x-value that produces a maximum volume.

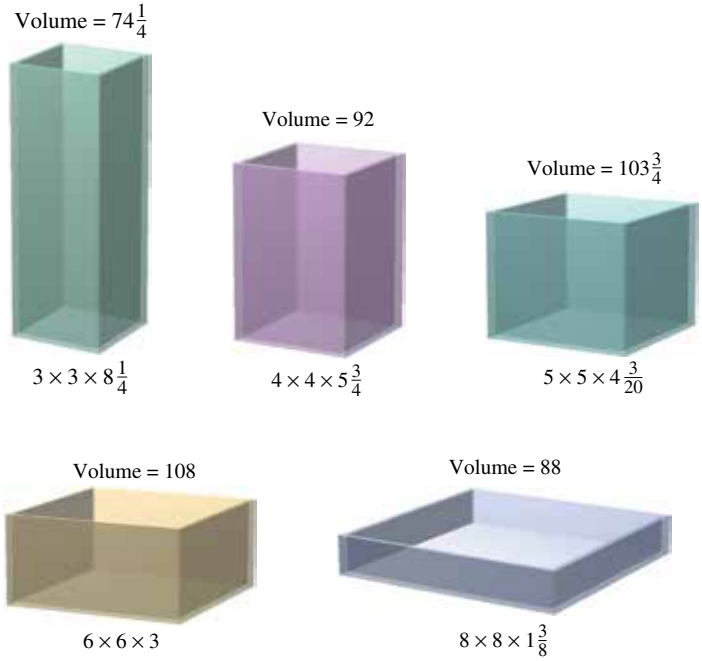
GO DIGITAL

In Example 1, you should realize that there are infinitely many open boxes having 108 square inches of surface area. To begin solving the problem, you might ask yourself which basic shape would seem to yield a maximum volume. Should the box be tall, squat, or nearly cubical?

You might even try calculating a few volumes, as shown in Figure 3.54, to determine whether you can get a better feeling for what the optimum dimensions should be. Remember that you are not ready to begin solving a problem until you have clearly identified what the problem is.



Volume = $74\frac{1}{4}$
$3 \times 3 \times 8\frac{1}{4}$
Volume = 92
$4 \times 4 \times 5\frac{3}{4}$
Volume = $103\frac{3}{4}$
$5 \times 5 \times 4\frac{3}{20}$
Volume = 108
$6 \times 6 \times 3$
Volume = 88
$8 \times 8 \times 1\frac{3}{8}$

Which box has the greatest volume?

Figure 3.54

Example 1 illustrates the following guidelines for solving applied minimum and maximum problems.

Guidelines for Solving Applied Minimum and Maximum Problems

1. Identify all *given* quantities and all quantities *to be determined*. If possible, make a sketch.
2. Write a **primary equation** for the quantity that is to be maximized or minimized. (Several useful formulas from geometry are listed on the formula cards for this text.)
3. Reduce the primary equation to one having a *single independent variable*. This may involve the use of **secondary equations** relating the independent variables of the primary equation.
4. Determine the feasible domain of the primary equation. That is, determine the values for which the stated problem makes sense.
5. Determine the desired maximum or minimum value by the calculus techniques discussed in Sections 3.1 through 3.4.

REMARK For Step 5, recall that to determine the maximum or minimum value of a continuous function f on a closed interval, you should compare the values of f at its critical numbers with the values of f at the endpoints of the interval.

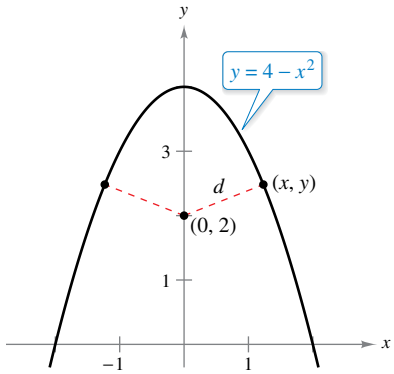
GO DIGITAL



The quantity to be minimized is distance: $d = \sqrt{(x - 0)^2 + (y - 2)^2}$.

Figure 3.55

EXAMPLE 2 Finding Minimum Distance

See LarsonCalculus.com for an interactive version of this type of example.

Which points on the graph of $y = 4 - x^2$ are closest to the point $(0, 2)$?

Solution Figure 3.55 shows that there are two points at a minimum distance from the point $(0, 2)$. The distance between the point $(0, 2)$ and a point (x, y) on the graph of $y = 4 - x^2$ is

$$d = \sqrt{(x - 0)^2 + (y - 2)^2}. \qquad \text{Primary equation}$$

Using the secondary equation $y = 4 - x^2$, rewrite the primary equation as

$$d = \sqrt{x^2 + (4 - x^2 - 2)^2} \qquad \text{Substitute } 4 - x^2 \text{ for } y.$$

$$= \sqrt{x^4 - 3x^2 + 4}. \qquad \text{Simplify.}$$

Because d is smallest when the expression inside the radical is smallest, you need only find the critical numbers of $f(x) = x^4 - 3x^2 + 4$. Note that the domain of f is the entire real number line. So, there are no endpoints of the domain to consider. Moreover, the derivative of f

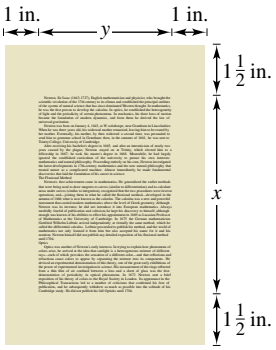
$$f'(x) = 4x^3 - 6x \qquad \text{Differentiate with respect to } x.$$

$$= 2x(2x^2 - 3) \qquad \text{Factor.}$$

is zero when

$$x = 0, \quad \sqrt{\frac{3}{2}}, \quad \text{and} \quad -\sqrt{\frac{3}{2}}. \qquad \text{Zeros of } f'$$

Testing these critical numbers using the First Derivative Test verifies that $x = 0$ yields a relative maximum, whereas both $x = \sqrt{3/2}$ and $x = -\sqrt{3/2}$ yield a minimum distance. So, the closest points are $\left(\sqrt{3/2}, 5/2\right)$ and $\left(-\sqrt{3/2}, 5/2\right)$.



The quantity to be minimized is area: $A = (x + 3)(y + 2)$.

Figure 3.56

EXAMPLE 3 Finding Minimum Area

A rectangular page is to contain 24 square inches of print. The margins at the top and bottom of the page are to be $1\frac{1}{2}$ inches, and the margins on the left and right are to be 1 inch (see Figure 3.56). What should the dimensions of the page be so that the least amount of paper is used?

Solution Let A be the area to be minimized.

$$A = (x + 3)(y + 2) \qquad \text{Primary equation}$$

The printed area inside the margins is

$$24 = xy. \qquad \text{Secondary equation}$$

Solving this equation for y produces $y = 24/x$. Substituting $24/x$ for y in the primary equation produces

$$A = (x + 3)\left(\frac{24}{x} + 2\right) = 30 + 2x + \frac{72}{x}. \qquad \text{Function of one variable}$$

Because x must be positive, you are interested only in values of A for $x > 0$. To find the critical numbers, differentiate with respect to x

$$\frac{dA}{dx} = 2 - \frac{72}{x^2} \qquad \text{Differentiate with respect to } x.$$

and note that the derivative is zero when $x^2 = 36$, or $x = \pm 6$. So, the critical numbers are $x = \pm 6$. You do not have to consider $x = -6$ because it is outside the domain. The First Derivative Test confirms that A is a minimum when $x = 6$. So, $y = \frac{24}{6} = 4$ and the dimensions of the page should be $x + 3 = 9$ inches by $y + 2 = 6$ inches. ■

EXAMPLE 4 Finding Minimum Length

Two posts, one 12 feet high and the other 28 feet high, stand 30 feet apart. They are to be stayed by two wires, attached to a single stake, running from ground level to the top of each post. Where should the stake be placed to use the least amount of wire?

Solution Let W be the wire length to be minimized. Using Figure 3.57, you can write

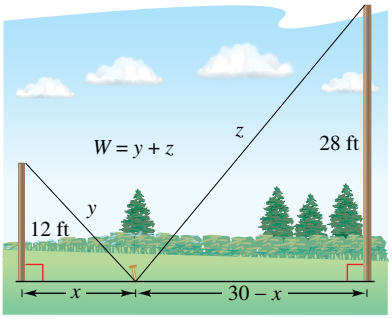
$$W = y + z. \qquad \text{Primary equation}$$

In this problem, rather than solving for y in terms of z (or vice versa), you can solve for both y and z in terms of a third variable x, as shown in Figure 3.57. From the Pythagorean Theorem, you obtain

$$x^2 + 12^2 = y^2$$
$$(30 - x)^2 + 28^2 = z^2$$

which implies that

$$y = \sqrt{x^2 + 144}$$
$$z = \sqrt{x^2 - 60x + 1684}.$$



The quantity to be minimized is length. From the diagram, you can see that x varies between 0 and 30.

Figure 3.57

So, you can rewrite the primary equation as

$$W = y + z$$
$$= \sqrt{x^2 + 144} + \sqrt{x^2 - 60x + 1684}, \quad 0 \le x \le 30.$$

Differentiating W with respect to x yields

$$\frac{dW}{dx} = \frac{x}{\sqrt{x^2 + 144}} + \frac{x - 30}{\sqrt{x^2 - 60x + 1684}}.$$

By letting $dW/dx = 0$, you obtain

$$\frac{x}{\sqrt{x^2 + 144}} + \frac{x - 30}{\sqrt{x^2 - 60x + 1684}} = 0$$
$$\frac{x}{\sqrt{x^2 + 144}} = \frac{30 - x}{\sqrt{x^2 - 60x + 1684}}$$
$$x\sqrt{x^2 - 60x + 1684} = (30 - x)\sqrt{x^2 + 144}$$
$$x^2(x^2 - 60x + 1684) = (30 - x)^2(x^2 + 144)$$
$$x^4 - 60x^3 + 1684x^2 = x^4 - 60x^3 + 1044x^2 - 8640x + 129{,}600$$
$$640x^2 + 8640x - 129{,}600 = 0$$
$$320(x - 9)(2x + 45) = 0$$
$$x = 9, -22.5.$$

Because $x = -22.5$ is not in the domain and

$$W(0) \approx 53.04, \quad W(9) = 50, \quad \text{and} \quad W(30) \approx 60.31$$

you can conclude that the wires should be staked at 9 feet from the 12-foot pole. ■

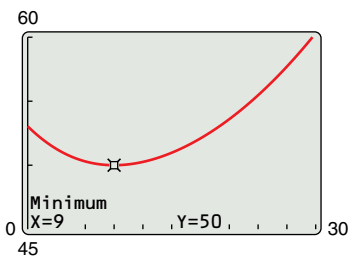


Figure 3.58

TECHNOLOGY From Example 4, you can see that applied optimization problems can involve a lot of algebra. Use a graphing utility to support the conclusion that $x = 9$ yields a minimum value of W by graphing

$$W = \sqrt{x^2 + 144} + \sqrt{x^2 - 60x + 1684}$$

as shown in Figure 3.58.

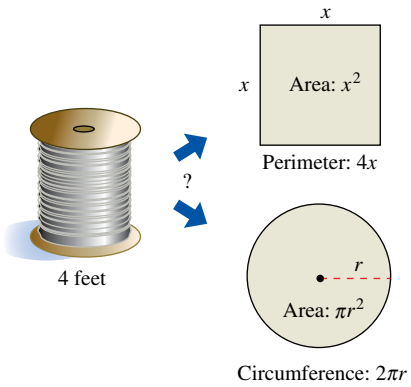
GO DIGITAL

In each of the first four examples, the extreme value occurred at a critical number. Although this happens often, remember that an extreme value can also occur at an endpoint of an interval, as shown in Example 5.

EXAMPLE 5 An Endpoint Maximum

Four feet of wire is to be used to form a square and a circle. How much of the wire should be used for the square and how much should be used for the circle to enclose the maximum total area?



The quantity to be maximized is area: $A = x^2 + \pi r^2$.

Figure 3.59

Solution The total area (see Figure 3.59) is

$$A = (\text{area of square}) + (\text{area of circle})$$

$$A = x^2 + \pi r^2. \qquad \text{Primary equation}$$

Because the total length of wire is 4 feet, you obtain

$$4 = (\text{perimeter of square}) + (\text{circumference of circle})$$

$$4 = 4x + 2\pi r. \qquad \text{Secondary equation}$$

So, $r = 2(1 - x)/\pi$, and by substituting into the primary equation you have

$$A = x^2 + \pi\left[\frac{2(1 - x)}{\pi}\right]^2$$

$$= x^2 + \frac{4(1 - x)^2}{\pi}$$

$$= \frac{1}{\pi}(\pi x^2 + 4 - 8x + 4x^2)$$

$$= \frac{1}{\pi}[(\pi + 4)x^2 - 8x + 4].$$

The feasible domain is $0 \le x \le 1$, restricted by the square's perimeter. Because

$$\frac{dA}{dx} = \frac{2(\pi + 4)x - 8}{\pi}$$

the only critical number in $(0, 1)$ is $x = 4/(\pi + 4) \approx 0.56$. So, using

$$A(0) \approx 1.27, \quad A(0.56) \approx 0.56, \quad \text{and} \quad A(1) = 1$$

you can conclude that the maximum area occurs when $x = 0$. That is, *all* the wire is used for the circle. ■

Exploration

What would the answer be if Example 5 asked for the dimensions needed to enclose the *minimum* total area?

Before doing the section exercises, review the primary equations developed in Examples 1–5. The applications in these five examples are fairly simple, and yet the resulting primary equations are quite complicated.

$$V = 27x - \frac{x^3}{4} \qquad \text{Example 1}$$

$$d = \sqrt{x^4 - 3x^2 + 4} \qquad \text{Example 2}$$

$$A = 30 + 2x + \frac{72}{x} \qquad \text{Example 3}$$

$$W = \sqrt{x^2 + 144} + \sqrt{x^2 - 60x + 1684} \qquad \text{Example 4}$$

$$A = \frac{1}{\pi}[(\pi + 4)x^2 - 8x + 4] \qquad \text{Example 5}$$

You must expect that real-life applications often involve equations that are *at least as complicated* as these five. Remember that one of the main goals of this course is to learn to use calculus to analyze equations that initially seem formidable.

3.7 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Define *primary equation*, *secondary equation*, and *feasible domain*.
2. Describe the guidelines for solving applied minimum and maximum problems.

3. Numerical, Graphical, and Analytic Analysis Use the steps below to find two positive numbers whose sum is 110 and whose product is a maximum.

(a) Analytically complete six rows of a table such as the one below. (The first two rows are shown.) Use the table to guess the maximum product.

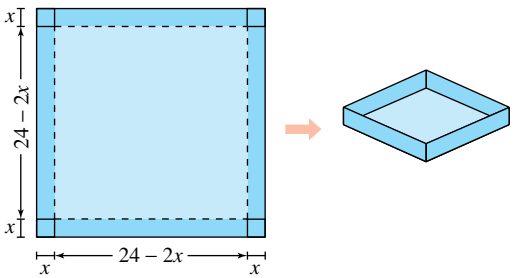
First Number, x	Second Number	Product, P
10	$110 - 10$	$10(110 - 10) = 1000$
20	$110 - 20$	$20(110 - 20) = 1800$

(b) Write the product P as a function of x.

(c) Use calculus to find the critical number of the function in part (b). Then find the first and second numbers.

(d) Use a graphing utility to graph the function in part (b) and verify the solution from the graph.

4. Numerical, Graphical, and Analytic Analysis An open box of maximum volume is to be made from a square piece of material, 24 inches on a side, by cutting equal squares from the corners and turning up the sides (see figure).



(a) Analytically complete six rows of a table such as the one below. (The first two rows are shown.) Use the table to guess the maximum volume.

Height, x	Length and Width	Volume, V
1	$24 - 2(1)$	$1[24 - 2(1)]^2 = 484$
2	$24 - 2(2)$	$2[24 - 2(2)]^2 = 800$

(b) Write the volume V as a function of x.

(c) Use calculus to find the critical number of the function in part (b). Then find the maximum volume.

(d) Use a graphing utility to graph the function in part (b) and verify the maximum volume from the graph.

Finding Numbers **In Exercises 5–10, find two positive numbers that satisfy the given requirements.**

5. The sum is S and the product is a maximum.
6. The product is 185 and the sum is a minimum.
7. The product is 147 and the sum of the first number plus three times the second number is a minimum.
8. The sum of the first number squared and the second number is 54 and the product is a maximum.
9. The sum of the first number and twice the second number is 108 and the product is a maximum.
10. The sum of the first number cubed and the second number is 500 and the product is a maximum.

Maximum Area **In Exercises 11 and 12, find the length and width of a rectangle that has the given perimeter and a maximum area.**

11. Perimeter: 80 meters
12. Perimeter: P units

Minimum Perimeter **In Exercises 13 and 14, find the length and width of a rectangle that has the given area and a minimum perimeter.**

13. Area: 49 square feet
14. Area: A square centimeters

Minimum Distance **In Exercises 15–18, find the points on the graph of the function that are closest to the given point.**

15. $y = x^2$, $(0, 3)$
16. $y = x^2 - 2$, $(0, -1)$
17. $f(x) = \sqrt{x}$, $(4, 0)$
18. $f(x) = \sqrt{x - 8}$, $(12, 0)$

19. **Minimum Area** A rectangular poster is to contain 648 square inches of print. The margins at the top and bottom of the poster are to be 2 inches, and the margins on the left and right are to be 1 inch. What should the dimensions of the poster be so that the least amount of poster is used?
20. **Minimum Area** A rectangular page is to contain 36 square inches of print. The margins on each side are to be $1\frac{1}{2}$ inches. Find the dimensions of the page such that the least amount of paper is used.
21. **Minimum Length** A farmer plans to fence a rectangular pasture adjacent to a river (see figure). The pasture must contain 405,000 square meters in order to provide enough grass for the herd. No fencing is needed along the river. What dimensions will require the least amount of fencing?

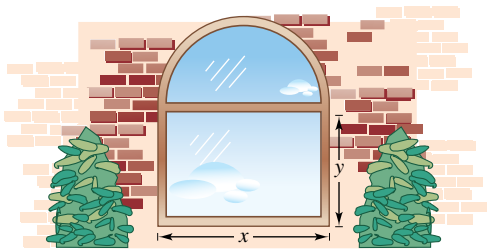
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

22. Maximum Volume A rectangular solid (with a square base) has a surface area of 337.5 square centimeters. Find the dimensions that will result in a solid with maximum volume.

23. Maximum Area A Norman window is constructed by adjoining a semicircle to the top of an ordinary rectangular window (see figure). Find the dimensions of a Norman window of maximum area when the total perimeter is 16 feet.



24. Maximum Area A rectangle is bounded by the x- and y-axes and the graph of $y = (6 - x)/2$ (see figure). What length and width should the rectangle have so that its area is a maximum?

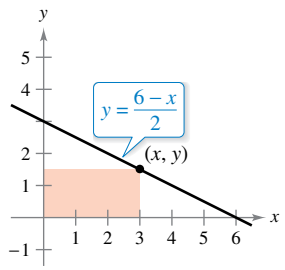


Figure for 24

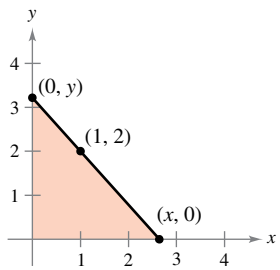

Figure for 25

25. Minimum Length and Minimum Area A right triangle is formed in the first quadrant by the x- and y-axes and a line through the point $(1, 2)$ (see figure).

(a) Write the length L of the hypotenuse as a function of x.

(b) Use a graphing utility to approximate x graphically such that the length of the hypotenuse is a minimum.

(c) Find the vertices of the triangle such that its area is a minimum.

26. Maximum Area Find the area of the largest isosceles triangle that can be inscribed in a circle of radius 6 (see figure).

(a) Solve by writing the area as a function of h.

(b) Solve by writing the area as a function of α.

(c) Identify the type of triangle of maximum area.

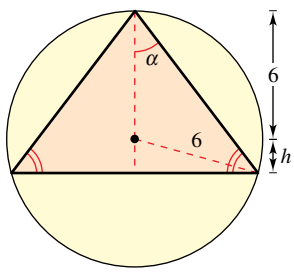

Figure for 26

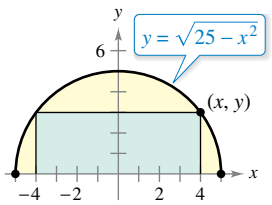

Figure for 27

27. Maximum Area A rectangle is bounded by the x-axis and the semicircle

$$y = \sqrt{25 - x^2}$$

(see figure). What length and width should the rectangle have so that its area is a maximum?

28. Maximum Area Find the dimensions of the largest rectangle that can be inscribed in a semicircle of radius r (see Exercise 27).

29. Numerical, Graphical, and Analytic Analysis An exercise room consists of a rectangle with a semicircle on each end. A 200-meter running track runs around the outside of the room.

(a) Draw a figure to represent the problem. Let x and y represent the length and width of the rectangle, respectively.

(b) Analytically complete six rows of a table such as the one below. (The first two rows are shown.) Use the table to guess the maximum area of the rectangular region.

Length, x	Width, y	Area, xy
10	$\frac{2}{\pi}(100 - 10)$	$(10)\frac{2}{\pi}(100 - 10) \approx 573$
20	$\frac{2}{\pi}(100 - 20)$	$(20)\frac{2}{\pi}(100 - 20) \approx 1019$

(c) Write the area A of the rectangular region as a function of x.

(d) Use calculus to find the critical number of the function in part (c). Then find the maximum area and the dimensions that yield the maximum area.

(e) Use a graphing utility to graph the function in part (c) and verify the maximum area from the graph.

30. Numerical, Graphical, and Analytic Analysis A right circular cylinder is designed to hold 22 cubic inches of a soft drink (approximately 12 fluid ounces).

(a) Analytically complete six rows of a table such as the one below. (The first two rows are shown.)

Radius, r	Height, h	Surface Area, S
0.2	$\frac{22}{\pi(0.2)^2}$	$2\pi(0.2)\left[0.2 + \frac{22}{\pi(0.2)^2}\right] \approx 220.3$
0.4	$\frac{22}{\pi(0.4)^2}$	$2\pi(0.4)\left[0.4 + \frac{22}{\pi(0.4)^2}\right] \approx 111.0$

(b) Use a graphing utility to generate additional rows of the table. Use the table to estimate the minimum surface area.

(c) Write the surface area S as a function of r.

(d) Use calculus to find the critical number of the function in part (c). Then find the minimum surface area and the dimensions that yield the minimum surface area.

(e) Use a graphing utility to graph the function in part (c) and verify the minimum surface area from the graph.

Exploring Concepts

31. A shampoo bottle is a right circular cylinder. Because the surface area of the bottle does not change when it is squeezed, is it true that the volume remains the same? Explain.

32. The perimeter of a rectangle is 20 feet. Of all possible dimensions, the maximum area is 25 square feet when its length and width are both 5 feet. Are there dimensions that yield a minimum area? Explain.

33. Minimum Surface Area A solid is formed by adjoining two hemispheres to the ends of a right circular cylinder. The total volume of the solid is 14 cubic centimeters. Find the radius of the cylinder that produces the minimum surface area.

34. Minimum Cost An industrial tank of the shape described in Exercise 33 must have a volume of 4000 cubic feet. The hemispherical ends cost twice as much per square foot of surface area as the sides. Find the dimensions that will minimize cost.

35. Minimum Area The sum of the perimeters of an equilateral triangle and a square is 10. Find the dimensions of the triangle and the square that produce a minimum total area.

36. Maximum Area Twenty feet of wire is to be used to form two figures. In each of the following cases, how much wire should be used for each figure so that the total enclosed area is maximum?

(a) Equilateral triangle and square

(b) Square and regular pentagon

(c) Regular pentagon and regular hexagon

(d) Regular hexagon and circle

What can you conclude from this pattern? {*Hint:* The area of a regular polygon with n sides of length x is $A = (n/4)[\cot(\pi/n)]x^2$.}

37. Beam Strength A wooden beam has a rectangular cross section of height h and width w (see figure). The strength S of the beam is directly proportional to the width and the square of the height. What are the dimensions of the strongest beam that can be cut from a round log of diameter 20 inches? (*Hint:* $S = kh^2w$, where k is the proportionality constant.)

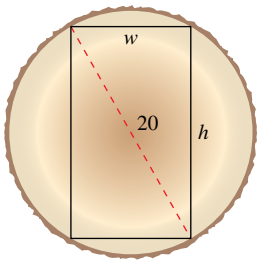

Figure for 37

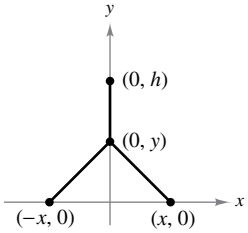

Figure for 38

38. Minimum Length Two factories are located at the coordinates $(-x, 0)$ and $(x, 0)$, and their power supply is at $(0, h)$, as shown in the figure. Find y such that the total length of power line from the power supply to the factories is a minimum.

39. Maximum Perimeter Consider an isosceles triangle inscribed in a circle of radius 2, as shown in the figure. Find the value of the largest possible perimeter of the triangle.

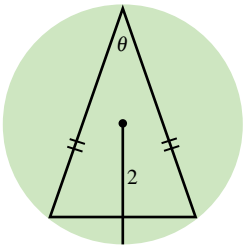

Figure for 39

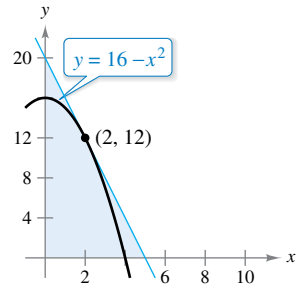

Figure for 40

40. Minimum Area Consider the tangent line L at $(2, 12)$ to the parabola $y = 16 - x^2$ (see figure). Find the area of the triangle in the first quadrant determined by the intersection of L with the x- and y-axes. Then find the point on the parabola for which the tangent line determines the triangle of least area.

41. Minimum Cost

An offshore oil well is 2 kilometers off the coast. The refinery is 4 kilometers down the coast. Laying pipe in the ocean is twice as expensive as laying it on land. What path should the pipe follow in order to minimize the cost?

42. Illumination A light source is located over the center of a circular table of diameter 4 feet (see figure). Find the height h of the light source such that the illumination I at the perimeter of the table is maximum when

$$I = \frac{k \sin \alpha}{s^2}$$

where s is the slant height, α is the angle at which the light strikes the table, and k is a constant.

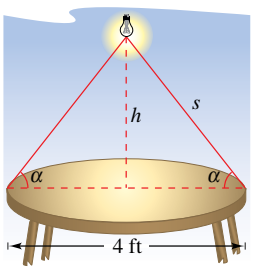

Figure for 42

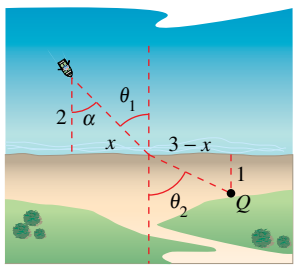

Figure for 43

43. Minimum Time A tour guide is in a boat 2 miles from the nearest point on the coast and is traveling to a point Q, located 3 miles down the coast and 1 mile inland (see figure). The tour guide can row at 2 miles per hour and walk at 4 miles per hour. Toward what point on the coast should the tour guide row in order to reach point Q in the least time?

44. Minimum Time The conditions are the same as in Exercise 43 except that the tour guide can row at v_1 miles per hour and walk at v_2 miles per hour. If θ_1 and θ_2 are the magnitudes of the angles, show that the tour guide will reach point Q in the least time when

$$\frac{\sin\theta_1}{v_1} = \frac{\sin\theta_2}{v_2}.$$

45. Minimum Distance Sketch the graph of

$$f(x) = 2 - 2\sin x$$

on the interval $[0, \pi/2]$.

(a) Find the distance from the origin to the y-intercept and the distance from the origin to the x-intercept.

(b) Write the distance d from the origin to a point on the graph of f as a function of x.

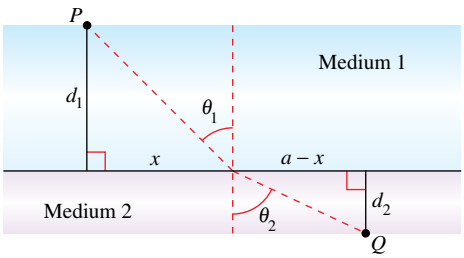
(c) Use calculus to find the value of x that minimizes the function d on the interval $[0, \pi/2]$. What is the minimum distance? Use a graphing utility to verify your results.

(Submitted by Tim Chapell, Penn Valley Community College, Kansas City, MO)

46. Minimum Time When light waves traveling in a transparent medium strike the surface of a second transparent medium, they change direction. This change of direction is called *refraction* and is defined by **Snell's Law of Refraction,**

$$\frac{\sin\theta_1}{v_1} = \frac{\sin\theta_2}{v_2}$$

where θ_1 and θ_2 are the magnitudes of the angles shown in the figure and v_1 and v_2 are the velocities of light in the two media. Show that this problem is equivalent to that in Exercise 44 and that light waves traveling from P to Q follow the path of minimum time.



47. Maximum Volume A sector with central angle θ is cut from a circle of radius 12 inches (see figure), and the edges of the sector are brought together to form a cone. Find the magnitude of θ such that the volume of the cone is a maximum.

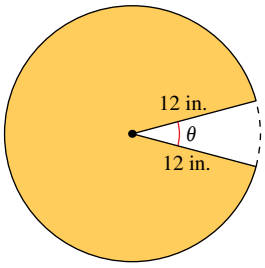


Figure for 47

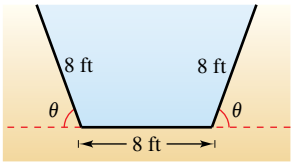

Figure for 48

48. Numerical, Graphical, and Analytic Analysis The cross sections of an irrigation canal are isosceles trapezoids of which three sides are 8 feet long (see figure). Determine the angle of elevation θ of the sides such that the area of the cross sections is a maximum by completing the following.

(a) Analytically complete six rows of a table such as the one below. (The first two rows are shown.)

θ	Base 1	Base 2	Altitude	Area
10°	8	$8 + 16\cos 10°$	$8\sin 10°$	≈ 22.1
20°	8	$8 + 16\cos 20°$	$8\sin 20°$	≈ 42.5

(b) Use a graphing utility to generate additional rows of the table. Use the table to estimate the maximum cross-sectional area.

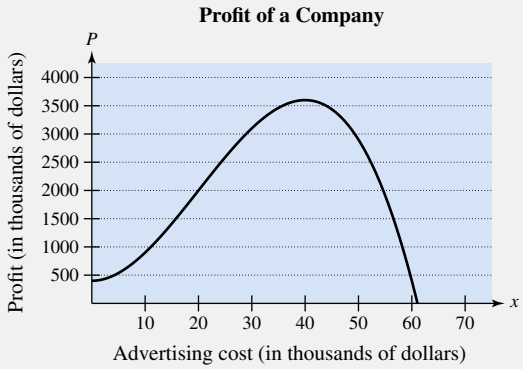
(c) Write the cross-sectional area A as a function of θ.

(d) Use calculus to find the critical number of the function in part (c). Then find the angle that will yield the maximum cross-sectional area. What is the maximum area?

(e) Use a graphing utility to graph the function in part (c) and verify the maximum cross-sectional area.

49. Maximum Profit Assume that the amount of money deposited in a bank is proportional to the square of the interest rate the bank pays on this money. Furthermore, the bank can reinvest this money at 8%. Find the interest rate the bank should pay to maximize profit. (Use the simple interest formula.)

50. HOW DO YOU SEE IT? The graph shows the profit P (in thousands of dollars) of a company in terms of its advertising cost x (in thousands of dollars).



(a) Estimate the interval on which the profit is increasing.

(b) Estimate the interval on which the profit is decreasing.

(c) Estimate the amount of money the company should spend on advertising in order to yield a maximum profit.

(d) The *point of diminishing returns* is the point at which the rate of growth of the profit function begins to decline. Estimate the point of diminishing returns.

Minimum Distance **In Exercises 51–53, consider a fuel distribution center located at the origin of the rectangular coordinate system (units in miles; see figures). The center supplies three factories with coordinates (4, 1), (5, 6), and (10, 3). A trunk line will run from the distribution center along the line $y = mx$, and feeder lines will run to the three factories. The objective is to find m such that the lengths of the feeder lines are minimized.**

51. Minimize the sum of the squares of the lengths of the vertical feeder lines (see figure) given by

$$S_1 = (4m - 1)^2 + (5m - 6)^2 + (10m - 3)^2.$$

Find the equation of the trunk line by this method and then determine the sum of the lengths of the feeder lines.

52. Minimize the sum of the absolute values of the lengths of the vertical feeder lines (see figure) given by

$$S_2 = |4m - 1| + |5m - 6| + |10m - 3|.$$

Find the equation of the trunk line by this method and then determine the sum of the lengths of the feeder lines. (*Hint:* Use a graphing utility to graph the function S_2 and approximate the required critical number.)

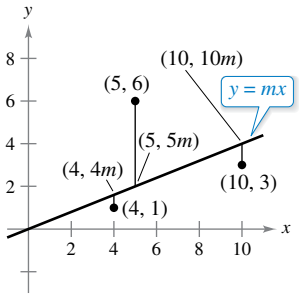

Figure for 51 and 52

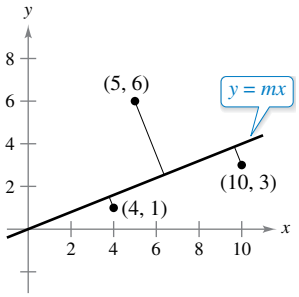

Figure for 53

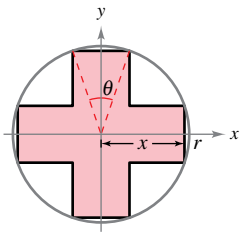
53. Minimize the sum of the lengths of the perpendicular feeder lines (see figure above and Exercise 77 in Section P.2) from the trunk line to the factories given by

$$S_3 = \frac{|4m - 1|}{\sqrt{m^2 + 1}} + \frac{|5m - 6|}{\sqrt{m^2 + 1}} + \frac{|10m - 3|}{\sqrt{m^2 + 1}}.$$

Find the equation of the trunk line by this method and then determine the sum of the lengths of the feeder lines. (*Hint:* Use a graphing utility to graph the function S_3 and approximate the required critical number.)

54. Maximum Area Consider a symmetric cross inscribed in a circle of radius r (see figure).



(a) Write the area A of the cross as a function of x and find the value of x that maximizes the area.

(b) Write the area A of the cross as a function of θ and find the value of θ that maximizes the area.

(c) Show that the critical numbers of parts (a) and (b) yield the same maximum area. What is that area?

55. Minimum Distance Find the point on the graph of the equation

$$16x = y^2$$

that is closest to the point (6, 0).

56. Minimum Distance Find the point on the graph of the function

$$x = \sqrt{10y}$$

that is closest to the point (0, 4). (*Hint:* Consider the domain of the function.)

PUTNAM EXAM CHALLENGE

57. Find, with explanation, the maximum value of $f(x) = x^3 - 3x$ on the set of all real numbers x satisfying $x^4 + 36 \leq 13x^2$.

58. Find the minimum value of

$$\frac{(x + 1/x)^6 - (x^6 + 1/x^6) - 2}{(x + 1/x)^3 + (x^3 + 1/x^3)} \quad \text{for} \quad x > 0.$$

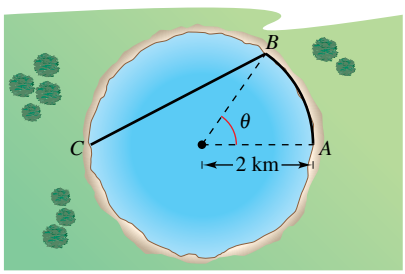
SECTION PROJECT

Minimum Time

A person is at point A on the shore of a circular lake of radius 2 kilometers (see figure). They must walk around the lake to point B and then swim to point C in the least amount of time. Point C lies on the diameter through point A. Assume that the person can walk at v_1 kilometers per hour and swim at v_2 kilometers per hour, and that $0 \leq \theta \leq \pi$.



(a) Find the distance walked from point A to point B in terms of θ.

(b) Find the distance swam from point B to point C in terms of θ.

(c) Write the function $f(\theta)$ that represents the total time to move from point A to point C.

(d) Find $f'(\theta)$.

(e) If $v_1 = 5$ and $v_2 = 2$, approximate the critical number(s) of f. Does the critical number(s) correspond to a relative maximum or a relative minimum? Where should point B be located in order to minimize the time to get from point A to point C? Explain.

(f) Repeat part (e) for $v_1 = 3$ and $v_2 = 2$.

3.8 Newton's Method

GO DIGITAL

Approximate a zero of a function using Newton's Method.

Newton's Method

In this section, you will study a technique for approximating the real zeros of a function. The technique is called **Newton's Method,** and it uses tangent lines to approximate the graph of the function near its x-intercepts.

To see how Newton's Method works, consider a function f that is continuous on the interval $[a, b]$ and differentiable on the interval (a, b). If $f(a)$ and $f(b)$ differ in sign, then, by the Intermediate Value Theorem, f must have at least one zero in the interval (a, b). To estimate this zero, choose

$$x = x_1 \qquad \text{First estimate}$$

as shown in Figure 3.60(a). Newton's Method is based on the assumption that the graph of f and the tangent line at $(x_1, f(x_1))$ both cross the x-axis at *about* the same point. Because you can calculate the x-intercept for this tangent line, use it as a second (and, usually, better) estimate of the zero of f. The tangent line passes through the point $(x_1, f(x_1))$ with a slope of $f'(x_1)$. In point-slope form, the equation of the tangent line is

$$y - f(x_1) = f'(x_1)(x - x_1) \qquad \text{Point-slope form}$$
$$y = f'(x_1)(x - x_1) + f(x_1). \qquad \text{Isolate } y.$$

Letting $y = 0$ and solving for x produces

$$f'(x_1)(x - x_1) + f(x_1) = 0 \quad \Rightarrow \quad x - x_1 = -\frac{f(x_1)}{f'(x_1)} \quad \Rightarrow \quad x = x_1 - \frac{f(x_1)}{f'(x_1)}.$$

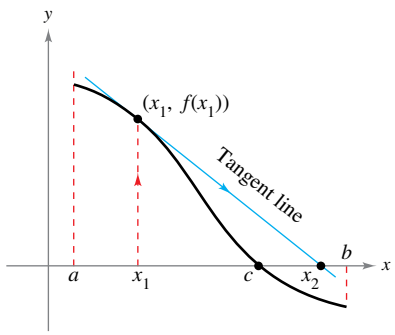
So, from the initial estimate x_1, calculate a second estimate of the actual zero.

$$x_2 = x_1 - \frac{f(x_1)}{f'(x_1)} \qquad \text{Second estimate [See Figure 3.60(a).]}$$

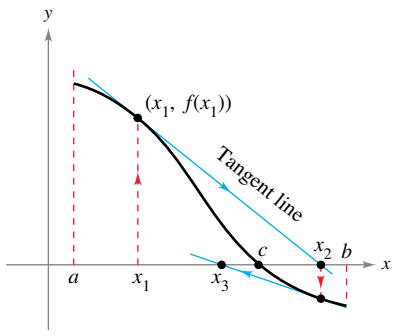
To obtain a better approximation, use x_2 to calculate a third estimate.

$$x_3 = x_2 - \frac{f(x_2)}{f'(x_2)} \qquad \text{Third estimate [See Figure 3.60(b).]}$$

Repeated application of this process is called Newton's Method.



(a)



(b)

The x-intercept of the tangent line approximates the zero of f.

Figure 3.60

NEWTON'S METHOD

Isaac Newton first described the method for approximating the real zeros of a function in his text *Method of Fluxions*. Although the book was written in 1671, it was not published until 1736. Meanwhile, in 1690, Joseph Raphson (1648–1715) published a paper describing a method for approximating the real zeros of a function that was very similar to Newton's. For this reason, the method is often referred to as the Newton-Raphson method.

Newton's Method for Approximating the Zeros of a Function

Let $f(c) = 0$, where f is differentiable on an open interval containing c. Then, to approximate c, use these steps.

1. Make an initial estimate x_1 that is close to c. (A graph is helpful.)
2. Determine a new approximation using the iterative formula

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}. \qquad \text{Iterative formula}$$

3. When $|x_n - x_{n+1}|$ is within the desired accuracy, let x_{n+1} serve as the final approximation. Otherwise, return to Step 2 and calculate a new approximation.

Each successive application of this procedure is called an **iteration.**

GO DIGITAL

For many functions, just a few iterations of Newton's Method will produce approximations having very small errors, as shown in Example 1.

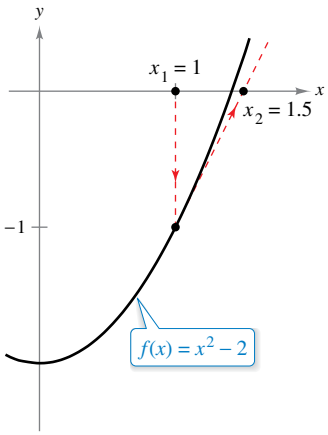
EXAMPLE 1 Using Newton's Method

Calculate three iterations of Newton's Method to approximate a zero of $f(x) = x^2 - 2$. Use $x_1 = 1$ as the initial guess.

Solution Because $f(x) = x^2 - 2$, you have $f'(x) = 2x$, and the iterative formula is

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^2 - 2}{2x_n}.$$

The calculations for three iterations are shown in the table. The first iteration of this process is shown in Figure 3.61.



The first iteration of Newton's Method
Figure 3.61

n	x_n	$f(x_n)$	$f'(x_n)$	$\frac{f(x_n)}{f'(x_n)}$	$x_n - \frac{f(x_n)}{f'(x_n)}$
1	1.000000	−1.000000	2.000000	−0.500000	1.500000
2	1.500000	0.250000	3.000000	0.083333	1.416667
3	1.416667	0.006945	2.833334	0.002451	1.414216
4	1.414216				

Of course, in this case you know that the two zeros of the function are $\pm\sqrt{2}$. To six decimal places, $\sqrt{2} = 1.414214$. So, after only three iterations of Newton's Method, you have obtained an approximation that is within 0.000002 of an actual zero.

EXAMPLE 2 Using Newton's Method

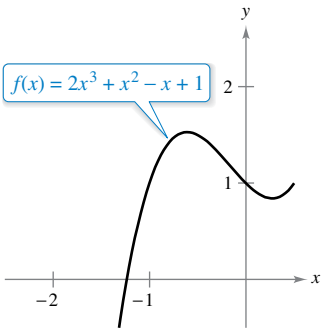
See LarsonCalculus.com for an interactive version of this type of example.

Use Newton's Method to approximate the zeros of $f(x) = 2x^3 + x^2 - x + 1$. Continue the iterations until two successive approximations differ by less than 0.0001.

Solution Begin by sketching a graph of f, as shown in Figure 3.62. From the graph, notice that the function has only one zero, which occurs near $x = -1.2$. Next, differentiate f and form the iterative formula

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{2x_n^3 + x_n^2 - x_n + 1}{6x_n^2 + 2x_n - 1}.$$

The calculations are shown in the table.



After three iterations of Newton's Method, the zero of f is approximated to the desired accuracy.
Figure 3.62

n	x_n	$f(x_n)$	$f'(x_n)$	$\frac{f(x_n)}{f'(x_n)}$	$x_n - \frac{f(x_n)}{f'(x_n)}$
1	−1.20000	0.18400	5.24000	0.03511	−1.23511
2	−1.23511	−0.00771	5.68276	−0.00136	−1.23375
3	−1.23375	0.00001	5.66533	0.00000	−1.23375
4	−1.23375				

Because two successive approximations differ by less than the required 0.0001, you can estimate the zero of f to be −1.23375. ■

GO DIGITAL

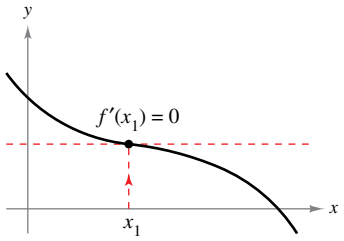
When, as in Examples 1 and 2, the approximations approach a limit, the sequence of approximations

$$x_1, x_2, x_3, \ldots, x_n, \ldots$$

is said to **converge.** Moreover, when the limit is c, it can be shown that c must be a zero of f.

FOR FURTHER INFORMATION
For more on when Newton's Method fails, see the article "No Fooling! Newton's Method Can Be Fooled" by Peter Horton in *Mathematics Magazine*. To view this article, go to *MathArticles.com*.

Newton's Method does not always yield a a convergent sequence. One way it can fail to do so is shown in Figure 3.63. Because Newton's Method involves division by $f'(x_n)$, it is clear that the method will fail when the derivative is zero for any x_n in the sequence. When you encounter this problem, you can usually overcome it by choosing a different value for x_1. Another way Newton's Method can fail is shown in the next example.



Newton's Method fails to converge when $f'(x_n) = 0$.
Figure 3.63

EXAMPLE 3 An Example in Which Newton's Method Fails

The function $f(x) = x^{1/3}$ is not differentiable at $x = 0$. Show that Newton's Method fails to converge using $x_1 = 0.1$.

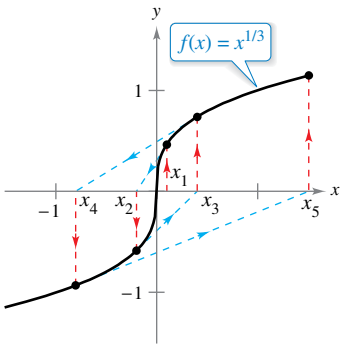
Solution Because $f'(x) = \frac{1}{3}x^{-2/3}$, the iterative formula is

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^{1/3}}{\frac{1}{3}x_n^{-2/3}} = x_n - 3x_n = -2x_n.$$

The calculations are shown in the table. This table and Figure 3.64 indicate that x_n continues to increase in magnitude as $n \to \infty$, and so the limit of the sequence does not exist.

n	x_n	$f(x_n)$	$f'(x_n)$	$\frac{f(x_n)}{f'(x_n)}$	$x_n - \frac{f(x_n)}{f'(x_n)}$
1	0.10000	0.46416	1.54720	0.30000	−0.20000
2	−0.20000	−0.58480	0.97467	−0.60000	0.40000
3	0.40000	0.73681	0.61401	1.20000	−0.80000
4	−0.80000	−0.92832	0.38680	−2.40000	1.60000

REMARK In Example 3, the initial estimate $x_1 = 0.1$ fails to produce a convergent sequence. Try showing that Newton's Method also fails for every other choice of x_1 (other than the actual zero).



Newton's Method fails to converge for every x-value other than the actual zero of f.

GO DIGITAL

It can be shown that a condition sufficient to produce convergence of Newton's Method to a zero of f is that

$$\left|\frac{f(x)f''(x)}{[f'(x)]^2}\right| < 1 \qquad \text{Condition for convergence}$$

on an open interval containing the zero. For instance, in Example 1, this test would yield

$$f(x) = x^2 - 2, \quad f'(x) = 2x, \quad f''(x) = 2,$$

and

$$\left|\frac{f(x)f''(x)}{[f'(x)]^2}\right| = \left|\frac{(x^2 - 2)(2)}{4x^2}\right| = \left|\frac{1}{2} - \frac{1}{x^2}\right|. \qquad \text{Example 1}$$

On the interval $(1, 3)$, this quantity is less than 1 and so the convergence of Newton's Method is guaranteed. On the other hand, in Example 3, you have

$$f(x) = x^{1/3}, \quad f'(x) = \frac{1}{3}x^{-2/3}, \quad f''(x) = -\frac{2}{9}x^{-5/3}$$

and

$$\left|\frac{f(x)f''(x)}{[f'(x)]^2}\right| = \left|\frac{x^{1/3}(-2/9)(x^{-5/3})}{(1/9)(x^{-4/3})}\right| = 2 \qquad \text{Example 3}$$

which is not less than 1 for any value of x, so you cannot conclude that Newton's Method will converge.

You have learned several techniques for finding the zeros of functions. The zeros of some functions, such as

$$f(x) = x^3 - 2x^2 - x + 2$$

can be found by simple algebraic techniques, such as factoring. The zeros of other functions, such as

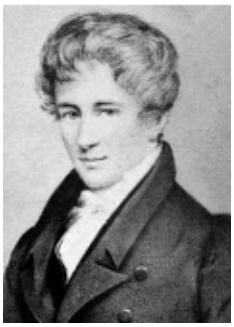
$$f(x) = x^3 - x + 1$$

cannot be found by *elementary* algebraic methods. This particular function has only one real zero, and by using more advanced algebraic techniques, you can determine the zero to be

$$x = -\sqrt[3]{\frac{3 - \sqrt{23/3}}{6}} - \sqrt[3]{\frac{3 + \sqrt{23/3}}{6}}.$$

Because the *exact* solution is written in terms of square roots and cube roots, it is called a **solution by radicals.**

The determination of radical solutions of a polynomial equation is one of the fundamental problems of algebra. The earliest such result is the Quadratic Formula, which dates back at least to Babylonian times. The general formula for the zeros of a cubic function was developed much later. In the sixteenth century, an Italian mathematician, Jerome Cardan, published a method for finding radical solutions to cubic and quartic equations. Then, for 300 years, the problem of finding a general quintic formula remained open. Finally, in the nineteenth century, the problem was answered independently by two young mathematicians. Niels Henrik Abel, a Norwegian mathematician, and Evariste Galois, a French mathematician, proved that it is not possible to solve a *general* fifth- (or higher-) degree polynomial equation by radicals. Of course, you can solve particular fifth-degree equations, such as $x^5 - 1 = 0$, but Abel and Galois were able to show that no general *radical* solution exists.



NIELS HENRIK ABEL (1802–1829)

EVARISTE GALOIS (1811–1832)

Although the lives of both Abel and Galois were brief, their work in the fields of analysis and abstract algebra was far-reaching. *See LarsonCalculus.com to read a biography about each of these mathematicians.*

3.8 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain Newton's Method for approximating the zeros of a function. Include a sketch in your explanation.
2. Why does Newton's Method fail when $f'(x_n) = 0$? What does this mean graphically?

Using Newton's Method **In Exercises 3–6, calculate two iterations of Newton's Method to approximate a zero of the function using the given initial guess.**

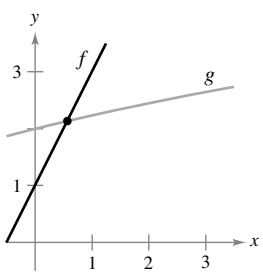
3. $f(x) = x^2 - 5, \quad x_1 = 2$
4. $f(x) = x^3 - 3, \quad x_1 = 1.4$
5. $f(x) = \cos x, \quad x_1 = 1.6$
6. $f(x) = \tan x, \quad x_1 = 0.1$

Using Newton's Method **In Exercises 7–16, use Newton's Method to approximate the zero(s) of the function. Continue the iterations until two successive approximations differ by less than 0.001. Then find the zero(s) using a graphing utility and compare the results.**

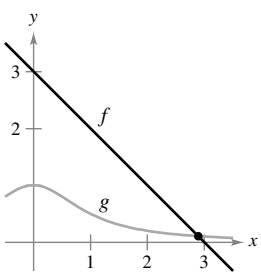
7. $f(x) = x^3 + 4$
8. $f(x) = 2 - x^3$
9. $f(x) = x^3 + x - 1$
10. $f(x) = x^5 + x - 1$
11. $f(x) = 5\sqrt{x - 1} - 2x$
12. $f(x) = x - 2\sqrt{x + 1}$
13. $f(x) = x^3 - 3.9x^2 + 4.79x - 1.881$
14. $f(x) = -x^3 + 2.7x^2 + 3.55x - 2.422$
15. $f(x) = 1 - x + \sin x$
16. $f(x) = x^3 - \cos x$

Points of Intersection **In Exercises 17–20, apply Newton's Method to approximate the x-value(s) of the indicated point(s) of intersection of the two graphs. Continue the iterations until two successive approximations differ by less than 0.001.** [***Hint:*** **Let $h(x) = f(x) - g(x)$.**]

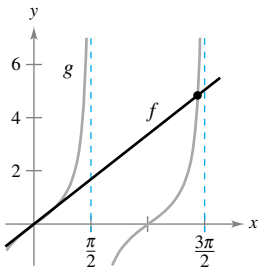
17. $f(x) = 2x + 1$
$g(x) = \sqrt{x + 4}$



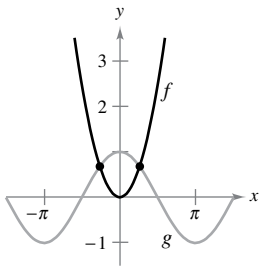
18. $f(x) = 3 - x$
$g(x) = \dfrac{1}{x^2 + 1}$



19. $f(x) = x$
$g(x) = \tan x$



20. $f(x) = x^2$
$g(x) = \cos x$



21. **Using Newton's Method** Consider the function $f(x) = x^3 - 3x^2 + 3$.
   (a) Use a graphing utility to graph f.
   (b) Use Newton's Method to approximate a zero with $x_1 = 1$ as the initial guess.
   (c) Repeat part (b) using $x_1 = \frac{1}{4}$ as the initial guess and observe that the result is different.
   (d) To understand why the results in parts (b) and (c) are different, sketch the tangent lines to the graph of f at the points $(1, f(1))$ and $\left(\frac{1}{4}, f\left(\frac{1}{4}\right)\right)$. Describe why it is important to select the initial guess carefully.

22. **Using Newton's Method** Repeat the steps in Exercise 21 for the function $f(x) = \sin x$ with initial guesses of $x_1 = 1.8$ and $x_1 = 3$.

Failure of Newton's Method **In Exercises 23 and 24, apply Newton's Method using the given initial guess, and explain why the method fails.**

23. $y = 2x^3 - 6x^2 + 6x - 1, \quad x_1 = 1$

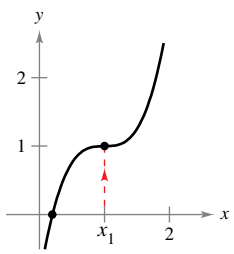


Figure for 23

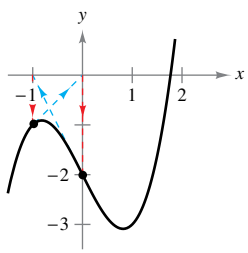

Figure for 24

24. $y = x^3 - 2x - 2, \quad x_1 = 0$

Exploring Concepts

25. What will be the values of future guesses for x if your initial guess is a zero of f? Explain.
26. Does Newton's Method fail when the initial guess is a relative maximum of f? Explain.

Fixed Point **In Exercises 27 and 28, approximate the fixed point of the function to two decimal places. [A *fixed point* of a function f is a real number c such that $f(c) = c$.]**

27. $f(x) = \cos x$

28. $f(x) = \cot x, \quad 0 < x < \pi$

29. Proof Prove that if f is differentiable on $(-\infty, \infty)$ and $f'(x) < 1$ for all real numbers, then f has at most one fixed point. [A *fixed point* of a function f is a real number c such that $f(c) = c$.]

30. Fixed Point Use the result of Exercise 29 to show that $f(x) = \frac{1}{2}\cos x$ has at most one fixed point.

Using Newton's Method **Exercises 31–33 present problems similar to exercises from the previous sections of this chapter. In each case, use Newton's Method to approximate the solution.**

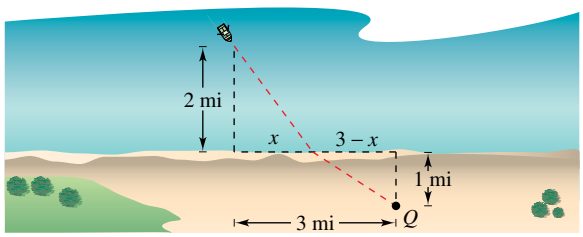
31. Minimum Distance Find the point on the graph of $f(x) = 4 - x^2$ that is closest to the point $(1, 0)$.

32. Medicine The concentration C of a chemical in the bloodstream t hours after injection into muscle tissue is given by

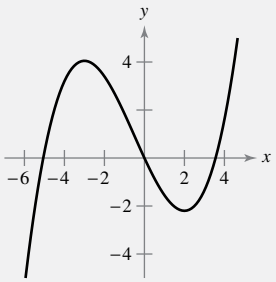
$$C = \frac{3t^2 + t}{50 + t^3}.$$

When is the concentration the greatest?

33. Minimum Time A person is in a boat 2 miles from the nearest point on the coast. They are traveling to a point Q that is 3 miles down the coast and 1 mile inland (see figure). They can row at 3 miles per hour and walk at 4 miles per hour. Toward what point on the coast should they row in order to reach point Q in the least time?



34. HOW DO YOU SEE IT? For what value(s) will Newton's Method fail to converge for the function shown in the graph? Explain your reasoning.



35. Mechanic's Rule The Mechanic's Rule for approximating $\sqrt{a}$, $a > 0$, is

$$x_{n+1} = \frac{1}{2}\left(x_n + \frac{a}{x_n}\right), \quad n = 1, 2, 3, \ldots$$

where x_1 is an approximation of $\sqrt{a}$.

(a) Use Newton's Method and the function $f(x) = x^2 - a$ to derive the Mechanic's Rule.

(b) Use the Mechanic's Rule to approximate $\sqrt{5}$ and $\sqrt{7}$ to three decimal places.

36. Approximating Radicals

(a) Use Newton's Method and the function $f(x) = x^n - a$ to obtain a general rule for approximating $x = \sqrt[n]{a}$.

(b) Use the general rule found in part (a) to approximate $\sqrt[4]{6}$ and $\sqrt[3]{15}$ to three decimal places.

37. Approximating Reciprocals Use Newton's Method to show that the equation $x_{n+1} = x_n(2 - ax_n)$ can be used to approximate $1/a$ when x_1 is an initial guess of the reciprocal of a. Note that this method of approximating reciprocals uses only the operations of multiplication and subtraction. (*Hint:* Consider

$$f(x) = \frac{1}{x} - a.\Big)$$

38. Approximating Reciprocals Use the result of Exercise 37 to approximate (a) $\frac{1}{3}$ and (b) $\frac{1}{11}$ to three decimal places.

True or False? **In Exercises 39–42, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

39. The zeros of $f(x) = \dfrac{p(x)}{q(x)}$ coincide with the zeros of $p(x)$.

40. If the coefficients of a polynomial function are all positive, then the polynomial has no positive zeros.

41. If $f(x)$ is a cubic polynomial such that $f'(x)$ is never zero, then any initial guess will force Newton's Method to converge to the zero of f.

42. Newton's Method fails when the initial guess x_1 corresponds to a horizontal tangent line for the graph of f at x_1.

43. Tangent Lines The graph of $f(x) = -\sin x$ has infinitely many tangent lines that pass through the origin. Use Newton's Method to approximate to three decimal places the slope of the tangent line having the greatest slope.

44. Point of Tangency The graph of $f(x) = \cos x$ and a tangent line to f through the origin are shown. Find the coordinates of the point of tangency to three decimal places.

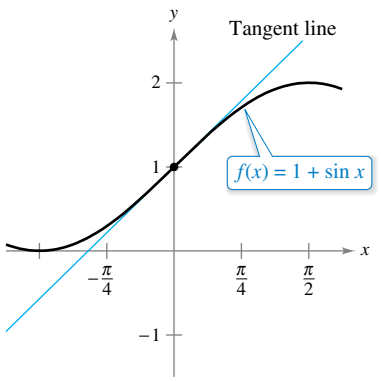
3.9 Differentials

GO DIGITAL

- Describe the concept of a tangent line approximation.
- Compare the value of the differential, *dy*, with the actual change in y, Δy.
- Estimate a propagated error using a differential.
- Find the differential of a function using differentiation formulas.

Exploration

Tangent Line Approximation Let $f(x) = x^2$. Use a graphing utility to graph f and its tangent line at the point $(1, 1)$ in the same viewing window. Use a viewing window with $0.4 \le x \le 1.6$ and $0.4 \le y \le 1.6$. As both graphs approach $(1, 1)$, what do you notice? Use the *trace* feature to compare the values of f with the y-values of the tangent line. As the x-values get closer to 1, what do you notice?



The tangent line approximation of f at the point $(0, 1)$

Figure 3.65

Tangent Line Approximations

Newton's Method (see Section 3.8) is an example of the use of a tangent line to approximate the graph of a function. In this section, you will study other situations in which the graph of a function can be approximated by a straight line.

To begin, consider a function f that is differentiable at c. The equation for the tangent line at the point $(c, f(c))$ is

$$y - f(c) = f'(c)(x - c)$$

$$y = f(c) + f'(c)(x - c)$$

and is called the **tangent line approximation** (or **linear approximation**) **of f at c.** Because c is a constant, y is a linear function of x. Moreover, by restricting the values of x to those sufficiently close to c, the values of y can be used as approximations (to any desired degree of accuracy) of the values of the function f. In other words, as x approaches c, the limit of y is $f(c)$.

EXAMPLE 1 Using a Tangent Line Approximation

See LarsonCalculus.com for an interactive version of this type of example.

Find the tangent line approximation of $f(x) = 1 + \sin x$ at the point $(0, 1)$. Then use a table to compare the y-values of the tangent line with those of $f(x)$ on an open interval containing $x = 0$.

Solution The derivative of f is $f'(x) = \cos x$. So, the equation of the tangent line to the graph of f at the point $(0, 1)$ is

$$y = f(0) + f'(0)(x - 0)$$
$$y = 1 + (1)(x - 0)$$
$$y = 1 + x.$$ Tangent line approximation

The table compares the values of y given by this tangent line approximation with $f(x)$ near $x = 0$. Notice that the closer x is to 0, the better the approximation. This conclusion is reinforced by the graph shown in Figure 3.65.

x	-0.5	-0.1	-0.01	0	0.01	0.1	0.5
$f(x) = 1 + \sin x$	0.521	0.9002	0.9900002	1	1.0099998	1.0998	1.479
$y = 1 + x$	0.5	0.9	0.99	1	1.01	1.1	1.5

REMARK Note that this linear approximation of $f(x) = 1 + \sin x$ depends on the point of tangency. At a different point on the graph of f, you would obtain a different tangent line approximation. For instance, find the tangent line approximation of $f(x) = 1 + \sin x$ at the point $(\pi/6, 3/2)$ and compare the result to the one in Example 1.

Differentials

When the tangent line to the graph of f at the point $(c, f(c))$

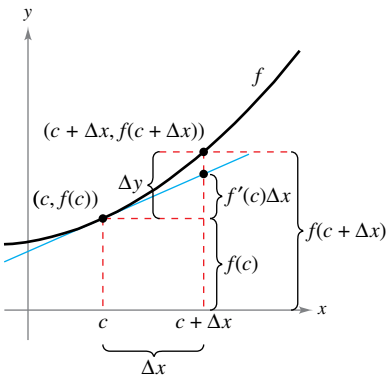
$$y = f(c) + f'(c)(x - c)$$ Tangent line at $(c, f(c))$

is used as an approximation of the graph of f, the quantity $x - c$ is called the change in x, and is denoted by Δx, as shown in Figure 3.66. When Δx is small, the change in y (denoted by Δy) can be approximated as shown.

$$\Delta y = f(c + \Delta x) - f(c)$$ Actual change in y

$$\approx f'(c)\Delta x$$ Approximate change in y

For such an approximation, the quantity Δx is traditionally denoted by dx and is called the **differential of x.** The expression $f'(x)\,dx$ is denoted by dy and is called the **differential of y.**



When Δx is small, $\Delta y = f(c + \Delta x) - f(c)$ is approximated by $f'(c)\Delta x$.
Figure 3.66

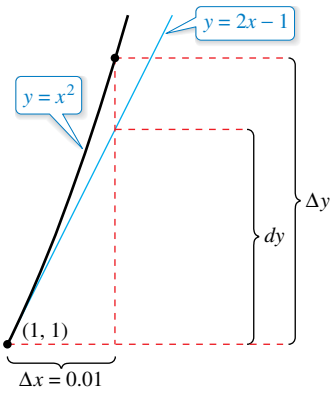
Definition of Differentials

Let $y = f(x)$ represent a function that is differentiable on an open interval containing x. The **differential of x** (denoted by dx) is any nonzero real number. The **differential of y** (denoted by dy) is

$$dy = f'(x)\,dx.$$

In many types of applications, the differential of y can be used as an approximation of the change in y. That is,

$$\Delta y \approx dy \quad \text{or} \quad \Delta y \approx f'(x)\,dx.$$



The change in y, Δy, is approximated by the differential of y, dy.
Figure 3.67

EXAMPLE 2 Comparing Δy and dy

Let $y = x^2$. Find dy when $x = 1$ and $dx = 0.01$. Compare this value with Δy for $x = 1$ and $\Delta x = 0.01$.

Solution Because $y = f(x) = x^2$, you have $f'(x) = 2x$, and the differential dy is

$$dy = f'(x)\,dx = f'(1)(0.01) = 2(0.01) = 0.02.$$ Differential of y

Now, using $\Delta x = 0.01$, the change in y is

$$\Delta y = f(x + \Delta x) - f(x) = f(1.01) - f(1) = (1.01)^2 - 1^2 = 0.0201.$$

Figure 3.67 shows the geometric comparison of dy and Δy. Try comparing other values of dy and Δy. You will see that the values become closer to each other as dx (or Δx) approaches 0. ■

In Example 2, the tangent line to the graph of $f(x) = x^2$ at $x = 1$ is

$$y = 2x - 1.$$ Tangent line to the graph of f at $x = 1$.

For x-values near 1, this line is close to the graph of f, as shown in Figure 3.67 and in the table.

x	0.5	0.9	0.99	1	1.01	1.1	1.5
$f(x) = x^2$	0.25	0.81	0.9801	1	1.0201	1.21	2.25
$y = 2x - 1$	0	0.8	0.98	1	1.02	1.2	2

Error Propagation

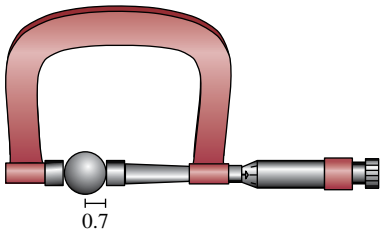
Physicists and engineers tend to make liberal use of the approximation of Δy by dy. One way this occurs in practice is in the estimation of errors propagated by physical measuring devices. For example, if you let x represent the measured value of a variable and let $x + \Delta x$ represent the exact value, then Δx is the *error in measurement*. Finally, if the measured value x is used to compute another value $f(x)$, then the difference between $f(x + \Delta x)$ and $f(x)$ is the **propagated error.**

$$\underbrace{f(\overbrace{x + \Delta x}^{\text{Measurement error}})}_{\text{Exact value}} - \underbrace{f(x)}_{\text{Measured value}} = \overbrace{\Delta y}^{\text{Propagated error}}$$

EXAMPLE 3 Estimation of Error

Ball bearings are used to reduce friction between moving machine parts.

The measured radius of a ball bearing is 0.7 inch, as shown in the figure. The measurement is correct to within 0.01 inch. Estimate the propagated error in the volume V of the ball bearing.



Ball bearing with measured radius that is correct to within 0.01 inch.

Solution The formula for the volume of a sphere is

$$V = \frac{4}{3}\pi r^3$$

where r is the radius of the sphere. So, you can write

$$r = 0.7 \qquad \text{Measured radius}$$

and

$$-0.01 \le \Delta r \le 0.01. \qquad \text{Possible error}$$

To approximate the propagated error in the volume, differentiate V to obtain $dV/dr = 4\pi r^2$ and write

$$\begin{aligned} \Delta V &\approx dV && \text{Approximate } \Delta V \text{ by } dV. \\ &= 4\pi r^2\, dr \\ &= 4\pi(0.7)^2(\pm 0.01) && \text{Substitute for } r \text{ and } dr. \\ &\approx \pm 0.06158 \text{ cubic inch.} \end{aligned}$$

So, the volume has a propagated error of about 0.06 cubic inch. ■

Would you say that the propagated error in Example 3 is large or small? The answer is best given in *relative* terms by comparing dV with V. The ratio

$$\begin{aligned} \frac{dV}{V} &= \frac{4\pi r^2\, dr}{\frac{4}{3}\pi r^3} && \text{Ratio of } dV \text{ to } V \\ &= \frac{3\, dr}{r} && \text{Simplify.} \\ &\approx \frac{3(\pm 0.01)}{0.7} && \text{Substitute for } dr \text{ and } r. \\ &\approx \pm 0.0429 \end{aligned}$$

is called the **relative error.** The corresponding **percent error** is approximately 4.29%.

Calculating Differentials

Each of the differentiation rules that you studied in Chapter 2 can be written in **differential form.** For example, let u and v be differentiable functions of x. By the definition of differentials, you have

$$du = u'\,dx \qquad \text{Differential of } u$$

and

$$dv = v'\,dx. \qquad \text{Differential of } v$$

So, you can write the differential form of the Product Rule as shown below.

$$\begin{aligned} d[uv] &= \frac{d}{dx}[uv]\,dx && \text{Differential of } uv \\ &= [uv' + vu']\,dx && \text{Product Rule} \\ &= uv'\,dx + vu'\,dx \\ &= u\,dv + v\,du \end{aligned}$$

Differential Formulas

Let u and v be differentiable functions of x.

Constant multiple:	$d[cu] = c\,du$
Sum or difference:	$d[u \pm v] = du \pm dv$
Product:	$d[uv] = u\,dv + v\,du$
Quotient:	$d\left[\frac{u}{v}\right] = \frac{v\,du - u\,dv}{v^2}$

EXAMPLE 4 Finding Differentials

Function	Derivative	Differential
a. $y = x^2$	$\frac{dy}{dx} = 2x$	$dy = 2x\,dx$
b. $y = \sqrt{x}$	$\frac{dy}{dx} = \frac{1}{2\sqrt{x}}$	$dy = \frac{dx}{2\sqrt{x}}$
c. $y = 2\sin x$	$\frac{dy}{dx} = 2\cos x$	$dy = 2\cos x\,dx$
d. $y = x\cos x$	$\frac{dy}{dx} = -x\sin x + \cos x$	$dy = (-x\sin x + \cos x)\,dx$
e. $y = \frac{1}{x}$	$\frac{dy}{dx} = -\frac{1}{x^2}$	$dy = -\frac{dx}{x^2}$

GOTTFRIED WILHELM LEIBNIZ (1646–1716)

Both Leibniz and Newton are credited with creating calculus. It was Leibniz, however, who tried to broaden calculus by developing rules and formal notation. He often spent days choosing an appropriate notation for a new concept. *See LarsonCalculus.com to read more of this biography.*

The notation in Example 4 is called the **Leibniz notation** for derivatives and differentials, named after the German mathematician Gottfried Wilhelm Leibniz. The beauty of this notation is that it provides an easy way to remember several important calculus formulas by making it seem as though the formulas were derived from algebraic manipulations of differentials. For instance, in Leibniz notation, the Chain Rule

$$\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx}$$

would appear to be true because the du's divide out. Even though this reasoning is *incorrect*, the notation does help one remember the Chain Rule.

EXAMPLE 5 Finding the Differential of a Composite Function

$$y = f(x) = \sin 3x \qquad \text{Original function}$$
$$f'(x) = 3\cos 3x \qquad \text{Apply Chain Rule.}$$
$$dy = f'(x)\,dx = 3\cos 3x\,dx \qquad \text{Differential form}$$

EXAMPLE 6 Finding the Differential of a Composite Function

$$y = f(x) = (x^2 + 1)^{1/2} \qquad \text{Original function}$$
$$f'(x) = \frac{1}{2}(x^2 + 1)^{-1/2}(2x) = \frac{x}{\sqrt{x^2 + 1}} \qquad \text{Apply Chain Rule.}$$
$$dy = f'(x)\,dx = \frac{x}{\sqrt{x^2 + 1}}\,dx \qquad \text{Differential form}$$

Differentials can be used to approximate function values. To do this for the function given by $y = f(x)$, use the formula

$$f(x + \Delta x) \approx f(x) + dy = f(x) + f'(x)\,dx$$

which is derived from the approximation

$$\Delta y = f(x + \Delta x) - f(x) \approx dy.$$

REMARK This formula is equivalent to the tangent line approximation given earlier in this section.

The key to using this formula is to choose a value for x that makes the calculations easier, as shown in Example 7.

EXAMPLE 7 Approximating Function Values

Use differentials to approximate $\sqrt{16.5}$.

Solution Using $f(x) = \sqrt{x}$, you can write

$$f(x + \Delta x) \approx f(x) + f'(x)\,dx = \sqrt{x} + \frac{1}{2\sqrt{x}}\,dx.$$

Now, choosing $x = 16$ and $dx = 0.5$, you obtain the approximation

$$f(x + \Delta x) = \sqrt{16.5} \approx \sqrt{16} + \frac{1}{2\sqrt{16}}(0.5) = 4 + \left(\frac{1}{8}\right)\left(\frac{1}{2}\right) = 4.0625.$$

So, $\sqrt{16.5} \approx 4.0625$.

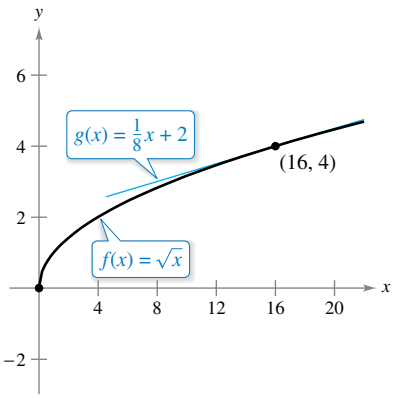

Figure 3.68

The tangent line approximation to $f(x) = \sqrt{x}$ at $x = 16$ is the line $g(x) = \frac{1}{8}x + 2$. For x-values near 16, the graph of g closely approximates the graph of f, as shown in Figure 3.68. For instance,

$$f(16.5) = \sqrt{16.5} \approx 4.0620 \qquad \text{Original function when } x = 16.5$$

and

$$g(16.5) = \frac{1}{8}(16.5) + 2 = 4.0625. \qquad \text{Tangent line approximation when } x = 16.5$$

In fact, if you use a graphing utility to zoom in near the point of tangency (16, 4), you will see that the two graphs appear to coincide. Notice also that as you move farther away from the point of tangency, the linear approximation becomes less accurate.

3.9 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Give the equation of the tangent line approximation to the graph of a function f at the point $(c, f(c))$.
2. Explain the meaning of the differentials of x and y.
3. Explain the terms *propagated error*, *relative error*, and *percent error*.
4. Explain how to find a differential of a function.

Using a Tangent Line Approximation **In Exercises 5–10, find the tangent line approximation T to the graph of f at the given point. Then complete the table.**

x	1.9	1.99	2	2.01	2.1
$f(x)$					
$T(x)$					

5. $f(x) = x^2, \quad (2, 4)$
6. $f(x) = \dfrac{6}{x^2}, \quad \left(2, \dfrac{3}{2}\right)$
7. $f(x) = x^5, \quad (2, 32)$
8. $f(x) = \sqrt{x}, \quad (2, \sqrt{2})$
9. $f(x) = \sin x, \quad (2, \sin 2)$
10. $f(x) = \csc x, \quad (2, \csc 2)$

Verifying a Tangent Line Approximation **In Exercises 11 and 12, verify the tangent line approximation of the function at the given point. Then use a graphing utility to graph the function and its approximation in the same viewing window.**

Function	Approximation	Point
11. $f(x) = \sqrt{x + 4}$	$y = 2 + \dfrac{x}{4}$	$(0, 2)$
12. $f(x) = \tan x$	$y = x$	$(0, 0)$

Comparing Δy and dy **In Exercises 13–18, use the information to find and compare Δy and dy.**

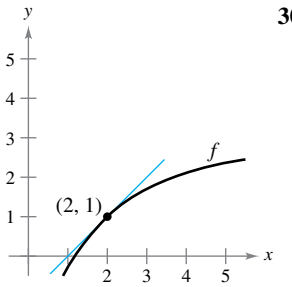
Function	x-Value	Differential of x
13. $y = 0.5x^3$	$x = 1$	$\Delta x = dx = 0.1$
14. $y = 6 - 2x^2$	$x = -2$	$\Delta x = dx = 0.1$
15. $y = x^4 + 1$	$x = -1$	$\Delta x = dx = 0.01$
16. $y = 2 - x^4$	$x = 2$	$\Delta x = dx = 0.01$
17. $y = x - 2x^3$	$x = 3$	$\Delta x = dx = 0.001$
18. $y = 7x^2 - 5x$	$x = -4$	$\Delta x = dx = 0.001$

Finding a Differential **In Exercises 19–28, find the differential dy of the given function.**

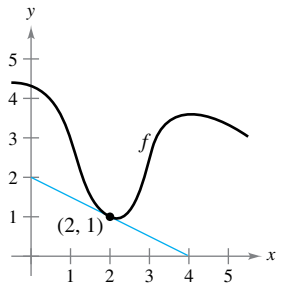
19. $y = 3x^2 - 4$
20. $y = 3x^{2/3}$
21. $y = x \tan x$
22. $y = \csc 2x$
23. $y = \dfrac{x + 1}{2x - 1}$
24. $y = \sqrt{x} + \dfrac{1}{\sqrt{x}}$
25. $y = \sqrt{9 - x^2}$
26. $y = x\sqrt{1 - x^2}$
27. $y = 3x - \sin^2 x$
28. $y = \dfrac{\sec^2 x}{x^2 + 1}$

Using Differentials **In Exercises 29 and 30, use differentials and the graph of f to approximate (a) $f(1.9)$ and (b) $f(2.04)$. To print an enlarged copy of the graph, go to *MathGraphs.com*.**

29.

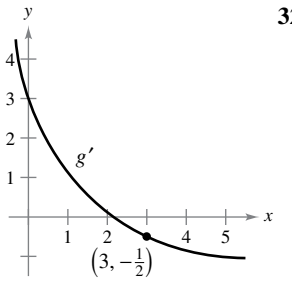


30.

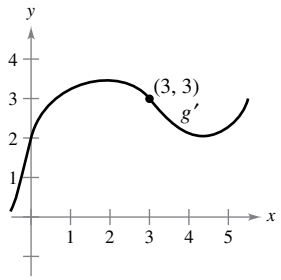


Using Differentials **In Exercises 31 and 32, use differentials and the graph of g' to approximate (a) $g(2.93)$ and (b) $g(3.1)$ given that $g(3) = 8$.**

31.



32.



33. **Area** The measurement of the side of a square floor tile is 10 inches, with a possible error of $\frac{1}{32}$ inch.
   (a) Use differentials to approximate the possible propagated error in computing the area of the square.
   (b) Approximate the percent error in computing the area of the square.
34. **Area** The measurements of the base and altitude of a triangle are found to be 36 and 50 centimeters, respectively. The possible error in each measurement is 0.25 centimeter.
   (a) Use differentials to approximate the possible propagated error in computing the area of the triangle.
   (b) Approximate the percent error in computing the area of the triangle.

35. Volume and Surface Area The measurement of the edge of a cube is found to be 15 inches, with a possible error of 0.03 inch.

(a) Use differentials to approximate the possible propagated error in computing the volume of the cube.

(b) Use differentials to approximate the possible propagated error in computing the surface area of the cube.

(c) Approximate the percent errors in parts (a) and (b).

36. Volume and Surface Area The radius of a spherical balloon is measured as 8 inches, with a possible error of 0.02 inch.

(a) Use differentials to approximate the possible propagated error in computing the volume of the sphere.

(b) Use differentials to approximate the possible propagated error in computing the surface area of the sphere.

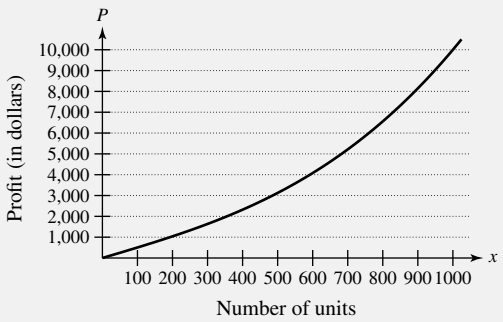
(c) Approximate the percent errors in parts (a) and (b).

37. Stopping Distance The total stopping distance T of a vehicle is

$$T = 2.2x + 0.05x^2$$

where T is in feet and x is the speed in miles per hour. Approximate the change and percent change in total stopping distance as speed changes from $x = 25$ to $x = 26$ miles per hour.

38. HOW DO YOU SEE IT? The graph shows the profit P (in dollars) from selling x units of an item. Use the graph to determine which is greater, the change in profit when the production level changes from 400 to 401 units or the change in profit when the production level changes from 900 to 901 units. Explain your reasoning.



39. Pendulum The period of a pendulum is given by

$$T = 2\pi\sqrt{\frac{L}{g}}$$

where L is the length of the pendulum in feet, g is the acceleration due to gravity, and T is the time in seconds. The pendulum has been subjected to an increase in temperature such that the length has increased by $\frac{1}{2}\%$.

(a) Find the approximate percent change in the period.

(b) Using the result in part (a), find the approximate error in this pendulum clock in 1 day.

40. Ohm's Law A current of I amperes passes through a resistor of R ohms. **Ohm's Law** states that the voltage E applied to the resistor is

$$E = IR.$$

The voltage is constant. Show that the magnitude of the relative error in R caused by a change in I is equal in magnitude to the relative error in I.

41. Projectile Motion The range R of a projectile is

$$R = \frac{v_0^2}{32}(\sin 2\theta)$$

where v_0 is the initial velocity in feet per second and θ is the angle of elevation. Use differentials to approximate the change in the range when $v_0 = 2500$ feet per second and θ is changed from 10° to 11°.

42. Surveying A surveyor standing 50 feet from the base of a large tree measures the angle of elevation to the top of the tree as 71.5°. How accurately must the angle be measured if the percent error in estimating the height of the tree is to be less than 6%?

Approximating Function Values **In Exercises 43–46, use differentials to approximate the value of the expression. Compare your answer with that of a calculator.**

43. $\sqrt{99.4}$

44. $\sqrt[3]{26}$

45. $\sqrt[4]{624}$

46. $(2.99)^3$

Exploring Concepts

47. Describe the change in accuracy of dy as an approximation for Δy when Δx approaches 0. Use a graph to support your answer.

48. Give a short explanation of why each approximation is valid.

(a) $\sqrt{4.02} \approx 2 + \frac{1}{4}(0.02)$

(b) $\tan 0.05 \approx 0 + 1(0.05)$

True or False? **In Exercises 49–53, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

49. If $y = x + c$, then $dy = dx$.

50. If $y = ax + b$, then $\dfrac{\Delta y}{\Delta x} = \dfrac{dy}{dx}$.

51. If y is differentiable, then $\lim_{\Delta x \to 0}(\Delta y - dy) = 0$.

52. If $y = f(x)$, f is increasing and differentiable, and $\Delta x > 0$, then $\Delta y \geq dy$.

53. The tangent line approximation at any point for any linear equation is the linear equation itself.

Review Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Exploring Concepts

In this chapter, you explored several applications of the derivative. One of the applications, graphical analysis, used concepts you reviewed in Chapter P and the concepts in Chapters 1–3 to help you fully sketch the graph of a function.

Chapter P
- x-intercepts and y-intercepts
- Symmetry
- Domain and range

Chapters 1–3
- Asymptotes
- Critical numbers
- Increasing and decreasing intervals
- Extrema
- Concavity and points of inflection

These concepts along with Rolle's Theorem and the Mean Value Theorem will help you to analyze real-life situations and solve optimization problems.

1. Give the definition of a critical number, and graph a function showing the different types of critical numbers.

2. Consider the function $f(x) = 3 - |x - 4|$.

(a) Graph the function and verify that $f(1) = f(7)$.

(b) Note that $f'(x)$ is not equal to zero for any x in $[1, 7]$. Explain why this does not contradict Rolle's Theorem.

3. Consider the inequality

$$\sqrt{x + 1} < \frac{1}{2}x + 1$$

where x is a positive real number.

(a) Use the *table* feature of a graphing utility to investigate the validity of the inequality.

(b) Use the Mean Value Theorem to prove that the inequality is true.

4. Consider the function $f(x) = 108x^2 - 4x^3$.

(a) Find the critical numbers of f.

(b) Find the relative extrema of f.

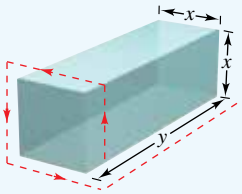
(c) Find the open intervals on which f is increasing or decreasing.

(d) Determine the open intervals on which f is concave upward or concave downward.

(e) Find the points of inflection of f.

(f) Sketch the graph of f.

5. A rectangular package to be sent by a shipping service can have a maximum combined length and girth (perimeter of a cross section) of 108 inches (see figure). Assume the cross section is square.



(a) Write the volume V of the package as a function of x. Compare this equation to the one in Exercise 4. What do you notice?

(b) Find the dimensions of the package of maximum volume that can be sent.

6. Consider the function

$$f(x) = 3\cos^2\left(\frac{\pi x}{2}\right).$$

(a) Use a graphing utility to graph f and f'.

(b) Is f a continuous function? Is f' a continuous function?

(c) Does Rolle's Theorem apply on the interval $[-1, 1]$? Does it apply on the interval $[1, 2]$? Explain.

(d) Evaluate, if possible, $\lim_{x\to 3^-} f'(x)$ and $\lim_{x\to 3^+} f'(x)$.

Finding Extrema on a Closed Interval **In Exercises 7–14, find the absolute extrema of the function on the closed interval.**

7. $f(x) = x^2 + 5x, \ [-4, 0]$

8. $f(x) = x^3 + 6x^2, \ [-6, 1]$

9. $f(x) = \sqrt{x} - 2, \ [0, 4]$

10. $h(x) = x - 3\sqrt{x}, \ [0, 9]$

11. $f(x) = \dfrac{4x}{x^2 + 9}, \ [-4, 4]$

12. $f(x) = \dfrac{x}{\sqrt{x^2 + 1}}, \ [0, 2]$

13. $g(x) = 2x + 5\cos x, \ [0, 2\pi]$

14. $f(x) = \sin 2x, \quad [0, 2\pi]$

Using Rolle's Theorem **In Exercises 15–18, determine whether Rolle's Theorem can be applied to f on the closed interval $[a, b]$. If Rolle's Theorem can be applied, find all values of c in the open interval (a, b) such that $f'(c) = 0$. If Rolle's Theorem cannot be applied, explain why not.**

15. $f(x) = x^3 - 3x - 6, \quad [-1, 2]$

16. $f(x) = (x - 2)(x + 3)^2, \quad [-3, 2]$

17. $f(x) = \dfrac{x^2}{1 - x^2}, \quad [-2, 2]$

18. $f(x) = \sin 2x, \quad [-\pi, \pi]$

Using the Mean Value Theorem **In Exercises 19–24, determine whether the Mean Value Theorem can be applied to f on the closed interval $[a, b]$. If the Mean Value Theorem can be applied, find all values of c in the open interval (a, b) such that**

$$f'(c) = \frac{f(b) - f(a)}{b - a}.$$

If the Mean Value Theorem cannot be applied, explain why not.

19. $f(x) = x^{2/3}, \quad [1, 8]$

20. $f(x) = \frac{1}{x}, \quad [1, 4]$

21. $f(x) = |5 - x|, \quad [2, 6]$

22. $f(x) = 2x - 3\sqrt{x}, \quad [-1, 1]$

23. $f(x) = x - \cos x, \quad \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

24. $f(x) = \sqrt{x} - 2x, \quad [0, 4]$

25. Mean Value Theorem Can the Mean Value Theorem be applied to the function

$$f(x) = \frac{1}{x^2}$$

on the interval $[-2, 1]$? Explain.

26. Using the Mean Value Theorem

(a) For the function $f(x) = Ax^2 + Bx + C$, determine the value of c guaranteed by the Mean Value Theorem on the interval $[x_1, x_2]$.

(b) Demonstrate the result of part (a) for

$$f(x) = 2x^2 - 3x + 1$$

on the interval $[0, 4]$.

Intervals on Which a Function Is Increasing or Decreasing **In Exercises 27–32, find the open intervals on which the function is increasing or decreasing.**

27. $f(x) = x^2 + 3x - 12$

28. $h(x) = (x + 2)^{1/3} + 8$

29. $f(x) = (x - 1)^2(2x - 5)$

30. $g(x) = (x + 1)^3$

31. $h(x) = \sqrt{x}(x - 3), \quad x > 0$

32. $f(x) = \sin x + \cos x, \quad 0 < x < 2\pi$

Applying the First Derivative Test **In Exercises 33–40, (a) find the critical numbers of f, if any, (b) find the open intervals on which the function is increasing or decreasing, (c) apply the First Derivative Test to identify all relative extrema, and (d) use a graphing utility to confirm your results.**

33. $f(x) = x^2 - 6x + 5$

34. $f(x) = 4x^3 - 5x$

35. $f(t) = \frac{1}{4}t^4 - 8t$

36. $f(x) = \frac{x^3 - 8x}{4}$

37. $f(x) = \frac{x + 4}{x^2}$

38. $f(x) = \frac{x^2 - 3x - 4}{x - 2}$

39. $f(x) = \cos x - \sin x, \quad (0, 2\pi)$

40. $f(x) = \frac{3}{2}\sin\left(\frac{\pi x}{2} - 1\right), \quad (0, 4)$

Motion Along a Line **In Exercises 41 and 42, the function $s(t)$ describes the motion of a particle along a line.**

(a) Find the velocity function of the particle at any time $t \geq 0$.

(b) Identify the time interval(s) on which the particle is moving in a positive direction.

(c) Identify the time interval(s) on which the particle is moving in a negative direction.

(d) Identify the time(s) at which the particle changes direction.

41. $s(t) = 3t - 2t^2$

42. $s(t) = 6t^3 - 8t + 3$

Finding Points of Inflection **In Exercises 43–48, find any points of inflection and discuss the concavity of the graph of the function.**

43. $f(x) = x^3 - 9x^2$

44. $f(x) = 6x^4 - x^2$

45. $g(x) = x\sqrt{x + 5}$

46. $f(x) = 3x - 5x^3$

47. $f(x) = x + \cos x, \quad [0, 2\pi]$

48. $f(x) = \tan\frac{x}{4}, \quad (0, 2\pi)$

Using the Second Derivative Test **In Exercises 49–54, find all relative extrema of the function. Use the Second Derivative Test where applicable.**

49. $f(x) = (x + 9)^2$

50. $f(x) = x^4 - 2x^2 + 6$

51. $g(x) = 2x^2(1 - x^2)$

52. $h(t) = t - 4\sqrt{t + 1}$

53. $f(x) = 2x + \frac{18}{x}$

54. $h(x) = x - 2\cos x, \quad [0, 4\pi]$

Think About It **In Exercises 55 and 56, sketch the graph of a function f having the given characteristics.**

55.
$f(0) = f(6) = 0$
$f'(3) = f'(5) = 0$
$f'(x) > 0$ for $x < 3$
$f'(x) > 0$ for $3 < x < 5$
$f'(x) < 0$ for $x > 5$
$f''(x) < 0$ for $x < 3$ or $x > 4$
$f''(x) > 0$ for $3 < x < 4$

56.
$f(0) = 4, f(6) = 0$
$f'(x) < 0$ for $x < 2$ or $x > 4$
$f'(2)$ does not exist.
$f'(4) = 0$
$f'(x) > 0$ for $2 < x < 4$
$f''(x) < 0$ for $x \neq 2$

57. Writing A newspaper article states that "The rate of growth of the national deficit is decreasing." What does this mean? What does it imply about the graph of the deficit as a function of time?

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. WCN 02-200-322

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

58. Inventory Cost The cost of inventory C depends on the ordering and storage costs according to the inventory model

$$C = \left(\frac{Q}{x}\right)s + \left(\frac{x}{2}\right)r.$$

Determine the order size that will minimize the cost, assuming that sales occur at a constant rate, Q is the number of units sold per year, r is the cost of storing one unit for one year, s is the cost of placing an order, and x is the number of units per order.

59. Modeling Data Outlays for national defense D (in billions of dollars) for 2011 through 2019 are shown in the table, where t is the time in years, with $t = 11$ corresponding to 2011. *(Source: U.S. Office of Management and Budget)*

t	11	12	13	14	15
D	705.6	677.9	633.4	603.5	589.7

t	16	17	18	19
D	593.4	598.7	631.1	686.0

(a) Use the regression capabilities of a graphing utility to find a model of the form $D = at^4 + bt^3 + ct^2 + dt + e$ for the data.

(b) Use a graphing utility to plot the data and graph the model.

(c) For the years shown in the table, when does the model indicate that the outlay for national defense was at a maximum? When was it at a minimum?

(d) For the years shown in the table, when does the model indicate that the outlay for national defense was increasing at the greatest rate?

60. Modeling Data The manager of a store recorded the annual sales S (in thousands of dollars) of a product over a period of 7 years, as shown in the table, where t is the time in years, with $t = 14$ corresponding to 2014.

t	14	15	16	17	18	19	20
S	8.1	7.3	7.8	9.2	11.3	12.8	12.9

(a) Use the regression capabilities of a graphing utility to find a model of the form $S = at^3 + bt^2 + ct + d$ for the data.

(b) Use a graphing utility to plot the data and graph the model.

(c) Use calculus and the model to find the time t when sales were increasing at the greatest rate.

(d) Do you think the model would be accurate for predicting future sales? Explain.

Finding a Limit **In Exercises 61–70, find the limit, if it exists.**

61. $\lim_{x\to\infty}\left(8 + \frac{1}{x}\right)$

62. $\lim_{x\to-\infty}\frac{1 - 4x}{x + 1}$

63. $\lim_{x\to\infty}\frac{x^2}{1 - 8x^2}$

64. $\lim_{x\to-\infty}\frac{9x^3 + 5}{7x^4}$

65. $\lim_{x\to-\infty}\frac{3x^2}{x + 5}$

66. $\lim_{x\to-\infty}\frac{\sqrt{x^2 + x}}{-2x}$

67. $\lim_{x\to\infty}\frac{5\cos x}{x}$

68. $\lim_{x\to\infty}\frac{x^3}{\sqrt{x^2 + 2}}$

69. $\lim_{x\to-\infty}\frac{6x}{x + \cos x}$

70. $\lim_{x\to-\infty}\frac{x}{2\sin x}$

Finding Horizontal Asymptotes Using Technology **In Exercises 71–74, use a graphing utility to graph the function and identify any horizontal asymptotes.**

71. $f(x) = \frac{3}{x} + 4$

72. $g(x) = \frac{5x^2}{x^2 + 2}$

73. $f(x) = \frac{x}{\sqrt{x^2 + 6}}$

74. $f(x) = \frac{\sqrt{4x^2 - 1}}{8x + 1}$

Analyzing the Graph of a Function **In Exercises 75–84, analyze and sketch a graph of the function. Label any intercepts, relative extrema, points of inflection, and asymptotes. Use a graphing utility to verify your results.**

75. $f(x) = 4x - x^2$

76. $f(x) = x^4 - 2x^2 + 6$

77. $f(x) = x\sqrt{16 - x^2}$

78. $f(x) = (x^2 - 4)^2$

79. $f(x) = x^{1/3}(x + 3)^{2/3}$

80. $f(x) = (x - 3)(x + 2)^3$

81. $f(x) = \frac{5 - 3x}{x - 2}$

82. $f(x) = \frac{2x}{1 + x^2}$

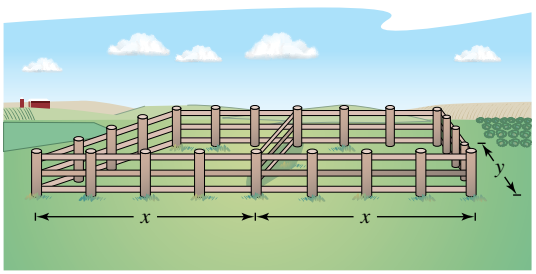
83. $f(x) = x^3 + x + \frac{4}{x}$

84. $f(x) = x^2 + \frac{1}{x}$

85. Finding Numbers Find two positive numbers such that the sum of twice the first number and three times the second number is 216 and the product is a maximum.

86. Minimum Distance Find the point on the graph of $f(x) = \sqrt{x}$ that is closest to the point $(6, 0)$.

87. Maximum Area A rancher has 400 feet of fencing with which to enclose two adjacent rectangular corrals (see figure). What dimensions should be used so that the enclosed area will be a maximum?



88. Maximum Area Find the dimensions of the rectangle of maximum area, with sides parallel to the coordinate axes, that can be inscribed in the ellipse given by

$$\frac{x^2}{144} + \frac{y^2}{16} = 1.$$

89. Minimum Length A right triangle in the first quadrant has the coordinate axes as sides, and the hypotenuse passes through the point $(1, 8)$. Find the vertices of the triangle such that the length of the hypotenuse is minimum.

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

90. Minimum Length The wall of a building is to be braced by a beam that must pass over a parallel fence 5 feet high and 4 feet from the building. Find the length of the shortest beam that can be used.

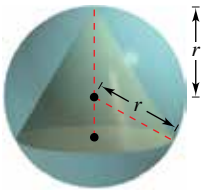
91. Maximum Length Find the length of the longest pipe that can be carried level around a right-angle corner at the intersection of two corridors of widths 4 feet and 6 feet.

92. Maximum Length A hallway of width 6 feet meets a hallway of width 9 feet at right angles. Find the length of the longest pipe that can be carried level around this corner. [*Hint:* If L is the length of the pipe, show that

$$L = 6 \csc \theta + 9 \csc\left(\frac{\pi}{2} - \theta\right)$$

where θ is the angle between the pipe and the wall of the narrower hallway.]

93. Maximum Volume Find the volume of the largest right circular cone that can be inscribed in a sphere of radius r.



94. Maximum Volume Find the volume of the largest right circular cylinder that can be inscribed in a sphere of radius r.

Using Newton's Method **In Exercises 95–98, use Newton's Method to approximate the zero(s) of the function. Continue the iterations until two successive approximations differ by less than 0.001. Then find the zero(s) using a graphing utility and compare the results.**

95. $f(x) = x^3 - 3x - 1$

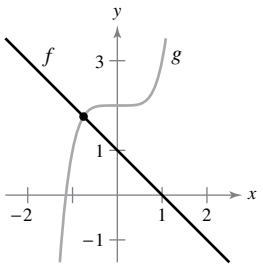
96. $f(x) = x^3 + 2x + 1$

97. $f(x) = x^4 + x^3 - 3x^2 + 2$

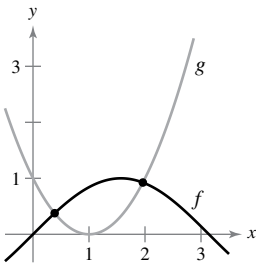
98. $f(x) = 3\sqrt{x - 1} - x$

Points of Intersection **In Exercises 99 and 100, apply Newton's Method to approximate the x-value(s) of the indicated point(s) of intersection of the two graphs. Continue the iterations until two successive approximations differ by less than 0.001. [*Hint:* Let $h(x) = f(x) - g(x)$.]**

99. $f(x) = 1 - x$
$g(x) = x^5 + 2$



100. $f(x) = \sin x$
$g(x) = x^2 - 2x + 1$



Comparing Δy and dy **In Exercises 101 and 102, use the information to find and compare Δy and dy.**

	Function	x-Value	Differential of x
101.	$y = 4x^3$	$x = 2$	$\Delta x = dx = 0.1$
102.	$y = x^2 - 5x$	$x = -3$	$\Delta x = dx = 0.01$

Finding a Differential **In Exercises 103 and 104, find the differential dy of the given function.**

103. $y = x(1 - \cos x)$

104. $y = \sqrt{36 - x^2}$

105. Approximating Function Values Use differentials to approximate the value of (a) $\sqrt{63.9}$ and (b) $(2.02)^4$. Compare your answers with that of a calculator.

106. Volume and Surface Area The radius of a sphere is measured as 9 centimeters, with a possible error of 0.025 centimeter.

(a) Use differentials to approximate the possible propagated error in computing the volume of the sphere.

(b) Use differentials to approximate the possible propagated error in computing the surface area of the sphere.

(c) Approximate the percent errors in parts (a) and (b).

Building on Concepts

107. The figures show a rectangle, a circle, and a semicircle inscribed in a triangle bounded by the coordinate axes and the first-quadrant portion of the line with intercepts $(3, 0)$ and $(0, 4)$. Find the dimensions of each inscribed figure such that its area is maximum. State whether calculus was helpful in finding the required dimensions. Explain your reasoning.

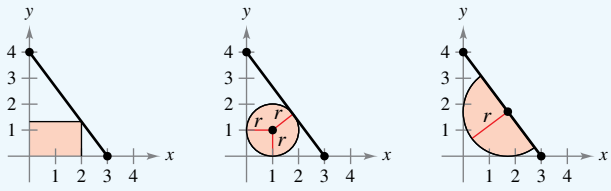


Figure for 107

108. Find the point on the graph of $y = 1/(1 + x^2)$ where the tangent line has the greatest slope, and the point where the tangent line has the least slope (see figure).

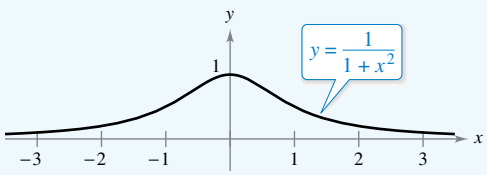

Figure for 108

109. Find a, b, and c so that the function f satisfies the hypotheses of the Mean Value Theorem on the interval $[0, 3]$.

$$f(x) = \begin{cases} 1, & x = 0 \\ ax + b, & 0 < x \le 1 \\ x^2 + 4x + c, & 1 < x \le 3 \end{cases}$$

P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Relative Extrema Graph the fourth-degree polynomial

$$p(x) = x^4 + ax^2 + 1$$

for various values of the constant a.

(a) Determine the values of a for which p has exactly one relative minimum.

(b) Determine the values of a for which p has exactly one relative maximum.

(c) Determine the values of a for which p has exactly two relative minima.

(d) Show that the graph of p cannot have exactly two relative extrema.

2. Relative Minimum Let

$$f(x) = \frac{c}{x} + x^2.$$

Determine all values of the constant c such that f has a relative minimum, but no relative maximum.

3. Points of Inflection

(a) Let

$$f(x) = ax^2 + bx + c, \quad a \neq 0$$

be a quadratic polynomial. How many points of inflection does the graph of f have?

(b) Let

$$f(x) = ax^3 + bx^2 + cx + d, \quad a \neq 0$$

be a cubic polynomial. How many points of inflection does the graph of f have?

(c) Suppose the function $y = f(x)$ satisfies the equation

$$\frac{dy}{dx} = ky\left(1 - \frac{y}{L}\right)$$

where k and L are positive constants. Show that the graph of f has a point of inflection at the point where $y = L/2$. (This equation is called the **logistic differential equation.**)

4. Proof

(a) Prove that $\lim_{x\to\infty} x^2 = \infty$.

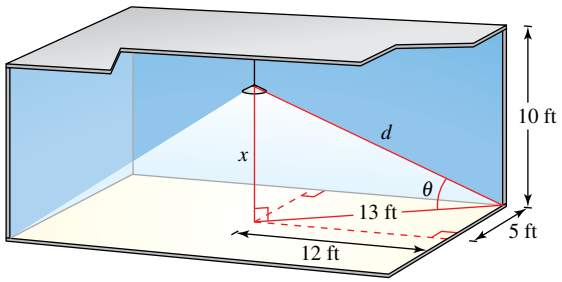
(b) Prove that $\lim_{x\to\infty} \frac{1}{x^2} = 0$.

(c) Let L be a real number. Prove that if $\lim_{x\to\infty} f(x) = L$, then

$$\lim_{y\to 0^+} f\left(\frac{1}{y}\right) = L.$$

5. Darboux's Theorem Prove **Darboux's Theorem:** Let f be differentiable on the closed interval $[a, b]$ such that $f'(a) = y_1$ and $f'(b) = y_2$. If d lies between y_1 and y_2, then there exists c in (a, b) such that $f'(c) = d$.

6. Illumination The amount of illumination of a surface is proportional to the intensity of the light source, inversely proportional to the square of the distance from the light source, and proportional to $\sin\theta$, where θ is the angle at which the light strikes the surface. A rectangular room measures 10 feet by 24 feet, with a 10-foot ceiling (see figure). Determine the height at which the light should be placed to allow the corners of the floor to receive as much light as possible.



7. Minimum Distance Consider a room in the shape of a cube, 4 meters on each side. A bug at point P wants to walk to point Q at the opposite corner, as shown in the figure. Use calculus to determine the shortest path. Explain how you can solve this problem without calculus. (*Hint:* Consider the two walls as one wall.)

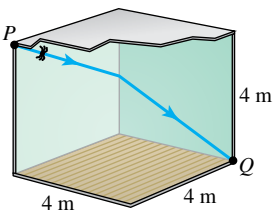


Figure for 7

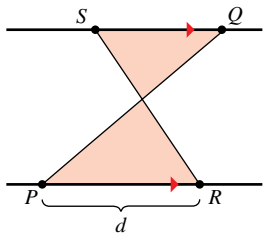

Figure for 8

8. Areas of Triangles The line joining P and Q crosses the two parallel lines, as shown in the figure. The point R is d units from P. How far from Q should the point S be positioned so that the sum of the areas of the two shaded triangles is a minimum? So that the sum is a maximum?

9. Extended Mean Value Theorem Prove the **Extended Mean Value Theorem:** If f and f' are continuous on the closed interval $[a, b]$, and if f'' exists in the open interval (a, b), then there exists a number c in (a, b) such that

$$f(b) = f(a) + f'(a)(b - a) + \frac{1}{2}f''(c)(b - a)^2.$$

10. Mean Value Theorem Determine the values a, b, c, and d such that the function f satisfies the hypotheses of the Mean Value Theorem on the interval $[-1, 2]$.

$$f(x) = \begin{cases} a, & x = -1 \\ 2, & -1 < x \leq 0 \\ bx^2 + c, & 0 < x \leq 1 \\ dx + 4, & 1 < x \leq 2 \end{cases}$$

4.1 Antiderivatives and Indefinite Integration

GO DIGITAL

- **Write the general solution of a differential equation and use indefinite integral notation for antiderivatives.**
- **Use basic integration rules to find antiderivatives.**
- **Find a particular solution of a differential equation.**

Antiderivatives

To find a function F whose derivative is $f(x) = 3x^2$, you might use your knowledge of derivatives to conclude that

$$F(x) = x^3 \quad \text{because} \quad \frac{d}{dx}[x^3] = 3x^2.$$

The function F is an *antiderivative* of f.

Definition of Antiderivative

A function F is an **antiderivative** of f on an interval I when $F'(x) = f(x)$ for all x in I.

Note that F is called *an* antiderivative of f rather than *the* antiderivative of f. To see why, observe that

$$F_1(x) = x^3, \quad F_2(x) = x^3 - 5, \quad \text{and} \quad F_3(x) = x^3 + 97$$

are all antiderivatives of $f(x) = 3x^2$. In fact, for any constant C, the function $F(x) = x^3 + C$ is an antiderivative of f.

Exploration

Finding Antiderivatives

For each derivative, describe the original function F.

a. $F'(x) = 2x$

b. $F'(x) = x$

c. $F'(x) = x^2$

d. $F'(x) = \dfrac{1}{x^2}$

e. $F'(x) = \dfrac{1}{x^3}$

f. $F'(x) = \cos x$

What strategy did you use to find F?

THEOREM 4.1 Representation of Antiderivatives

If F is an antiderivative of f on an interval I, then G is an antiderivative of f on the interval I if and only if G is of the form $G(x) = F(x) + C$ for all x in I, where C is a constant.

Proof The proof of Theorem 4.1 in one direction is straightforward. That is, if $G(x) = F(x) + C$, $F'(x) = f(x)$, and C is a constant, then

$$G'(x) = \frac{d}{dx}[F(x) + C] = F'(x) + 0 = f(x).$$

To prove this theorem in the other direction, assume that G is an antiderivative of f. Define a function H such that

$$H(x) = G(x) - F(x).$$

For any two points a and b $(a < b)$ in the interval, H is continuous on $[a, b]$ and differentiable on (a, b). By the Mean Value Theorem,

$$H'(c) = \frac{H(b) - H(a)}{b - a}$$

for some c in (a, b). However, $H'(c) = 0$, so $H(a) = H(b)$. Because a and b are arbitrary points in the interval, you know that H is a constant function C. So, $G(x) - F(x) = C$ and it follows that $G(x) = F(x) + C$. ∎

Big Ideas of Calculus

In this chapter, you will study integration. Integration, like differentiation, is a major theme of calculus. Interestingly, as you will learn in the Fundamental Theorem of Calculus, these two major themes have an inverse relationship. As part of your study of integration, you will examine the areas of plane regions.

GO DIGITAL

Using Theorem 4.1, you can represent the entire family of antiderivatives of a function by adding a constant to a *known* antiderivative. For example, knowing that

$$D_x[x^2] = 2x$$

you can represent the family of *all* antiderivatives of $f(x) = 2x$ by

$$G(x) = x^2 + C \qquad \text{Family of all antiderivatives of } f(x) = 2x$$

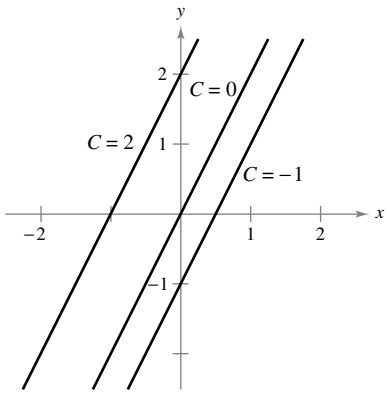
where C is a constant. The constant C is called the **constant of integration.** The family of functions represented by G is the **general antiderivative** of f, and $G(x) = x^2 + C$ is the **general solution** of the *differential equation*

$$G'(x) = 2x. \qquad \text{Differential equation}$$

A **differential equation** in x and y is an equation that involves x, y, and derivatives of y. For instance,

$$y' = 3x \quad \text{and} \quad y' = x^2 + 1$$

are examples of differential equations.



Functions of the form $y = 2x + C$
Figure 4.1

EXAMPLE 1 Solving a Differential Equation

Find the general solution of the differential equation $dy/dx = 2$.

Solution To begin, you need to find a function whose derivative is 2. One such function is

$$y = 2x. \qquad 2x \text{ is } \textit{an} \text{ antiderivative of } 2.$$

Now, use Theorem 4.1 to conclude that the general solution of the differential equation $dy/dx = 2$ is

$$y = 2x + C. \qquad \text{General solution}$$

The graphs of several functions of the form $y = 2x + C$ are shown in Figure 4.1. ■

When solving a differential equation of the form

$$\frac{dy}{dx} = f(x) \qquad \text{Differential equation}$$

it is convenient to write it in the equivalent differential form

$$dy = f(x)\,dx. \qquad \text{Equation in differential form}$$

The operation of finding all solutions of this equation is called **antidifferentiation** (or **indefinite integration**) and is denoted by an integral sign $\int$. The general solution is denoted by

Variable of integration — Constant of integration

$$y = \int f(x)\,dx = F(x) + C.$$

Integrand — An antiderivative of $f(x)$

REMARK In this text, the notation $\int f(x)\,dx = F(x) + C$ means that F is an antiderivative of f *on an interval*.

The expression $\int f(x)\,dx$ is read as the *antiderivative of f with respect to x*. So, the differential dx serves to identify x as the variable of integration. The term **indefinite integral** is a synonym for antiderivative.

Basic Integration Rules

The inverse nature of integration and differentiation can be verified by substituting $F'(x)$ for $f(x)$ in the indefinite integration definition to obtain

$$\int F'(x)\,dx = F(x) + C.$$ Integration is the "inverse" of differentiation.

Moreover, if $\int f(x)\,dx = F(x) + C$, then

$$\frac{d}{dx}\left[\int f(x)\,dx\right] = f(x).$$ Differentiation is the "inverse" of integration.

These two equations allow you to obtain integration formulas directly from differentiation formulas, as shown in the following summary.

Basic Integration Rules

Differentiation Formula	Integration Formula	
$\frac{d}{dx}[C] = 0$	$\int 0\,dx = C$	
$\frac{d}{dx}[kx] = k$	$\int k\,dx = kx + C$	
$\frac{d}{dx}[kf(x)] = kf'(x)$	$\int kf(x)\,dx = k\int f(x)\,dx$	
$\frac{d}{dx}[f(x) \pm g(x)] = f'(x) \pm g'(x)$	$\int [f(x) \pm g(x)]\,dx = \int f(x)\,dx \pm \int g(x)\,dx$	
$\frac{d}{dx}[x^n] = nx^{n-1}$	$\int x^n\,dx = \frac{x^{n+1}}{n+1} + C, \quad n \neq -1$	Power Rule
$\frac{d}{dx}[\sin x] = \cos x$	$\int \cos x\,dx = \sin x + C$	
$\frac{d}{dx}[\cos x] = -\sin x$	$\int \sin x\,dx = -\cos x + C$	
$\frac{d}{dx}[\tan x] = \sec^2 x$	$\int \sec^2 x\,dx = \tan x + C$	
$\frac{d}{dx}[\sec x] = \sec x \tan x$	$\int \sec x \tan x\,dx = \sec x + C$	
$\frac{d}{dx}[\cot x] = -\csc^2 x$	$\int \csc^2 x\,dx = -\cot x + C$	
$\frac{d}{dx}[\csc x] = -\csc x \cot x$	$\int \csc x \cot x\,dx = -\csc x + C$	

Note that the Power Rule for Integration has the restriction that $n \neq -1$. The integration formula for

$$\int \frac{1}{x}\,dx$$ Antiderivative of the reciprocal function

must wait until the introduction of the natural logarithmic function in Chapter 5.

REMARK In Example 2, note that the general pattern of integration is similar to that of differentiation.

Original integral
⇩
Rewrite
⇩
Integrate
⇩
Simplify

EXAMPLE 2 Describing Antiderivatives

$$\int 3x\,dx = 3\int x\,dx \qquad \text{Constant Multiple Rule}$$
$$= 3\int x^1\,dx \qquad \text{Rewrite } x \text{ as } x^1.$$
$$= 3\left(\frac{x^2}{2}\right) + C \qquad \text{Power Rule } (n = 1)$$
$$= \frac{3}{2}x^2 + C \qquad \text{Simplify.}$$

The antiderivatives of $3x$ are of the form $\frac{3}{2}x^2 + C$, where C is any constant. ■

When finding indefinite integrals, a strict application of the basic integration rules tends to produce complicated constants of integration. For instance, in Example 2, the solution could have been written as

$$\int 3x\,dx = 3\int x\,dx = 3\left(\frac{x^2}{2} + C\right) = \frac{3}{2}x^2 + 3C.$$

Because C represents *any* constant, it is both cumbersome and unnecessary to write $3C$ as the constant of integration. So, $\frac{3}{2}x^2 + 3C$ is written in the simpler form $\frac{3}{2}x^2 + C$.

EXAMPLE 3 Rewriting Before Integrating

See LarsonCalculus.com for an interactive version of this type of example.

	Original Integral	Rewrite	Integrate	Simplify
a.	$\int \frac{1}{x^3}\,dx$	$\int x^{-3}\,dx$	$\frac{x^{-2}}{-2} + C$	$-\frac{1}{2x^2} + C$
b.	$\int \sqrt{x}\,dx$	$\int x^{1/2}\,dx$	$\frac{x^{3/2}}{3/2} + C$	$\frac{2}{3}x^{3/2} + C$
c.	$\int 2\sin x\,dx$	$2\int \sin x\,dx$	$2(-\cos x) + C$	$-2\cos x + C$

REMARK The basic integration rules allow you to integrate any polynomial function.

EXAMPLE 4 Integrating Polynomial Functions

a. $\int dx = \int 1\,dx$ Integrand is understood to be 1.

$= x + C$ Constant Rule

b. $\int (x + 2)\,dx = \int x\,dx + \int 2\,dx$ Sum Rule

$= \frac{x^2}{2} + C_1 + 2x + C_2$ Power and Constant Rules

$= \frac{x^2}{2} + 2x + C$ $C = C_1 + C_2$

The second line in the solution is usually omitted.

c. $\int (3x^4 - 5x^2 + x)\,dx = 3\left(\frac{x^5}{5}\right) - 5\left(\frac{x^3}{3}\right) + \frac{x^2}{2} + C$

$= \frac{3}{5}x^5 - \frac{5}{3}x^3 + \frac{1}{2}x^2 + C$ ■

GO DIGITAL

One of the most important steps in integration is *rewriting the integrand* in a form that fits one of the basic integration rules. To further illustrate this point, note how the integrands are rewritten in the next three examples.

EXAMPLE 5 Rewriting Before Integrating

$$\int \frac{x+1}{\sqrt{x}}\,dx = \int \left(\frac{x}{\sqrt{x}} + \frac{1}{\sqrt{x}}\right) dx \qquad \text{Rewrite as two fractions.}$$

$$= \int (x^{1/2} + x^{-1/2})\,dx \qquad \text{Rewrite with rational exponents.}$$

$$= \frac{x^{3/2}}{3/2} + \frac{x^{1/2}}{1/2} + C \qquad \text{Integrate.}$$

$$= \frac{2}{3}x^{3/2} + 2x^{1/2} + C \qquad \text{Simplify.}$$

When integrating quotients, do not integrate the numerator and denominator separately. This is no more valid in integration than it is in differentiation. For instance, in Example 5, be sure you understand that

$$\int \frac{x+1}{\sqrt{x}}\,dx \neq \frac{\int (x+1)\,dx}{\int \sqrt{x}\,dx}.$$

EXAMPLE 6 Rewriting Before Integrating

$$\int \frac{\sin x}{\cos^2 x}\,dx = \int \left(\frac{1}{\cos x}\right)\left(\frac{\sin x}{\cos x}\right) dx \qquad \text{Rewrite as a product.}$$

$$= \int \sec x \tan x\,dx \qquad \text{Rewrite using trigonometric identities.}$$

$$= \sec x + C \qquad \text{Integrate.}$$

REMARK Recall from trigonometry that

$$\sec x = \frac{1}{\cos x}$$

and

$$\tan x = \frac{\sin x}{\cos x}.$$

EXAMPLE 7 Rewriting Before Integrating

	Original Integral	Rewrite	Integrate	Simplify
a.	$\int \frac{2}{\sqrt{x}}\,dx$	$2\int x^{-1/2}\,dx$	$2\left(\frac{x^{1/2}}{1/2}\right) + C$	$4x^{1/2} + C$
b.	$\int (t^2+1)^2\,dt$	$\int (t^4 + 2t^2 + 1)\,dt$	$\frac{t^5}{5} + 2\left(\frac{t^3}{3}\right) + t + C$	$\frac{1}{5}t^5 + \frac{2}{3}t^3 + t + C$
c.	$\int \frac{x^3+3}{x^2}\,dx$	$\int (x + 3x^{-2})\,dx$	$\frac{x^2}{2} + 3\left(\frac{x^{-1}}{-1}\right) + C$	$\frac{1}{2}x^2 - \frac{3}{x} + C$
d.	$\int \sqrt[3]{x}(x-4)\,dx$	$\int (x^{4/3} - 4x^{1/3})\,dx$	$\frac{x^{7/3}}{7/3} - 4\left(\frac{x^{4/3}}{4/3}\right) + C$	$\frac{3}{7}x^{7/3} - 3x^{4/3} + C$

As you do the exercises, note that you can check your answer to an antidifferentiation problem by differentiating. For instance, in Example 7(a), you can check that $4x^{1/2} + C$ is the correct antiderivative by differentiating the answer to obtain

$$D_x[4x^{1/2} + C] = 4\left(\frac{1}{2}\right)x^{-1/2} = \frac{2}{\sqrt{x}}. \qquad \text{Use differentiation to check antiderivative.}$$

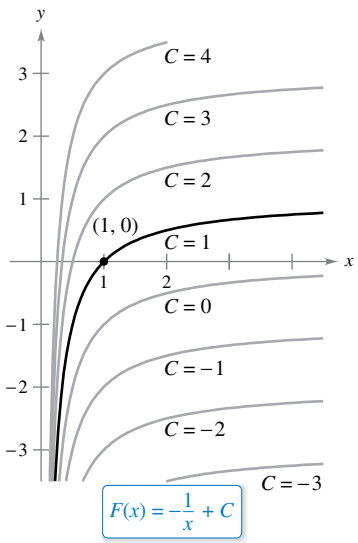
The particular solution that satisfies the initial condition $F(2) = 4$ is $F(x) = x^3 - x - 2$.

Figure 4.2

GO DIGITAL



The particular solution that satisfies the initial condition $F(1) = 0$ is $F(x) = -(1/x) + 1, x > 0$.

Figure 4.3

Initial Conditions and Particular Solutions

You have already seen that the equation $y = \int f(x)\,dx$ has many solutions (each differing from the others by a constant). This means that the graphs of any two antiderivatives of f are vertical translations of each other. For example, Figure 4.2 shows the graphs of several antiderivatives of the form

$$y = \int (3x^2 - 1)\,dx = x^3 - x + C \qquad \text{General solution}$$

for various integer values of C. Each of these antiderivatives is a solution of the differential equation

$$\frac{dy}{dx} = 3x^2 - 1. \qquad \text{Differential equation}$$

In many applications of integration, you are given enough information to determine a **particular solution.** To do this, you need only know the value of $y = F(x)$ for one value of x. This information is called an **initial condition.** For example, in Figure 4.2, only one curve passes through the point $(2, 4)$. To find this curve, use the general solution

$$F(x) = x^3 - x + C \qquad \text{General solution}$$

and the initial condition

$$F(2) = 4. \qquad \text{Initial condition}$$

By using the initial condition in the general solution, you can determine that

$$F(2) = 8 - 2 + C = 4$$

which implies that $C = -2$. So, the particular solution that passes through $(2, 4)$ is

$$F(x) = x^3 - x - 2. \qquad \text{Particular solution}$$

EXAMPLE 8 Finding a Particular Solution

Find the general solution of

$$F'(x) = \frac{1}{x^2}, \quad x > 0$$

and find the particular solution that satisfies the initial condition $F(1) = 0$.

Solution To find the general solution, integrate to obtain

$$\begin{aligned} F(x) &= \int \frac{1}{x^2}\,dx && F(x) = \textstyle\int F'(x)\,dx \\ &= \int x^{-2}\,dx && \text{Rewrite as a power.} \\ &= \frac{x^{-1}}{-1} + C && \text{Integrate.} \\ &= -\frac{1}{x} + C, \quad x > 0. && \text{General solution} \end{aligned}$$

Using the initial condition $F(1) = 0$, you can solve for C as shown.

$$F(1) = -\frac{1}{1} + C = 0 \quad \Rightarrow \quad C = 1$$

So, the particular solution, as shown in Figure 4.3, is

$$F(x) = -\frac{1}{x} + 1, \quad x > 0. \qquad \text{Particular solution}$$

GO DIGITAL

So far in this section, you have been using x as the variable of integration. In applications, it is often convenient to use a different variable. For instance, in the next example, involving *time*, the variable of integration is t.

EXAMPLE 9 Solving a Vertical Motion Problem

A ball is thrown upward with an initial velocity of 64 feet per second from an initial height of 80 feet. [Assume the acceleration is $a(t) = -32$ feet per second per second.]

a. Find the position function giving the height s as a function of the time t.

b. When does the ball hit the ground?

Solution

a. Let $t = 0$ represent the initial time. The two given initial conditions can be written as shown.

$$s(0) = 80 \qquad \text{Initial height is 80 feet.}$$
$$s'(0) = 64 \qquad \text{Initial velocity is 64 feet per second.}$$

Recall that $a(t) = s''(t)$, so integrate $s''(t) = -32$ to find the velocity function.

$$s'(t) = \int s''(t)\,dt = \int -32\,dt = -32t + C_1$$

Using the initial velocity, you obtain $s'(0) = 64 = -32(0) + C_1$, which implies that $C_1 = 64$. Next, integrate the velocity function $s'(t)$ to find the position function.

$$s(t) = \int s'(t)\,dt = \int (-32t + 64)\,dt = -16t^2 + 64t + C_2$$

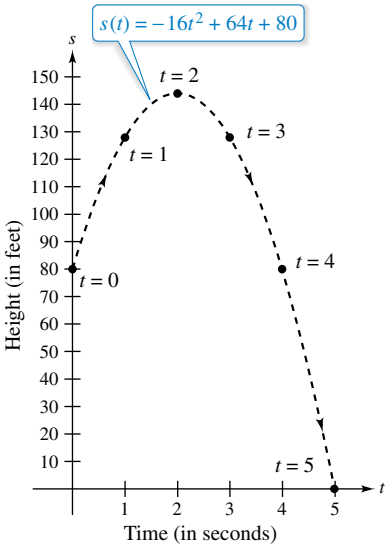
Using the initial height, you obtain

$$s(0) = 80 = -16(0^2) + 64(0) + C_2$$

which implies that $C_2 = 80$. So, the position function is

$$s(t) = -16t^2 + 64t + 80. \qquad \text{Position function}$$

The graph of s is shown in Figure 4.4.



Height of a ball at time t

Figure 4.4

b. Using the position function found in part (a), you can find the time at which the ball hits the ground by solving the equation $s(t) = 0$.

$$-16t^2 + 64t + 80 = 0 \qquad \text{Set } s(t) \text{ equal to 0.}$$
$$-16(t + 1)(t - 5) = 0 \qquad \text{Factor.}$$
$$t = -1, 5 \qquad t\text{-values for which } s(t) = 0$$

Because t must be positive, you can conclude that the ball hits the ground 5 seconds after it was thrown. ■

In Example 9, note that the position function has the form

$$s(t) = -\frac{1}{2}gt^2 + v_0t + s_0 \qquad \text{Position function}$$

where g is the acceleration due to gravity, v_0 is the initial velocity, and s_0 is the initial height, as presented in Section 2.2.

Example 9 shows how to use calculus to analyze vertical motion problems in which the acceleration is determined by a gravitational force. You can use a similar strategy to analyze other linear motion problems (vertical or horizontal) in which the acceleration (or deceleration) is the result of some other force, as you will see in Exercises 65–72.

4.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain what it means for a function F to be an antiderivative of a function f on an interval I.
2. Can two different functions both be antiderivatives of the same function? Explain.
3. Explain how to find a particular solution of a differential equation.
4. Describe the difference between the general solution and a particular solution of a differential equation.

Integration and Differentiation **In Exercises 5 and 6, verify the statement by showing that the derivative of the right side equals the integrand on the left side.**

5. $\int \left(-\frac{6}{x^4}\right) dx = \frac{2}{x^3} + C$
6. $\int \left(8x^3 + \frac{1}{2x^2}\right) dx = 2x^4 - \frac{1}{2x} + C$

Solving a Differential Equation **In Exercises 7–10, find the general solution of the differential equation and check the result by differentiation.**

7. $\frac{dy}{dt} = 9t^2$
8. $\frac{dy}{dt} = 5$
9. $\frac{dy}{dx} = x^{3/2}$
10. $\frac{dy}{dx} = 2x^{-3}$

Rewriting Before Integrating **In Exercises 11–14, complete the table to find the indefinite integral.**

Original Integral	Rewrite	Integrate	Simplify
11. $\int \sqrt[3]{x}\, dx$			
12. $\int \frac{1}{4x^2}\, dx$			
13. $\int \frac{1}{x\sqrt{x}}\, dx$			
14. $\int \frac{1}{(3x)^2}\, dx$			

Finding an Indefinite Integral **In Exercises 15–36, find the indefinite integral and check the result by differentiation.**

15. $\int (x + 7)\, dx$
16. $\int (13 - x)\, dx$
17. $\int (x^5 + 1)\, dx$
18. $\int (9x^8 - 2x - 6)\, dx$
19. $\int (x^{3/2} + 2x + 1)\, dx$
20. $\int \left(\sqrt{x} + \frac{1}{2\sqrt{x}}\right) dx$
21. $\int \sqrt[3]{x^2}\, dx$
22. $\int \left(\sqrt[4]{x^3} + 1\right) dx$
23. $\int \frac{1}{x^5}\, dx$
24. $\int \left(2 - \frac{3}{x^{10}}\right) dx$
25. $\int \frac{x + 6}{\sqrt{x}}\, dx$
26. $\int \frac{x^4 - 3x^2 + 5}{x^4}\, dx$
27. $\int (x + 1)(3x - 2)\, dx$
28. $\int (4t^2 + 3)^2\, dt$
29. $\int (5\cos x + 4\sin x)\, dx$
30. $\int (\sin x - 6\cos x)\, dx$
31. $\int (\csc x \cot x - 2x)\, dx$
32. $\int (\theta^2 + \sec^2\theta)\, d\theta$
33. $\int (\sec^2\theta - \sin\theta)\, d\theta$
34. $\int (\sec y)(\tan y - \sec y)\, dy$
35. $\int (\tan^2 y + 1)\, dy$
36. $\int (4x - \csc^2 x)\, dx$

Finding a Particular Solution **In Exercises 37–44, find the particular solution of the differential equation that satisfies the initial condition(s).**

37. $f'(x) = 6x,\ f(0) = 8$
38. $g'(x) = 4x^2,\ g(-1) = 3$
39. $h'(x) = 7x^6 + 5,\ h(1) = -1$
40. $f'(s) = 10s - 12s^3,\ f(3) = 2$
41. $f''(x) = 2,\ f'(2) = 5,\ f(2) = 10$
42. $f''(x) = 3x^2,\ f'(-1) = -2,\ f(2) = 3$
43. $f''(x) = x^{-3/2},\ f'(4) = 2,\ f(0) = 0$
44. $f''(x) = \sin x,\ f'(0) = 1,\ f(0) = 6$

Slope Field **In Exercises 45 and 46, a differential equation, a point, and a slope field are given. A *slope field* (or *direction field*) consists of line segments with slopes given by the differential equation. These line segments give a visual perspective of the slopes of the solutions of the differential equation. (a) Sketch two approximate solutions of the differential equation on the slope field, one of which passes through the indicated point. (To print an enlarged copy of the graph, go to *MathGraphs.com*.) (b) Use integration and the given point to find the particular solution of the differential equation and use a graphing utility to graph the solution. Compare the result with the sketch in part (a) that passes through the given point.**

45. $\frac{dy}{dx} = x^2 - 1,\ (-1, 3)$
46. $\frac{dy}{dx} = -\frac{1}{x^2},\ x > 0,\ (1, 3)$

Slope Field **In Exercises 47 and 48, (a) use a graphing utility to graph a slope field for the differential equation, (b) use integration and the given point to find the particular solution of the differential equation, and (c) graph the particular solution and the slope field in the same viewing window.**

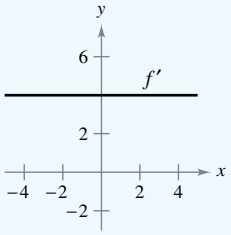
47. $\frac{dy}{dx} = 2x, (-2, -2)$

48. $\frac{dy}{dx} = 2\sqrt{x}, (4, 12)$

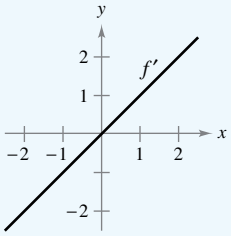
Exploring Concepts

In Exercises 49 and 50, the graph of the derivative of a function is given. Sketch the graphs of *two* functions that have the given derivative. (There is more than one correct answer.) To print an enlarged copy of the graph, go to *MathGraphs.com*.

49.

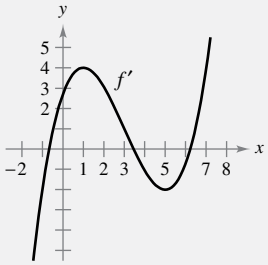


50.



51. Consider $f(x) = \tan^2 x$ and $g(x) = \sec^2 x$. What do you notice about the derivatives of f and g? What can you conclude about the relationship between f and g?

52. **HOW DO YOU SEE IT?** Use the graph of f' shown in the figure to answer the following.



(a) Approximate the slope of f at $x = 4$. Explain.

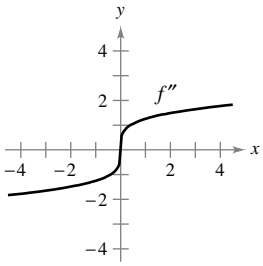
(b) Is $f(5) - f(4) > 0$? Explain.

(c) Approximate the value of x where f is maximum. Explain.

(d) Approximate any open intervals on which the graph of f is concave upward and any open intervals on which it is concave downward. Approximate the x-coordinates of any points of inflection.

53. **Horizontal Tangent** Find a function f such that the graph of f has a horizontal tangent at $(2, 0)$ and $f''(x) = 2x$.

54. **Sketching Graphs** The graphs of f and f' each pass through the origin. Use the graph of f'' shown in the figure to sketch the graphs of f and f'. To print an enlarged copy of the graph, go to *MathGraphs.com.*



55. **Tree Growth** An evergreen nursery usually sells a certain type of shrub after 6 years of growth and shaping. The growth rate during those 6 years is approximated by $dh/dt = 1.5t + 5$, where t is the time in years and h is the height in centimeters. The seedlings are 12 centimeters tall when planted ($t = 0$).

(a) Find the height after t years.

(b) How tall are the shrubs when they are sold?

56. **Population Growth** The rate of growth dP/dt of a population of bacteria is proportional to the square root of t, where P is the population size and t is the time in days ($0 \le t \le 10$). That is,

$$\frac{dP}{dt} = k\sqrt{t}.$$

The initial size of the population is 500. After 1 day, the population has grown to 600. Estimate the population after 7 days.

Vertical Motion **In Exercises 57–59, assume the acceleration of the object is $a(t) = -32$ feet per second per second. (Neglect air resistance.)**

57. A ball is launched vertically upward from a height of 6 feet with an initial velocity of 60 feet per second. Determine its maximum height.

58. With what initial velocity must an object be launched upward (from ground level) to reach the top of the Washington Monument (approximately 550 feet)?

59. A balloon, rising vertically with a velocity of 16 feet per second, releases a sandbag at the instant it is 64 feet above the ground.

(a) How many seconds after its release will the bag strike the ground?

(b) At what velocity will the bag hit the ground?

Vertical Motion **In Exercises 60–62, assume the acceleration of the object is $a(t) = -9.8$ meters per second per second. (Neglect air resistance.)**

60. A baseball is thrown upward from a height of 2 meters with an initial velocity of 10 meters per second. Determine its maximum height.

61. With what initial velocity must an object be launched upward (from a height of 2 meters) to reach a maximum height of 200 meters?

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

62. Grand Canyon

The Grand Canyon is 1800 meters deep at its deepest point. A rock is dropped from the rim above this point. How long will it take the rock to hit the canyon floor?

63. Lunar Gravity On the moon, the acceleration of a free-falling object is $a(t) = -1.6$ meters per second per second. A stone is dropped from a cliff on the moon and hits the surface of the moon 20 seconds later. How far did it fall? What was its velocity at impact?

64. Escape Velocity The minimum velocity required for an object to escape Earth's gravitational pull is obtained from the solution of the equation

$$\int v\,dv = -GM\int \frac{1}{y^2}\,dy$$

where v is the velocity of the object projected from Earth, y is the distance from the center of Earth, G is the gravitational constant, and M is the mass of Earth. Show that v and y are related by the equation

$$v^2 = v_0^2 + 2GM\left(\frac{1}{y} - \frac{1}{R}\right)$$

where v_0 is the initial velocity of the object and R is the radius of Earth.

Rectilinear Motion **In Exercises 65–68, consider a particle moving along the x-axis, where $x(t)$ is the position of the particle at time t, $x'(t)$ is its velocity, and $x''(t)$ is its acceleration.**

65. $x(t) = t^3 - 6t^2 + 9t - 2, \quad 0 \le t \le 5$

(a) Find the velocity and acceleration of the particle.

(b) Find the open t-intervals on which the particle is moving to the right.

(c) Find the velocity of the particle when the acceleration is 0.

66. Repeat Exercise 65 for the position function $x(t) = (t-1)(t-3)^2, 0 \le t \le 5$.

67. A particle moves along the x-axis at a velocity of $v(t) = 1/\sqrt{t}$, $t > 0$. At time $t = 1$, its position is $x = 4$. Find the acceleration and position functions for the particle.

68. A particle, initially at rest, moves along the x-axis such that its acceleration at time $t > 0$ is given by $a(t) = \cos t$. At time $t = 0$, its position is $x = 3$.

(a) Find the velocity and position functions for the particle.

(b) Find the values of t for which the particle is at rest.

69. Acceleration A car dealership advertises that a car takes 13 seconds to accelerate from 25 kilometers per hour to 80 kilometers per hour. Assume the acceleration is constant.

(a) Find the acceleration in meters per second per second.

(b) Find the distance the car travels during the 13 seconds.

70. Deceleration A car traveling at 45 miles per hour is brought to a stop, at constant deceleration, 132 feet from where the brakes are applied.

(a) How far has the car moved when its speed has been reduced to 30 miles per hour?

(b) How far has the car moved when its speed has been reduced to 15 miles per hour?

(c) Draw the real number line from 0 to 132. Plot the points found in parts (a) and (b). What can you conclude?

71. Acceleration At the instant the traffic light turns green, a car that has been waiting at an intersection starts with a constant acceleration of 6 feet per second per second. At the same instant, a truck traveling with a constant velocity of 30 feet per second passes the car.

(a) How far beyond its starting point will the car pass the truck?

(b) How fast will the car be traveling when it passes the truck?

72. Acceleration A fully loaded plane starting from rest has a constant acceleration while moving down a runway. The plane requires 0.7 mile of runway and a speed of 160 miles per hour in order to lift off. What is the plane's acceleration?

True or False? **In Exercises 73–78, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

73. The antiderivative of $f(x)$ is unique.

74. Each antiderivative of an nth-degree polynomial function is an $(n+1)$th-degree polynomial function.

75. If $p(x)$ is a polynomial function, then p has exactly one antiderivative whose graph contains the origin.

76. If $F(x)$ and $G(x)$ are antiderivatives of $f(x)$, then

$$F(x) = G(x) + C.$$

77. If $f'(x) = g(x)$, then $\int g(x)\,dx = f(x) + C$.

78. $\int f(x)g(x)\,dx = \left(\int f(x)\,dx\right)\left(\int g(x)\,dx\right)$

79. Proof Let $s(x)$ and $c(x)$ be two functions satisfying $s'(x) = c(x)$ and $c'(x) = -s(x)$ for all x. If $s(0) = 0$ and $c(0) = 1$, prove that $[s(x)]^2 + [c(x)]^2 = 1$.

80. Think About It Find the general solution of

$$f'(x) = -2x\sin x^2.$$

PUTNAM EXAM CHALLENGE

81. Suppose f and g are non-constant, differentiable, real-valued functions defined on $(-\infty, \infty)$. Furthermore, suppose that for each pair of real numbers x and y,

$$f(x+y) = f(x)f(y) - g(x)g(y) \quad \text{and}$$
$$g(x+y) = f(x)g(y) + g(x)f(y).$$

If $f'(0) = 0$, prove that $(f(x))^2 + (g(x))^2 = 1$ for all x.

This problem was composed by the Committee on the Putnam Prize Competition.

4.2 Area

GO DIGITAL

- Use sigma notation to write and evaluate a sum.
- Describe the concept of area.
- Approximate the area of a plane region.
- Find the area of a plane region using limits.

Sigma Notation

In the preceding section, you studied antidifferentiation. In this section, you will look further into a problem introduced in Section 1.1—that of finding the area of a region in the plane. At first glance, these two ideas may seem unrelated, but you will discover in Section 4.4 that they are closely related by an extremely important theorem called the Fundamental Theorem of Calculus.

This section begins by introducing a concise notation for sums. This notation is called **sigma notation** because it uses the uppercase Greek letter sigma, written as Σ.

Sigma Notation

The sum of n terms $a_1, a_2, a_3, \ldots, a_n$ is written as

$$\sum_{i=1}^{n} a_i = a_1 + a_2 + a_3 + \cdots + a_n$$

where i is the **index of summation,** a_i is the ***i*th term** of the sum, and the **upper and lower bounds of summation** are n and 1.

REMARK The upper and lower bounds must be constant with respect to the index of summation. The lower bound, however, does not have to be 1. Any integer less than or equal to the upper bound is legitimate.

EXAMPLE 1 Using Sigma Notation

a. $\displaystyle\sum_{i=1}^{6} i = 1 + 2 + 3 + 4 + 5 + 6$

b. $\displaystyle\sum_{i=0}^{5} (i + 1) = 1 + 2 + 3 + 4 + 5 + 6$

c. $\displaystyle\sum_{j=3}^{7} j^2 = 3^2 + 4^2 + 5^2 + 6^2 + 7^2$

d. $\displaystyle\sum_{j=1}^{5} \frac{1}{\sqrt{j}} = \frac{1}{\sqrt{1}} + \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} + \frac{1}{\sqrt{4}} + \frac{1}{\sqrt{5}}$

e. $\displaystyle\sum_{k=1}^{n} \frac{1}{n}(k^2 + 1) = \frac{1}{n}(1^2 + 1) + \frac{1}{n}(2^2 + 1) + \cdots + \frac{1}{n}(n^2 + 1)$

f. $\displaystyle\sum_{i=1}^{n} f(x_i)\,\Delta x = f(x_1)\,\Delta x + f(x_2)\,\Delta x + \cdots + f(x_n)\,\Delta x$

From parts (a) and (b), notice that the same sum can be represented in different ways using sigma notation.

REMARK In Example 1(e), note that k is the variable and the factor $1/n$ is held constant. What factor is held constant in Example 1(f)?

Although any variable can be used as the index of summation, i, j, and k are often used. Notice in Example 1 that the index of summation does not appear in the terms of the expanded sum.

GO DIGITAL

The properties of summation shown below can be derived using the Associative and Commutative Properties of Addition and the Distributive Property of Addition over Multiplication. (In the first property, k is a constant.)

1. $\sum_{i=1}^{n} ka_i = k\sum_{i=1}^{n} a_i$ **2.** $\sum_{i=1}^{n} (a_i \pm b_i) = \sum_{i=1}^{n} a_i \pm \sum_{i=1}^{n} b_i$

The next theorem lists some useful formulas for sums of powers.

THE SUM OF THE FIRST 100 INTEGERS

A teacher of Carl Friedrich Gauss (1777–1855) asked him to add all the integers from 1 to 100. When Gauss returned with the correct answer after only a few moments, the teacher could only look at him in astounded silence. This is what Gauss did.

$$\begin{array}{r} 1 + 2 + 3 + \cdots + 100 \\ 100 + 99 + 98 + \cdots + 1 \\ \hline 101 + 101 + 101 + \cdots + 101 \end{array}$$

$$\frac{100 \times 101}{2} = 5050$$

This is generalized by Theorem 4.2, Property 2, where

$$\sum_{i=1}^{100} i = \frac{100(101)}{2} = 5050.$$

THEOREM 4.2 Summation Formulas

1. $\sum_{i=1}^{n} c = cn$, c is a constant **2.** $\sum_{i=1}^{n} i = \frac{n(n+1)}{2}$

3. $\sum_{i=1}^{n} i^2 = \frac{n(n+1)(2n+1)}{6}$ **4.** $\sum_{i=1}^{n} i^3 = \frac{n^2(n+1)^2}{4}$

A proof of this theorem is given in Appendix A.

EXAMPLE 2 Evaluating a Sum

Evaluate $\sum_{i=1}^{n} \frac{i+1}{n^2}$ for $n = 10$, 100, 1000, and 10,000.

Solution Use algebra and Theorem 4.2 to simplify the sum.

$$\sum_{i=1}^{n} \frac{i+1}{n^2} = \frac{1}{n^2}\sum_{i=1}^{n} (i+1)$$ Factor the constant $1/n^2$ out of sum.

$$= \frac{1}{n^2}\left(\sum_{i=1}^{n} i + \sum_{i=1}^{n} 1\right)$$ Write as two sums.

$$= \frac{1}{n^2}\left[\frac{n(n+1)}{2} + n\right]$$ Apply Theorem 4.2.

$$= \frac{1}{n^2}\left(\frac{n^2+3n}{2}\right)$$ Simplify.

$$= \frac{n+3}{2n}$$ Simplify.

Next, use this formula to evaluate the sum for the appropriate values of n, as shown in the table below.

n	10	100	1000	10,000
$\sum_{i=1}^{n} \frac{i+1}{n^2} = \frac{n+3}{2n}$	0.65000	0.51500	0.50150	0.50015

FOR FURTHER INFORMATION

For a geometric interpretation of summation formulas, see the article "Looking at $\sum_{k=1}^{n} k$ and $\sum_{k=1}^{n} k^2$ Geometrically" by Eric Hegblom in *Mathematics Teacher*. To view this article, go to *MathArticles.com*.

In Example 2, note in the table that the sum appears to approach a limit as n increases. Although the discussion of limits at infinity in Section 3.5 applies to a variable x, where x can be any real number, many of the same results hold true for limits involving the variable n, where n is restricted to positive integer values. So, to find the limit of $(n+3)/2n$ as n approaches infinity, you can write

$$\lim_{n\to\infty} \frac{n+3}{2n} = \lim_{n\to\infty} \left(\frac{n}{2n} + \frac{3}{2n}\right) = \lim_{n\to\infty} \left(\frac{1}{2} + \frac{3}{2n}\right) = \frac{1}{2} + 0 = \frac{1}{2}.$$

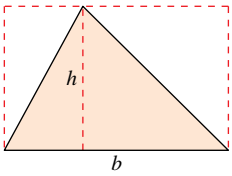
Area

In Euclidean geometry, the simplest type of plane region is a rectangle. Although people often say that the *formula* for the area of a rectangle is

$$A = bh$$

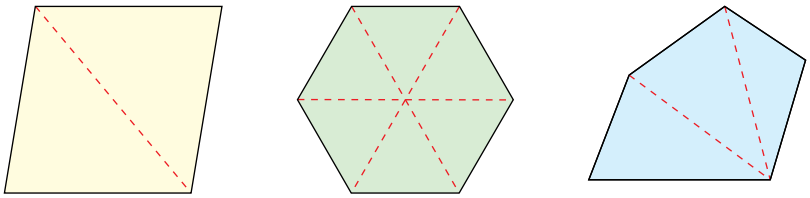
it is actually more proper to say that this is the *definition* of the **area of a rectangle.**

From this definition, you can develop formulas for the areas of many other plane regions. For example, to determine the area of a triangle, you can form a rectangle whose area is twice that of the triangle, as shown in Figure 4.5. Once you know how to find the area of a triangle, you can determine the area of any polygon by subdividing the polygon into triangular regions, as shown in Figure 4.6.



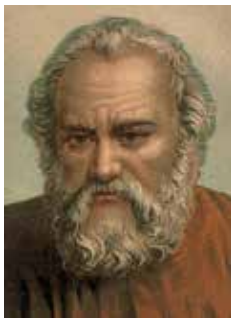
Triangle: $A = \frac{1}{2}bh$

Figure 4.5



Parallelogram Hexagon Polygon

Figure 4.6



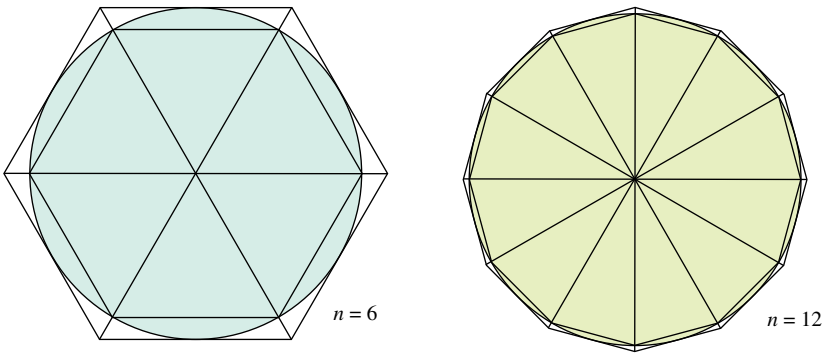
ARCHIMEDES (287–212 B.C.)

Archimedes used the method of exhaustion to derive formulas for the areas of ellipses, parabolic segments, and sectors of a spiral. He is considered to have been the greatest applied mathematician of antiquity.

See LarsonCalculus.com to read more of this biography.

Finding the areas of regions other than polygons is more difficult. The ancient Greeks were able to determine formulas for the areas of some general regions (principally those bounded by conics) by the *exhaustion* method. The clearest description of this method was given by Archimedes. Essentially, the method is a limiting process in which the area is squeezed between two polygons—one inscribed in the region and one circumscribed about the region.

For instance, in Figure 4.7, the area of a circular region is approximated by an n-sided inscribed polygon and an n-sided circumscribed polygon. For each value of n, the area of the inscribed polygon is less than the area of the circle, and the area of the circumscribed polygon is greater than the area of the circle. Moreover, as n increases, the areas of both polygons become better and better approximations of the area of the circle.



The exhaustion method for finding the area of a circular region

Figure 4.7

FOR FURTHER INFORMATION

For an alternative development of the formula for the area of a circle, see the article "Proof Without Words: Area of a Disk is πR^2" by Russell Jay Hendel in *Mathematics Magazine*. To view this article, go to *MathArticles.com*.

A process that is similar to that used by Archimedes to determine the area of a plane region is used in the remaining examples in this section.

The Area of a Plane Region

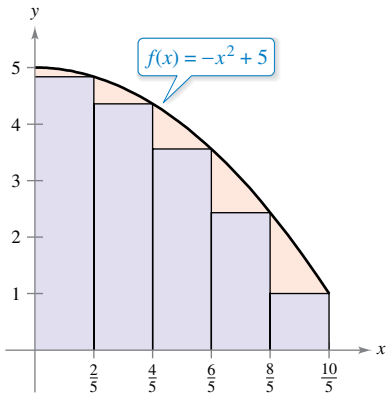
Recall from Section 1.1 that the origins of calculus are connected to two classic problems: the tangent line problem and the area problem. Example 3 begins the investigation of the area problem.

EXAMPLE 3 Approximating the Area of a Plane Region

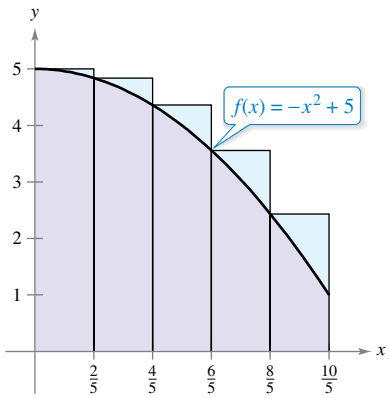
Use the five rectangles in Figures 4.8(a) and 4.8(b) to find *two* approximations of the area of the region lying between the graph of

$$f(x) = -x^2 + 5$$

and the x-axis between $x = 0$ and $x = 2$.



(a) The area of the parabolic region is greater than the area of the rectangles.



(b) The area of the parabolic region is less than the area of the rectangles.

Figure 4.8

Solution

a. The right endpoints of the five intervals are

$$\frac{2}{5}i \qquad \text{Right endpoints}$$

where $i = 1, 2, 3, 4, 5$. The width of each rectangle is $\frac{2}{5}$, and the height of each rectangle can be obtained by evaluating f at the right endpoint of each interval.

$$\left[0, \frac{2}{5}\right], \left[\frac{2}{5}, \frac{4}{5}\right], \left[\frac{4}{5}, \frac{6}{5}\right], \left[\frac{6}{5}, \frac{8}{5}\right], \left[\frac{8}{5}, \frac{10}{5}\right]$$

Evaluate f at the right endpoints of these intervals.

The sum of the areas of the five rectangles is

$$\overbrace{f\left(\frac{2i}{5}\right)}^{\text{Height}}\overbrace{\left(\frac{2}{5}\right)}^{\text{Width}} = \sum_{i=1}^{5} f\left(\frac{2i}{5}\right)\left(\frac{2}{5}\right) = \sum_{i=1}^{5}\left[-\left(\frac{2i}{5}\right)^2 + 5\right]\left(\frac{2}{5}\right) = \frac{162}{25} = 6.48.$$

Because each of the five rectangles lies inside the parabolic region, you can conclude that the area of the parabolic region is greater than 6.48.

b. The left endpoints of the five intervals are

$$\frac{2}{5}(i - 1) \qquad \text{Left endpoints}$$

where $i = 1, 2, 3, 4, 5$. The width of each rectangle is $\frac{2}{5}$, and the height of each rectangle can be obtained by evaluating f at the left endpoint of each interval. So, the sum is

$$\overbrace{f\left(\frac{2i-2}{5}\right)}^{\text{Height}}\overbrace{\left(\frac{2}{5}\right)}^{\text{Width}} = \sum_{i=1}^{5} f\left(\frac{2i-2}{5}\right)\left(\frac{2}{5}\right) = \sum_{i=1}^{5}\left[-\left(\frac{2i-2}{5}\right)^2 + 5\right]\left(\frac{2}{5}\right) = \frac{202}{25} = 8.08.$$

Because the parabolic region lies within the union of the five rectangular regions, you can conclude that the area of the parabolic region is less than 8.08.

By combining the results in parts (a) and (b), you can conclude that

$$6.48 < (\text{Area of region}) < 8.08.$$

By increasing the number of rectangles used in Example 3, you can obtain closer and closer approximations of the area of the region. For instance, using 25 rectangles of width $\frac{2}{25}$ each, you can conclude that

$$7.1712 < (\text{Area of region}) < 7.4912.$$

Figure 4.10

Finding Area by the Limit Definition

Think about the procedure used to find area in Example 3. Can this procedure be generalized to find areas under other curves? Consider the plane region shown in Figure 4.9. The upper boundary of the region is the graph of $y = f(x)$, the lower boundary is the x-axis, and the left and right boundaries are the vertical lines $x = a$ and $x = b$. Also, the function f is continuous and nonnegative on the closed interval $[a, b]$.

To approximate the area of the region, begin by subdividing the interval $[a, b]$ into n subintervals, each of width

$$\Delta x = \frac{b - a}{n}$$ Width of each subinterval

as shown in Figure 4.10. The endpoints of the intervals are

$$\overbrace{a = x_0}\quad \overbrace{x_1}\quad \overbrace{x_2}\quad \overbrace{x_n = b}$$
$$a + 0(\Delta x) < a + 1(\Delta x) < a + 2(\Delta x) < \cdots < a + n(\Delta x).$$

Because f is continuous, the Extreme Value Theorem guarantees the existence of a minimum and a maximum value of f on *each* subinterval.

$f(m_i)$ = Minimum value of f on ith subinterval

$f(M_i)$ = Maximum value of f on ith subinterval

Next, define an **inscribed rectangle** lying *inside* the ith subregion and a **circumscribed rectangle** extending *outside* the ith subregion. The height of the ith inscribed rectangle is $f(m_i)$ and the height of the ith circumscribed rectangle is $f(M_i)$. For *each* i, the area of the inscribed rectangle is less than or equal to the area of the circumscribed rectangle.

$$\begin{pmatrix}\text{Area of inscribed}\\ \text{rectangle}\end{pmatrix} = f(m_i)\,\Delta x \le f(M_i)\,\Delta x = \begin{pmatrix}\text{Area of circumscribed}\\ \text{rectangle}\end{pmatrix}$$

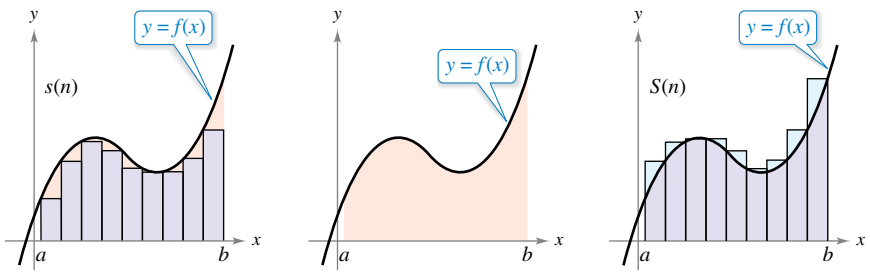
The sum of the areas of the inscribed rectangles is called a **lower sum,** and the sum of the areas of the circumscribed rectangles is called an **upper sum.**

$$\text{Lower sum} = s(n) = \sum_{i=1}^{n} f(m_i)\,\Delta x$$ Area of inscribed rectangles

$$\text{Upper sum} = S(n) = \sum_{i=1}^{n} f(M_i)\,\Delta x$$ Area of circumscribed rectangles

From Figure 4.11, note that the lower sum $s(n)$ is less than or equal to the upper sum $S(n)$. Moreover, the actual area of the region lies between these two sums.

$$s(n) \le (\text{Area of region}) \le S(n)$$



Area of inscribed rectangles is less than area of region.

Area of region

Area of circumscribed rectangles is greater than area of region.

Figure 4.11

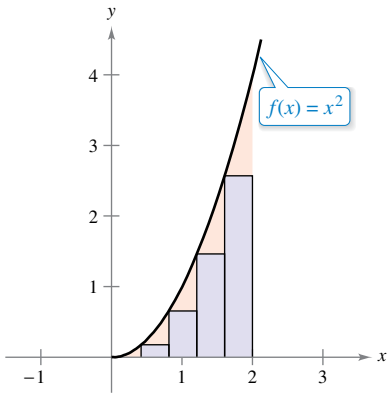
EXAMPLE 4 Finding Upper and Lower Sums for a Region

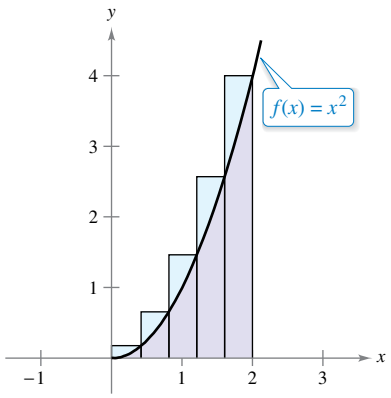
Find the upper and lower sums for the region bounded by the graph of $f(x) = x^2$ and the x-axis between $x = 0$ and $x = 2$.

Solution To begin, partition the interval $[0, 2]$ into n subintervals, each of width

$$\Delta x = \frac{b - a}{n} = \frac{2 - 0}{n} = \frac{2}{n}.$$



Inscribed rectangles



Circumscribed rectangles

Figure 4.12

Figure 4.12 shows the endpoints of the subintervals and several inscribed and circumscribed rectangles. Because f is increasing on the interval $[0, 2]$, the minimum value on each subinterval occurs at the left endpoint, and the maximum value occurs at the right endpoint.

Left Endpoints

$$m_i = 0 + (i - 1)\left(\frac{2}{n}\right) = \frac{2(i - 1)}{n}$$

Right Endpoints

$$M_i = 0 + i\left(\frac{2}{n}\right) = \frac{2i}{n}$$

Using the left endpoints, the lower sum is

$$\begin{aligned}
s(n) &= \sum_{i=1}^{n} f(m_i)\,\Delta x && \text{Formula for lower sum}\\
&= \sum_{i=1}^{n} f\left[\frac{2(i-1)}{n}\right]\left(\frac{2}{n}\right) && \text{Substitute for } m_i.\\
&= \sum_{i=1}^{n} \left[\frac{2(i-1)}{n}\right]^2\left(\frac{2}{n}\right) && \text{Definition of } f(x)\\
&= \sum_{i=1}^{n} \left(\frac{8}{n^3}\right)(i^2 - 2i + 1) && \text{Evaluate power and factor.}\\
&= \frac{8}{n^3}\left(\sum_{i=1}^{n} i^2 - 2\sum_{i=1}^{n} i + \sum_{i=1}^{n} 1\right) && \text{Factor and write as three sums.}\\
&= \frac{8}{n^3}\left\{\frac{n(n+1)(2n+1)}{6} - 2\left[\frac{n(n+1)}{2}\right] + n\right\} && \text{Apply Theorem 4.2.}\\
&= \frac{4}{3n^3}(2n^3 - 3n^2 + n) && \text{Simplify.}\\
&= \frac{8}{3} - \frac{4}{n} + \frac{4}{3n^2}. && \text{Lower sum}
\end{aligned}$$

Using the right endpoints, the upper sum is

$$\begin{aligned}
S(n) &= \sum_{i=1}^{n} f(M_i)\,\Delta x && \text{Formula for upper sum}\\
&= \sum_{i=1}^{n} f\left(\frac{2i}{n}\right)\left(\frac{2}{n}\right) && \text{Substitute for } M_i.\\
&= \sum_{i=1}^{n} \left(\frac{2i}{n}\right)^2\left(\frac{2}{n}\right) && \text{Definition of } f(x)\\
&= \sum_{i=1}^{n} \left(\frac{8}{n^3}\right) i^2 && \text{Evaluate power and factor.}\\
&= \frac{8}{n^3}\left[\frac{n(n+1)(2n+1)}{6}\right] && \text{Apply Theorem 4.2.}\\
&= \frac{4}{3n^3}(2n^3 + 3n^2 + n) && \text{Simplify.}\\
&= \frac{8}{3} + \frac{4}{n} + \frac{4}{3n^2}. && \text{Upper sum}
\end{aligned}$$

Exploration

For the region given in Example 4, evaluate the lower sum

$$s(n) = \frac{8}{3} - \frac{4}{n} + \frac{4}{3n^2}$$

and the upper sum

$$S(n) = \frac{8}{3} + \frac{4}{n} + \frac{4}{3n^2}$$

for $n = 10$, 100, and 1000. Use your results to determine the area of the region.

Example 4 illustrates some important things about lower and upper sums. First, notice that for any value of n, the lower sum is less than (or equal to) the upper sum.

$$s(n) = \frac{8}{3} - \frac{4}{n} + \frac{4}{3n^2} < \frac{8}{3} + \frac{4}{n} + \frac{4}{3n^2} = S(n) \qquad \text{(Lower sum) < (upper sum)}$$

Second, the difference between these two sums lessens as n increases. In fact, when you take the limits as $n \to \infty$, both the lower sum and the upper sum approach $\frac{8}{3}$.

$$\lim_{n\to\infty} s(n) = \lim_{n\to\infty} \left(\frac{8}{3} - \frac{4}{n} + \frac{4}{3n^2}\right) = \frac{8}{3} \qquad \text{Lower sum limit}$$

and

$$\lim_{n\to\infty} S(n) = \lim_{n\to\infty} \left(\frac{8}{3} + \frac{4}{n} + \frac{4}{3n^2}\right) = \frac{8}{3} \qquad \text{Upper sum limit}$$

The next theorem shows that the equivalence of the limits (as $n \to \infty$) of the upper and lower sums is not mere coincidence. It is true for all functions that are continuous and nonnegative on the closed interval $[a, b]$. The proof of this theorem is best left to a course in advanced calculus.

THEOREM 4.3 Limits of the Lower and Upper Sums

Let a function f be continuous and nonnegative on the interval $[a, b]$. The limits as $n \to \infty$ of both the lower and upper sums exist and are equal to each other. That is,

$$\lim_{n\to\infty} s(n) = \lim_{n\to\infty} \sum_{i=1}^{n} f(m_i)\,\Delta x \qquad \text{Limit of lower sum}$$

$$= \lim_{n\to\infty} \sum_{i=1}^{n} f(M_i)\,\Delta x$$

$$= \lim_{n\to\infty} S(n) \qquad \text{Limit of upper sum}$$

where $\Delta x = (b - a)/n$ and $f(m_i)$ and $f(M_i)$ are the minimum and maximum values of f on the ith subinterval.

In Theorem 4.3, the same limit is attained for both the minimum value $f(m_i)$ and the maximum value $f(M_i)$. So, it follows from the Squeeze Theorem (Theorem 1.8) that the choice of x in the ith subinterval does not affect the limit. This means that you are free to choose an *arbitrary* x-value in the ith subinterval, as shown in the *definition of the area of a region in the plane.*

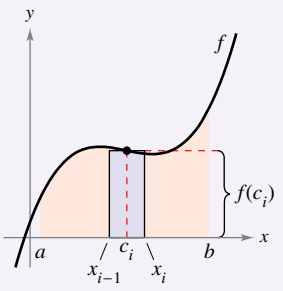
Definition of the Area of a Region in the Plane

Let a function f be continuous and nonnegative on the interval $[a, b]$. (See Figure 4.13.) The area of the region bounded by the graph of f, the x-axis, and the vertical lines $x = a$ and $x = b$ is

$$\text{Area} = \lim_{n\to\infty} \sum_{i=1}^{n} f(c_i)\,\Delta x$$

where $x_{i-1} \le c_i \le x_i$ and

$$\Delta x = \frac{b - a}{n}.$$



The width of the ith subinterval is $\Delta x = x_i - x_{i-1}$.

The area of the region bounded by the graph of f, the x-axis, $x = 0$, and $x = 1$ is $\frac{1}{4}$.
Figure 4.14

EXAMPLE 5 Finding Area by the Limit Definition

Find the area of the region bounded by the graph of $f(x) = x^3$, the x-axis, and the vertical lines $x = 0$ and $x = 1$, as shown in Figure 4.14.

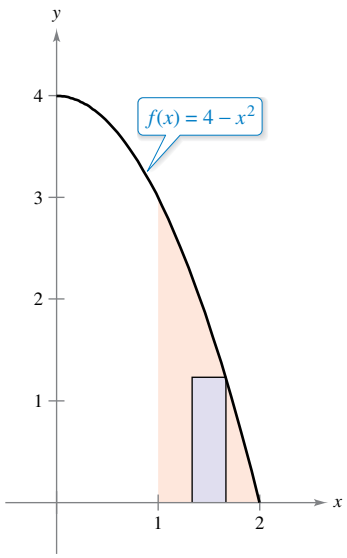
Solution Note that the function f is continuous and nonnegative on the interval $[0, 1]$. So, begin by partitioning the interval $[0, 1]$ into n subintervals, each of width $\Delta x = 1/n$. According to the definition of area, you can choose any x-value in the ith subinterval. For this example, the right endpoints $c_i = i/n$ are convenient.

$$\begin{aligned}
\text{Area} &= \lim_{n\to\infty} \sum_{i=1}^{n} f(c_i)\,\Delta x && \text{Limit definition of area} \\
&= \lim_{n\to\infty} \sum_{i=1}^{n} \left(\frac{i}{n}\right)^3 \left(\frac{1}{n}\right) && \text{Right endpoints: } c_i = \frac{i}{n} \\
&= \lim_{n\to\infty} \frac{1}{n^4} \sum_{i=1}^{n} i^3 && \text{Factor constant } \frac{1}{n^4} \text{ out of sum.} \\
&= \lim_{n\to\infty} \frac{1}{n^4} \left[\frac{n^2(n+1)^2}{4}\right] && \text{Theorem 4.2, Property 4} \\
&= \lim_{n\to\infty} \left(\frac{1}{4} + \frac{1}{2n} + \frac{1}{4n^2}\right) && \text{Simplify.} \\
&= \frac{1}{4} && \text{Evaluate limit.}
\end{aligned}$$

The area of the region is $\frac{1}{4}$.

EXAMPLE 6 Finding Area by the Limit Definition

See LarsonCalculus.com for an interactive version of this type of example.



The area of the region bounded by the graph of f, the x-axis, $x = 1$, and $x = 2$ is $\frac{5}{3}$.
Figure 4.15

Find the area of the region bounded by the graph of $f(x) = 4 - x^2$, the x-axis, and the vertical lines $x = 1$ and $x = 2$, as shown in Figure 4.15.

Solution Note that the function f is continuous and nonnegative on the interval $[1, 2]$. So, begin by partitioning the interval into n subintervals, each of width $\Delta x = 1/n$. Choosing the right endpoint

$$c_i = a + i\Delta x = 1 + \frac{i}{n} \qquad \text{Right endpoints}$$

of each subinterval, you obtain

$$\begin{aligned}
\text{Area} &= \lim_{n\to\infty} \sum_{i=1}^{n} f(c_i)\,\Delta x && \text{Limit definition of area} \\
&= \lim_{n\to\infty} \sum_{i=1}^{n} \left[4 - \left(1 + \frac{i}{n}\right)^2\right]\left(\frac{1}{n}\right) && \text{Right endpoints: } c_i = 1 + \frac{i}{n} \\
&= \lim_{n\to\infty} \sum_{i=1}^{n} \left(3 - \frac{2i}{n} - \frac{i^2}{n^2}\right)\left(\frac{1}{n}\right) && \text{Simplify.} \\
&= \lim_{n\to\infty} \left(\frac{1}{n}\sum_{i=1}^{n} 3 - \frac{2}{n^2}\sum_{i=1}^{n} i - \frac{1}{n^3}\sum_{i=1}^{n} i^2\right) && \text{Factor and write as three sums.} \\
&= \lim_{n\to\infty} \left[3 - \left(1 + \frac{1}{n}\right) - \left(\frac{1}{3} + \frac{1}{2n} + \frac{1}{6n^2}\right)\right] && \text{Apply Theorem 4.2.} \\
&= 3 - 1 - \frac{1}{3} && \text{Evaluate limit.} \\
&= \frac{5}{3}.
\end{aligned}$$

The area of the region is $\frac{5}{3}$.

GO DIGITAL

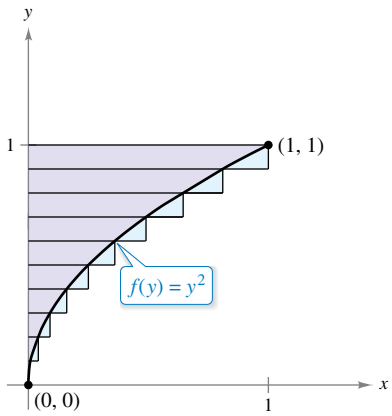
The next example looks at a region that is bounded by the y-axis (rather than by the x-axis).

EXAMPLE 7 A Region Bounded by the y-axis

Find the area of the region bounded by the graph of $f(y) = y^2$ and the y-axis for $0 \le y \le 1$, as shown in Figure 4.16.



The area of the region bounded by the graph of f and the y-axis for $0 \le y \le 1$ is $\frac{1}{3}$.
Figure 4.16

Solution When f is a continuous, nonnegative function of y, you can still use the same basic procedure shown in Examples 5 and 6. Begin by partitioning the interval $[0, 1]$ into n subintervals, each of width $\Delta y = 1/n$. Then, using the upper endpoints $c_i = i/n$, you obtain

$$\begin{aligned}
\text{Area} &= \lim_{n\to\infty} \sum_{i=1}^{n} f(c_i)\,\Delta y && \text{Limit definition of area} \\
&= \lim_{n\to\infty} \sum_{i=1}^{n} \left(\frac{i}{n}\right)^2\left(\frac{1}{n}\right) && \text{Upper endpoints: } c_i = \frac{i}{n} \\
&= \lim_{n\to\infty} \frac{1}{n^3}\sum_{i=1}^{n} i^2 && \text{Factor constant } \frac{1}{n^3} \text{ out of sum.} \\
&= \lim_{n\to\infty} \frac{1}{n^3}\left[\frac{n(n+1)(2n+1)}{6}\right] && \text{Theorem 4.2, Property 3} \\
&= \lim_{n\to\infty} \left(\frac{1}{3} + \frac{1}{2n} + \frac{1}{6n^2}\right) && \text{Simplify.} \\
&= \frac{1}{3}. && \text{Evaluate limit.}
\end{aligned}$$

The area of the region is $\frac{1}{3}$. ■

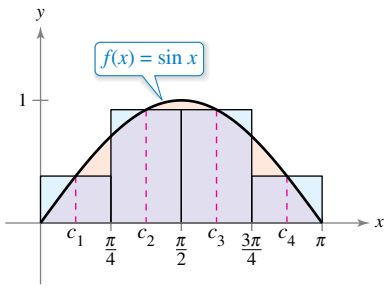
REMARK You will study other approximation methods in Section 8.6. One of the methods, the Trapezoidal Rule, is similar to the Midpoint Rule.

In Examples 5, 6, and 7, c_i is chosen to be a value that is convenient for calculating the limit. Because each limit gives the exact area for *any* c_i, there is no need to find values that give good approximations when n is small. For an *approximation*, however, you should try to find a value of c_i that gives a good approximation of the area of the ith subregion. In general, a good value to choose is the midpoint of the interval, $c_i = (x_{i-1} + x_i)/2$, and apply the **Midpoint Rule.**

$$\text{Area} \approx \sum_{i=1}^{n} f\left(\frac{x_{i-1} + x_i}{2}\right)\Delta x \qquad \text{Midpoint Rule}$$

EXAMPLE 8 Approximating Area with the Midpoint Rule

Use the Midpoint Rule with $n = 4$ to approximate the area of the region bounded by the graph of $f(x) = \sin x$ and the x-axis for $0 \le x \le \pi$, as shown in Figure 4.17.



The area of the region bounded by the graph of $f(x) = \sin x$ and the x-axis for $0 \le x \le \pi$ is about 2.052.
Figure 4.17

Solution For $n = 4$, $\Delta x = \pi/4$. The midpoints of the subregions are shown below.

$$c_1 = \frac{0 + (\pi/4)}{2} = \frac{\pi}{8} \qquad c_2 = \frac{(\pi/4) + (\pi/2)}{2} = \frac{3\pi}{8}$$

$$c_3 = \frac{(\pi/2) + (3\pi/4)}{2} = \frac{5\pi}{8} \qquad c_4 = \frac{(3\pi/4) + \pi}{2} = \frac{7\pi}{8}$$

So, the area is approximated by

$$\text{Area} \approx \sum_{i=1}^{n} f(c_i)\,\Delta x = \sum_{i=1}^{4} (\sin c_i)\left(\frac{\pi}{4}\right) = \frac{\pi}{4}\left(\sin\frac{\pi}{8} + \sin\frac{3\pi}{8} + \sin\frac{5\pi}{8} + \sin\frac{7\pi}{8}\right)$$

which is about 2.052. ■

GO DIGITAL

Concept Check

1. Identify the index of summation, the upper bound of summation, and the lower bound of summation for $\sum_{i=3}^{8} (i - 4)$.
2. Find the value of n.

   (a) $\sum_{i=1}^{n} i = \frac{5(5 + 1)}{2}$ (b) $\sum_{i=1}^{n} i^2 = \frac{20(20 + 1)[2(20) + 1]}{6}$
3. Describe the methods of upper sums and lower sums in approximating the area of a region, using figures where appropriate.
4. Explain how to find the area of a plane region using limits.

Finding a Sum **In Exercises 5–10, find the sum by adding each term together. Use the summation capabilities of a graphing utility to verify your result.**

5. $\sum_{i=1}^{6} (3i + 2)$
6. $\sum_{k=3}^{9} (k^2 + 1)$
7. $\sum_{k=0}^{4} \frac{1}{k^2 + 1}$
8. $\sum_{j=2}^{5} \frac{1}{2j}$
9. $\sum_{k=0}^{7} c$
10. $\sum_{i=1}^{4} [(i - 1)^2 + (i + 1)^3]$

Using Sigma Notation **In Exercises 11–16, use sigma notation to write the sum.**

11. $\frac{1}{5(1)} + \frac{1}{5(2)} + \frac{1}{5(3)} + \cdots + \frac{1}{5(11)}$
12. $\frac{6}{2 + 1} + \frac{6}{2 + 2} + \frac{6}{2 + 3} + \cdots + \frac{6}{2 + 11}$
13. $\left[7\left(\frac{1}{6}\right) + 5\right] + \left[7\left(\frac{2}{6}\right) + 5\right] + \cdots + \left[7\left(\frac{6}{6}\right) + 5\right]$
14. $\left[1 - \left(\frac{1}{4}\right)^2\right] + \left[1 - \left(\frac{2}{4}\right)^2\right] + \cdots + \left[1 - \left(\frac{4}{4}\right)^2\right]$
15. $\left[\left(\frac{2}{n}\right)^3 - \frac{2}{n}\right]\left(\frac{2}{n}\right) + \cdots + \left[\left(\frac{2n}{n}\right)^3 - \frac{2n}{n}\right]\left(\frac{2}{n}\right)$
16. $\left[2\left(1 + \frac{3}{n}\right)^2\right]\left(\frac{3}{n}\right) + \cdots + \left[2\left(1 + \frac{3n}{n}\right)^2\right]\left(\frac{3}{n}\right)$

Evaluating a Sum **In Exercises 17–24, use the properties of summation and Theorem 4.2 to evaluate the sum. Use the summation capabilities of a graphing utility to verify your result.**

17. $\sum_{i=1}^{12} 7$
18. $\sum_{i=1}^{20} -8$
19. $\sum_{i=1}^{24} 4i$
20. $\sum_{i=1}^{16} (5i - 4)$
21. $\sum_{i=1}^{20} (i - 1)^2$
22. $\sum_{i=1}^{10} (i^2 - 1)$
23. $\sum_{i=1}^{7} i(i + 3)^2$
24. $\sum_{i=1}^{25} (i^3 - 2i)$

Evaluating a Sum **In Exercises 25–28, use the summation formulas to rewrite the expression without the summation notation. Use the result to find the sums for $n = 10$, 100, 1000, and 10,000.**

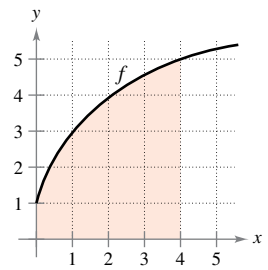
25. $\sum_{i=1}^{n} \frac{2i + 1}{n^2}$
26. $\sum_{j=1}^{n} \frac{7j + 4}{n^2}$
27. $\sum_{k=1}^{n} \frac{6k(k - 1)}{n^3}$
28. $\sum_{i=1}^{n} \frac{2i^3 - 3i}{n^4}$

Approximating the Area of a Plane Region **In Exercises 29–34, use left and right endpoints and the given number of rectangles to find two approximations of the area of the region between the graph of the function and the x-axis over the given interval.**

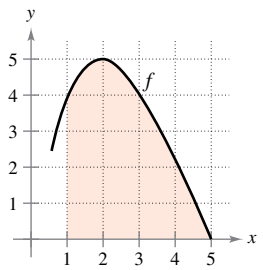
29. $f(x) = 2x + 5$, $[0, 2]$, 4 rectangles
30. $f(x) = 9 - x$, $[2, 4]$, 6 rectangles
31. $g(x) = 2x^2 - x - 1$, $[2, 5]$, 6 rectangles
32. $g(x) = x^2 + 1$, $[1, 3]$, 8 rectangles
33. $f(x) = \cos x$, $\left[0, \frac{\pi}{2}\right]$, 4 rectangles
34. $g(x) = \sin x$, $[0, \pi]$, 6 rectangles

Using Upper and Lower Sums **In Exercises 35 and 36, bound the area of the shaded region by approximating the upper and lower sums. Use rectangles of width 1.**

35.

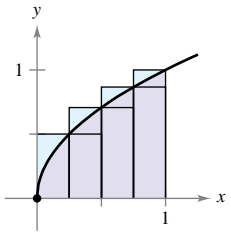


36.



Finding Upper and Lower Sums for a Region **In Exercises 37–40, use upper and lower sums to approximate the area of the region using the given number of subintervals (of equal width).**

37. $y = \sqrt{x}$



38. $y = \sqrt{x} + 2$

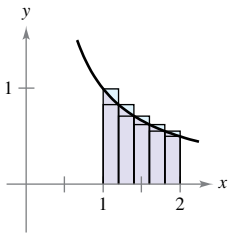
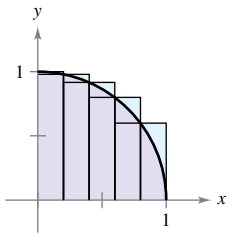
39. $y = \frac{1}{x}$



40. $y = \sqrt{1 - x^2}$



Finding Upper and Lower Sums for a Region **In Exercises 41–44, find the upper and lower sums for the region bounded by the graph of the function and the x-axis on the given interval. Leave your answer in terms of n, the number of subintervals.**

	Function	Interval
41.	$f(x) = 3x$	$[0, 4]$
42.	$f(x) = 6 - 2x$	$[1, 2]$
43.	$f(x) = 5x^2$	$[0, 1]$
44.	$f(x) = 9 - x^2$	$[0, 2]$

45. Numerical Reasoning Consider a triangle of area 2 bounded by the graphs of $y = x$, $y = 0$, and $x = 2$.

(a) Sketch the region.

(b) Divide the interval $[0, 2]$ into n subintervals of equal width and show that the endpoints are

$$0 < 1\left(\frac{2}{n}\right) < \cdots < (n-1)\left(\frac{2}{n}\right) < n\left(\frac{2}{n}\right).$$

(c) Show that $s(n) = \sum_{i=1}^{n}\left[(i-1)\left(\frac{2}{n}\right)\right]\left(\frac{2}{n}\right)$.

(d) Show that $S(n) = \sum_{i=1}^{n}\left[i\left(\frac{2}{n}\right)\right]\left(\frac{2}{n}\right)$.

(e) Find $s(n)$ and $S(n)$ for $n = 5$, 10, 50, and 100.

(f) Show that $\lim_{n\to\infty} s(n) = \lim_{n\to\infty} S(n) = 2$.

46. Numerical Reasoning Consider a trapezoid of area 4 bounded by the graphs of $y = x$, $y = 0$, $x = 1$, and $x = 3$.

(a) Sketch the region.

(b) Divide the interval $[1, 3]$ into n subintervals of equal width and show that the endpoints are

$$1 < 1 + 1\left(\frac{2}{n}\right) < \cdots < 1 + (n-1)\left(\frac{2}{n}\right) < 1 + n\left(\frac{2}{n}\right).$$

(c) Show that $s(n) = \sum_{i=1}^{n}\left[1 + (i-1)\left(\frac{2}{n}\right)\right]\left(\frac{2}{n}\right)$.

(d) Show that $S(n) = \sum_{i=1}^{n}\left[1 + i\left(\frac{2}{n}\right)\right]\left(\frac{2}{n}\right)$.

(e) Find $s(n)$ and $S(n)$ for $n = 5$, 10, 50, and 100.

(f) Show that $\lim_{n\to\infty} s(n) = \lim_{n\to\infty} S(n) = 4$.

Finding Area by the Limit Definition **In Exercises 47–56, use the limit process to find the area of the region bounded by the graph of the function and the x-axis over the given interval. Sketch the region.**

47. $y = -4x + 5$, $[0, 1]$

48. $y = 3x - 2$, $[2, 5]$

49. $y = x^2 + 2$, $[0, 1]$

50. $y = 5x^2 + 1$, $[0, 2]$

51. $y = 25 - x^2$, $[1, 4]$

52. $y = 4 - x^2$, $[-2, 2]$

53. $y = 27 - x^3$, $[1, 3]$

54. $y = 2x - x^3$, $[0, 1]$

55. $y = x^2 - x^3$, $[-1, 1]$

56. $y = 2x^3 - x^2$, $[1, 2]$

Finding Area by the Limit Definition **In Exercises 57–62, use the limit process to find the area of the region bounded by the graph of the function and the y-axis over the given y-interval. Sketch the region.**

57. $f(y) = 4y$, $0 \le y \le 2$

58. $g(y) = \frac{1}{2}y$, $2 \le y \le 4$

59. $f(y) = y^2$, $0 \le y \le 5$

60. $y = 3y - y^2$, $2 \le y \le 3$

61. $g(y) = 4y^2 - y^3$, $1 \le y \le 3$

62. $h(y) = y^3 + 1$, $1 \le y \le 2$

Approximating Area with the Midpoint Rule **In Exercises 63–66, use the Midpoint Rule with $n = 4$ to approximate the area of the region bounded by the graph of the function and the x-axis over the given interval.**

63. $f(x) = x^2 + 3$, $[0, 2]$

64. $f(x) = x^2 + 4x$, $[0, 4]$

65. $f(x) = \tan x$, $\left[0, \frac{\pi}{4}\right]$

66. $f(x) = \cos x$, $\left[0, \frac{\pi}{2}\right]$

Exploring Concepts

67. Determine which value best approximates the area of the region bounded by the graph of $f(x) = 4 - x^2$ and the x-axis over the interval $[0, 2]$. Make your selection on the basis of a sketch of the region, not by performing calculations.

(a) -2 (b) 6 (c) 10 (d) 3 (e) 8

68. A function is continuous, nonnegative, concave upward, and decreasing on the interval $[0, a]$. Does using the right endpoints of the subintervals produce an overestimate or an underestimate of the area of the region bounded by the function and the x-axis?

69. Explain why the Midpoint Rule almost always results in a better area approximation in comparison to the endpoint method.

70. Does the Midpoint Rule ever give the exact area between a function and the x-axis? Explain.

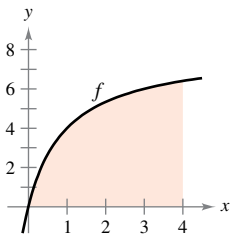
71. Graphical Reasoning Consider the region bounded by the graphs of $f(x) = 8x/(x + 1)$, $x = 0$, $x = 4$, and $y = 0$, as shown in the figure. To print an enlarged copy of the graph, go to *MathGraphs.com.*



(a) Redraw the figure, and complete and shade the rectangles representing the lower sum when $n = 4$. Find this lower sum.

(b) Redraw the figure, and complete and shade the rectangles representing the upper sum when $n = 4$. Find this upper sum.

(c) Redraw the figure, and complete and shade the rectangles whose heights are determined by the function values at the midpoint of each subinterval when $n = 4$. Find this sum using the Midpoint Rule.

(d) Verify the following formulas for approximating the area of the region using n subintervals of equal width.

$$\text{Lower sum: } s(n) = \sum_{i=1}^{n} f\left[(i-1)\frac{4}{n}\right]\left(\frac{4}{n}\right)$$

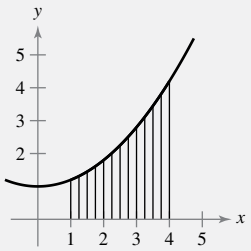
$$\text{Upper sum: } S(n) = \sum_{i=1}^{n} f\left[(i)\frac{4}{n}\right]\left(\frac{4}{n}\right)$$

$$\text{Midpoint Rule: } M(n) = \sum_{i=1}^{n} f\left[\left(i-\frac{1}{2}\right)\frac{4}{n}\right]\left(\frac{4}{n}\right)$$

(e) Use a graphing utility to create a table of values of $s(n)$, $S(n)$, and $M(n)$ for $n = 4$, 8, 20, 100, and 200.

(f) Explain why $s(n)$ increases and $S(n)$ decreases for increasing values of n, as shown in the table in part (e).

72. HOW DO YOU SEE IT? The function shown in the graph below is increasing on the interval $[1, 4]$. The interval is divided into 12 subintervals.



(a) Find the left endpoints of the first and last subintervals.

(b) Find the right endpoints of the first two subintervals.

(c) When using the right endpoints, do the rectangles lie above or below the graph of the function?

(d) What can you conclude about the heights of the rectangles when the function is constant on the given interval?

True or False? **In Exercises 73 and 74, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

73. The sum of the first n positive integers is $n(n + 1)/2$.

74. If f is continuous and nonnegative on $[a, b]$, then the limits as $n \to \infty$ of its lower sum $s(n)$ and upper sum $S(n)$ both exist and are equal.

75. Writing Use the figure to write a short paragraph explaining why the formula $1 + 2 + \cdots + n = \frac{1}{2}n(n + 1)$ is valid for all positive integers n.

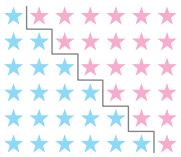


Figure for 75

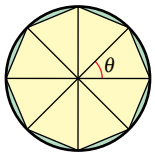

Figure for 76

76. Graphical Reasoning Consider an n-sided regular polygon inscribed in a circle of radius r. Join the vertices of the polygon to the center of the circle, forming n congruent triangles (see figure).

(a) Determine the central angle θ in terms of n.

(b) Show that the area of each triangle is $\frac{1}{2}r^2 \sin\theta$.

(c) Let A_n be the sum of the areas of the n triangles. Find $\lim_{n\to\infty} A_n$.

77. Seating Capacity

A teacher places n seats to form the back row of a classroom layout. Each successive row contains two fewer seats than the preceding row. Find a formula for the number of seats used in the layout. (Hint: The number of seats in the layout depends on whether n is odd or even.)

78. Proof Prove each formula by mathematical induction. (You may need to review the method of proof by induction from a precalculus text.)

(a) $\sum_{i=1}^{n} 2i = n(n + 1)$ (b) $\sum_{i=1}^{n} i^3 = \frac{n^2(n+1)^2}{4}$

PUTNAM EXAM CHALLENGE

79. A dart, thrown at random, hits a square target. Assuming that any two parts of the target of equal area are equally likely to be hit, find the probability that the point hit is nearer to the center than to any edge. Write your answer in the form $\left(a\sqrt{b} + c\right)/d$, where a, b, c, and d are integers.

This problem was composed by the Committee on the Putnam Prize Competition.

4.3 Riemann Sums and Definite Integrals

GO DIGITAL

- **Describe a Riemann sum.**
- **Evaluate a definite integral using limits and geometric formulas.**
- **Evaluate a definite integral using properties of definite integrals.**

Riemann Sums

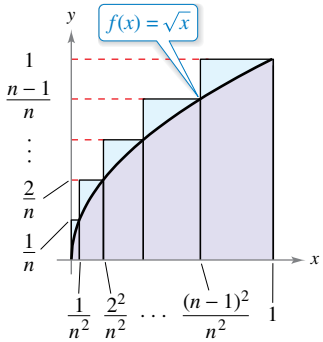
In the definition of area given in Section 4.2, the partitions have subintervals of *equal width*. This was done only for computational convenience. The next example shows that it is not necessary to have subintervals of equal width.

EXAMPLE 1 **A Partition with Subintervals of Unequal Widths**

Consider the region bounded by the graph of $f(x) = \sqrt{x}$ and the x-axis for $0 \le x \le 1$, as shown in Figure 4.18. Evaluate the limit

$$\lim_{n\to\infty} \sum_{i=1}^{n} f(c_i)\,\Delta x_i$$

where c_i is the right endpoint of the partition given by $c_i = i^2/n^2$ and Δx_i is the width of the ith interval.



The subintervals do not have equal widths.

Figure 4.18

Solution The left endpoint of the ith interval is $(i-1)^2/n^2$. So, the width of the ith interval is

$$\Delta x_i = \frac{i^2}{n^2} - \frac{(i-1)^2}{n^2}$$ Width = (right endpoint) − (left endpoint)

$$= \frac{i^2 - i^2 + 2i - 1}{n^2}$$ Subtract fractions and expand binomial.

$$= \frac{2i-1}{n^2}.$$ Simplify.

Now, evaluate the limit.

$$\lim_{n\to\infty} \sum_{i=1}^{n} f(c_i)\,\Delta x_i = \lim_{n\to\infty} \sum_{i=1}^{n} \sqrt{\frac{i^2}{n^2}}\left(\frac{2i-1}{n^2}\right)$$

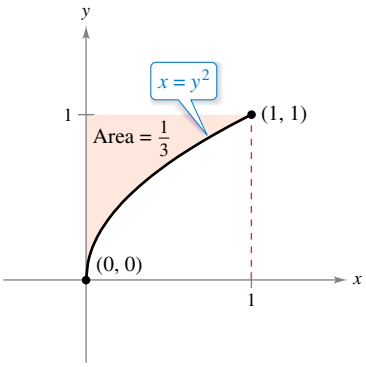
$$= \lim_{n\to\infty} \frac{1}{n^3} \sum_{i=1}^{n} (2i^2 - i)$$

$$= \lim_{n\to\infty} \frac{1}{n^3}\left[2\left(\frac{n(n+1)(2n+1)}{6}\right) - \frac{n(n+1)}{2}\right]$$

$$= \lim_{n\to\infty} \frac{4n^3 + 3n^2 - n}{6n^3}$$

$$= \lim_{n\to\infty} \left(\frac{2}{3} + \frac{1}{2n} - \frac{1}{6n^2}\right)$$

$$= \frac{2}{3}$$ ■



The area of the region bounded by the graph of $x = y^2$ and the y-axis for $0 \le y \le 1$ is $\frac{1}{3}$.

Figure 4.19

From Example 7 in Section 4.2, you know that the region shown in Figure 4.19 has an area of $\frac{1}{3}$. Because the square bounded by $0 \le x \le 1$ and $0 \le y \le 1$ has an area of 1, you can conclude that the area of the region shown in Figure 4.18 has an area of $\frac{2}{3}$. This agrees with the limit found in Example 1, even though that example used a partition having subintervals of unequal widths. The reason this particular partition gave the proper area is that as n increases, the *width of the largest subinterval approaches zero.* This is a key feature of the development of definite integrals.

GO DIGITAL

In Section 4.2, the limit of a sum was used to define the area of a region in the plane. Finding area by this method is only one of *many* applications involving the limit of a sum. A similar approach can be used to determine quantities as diverse as arc lengths, average values, centroids, volumes, work, and surface areas. The next definition is named after Georg Friedrich Bernhard Riemann. Although the definite integral had been defined and used long before Riemann's time, he generalized the concept to cover a broader category of functions.

In the definition of a Riemann sum below, note that the function f has no restrictions other than being defined on the interval $[a, b]$. (In Section 4.2, the function f was assumed to be continuous and nonnegative because you were finding the area under a curve.)

GEORG FRIEDRICH BERNHARD RIEMANN (1826–1866)

German mathematician Riemann did his most famous work in the areas of non-Euclidean geometry, differential equations, and number theory. It was Riemann's results in physics and mathematics that formed the structure on which Einstein's General Theory of Relativity is based.

See LarsonCalculus.com to read more of this biography.

Definition of Riemann Sum

Let a function f be defined on the closed interval $[a, b]$, and let Δ be a partition of $[a, b]$ given by

$$a = x_0 < x_1 < x_2 < \cdots < x_{n-1} < x_n = b$$

where Δx_i is the width of the ith subinterval

$$[x_{i-1}, x_i]. \qquad i\text{th subinterval}$$

If c_i is *any* point in the ith subinterval, then the sum

$$\sum_{i=1}^{n} f(c_i)\,\Delta x_i, \quad x_{i-1} \le c_i \le x_i$$

is called a **Riemann sum** of f for the partition Δ. (The sums in Section 4.2 are examples of Riemann sums, but there are more general Riemann sums than those covered there.)

The width of the largest subinterval of a partition Δ is the **norm** of the partition and is denoted by $\|\Delta\|$. If every subinterval is of equal width, then the partition is **regular** and the norm is denoted by

$$\|\Delta\| = \Delta x = \frac{b-a}{n}. \qquad \text{Regular partition}$$

For a **general partition,** the norm is related to the number of subintervals of $[a, b]$ by the inequality

$$\frac{b-a}{\|\Delta\|} \le n. \qquad \text{General partition}$$

So, the number of subintervals in a partition approaches infinity as the norm of the partition approaches 0. That is, $\|\Delta\| \to 0$ implies that $n \to \infty$.

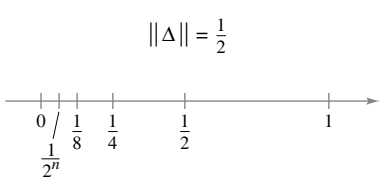
The converse of this statement is not true. For example, let Δ_n be the partition of the interval $[0, 1]$ given by

$$0 < \frac{1}{2^n} < \frac{1}{2^{n-1}} < \cdots < \frac{1}{8} < \frac{1}{4} < \frac{1}{2} < 1.$$

As shown in Figure 4.20, for any positive value of n, the norm of the partition Δ_n is $\frac{1}{2}$. So, letting n approach infinity does not force $\|\Delta\|$ to approach 0. In a regular partition, however, the statements

$$\|\Delta\| \to 0 \quad \text{and} \quad n \to \infty$$

are equivalent.



$n \to \infty$ does not imply that $\|\Delta\| \to 0$.

Definite Integrals

To define the definite integral, consider the limit

$$\lim_{\|\Delta\|\to 0} \sum_{i=1}^{n} f(c_i)\,\Delta x_i = L.$$

To say that this limit exists means there exists a real number L such that for each $\varepsilon > 0$, there exists a $\delta > 0$ such that for every partition with $\|\Delta\| < \delta$, it follows that

$$\left| L - \sum_{i=1}^{n} f(c_i)\,\Delta x_i \right| < \varepsilon$$

regardless of the choice of c_i in the ith subinterval of each partition Δ.

Definition of Definite Integral

If a function f is defined on the closed interval $[a, b]$ and the limit of Riemann sums over partitions Δ

$$\lim_{\|\Delta\|\to 0} \sum_{i=1}^{n} f(c_i)\,\Delta x_i$$

exists (as described above), then f is said to be **integrable** on $[a, b]$ and the limit is denoted by

$$\lim_{\|\Delta\|\to 0} \sum_{i=1}^{n} f(c_i)\,\Delta x_i = \int_a^b f(x)\,dx.$$

The limit is called the **definite integral** of f from a to b. The number a is the **lower limit** of integration, and the number b is the **upper limit** of integration.

REMARK Later in this chapter, you will learn convenient methods for calculating $\int_a^b f(x)\,dx$ for continuous functions. For now, you must use the limit definition.

It is not a coincidence that the notation for definite integrals is similar to that used for indefinite integrals. You will see why in the next section when the Fundamental Theorem of Calculus is introduced. For now, it is important to see that definite integrals and indefinite integrals are different concepts. A definite integral is a *number*, whereas an indefinite integral is a *family of functions*.

Though Riemann sums were defined for functions with very few restrictions, a sufficient condition for a function f to be integrable on $[a, b]$ is that it is continuous on $[a, b]$. A proof of this theorem is beyond the scope of this text.

THEOREM 4.4 Continuity Implies Integrability

If a function f is continuous on the closed interval $[a, b]$, then f is integrable on $[a, b]$. That is, $\int_a^b f(x)\,dx$ exists.

FOR FURTHER INFORMATION For insight into the history of the definite integral, see the article "The Evolution of Integration" by A. Shenitzer and J. Steprāns in *The American Mathematical Monthly.* To view this article, go to *MathArticles.com.*

Exploration

The Converse of Theorem 4.4 Is the converse of Theorem 4.4 true? That is, when a function is integrable, does it have to be continuous? Explain your reasoning and give examples.

Describe the relationships among continuity, differentiability, and integrability. Which is the strongest condition? Which is the weakest? Which conditions imply other conditions?

EXAMPLE 2 Evaluating a Definite Integral as a Limit

Evaluate the definite integral $\int_{-2}^{1} 2x\,dx$.

Solution The function $f(x) = 2x$ is integrable on the interval $[-2, 1]$ because it is continuous on $[-2, 1]$. Moreover, the definition of integrability implies that any partition whose norm approaches 0 can be used to determine the limit. For computational convenience, define Δ by subdividing $[-2, 1]$ into n subintervals of equal width

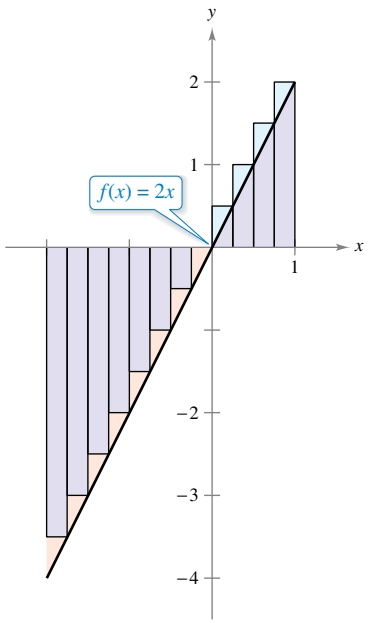
$$\Delta x_i = \Delta x = \frac{b-a}{n} = \frac{3}{n}. \qquad \text{Width of interval}$$

Choosing c_i as the right endpoint of each subinterval produces

$$c_i = a + i(\Delta x) = -2 + \frac{3i}{n}. \qquad \text{Right endpoint}$$

So, the definite integral is

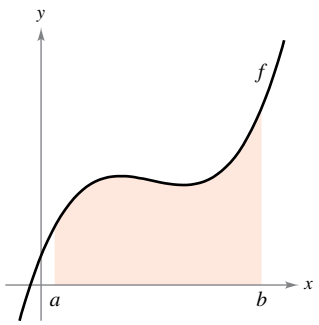
$$\begin{aligned}
\int_{-2}^{1} 2x\,dx &= \lim_{\|\Delta\|\to 0} \sum_{i=1}^{n} f(c_i)\,\Delta x_i && \text{Definition of definite integral} \\
&= \lim_{n\to\infty} \sum_{i=1}^{n} f(c_i)\,\Delta x && n \to \infty \text{ as } \|\Delta\| \to 0 \\
&= \lim_{n\to\infty} \sum_{i=1}^{n} 2\left(-2 + \frac{3i}{n}\right)\left(\frac{3}{n}\right) && f(c_i) = 2c_i \text{ and } \Delta x = \frac{3}{n} \\
&= \lim_{n\to\infty} \frac{6}{n} \sum_{i=1}^{n} \left(-2 + \frac{3i}{n}\right) && \text{Factor out constant term.} \\
&= \lim_{n\to\infty} \frac{6}{n} \left(-2\sum_{i=1}^{n} 1 + \frac{3}{n}\sum_{i=1}^{n} i\right) && \text{Property of summation} \\
&= \lim_{n\to\infty} \frac{6}{n} \left\{-2n + \frac{3}{n}\left[\frac{n(n+1)}{2}\right]\right\} && \text{Apply Theorem 4.2.} \\
&= \lim_{n\to\infty} \frac{6}{n} \left(-2n + \frac{3n}{2} + \frac{3}{2}\right) \\
&= \lim_{n\to\infty} \left(-12 + 9 + \frac{9}{n}\right) \\
&= -3.
\end{aligned}$$



Because the definite integral is negative, it does not represent the area of the region.

Figure 4.21

Because the definite integral in Example 2 is negative, it *does not* represent the area of the region shown in Figure 4.21. Definite integrals can be positive, negative, or zero. For a definite integral to be interpreted as an area (as defined in Section 4.2), the function f must be continuous and nonnegative on $[a, b]$, as stated in the next theorem. The proof of this theorem is straightforward—you simply use the definition of area given in Section 4.2, because it is a Riemann sum.



You can use a definite integral to find the area of the region bounded by the graph of f, the x-axis, $x = a$, and $x = b$.

Figure 4.22

THEOREM 4.5 The Definite Integral as the Area of a Region

If a function f is continuous and nonnegative on the closed interval $[a, b]$, then the area of the region bounded by the graph of f, the x-axis, and the vertical lines $x = a$ and $x = b$ is

$$\text{Area} = \int_a^b f(x)\,dx.$$

(See Figure 4.22.)

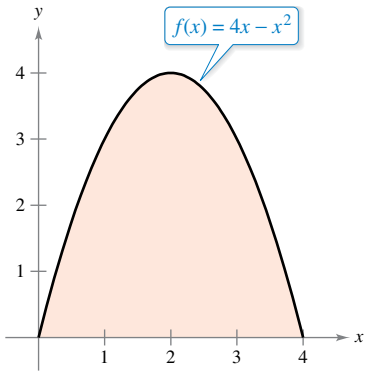
Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



$$\text{Area} = \int_0^4 (4x - x^2)\,dx$$

Figure 4.23

As an example of Theorem 4.5, consider the region bounded by the graph of

$$f(x) = 4x - x^2$$

and the x-axis, as shown in Figure 4.23. Because f is continuous and nonnegative on the closed interval $[0, 4]$, the area of the region is

$$\text{Area} = \int_0^4 (4x - x^2)\,dx.$$

A straightforward technique for evaluating a definite integral such as this will be discussed in Section 4.4. For now, however, you can evaluate a definite integral in two ways—you can use the limit definition *or* you can check to see whether the definite integral represents the area of a common geometric region, such as a rectangle, triangle, or semicircle.

EXAMPLE 3 Areas of Common Geometric Figures

Sketch the region corresponding to each definite integral. Then evaluate each integral using a geometric formula.

a. $\displaystyle\int_1^3 4\,dx$ **b.** $\displaystyle\int_0^3 (x + 2)\,dx$ **c.** $\displaystyle\int_{-2}^2 \sqrt{4 - x^2}\,dx$

Solution A sketch of each region is shown in Figure 4.24.

a. This region is a rectangle of height 4 and width 2.

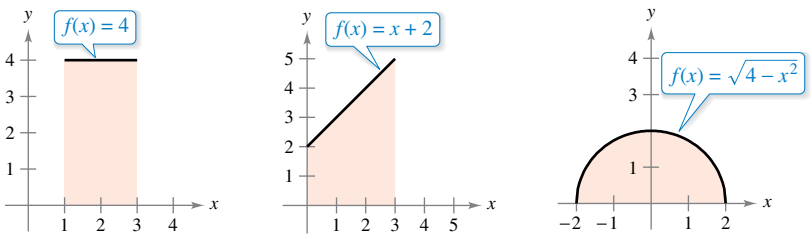
$$\int_1^3 4\,dx = (\text{Area of rectangle}) = 4(2) = 8$$

b. This region is a trapezoid with an altitude of 3 and parallel bases of lengths 2 and 5. The formula for the area of a trapezoid is $\frac{1}{2}h(b_1 + b_2)$.

$$\int_0^3 (x + 2)\,dx = (\text{Area of trapezoid}) = \frac{1}{2}(3)(2 + 5) = \frac{21}{2}$$

c. This region is a semicircle of radius 2. The formula for the area of a semicircle is $\frac{1}{2}\pi r^2$.

$$\int_{-2}^2 \sqrt{4 - x^2}\,dx = (\text{Area of semicircle}) = \frac{1}{2}\pi(2^2) = 2\pi$$



(a) **(b)** **(c)**

Figure 4.24

The variable of integration in a definite integral is sometimes called a *dummy variable* because it can be replaced by any other variable without changing the value of the integral. For instance, the definite integrals

$$\int_0^3 (x + 2)\,dx \quad \text{and} \quad \int_0^3 (t + 2)\,dt$$

have the same value.

Properties of Definite Integrals

The definition of the definite integral of f on the interval $[a, b]$ specifies that $a < b$. Now, however, it is convenient to extend the definition to cover cases in which $a = b$ or $a > b$. Geometrically, the next two definitions seem reasonable. For instance, it makes sense to define the area of a region of zero width and finite height to be 0.

Definitions of Two Special Definite Integrals

1. If a function f is defined at $x = a$, then $\int_a^a f(x)\,dx = 0$.

2. If a function f is integrable on $[a, b]$, then $\int_b^a f(x)\,dx = -\int_a^b f(x)\,dx$.

EXAMPLE 4 Evaluating Definite Integrals

See LarsonCalculus.com for an interactive version of this type of example.

Evaluate (a) $\int_\pi^\pi \sin x\,dx$ and (b) $\int_3^0 (x + 2)\,dx$.

Solution

a. Because the sine function is defined at $x = \pi$, and the upper and lower limits of integration are equal, you can write

$$\int_\pi^\pi \sin x\,dx = 0.$$

b. The integral $\int_3^0 (x + 2)\,dx$ is the same as that given in Example 3(b) except that the upper and lower limits are interchanged. Because the integral in Example 3(b) has a value of $\frac{21}{2}$, you can write

$$\int_3^0 (x + 2)\,dx = -\int_0^3 (x + 2)\,dx = -\frac{21}{2}.$$

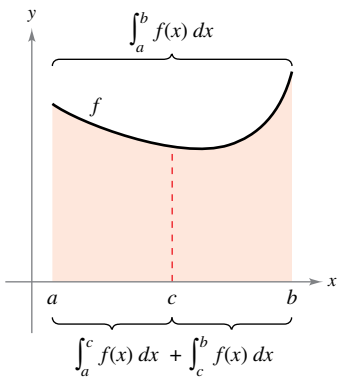

Figure 4.25

In Figure 4.25, the larger region can be divided at $x = c$ into two subregions whose intersection is a line segment. Because the line segment has zero area, it follows that the area of the larger region is equal to the sum of the areas of the two smaller regions.

THEOREM 4.6 Additive Interval Property

If a function f is integrable on the three closed intervals determined by a, b, and c, then

$$\int_a^b f(x)\,dx = \int_a^c f(x)\,dx + \int_c^b f(x)\,dx.$$

See Figure 4.25.

EXAMPLE 5 Using the Additive Interval Property

$$\int_{-1}^1 |x|\,dx = \int_{-1}^0 -x\,dx + \int_0^1 x\,dx \qquad \text{Theorem 4.6}$$

$$= \frac{1}{2} + \frac{1}{2} \qquad \text{Area of a triangle (See Figure 4.26.)}$$

$$= 1$$

Because the definite integral is defined as the limit of a sum, it inherits the properties of summation given at the top of page 259.

THEOREM 4.7 Properties of Definite Integrals

If the functions f and g are integrable on $[a, b]$ and k is a constant, then the functions kf and $f \pm g$ are integrable on $[a, b]$, and

1. $\int_a^b kf(x)\,dx = k\int_a^b f(x)\,dx$

2. $\int_a^b [f(x) \pm g(x)]\,dx = \int_a^b f(x)\,dx \pm \int_a^b g(x)\,dx.$

REMARK Property 2 of Theorem 4.7 can be extended to cover any finite number of functions (see Example 6).

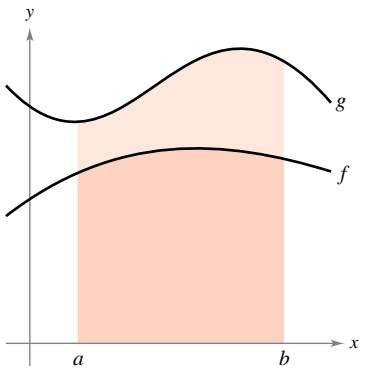
EXAMPLE 6 Evaluating a Definite Integral

Evaluate $\int_1^3 (-x^2 + 4x - 3)\,dx$ using the values shown below.

$$\int_1^3 x^2\,dx = \frac{26}{3}, \qquad \int_1^3 x\,dx = 4, \qquad \int_1^3 dx = 2$$

Solution

$$\begin{aligned}\int_1^3 (-x^2 + 4x - 3)\,dx &= \int_1^3 (-x^2)\,dx + \int_1^3 4x\,dx + \int_1^3 (-3)\,dx \\ &= -\int_1^3 x^2\,dx + 4\int_1^3 x\,dx - 3\int_1^3 dx \\ &= -\left(\frac{26}{3}\right) + 4(4) - 3(2) \\ &= \frac{4}{3}\end{aligned}$$



$\int_a^b f(x)\,dx \le \int_a^b g(x)\,dx$

Figure 4.27

If the functions f and g are continuous on the closed interval $[a, b]$ and $0 \le f(x) \le g(x)$ for $a \le x \le b$, then the following properties are true. First, the area of the region bounded by the graph of f and the x-axis (between a and b) must be nonnegative. Second, this area must be less than or equal to the area of the region bounded by the graph of g and the x-axis (between a and b), as shown in Figure 4.27. These two properties are generalized in Theorem 4.8.

THEOREM 4.8 Preservation of Inequality

1. If a function f is integrable and nonnegative on the closed interval $[a, b]$, then

$$0 \le \int_a^b f(x)\,dx.$$

2. If the functions f and g are integrable on the closed interval $[a, b]$ and $f(x) \le g(x)$ for every x in $[a, b]$, then

$$\int_a^b f(x)\,dx \le \int_a^b g(x)\,dx.$$

A proof of this theorem is given in Appendix A.

4.3 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain what a Riemann sum represents.
2. Explain how to find the area of a region using a definite integral.

Evaluating a Limit **In Exercises 3 and 4, use Example 1 as a model to evaluate the limit**

$$\lim_{n\to\infty} \sum_{i=1}^{n} f(c_i)\,\Delta x_i$$

over the region bounded by the graphs of the equations.

3. $f(x) = \sqrt{x}, \quad y = 0, \quad x = 0, \quad x = 3 \quad \left(\textit{Hint: Let } c_i = \frac{3i^2}{n^2}.\right)$

4. $f(x) = \sqrt[3]{x}, \quad y = 0, \quad x = 0, \quad x = 1 \quad \left(\textit{Hint: Let } c_i = \frac{i^3}{n^3}.\right)$

Evaluating a Definite Integral as a Limit **In Exercises 5–10, evaluate the definite integral by the limit definition.**

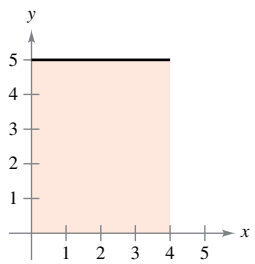
5. $\int_2^6 8\,dx$
6. $\int_{-2}^{3} x\,dx$
7. $\int_{-1}^{1} x^3\,dx$
8. $\int_1^4 4x^2\,dx$
9. $\int_1^2 (x^2 + 1)\,dx$
10. $\int_{-2}^{1} (2x^2 + 3)\,dx$

Writing a Limit as a Definite Integral **In Exercises 11 and 12, write the limit as a definite integral on the given interval, where c_i is any point in the ith subinterval.**

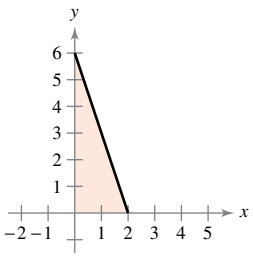
	Limit	Interval
11.	$\lim_{\|\Delta\|\to 0} \sum_{i=1}^{n} (3c_i + 10)\,\Delta x_i$	$[-1, 5]$
12.	$\lim_{\|\Delta\|\to 0} \sum_{i=1}^{n} \sqrt{c_i^2 + 4}\,\Delta x_i$	$[0, 3]$

Writing a Definite Integral **In Exercises 13–22, write a definite integral that represents the area of the region. (Do not evaluate the integral.)**

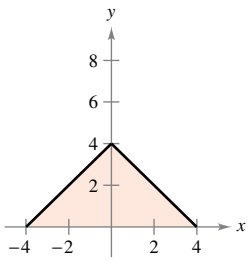
13. $f(x) = 5$



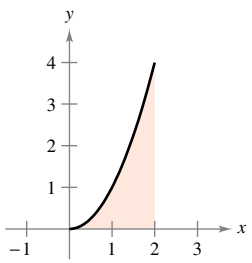
14. $f(x) = 6 - 3x$



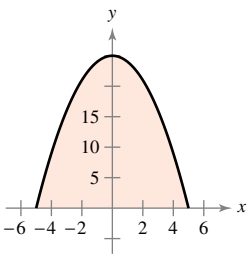
15. $f(x) = 4 - |x|$



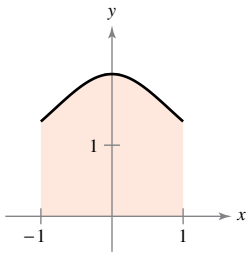
16. $f(x) = x^2$



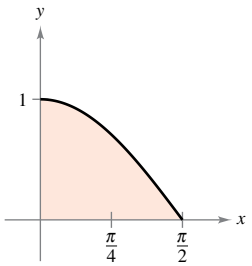
17. $f(x) = 25 - x^2$



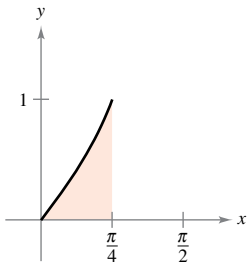
18. $f(x) = \dfrac{4}{x^2 + 2}$



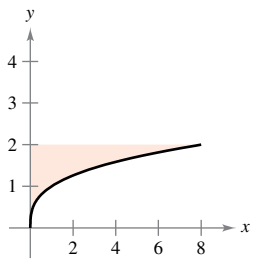
19. $f(x) = \cos x$



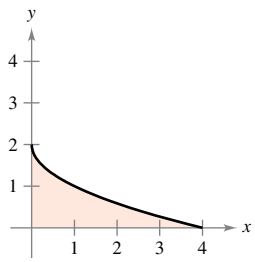
20. $f(x) = \tan x$



21. $g(y) = y^3$



22. $f(y) = (y - 2)^2$



Evaluating a Definite Integral Using a Geometric Formula **In Exercises 23–32, sketch the region whose area is given by the definite integral. Then use a geometric formula to evaluate the integral ($a > 0, r > 0$).**

23. $\int_0^3 4\,dx$
24. $\int_{-3}^{4} 9\,dx$
25. $\int_0^4 x\,dx$
26. $\int_0^8 \frac{x}{4}\,dx$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

27. $\int_0^2 (3x + 4)\,dx$ **28.** $\int_0^3 (8 - 2x)\,dx$

29. $\int_{-1}^1 (1 - |x|)\,dx$ **30.** $\int_{-a}^a (a - |x|)\,dx$

31. $\int_{-7}^7 \sqrt{49 - x^2}\,dx$ **32.** $\int_{-r}^r \sqrt{r^2 - x^2}\,dx$

Using Properties of Definite Integrals **In Exercises 33–40, evaluate the definite integral using the values below.**

$$\int_2^6 x^3\,dx = 320, \quad \int_2^6 x\,dx = 16, \quad \int_2^6 dx = 4$$

33. $\int_6^2 x^3\,dx$ **34.** $\int_2^2 x\,dx$

35. $\int_2^6 \frac{1}{4}x^3\,dx$ **36.** $\int_2^6 -3x\,dx$

37. $\int_2^6 (x - 14)\,dx$ **38.** $\int_2^6 \left(6x - \frac{1}{8}x^3\right)dx$

39. $\int_2^6 (2x^3 - 10x + 7)\,dx$ **40.** $\int_2^6 (21 - 5x - x^3)\,dx$

41. Using Properties of Definite Integrals Given

$$\int_0^5 f(x)\,dx = 10 \quad \text{and} \quad \int_5^7 f(x)\,dx = 3$$

evaluate

(a) $\int_0^7 f(x)\,dx$. (b) $\int_5^0 f(x)\,dx$.

(c) $\int_5^5 f(x)\,dx$. (d) $\int_0^5 3f(x)\,dx$.

42. Using Properties of Definite Integrals Given

$$\int_0^3 f(x)\,dx = 4 \quad \text{and} \quad \int_3^6 f(x)\,dx = -1$$

evaluate

(a) $\int_0^6 f(x)\,dx$. (b) $\int_6^3 f(x)\,dx$.

(c) $\int_3^3 f(x)\,dx$. (d) $\int_3^6 -5f(x)\,dx$.

43. Using Properties of Definite Integrals Given

$$\int_2^6 f(x)\,dx = 10 \quad \text{and} \quad \int_2^6 g(x)\,dx = -2$$

evaluate

(a) $\int_2^6 [f(x) + g(x)]\,dx$.

(b) $\int_2^6 [g(x) - f(x)]\,dx$.

(c) $\int_2^6 2g(x)\,dx$.

(d) $\int_2^6 3f(x)\,dx$.

44. Using Properties of Definite Integrals Given

$$\int_{-1}^1 f(x)\,dx = 0 \quad \text{and} \quad \int_0^1 f(x)\,dx = 5$$

evaluate

(a) $\int_{-1}^0 f(x)\,dx$. (b) $\int_0^1 f(x)\,dx - \int_{-1}^0 f(x)\,dx$.

(c) $\int_{-1}^1 3f(x)\,dx$. (d) $\int_0^1 3f(x)\,dx$.

45. Estimating a Definite Integral Use the table of values to find lower and upper estimates of

$$\int_0^{10} f(x)\,dx.$$

Assume that f is a decreasing function.

x	0	2	4	6	8	10
$f(x)$	32	24	12	−4	−20	−36

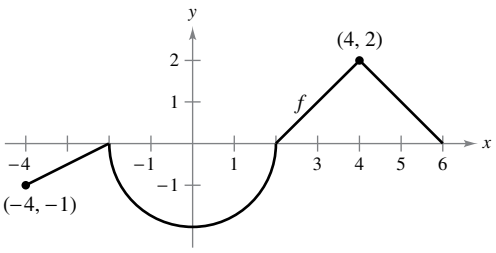
46. Estimating a Definite Integral Use the table of values to estimate

$$\int_0^6 f(x)\,dx.$$

Use three equal subintervals and the (a) left endpoints, (b) right endpoints, and (c) midpoints. When f is an increasing function, how does each estimate compare with the actual value? Explain your reasoning.

x	0	1	2	3	4	5	6
$f(x)$	−6	0	8	18	30	50	80

47. Think About It The graph of a function f consists of line segments and a semicircle, as shown in the figure. Evaluate each definite integral by using geometric formulas.



(a) $\int_0^2 f(x)\,dx$ (b) $\int_2^6 f(x)\,dx$

(c) $\int_{-4}^2 f(x)\,dx$

(d) $\int_{-4}^6 f(x)\,dx$

(e) $\int_{-4}^6 |f(x)|\,dx$

(f) $\int_{-4}^6 [f(x) + 2]\,dx$

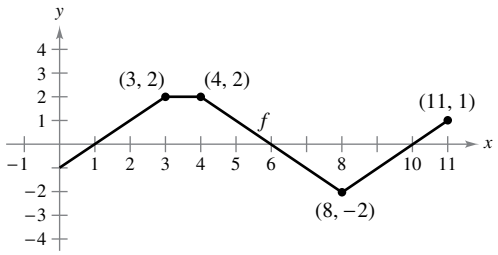
48. Think About It The graph of a function f consists of line segments, as shown in the figure. Evaluate each definite integral by using geometric formulas.



(a) $\int_0^1 -f(x)\,dx$ (b) $\int_3^4 3f(x)\,dx$

(c) $\int_0^7 f(x)\,dx$ (d) $\int_5^{11} f(x)\,dx$

(e) $\int_0^{11} f(x)\,dx$ (f) $\int_4^{10} f(x)\,dx$

49. Think About It Consider a function f that is continuous on the interval $[-5, 5]$ and for which

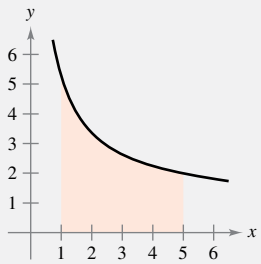
$$\int_0^5 f(x)\,dx = 4.$$

Evaluate each integral.

(a) $\int_0^5 [f(x) + 2]\,dx$ (b) $\int_{-2}^3 f(x + 2)\,dx$

(c) $\int_{-5}^5 f(x)\,dx$, f is even (d) $\int_{-5}^5 f(x)\,dx$, f is odd

50. HOW DO YOU SEE IT? Use the figure to fill in the blank with the symbol $<$, $>$, or $=$. Explain your reasoning.



(a) The interval $[1, 5]$ is partitioned into n subintervals of equal width Δx, and x_i is the left endpoint of the ith subinterval.

$$\sum_{i=1}^{n} f(x_i)\,\Delta x \quad \square \quad \int_1^5 f(x)\,dx$$

(b) The interval $[1, 5]$ is partitioned into n subintervals of equal width Δx, and x_i is the right endpoint of the ith subinterval.

$$\sum_{i=1}^{n} f(x_i)\,\Delta x \quad \square \quad \int_1^5 f(x)\,dx$$

51. Think About It A function f is defined below. Use geometric formulas to find $\int_0^8 f(x)\,dx$.

$$f(x) = \begin{cases} 4, & x < 4 \\ x, & x \geq 4 \end{cases}$$

52. Think About It A function f is defined below. Use geometric formulas to find $\int_0^{12} f(x)\,dx$.

$$f(x) = \begin{cases} 6, & x > 6 \\ -\frac{1}{2}x + 9, & x \leq 6 \end{cases}$$

Exploring Concepts

In Exercises 53 and 54, determine which value best approximates the definite integral. Make your selection on the basis of a sketch.

53. $\int_0^4 \sqrt{x}\,dx$

(a) 5 (b) -3 (c) 10 (d) 2 (e) 8

54. $\int_0^{1/2} 4\cos \pi x\,dx$

(a) 4 (b) $\frac{4}{3}$ (c) 16 (d) 2π (e) -6

55. Use a graph to explain why

$$\int_a^a f(x)\,dx = 0$$

if f is defined at $x = a$.

56. Use a graph to explain why

$$\int_a^b kf(x)\,dx = k\int_a^b f(x)\,dx$$

if f is integrable on $[a, b]$ and k is a constant.

57. Describe two ways to evaluate

$$\int_{-1}^3 (x + 2)\,dx.$$

Verify that each method gives the same result.

58. Give an example of a function that is integrable on the interval $[-1, 1]$ but not continuous on $[-1, 1]$.

Finding Values **In Exercises 59–62, find possible values of a and b that make the statement true. Use a graph to support your answer, when possible. (There may be more than one correct answer.)**

59. $\int_{-2}^1 f(x)\,dx + \int_1^5 f(x)\,dx = \int_a^b f(x)\,dx$

60. $\int_{-3}^3 f(x)\,dx + \int_3^6 f(x)\,dx - \int_a^b f(x)\,dx = \int_{-1}^6 f(x)\,dx$

61. $\int_a^b \sin x\,dx < 0$

62. $\int_a^b \cos x\,dx = 0$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

True or False? **In Exercises 63–68, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

63. $\int_a^b [f(x) + g(x)]\,dx = \int_a^b f(x)\,dx + \int_a^b g(x)\,dx$

64. $\int_a^b f(x)g(x)\,dx = \left[\int_a^b f(x)\,dx\right]\left[\int_a^b g(x)\,dx\right]$

65. If the norm of a partition approaches zero, then the number of subintervals approaches infinity.

66. If a function f is increasing on $[a, b]$, then the minimum value of f on $[a, b]$ is $f(a)$.

67. $\int_a^b f(x)\,dx \geq 0$

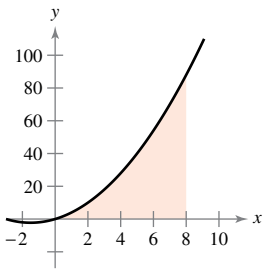
68. $\int_2^2 \sin x^2\,dx = 0$

69. Finding a Riemann Sum Find the Riemann sum for $f(x) = x^2 + 3x$ over the interval $[0, 8]$, where

$x_0 = 0, \quad x_1 = 1, \quad x_2 = 3, \quad x_3 = 7, \quad \text{and} \quad x_4 = 8$

and where

$c_1 = 1, \quad c_2 = 2, \quad c_3 = 5, \quad \text{and} \quad c_4 = 8.$

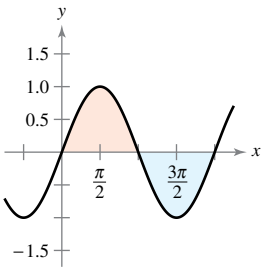


70. Finding a Riemann Sum Find the Riemann sum for $f(x) = \sin x$ over the interval $[0, 2\pi]$, where

$x_0 = 0, \quad x_1 = \frac{\pi}{4}, \quad x_2 = \frac{\pi}{3}, \quad x_3 = \pi, \quad \text{and} \quad x_4 = 2\pi$

and where

$c_1 = \frac{\pi}{6}, \quad c_2 = \frac{\pi}{3}, \quad c_3 = \frac{2\pi}{3}, \quad \text{and} \quad c_4 = \frac{3\pi}{2}.$



71. Proof Prove that $\int_a^b x\,dx = \frac{b^2 - a^2}{2}$.

72. Proof Prove that $\int_a^b x^2\,dx = \frac{b^3 - a^3}{3}$.

73. Think About It Determine whether the Dirichlet function

$$f(x) = \begin{cases} 1, & x \text{ is rational} \\ 0, & x \text{ is irrational} \end{cases}$$

is integrable on the interval $[0, 1]$. Explain.

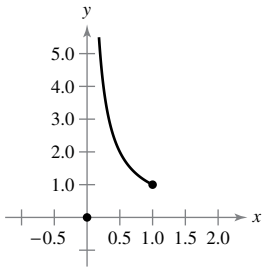
74. Finding a Definite Integral The function

$$f(x) = \begin{cases} 0, & x = 0 \\ \dfrac{1}{x}, & 0 < x \leq 1 \end{cases}$$

is defined on $[0, 1]$, as shown in the figure. Show that

$\int_0^1 f(x)\,dx$

does not exist. Does this contradict Theorem 4.4? Why or why not?



75. Finding Values Find the constants a and b, where $a < b$, that maximize the value of

$\int_a^b (1 - x^2)\,dx.$

Explain your reasoning.

76. Finding Values Find the constants a and b, where $a < 4 < b$, such that

$\left|\int_a^b (x - 4)\,dx\right| = 16$ and $\int_a^b |x - 4|\,dx = 20.$

77. Think About It When is

$\int_a^b f(x)\,dx = \int_a^b |f(x)|\,dx?$

Explain.

78. Step Function Evaluate, if possible, the integral

$\int_0^2 [\![x]\!]\,dx.$

79. Using a Riemann Sum Determine

$\lim_{n\to\infty} \frac{1}{n^3}(1^2 + 2^2 + 3^2 + \cdots + n^2)$

by using an appropriate Riemann sum.

4.4 The Fundamental Theorem of Calculus

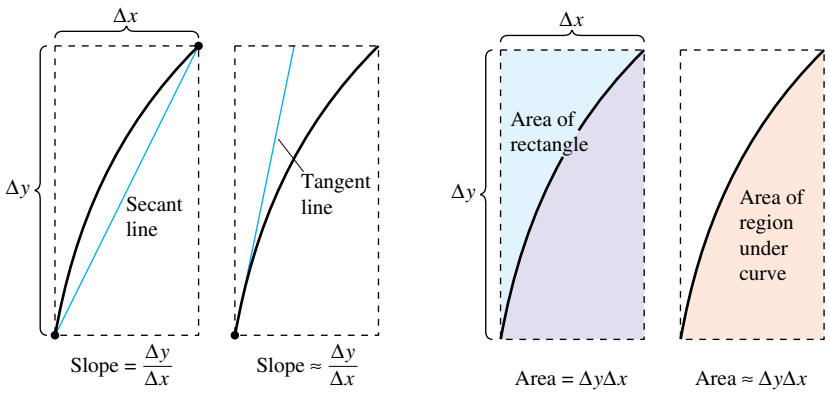
GO DIGITAL

- **Evaluate a definite integral using the Fundamental Theorem of Calculus.**
- **Describe and use the Mean Value Theorem for Integrals.**
- **Find the average value of a function over a closed interval.**
- **Describe and use the Second Fundamental Theorem of Calculus.**
- **Describe and use the Net Change Theorem.**

The Fundamental Theorem of Calculus

You have now been introduced to the two major branches of calculus: differential calculus (introduced with the tangent line problem) and integral calculus (introduced with the area problem). So far, these two problems might seem unrelated—but there is a very close connection. The connection was discovered independently by Isaac Newton and Gottfried Leibniz and is stated in the **Fundamental Theorem of Calculus.**

Informally, the theorem states that differentiation and (definite) integration are inverse operations, in the same sense that division and multiplication are inverse operations. To see how Newton and Leibniz might have anticipated this relationship, consider the approximations shown in Figure 4.28. The slope of the tangent line was defined using the *quotient* $\Delta y/\Delta x$ (the slope of the secant line). Similarly, the area of a region under a curve was defined using the *product* $\Delta y \Delta x$ (the area of a rectangle). So, at least in the primitive approximation stage, the operations of differentiation and definite integration appear to have an inverse relationship in the same sense that division and multiplication are inverse operations. The Fundamental Theorem of Calculus states that the limit processes (used to define the derivative and definite integral) preserve this inverse relationship.



(a) Differentiation **(b)** Definite integration

Differentiation and definite integration have an "inverse" relationship.

Figure 4.28

ANTIDIFFERENTIATION AND DEFINITE INTEGRATION

Throughout this chapter, you have been using the integral sign to denote an antiderivative (a family of functions) and a definite integral (a number).

Antidifferentiation: $\int f(x)\,dx$ Definite integration: $\int_a^b f(x)\,dx$

The use of the same symbol for both operations makes it appear that they are related. In the early work with calculus, however, it was not known that the two operations were related. The symbol $\int$ was first applied to the definite integral by Leibniz and was derived from the letter *S*. (Leibniz calculated area as an infinite sum, thus, the letter *S*.)

GO DIGITAL

THEOREM 4.9 The Fundamental Theorem of Calculus

If a function f is continuous on the closed interval $[a, b]$ and F is an antiderivative of f on the interval $[a, b]$, then

$$\int_a^b f(x)\,dx = F(b) - F(a).$$

Proof The key to the proof is writing the difference $F(b) - F(a)$ in a convenient form. Let Δ be any partition of $[a, b]$.

$$a = x_0 < x_1 < x_2 < \cdots < x_{n-1} < x_n = b$$

By pairwise subtraction and addition of like terms, you can write

$$\begin{aligned} F(b) - F(a) &= F(x_n) - F(x_{n-1}) + F(x_{n-1}) - \cdots - F(x_1) + F(x_1) - F(x_0) \\ &= \sum_{i=1}^{n} [F(x_i) - F(x_{i-1})]. \end{aligned}$$

By the Mean Value Theorem, there exists a number c_i in the ith subinterval such that

$$F'(c_i) = \frac{F(x_i) - F(x_{i-1})}{x_i - x_{i-1}}.$$

Because $F'(c_i) = f(c_i)$, let

$$\Delta x_i = x_i - x_{i-1}$$

and obtain

$$F(b) - F(a) = \sum_{i=1}^{n} f(c_i)\,\Delta x_i.$$

This important equation tells you that by repeatedly applying the Mean Value Theorem, you can always find a collection of c_i's such that the *constant* $F(b) - F(a)$ is a Riemann sum of f on $[a, b]$ for any partition. Theorem 4.4 guarantees that the limit of Riemann sums over the partition with $\|\Delta\| \to 0$ exists. So, taking the limit (as $\|\Delta\| \to 0$) produces

$$F(b) - F(a) = \int_a^b f(x)\,dx.$$

Guidelines for using The Fundamental Theorem of Calculus

1. *Provided you can find* an antiderivative of f, you now have a way to evaluate a definite integral without having to use the limit of a sum.
2. When applying the Fundamental Theorem of Calculus, the notation shown below is convenient.

$$\int_a^b f(x)\,dx = F(x)\Big]_a^b = F(b) - F(a)$$

For instance, to evaluate $\int_1^3 x^3\,dx$, you can write

$$\int_1^3 x^3\,dx = \frac{x^4}{4}\Big]_1^3 = \frac{3^4}{4} - \frac{1^4}{4} = \frac{81}{4} - \frac{1}{4} = 20.$$

3. It is not necessary to include a constant of integration C in the antiderivative.

$$\int_a^b f(x)\,dx = \Big[F(x) + C\Big]_a^b = [F(b) + C] - [F(a) + C] = F(b) - F(a)$$

REMARK Other common notations used when applying the Fundamental Theorem of Calculus are

$$\Big[F(x)\Big]_a^b \quad \text{and} \quad F(x)\Big|_a^b.$$

EXAMPLE 1 Evaluating Definite Integrals

See LarsonCalculus.com for an interactive version of this type of example.

Evaluate each definite integral.

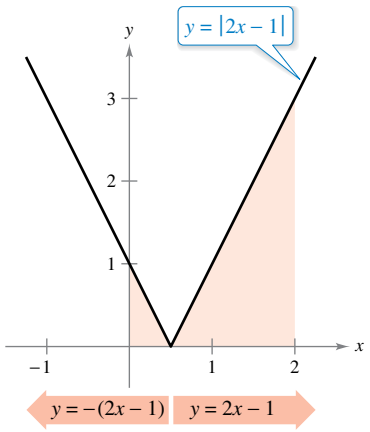
a. $\int_1^2 (x^2 - 3)\,dx$ **b.** $\int_1^4 3\sqrt{x}\,dx$ **c.** $\int_0^{\pi/4} \sec^2 x\,dx$

Solution

a. $\int_1^2 (x^2 - 3)\,dx = \left[\frac{x^3}{3} - 3x\right]_1^2 = \left(\frac{8}{3} - 6\right) - \left(\frac{1}{3} - 3\right) = -\frac{2}{3}$

b. $\int_1^4 3\sqrt{x}\,dx = 3\int_1^4 x^{1/2}\,dx = 3\left[\frac{x^{3/2}}{3/2}\right]_1^4 = 2(4)^{3/2} - 2(1)^{3/2} = 14$

c. $\int_0^{\pi/4} \sec^2 x\,dx = \tan x\Big]_0^{\pi/4} = \tan\frac{\pi}{4} - \tan 0 = 1 - 0 = 1$



The definite integral of y on $[0, 2]$ is $\frac{5}{2}$.
Figure 4.29

EXAMPLE 2 A Definite Integral Involving Absolute Value

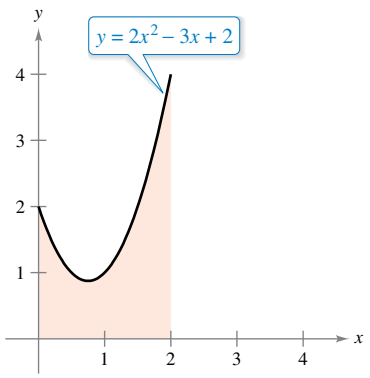
Evaluate $\int_0^2 |2x - 1|\,dx$.

Solution Using Figure 4.29 and the definition of absolute value, you can rewrite the integrand as shown.

$$|2x - 1| = \begin{cases} -(2x - 1), & x < \frac{1}{2} \\ 2x - 1, & x \geq \frac{1}{2} \end{cases}$$ Rewrite using definition of absolute value.

Next, use this and Theorem 4.6 to rewrite the integral in two parts.

$$\begin{aligned} \int_0^2 |2x - 1|\,dx &= \int_0^{1/2} -(2x - 1)\,dx + \int_{1/2}^2 (2x - 1)\,dx \\ &= \left[-x^2 + x\right]_0^{1/2} + \left[x^2 - x\right]_{1/2}^2 \\ &= \left(-\frac{1}{4} + \frac{1}{2}\right) - (0 + 0) + (4 - 2) - \left(\frac{1}{4} - \frac{1}{2}\right) \\ &= \frac{5}{2} \end{aligned}$$



The area of the region bounded by the graph of y, the x-axis, $x = 0$, and $x = 2$ is $\frac{10}{3}$.
Figure 4.30

EXAMPLE 3 Using the Fundamental Theorem to Find Area

Find the area of the region bounded by the graph of

$$y = 2x^2 - 3x + 2$$

the x-axis, and the vertical lines $x = 0$ and $x = 2$, as shown in Figure 4.30.

Solution Note that $y > 0$ on the interval $[0, 2]$.

$$\begin{aligned} \text{Area} &= \int_0^2 (2x^2 - 3x + 2)\,dx && \text{Integrate between } x = 0 \text{ and } x = 2. \\ &= \left[\frac{2x^3}{3} - \frac{3x^2}{2} + 2x\right]_0^2 && \text{Find antiderivative.} \\ &= \left(\frac{16}{3} - 6 + 4\right) - (0 - 0 + 0) && \text{Apply Fundamental Theorem.} \\ &= \frac{10}{3} && \text{Simplify.} \end{aligned}$$

Mean value rectangle:

$f(c)(b - a) = \int_a^b f(x)\,dx$

Figure 4.31

The Mean Value Theorem for Integrals

In Section 4.2, you saw that the area of a region under a curve is greater than the area of an inscribed rectangle and less than the area of a circumscribed rectangle. The Mean Value Theorem for Integrals states that somewhere "between" the inscribed and circumscribed rectangles, there is a rectangle whose area is precisely equal to the area of the region under the curve, as shown in Figure 4.31.

THEOREM 4.10 Mean Value Theorem for Integrals

If a function f is continuous on the closed interval $[a, b]$, then there exists a number c in the closed interval $[a, b]$ such that

$$\int_a^b f(x)\,dx = f(c)(b - a).$$

Proof

Case 1: If f is constant on the interval $[a, b]$, then the theorem is clearly valid because c can be any point in $[a, b]$.

Case 2: If f is not constant on $[a, b]$, then, by the Extreme Value Theorem, you can choose $f(m)$ and $f(M)$ to be the minimum and maximum values of f on $[a, b]$. Because

$$f(m) \le f(x) \le f(M)$$

for all x in $[a, b]$, you can apply Theorem 4.8 to write the double inequality below.

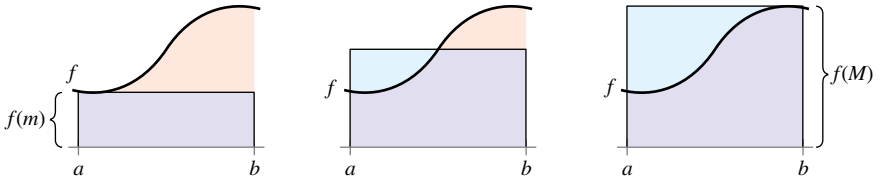
$$\int_a^b f(m)\,dx \le \int_a^b f(x)\,dx \le \int_a^b f(M)\,dx \qquad \text{See Figure 4.32.}$$

$$f(m)(b - a) \le \int_a^b f(x)\,dx \le f(M)(b - a) \qquad \text{Apply Fundamental Theorem.}$$

$$f(m) \le \frac{1}{b - a}\int_a^b f(x)\,dx \le f(M) \qquad \text{Divide by } b - a.$$

From the third inequality, you can apply the Intermediate Value Theorem to conclude that there exists some c in $[a, b]$ such that

$$f(c) = \frac{1}{b - a}\int_a^b f(x)\,dx \quad \text{or} \quad f(c)(b - a) = \int_a^b f(x)\,dx.$$



Inscribed rectangle (less than actual area)

$\int_a^b f(m)\,dx = f(m)(b - a)$

Mean value rectangle (equal to actual area)

$\int_a^b f(x)\,dx$

Circumscribed rectangle (greater than actual area)

$\int_a^b f(M)\,dx = f(M)(b - a)$

Figure 4.32

Notice that Theorem 4.10 does not specify how to determine c. It merely guarantees the existence of at least one number c in the interval.

Average value $= \frac{1}{b-a}\int_a^b f(x)\,dx$

Figure 4.33

GO DIGITAL

Average Value of a Function

The value of $f(c)$ given in the Mean Value Theorem for Integrals is called the **average value** of f on the interval $[a, b]$.

Definition of the Average Value of a Function on an Interval

If a function f is integrable on the closed interval $[a, b]$, then the **average value** of f on the interval is

$$\frac{1}{b-a}\int_a^b f(x)\,dx.$$ See Figure 4.33.

To see why the average value of f is defined in this way, partition $[a, b]$ into n subintervals of equal width $\Delta x = (b-a)/n$. If c_i is any point in the ith subinterval, then the arithmetic average (or mean) of the function values at the c_i's is

$$a_n = \frac{1}{n}[f(c_1) + f(c_2) + \cdots + f(c_n)].$$ Average of $f(c_1), \ldots, f(c_n)$

By writing the sum using summation notation and then multiplying and dividing by $(b-a)$, you can write the average as

$$\begin{aligned} a_n &= \frac{1}{n}\sum_{i=1}^{n} f(c_i) && \text{Rewrite using summation notation.} \\ &= \frac{1}{n}\sum_{i=1}^{n} f(c_i)\left(\frac{b-a}{b-a}\right) && \text{Multiply and divide by } (b-a). \\ &= \frac{1}{b-a}\sum_{i=1}^{n} f(c_i)\left(\frac{b-a}{n}\right) && \text{Rewrite.} \\ &= \frac{1}{b-a}\sum_{i=1}^{n} f(c_i)\,\Delta x. && \Delta x = \frac{b-a}{n} \end{aligned}$$

Finally, taking the limit as $n \to \infty$ produces the average value of f on the interval $[a, b]$, as given in the definition above. In Figure 4.33, notice that the area of the region under the graph of f is equal to the area of the rectangle whose height is the average value.

This development of the average value of a function on an interval is only one of many practical uses of definite integrals to represent summation processes. In Chapter 7, you will study other applications, such as volume, arc length, centers of mass, and work.

EXAMPLE 4 Finding the Average Value of a Function

Find the average value of $f(x) = 3x^2 - 2x$ on the interval $[1, 4]$.

Solution The average value is

$$\begin{aligned} \frac{1}{b-a}\int_a^b f(x)\,dx &= \frac{1}{4-1}\int_1^4 (3x^2 - 2x)\,dx \\ &= \frac{1}{3}\Big[x^3 - x^2\Big]_1^4 \\ &= \frac{1}{3}[64 - 16 - (1-1)] \\ &= \frac{48}{3} \\ &= 16. \end{aligned}$$ See Figure 4.34.

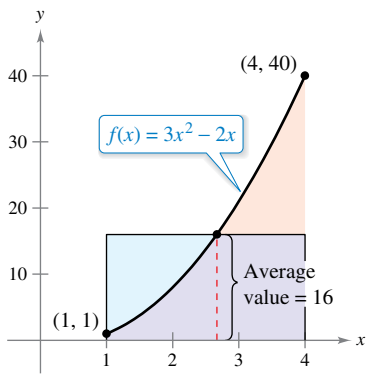

Figure 4.34

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

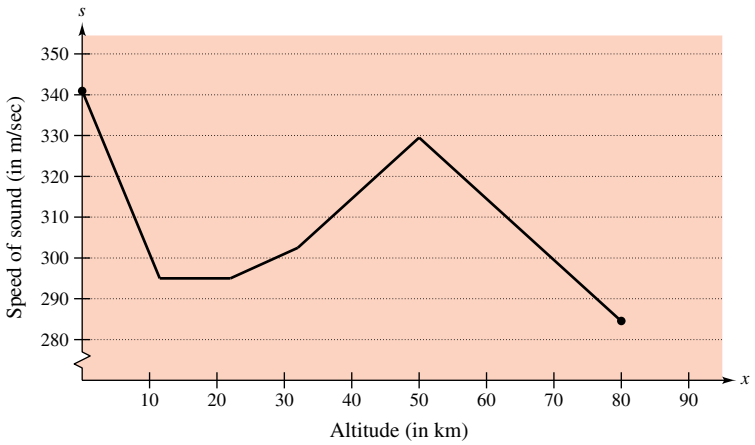
The first person to fly at a speed greater than the speed of sound was Charles Yeager. On October 14, 1947, Yeager was clocked at 295.9 meters per second at an altitude of 12.2 kilometers. If Yeager had been flying at an altitude below 11.275 kilometers, this speed would not have "broken the sound barrier." The photo shows an F/A-18F Super Hornet, a supersonic twin-engine strike fighter. A "green Hornet" using a 50/50 mixture of biofuel made from camelina oil became the first U.S. naval tactical aircraft to exceed 1 mach (the speed of sound).

EXAMPLE 5 The Speed of Sound

At different altitudes in Earth's atmosphere, sound travels at different speeds. The speed of sound $s(x)$, in meters per second, can be modeled by

$$s(x) = \begin{cases} -4x + 341, & 0 \le x < 11.5 \\ 295, & 11.5 \le x < 22 \\ \frac{3}{4}x + 278.5, & 22 \le x < 32 \\ \frac{3}{2}x + 254.5, & 32 \le x < 50 \\ -\frac{3}{2}x + 404.5, & 50 \le x \le 80 \end{cases}$$

where x is the altitude in kilometers (see figure). What is the average speed of sound over the interval $[0, 80]$?



Speed of sound depends on altitude.

Solution Begin by integrating $s(x)$ over the interval $[0, 80]$. To do this, break the integral into five parts.

$$\int_0^{11.5} s(x)\,dx = \int_0^{11.5} (-4x + 341)\,dx = \left[-2x^2 + 341x\right]_0^{11.5} = 3657$$

$$\int_{11.5}^{22} s(x)\,dx = \int_{11.5}^{22} 295\,dx = \left[295x\right]_{11.5}^{22} = 3097.5$$

$$\int_{22}^{32} s(x)\,dx = \int_{22}^{32} \left(\tfrac{3}{4}x + 278.5\right) dx = \left[\tfrac{3}{8}x^2 + 278.5x\right]_{22}^{32} = 2987.5$$

$$\int_{32}^{50} s(x)\,dx = \int_{32}^{50} \left(\tfrac{3}{2}x + 254.5\right) dx = \left[\tfrac{3}{4}x^2 + 254.5x\right]_{32}^{50} = 5688$$

$$\int_{50}^{80} s(x)\,dx = \int_{50}^{80} \left(-\tfrac{3}{2}x + 404.5\right) dx = \left[-\tfrac{3}{4}x^2 + 404.5x\right]_{50}^{80} = 9210$$

By adding the values of the five integrals, you have

$$\int_0^{80} s(x)\,dx = 24{,}640.$$

So, the average speed of sound from an altitude of 0 kilometers to an altitude of 80 kilometers is

$$\text{Average speed} = \frac{1}{80}\int_0^{80} s(x)\,dx = \frac{24{,}640}{80} = 308 \text{ meters per second.}$$

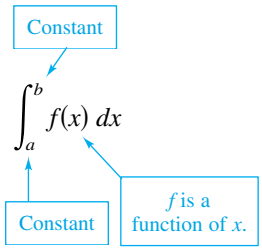
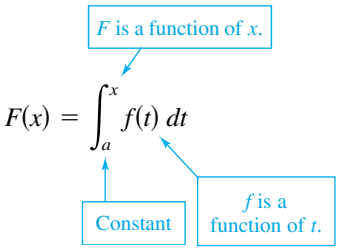
The Second Fundamental Theorem of Calculus

Earlier you saw that the definite integral of f on the interval $[a, b]$ was defined using the constant b as the upper limit of integration and x as the variable of integration. However, a slightly different situation may arise in which the variable x is used in the upper limit of integration. To avoid the confusion of using x in two different ways, t is temporarily used as the variable of integration. (Remember that the definite integral is *not* a function of its variable of integration.)

The Definite Integral as a Number



The Definite Integral as a Function of x



Exploration

Use a graphing utility to graph the function

$$F(x) = \int_0^x \cos t\,dt$$

for $0 \le x \le 2\pi$. Do you recognize this graph? Explain.

EXAMPLE 6 **The Definite Integral as a Function**

Evaluate the function

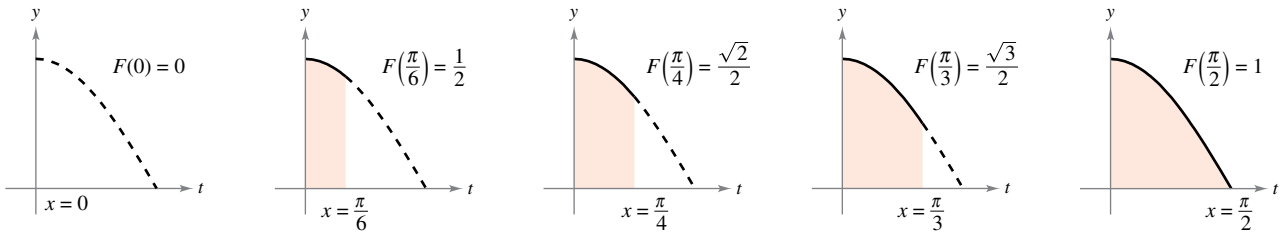
$$F(x) = \int_0^x \cos t\,dt$$

at $x = 0$, $\pi/6$, $\pi/4$, $\pi/3$, and $\pi/2$.

Solution You could solve this problem by evaluating five different definite integrals, one for each of the given upper limits. It is much simpler, however, to fix x (as a constant) temporarily to obtain

$$\begin{aligned}\int_0^x \cos t\,dt &= \sin t\Big]_0^x \\ &= \sin x - \sin 0 \\ &= \sin x.\end{aligned}$$

Now, using $F(x) = \sin x$, you can obtain the results shown in Figure 4.35.



$F(x) = \int_0^x \cos t\,dt$ is the area under the curve $f(t) = \cos t$ from 0 to x.

Figure 4.35

You can think of the function $F(x)$ as *accumulating* the area under the curve $f(t) = \cos t$ from $t = 0$ to $t = x$. For $x = 0$, the area is 0 and $F(0) = 0$. For $x = \pi/2$, $F(\pi/2) = 1$ gives the accumulated area under the cosine curve on the entire interval $[0, \pi/2]$. This interpretation of an integral as an **accumulation function** is used often in applications of integration.

GO DIGITAL

In Example 6, note that the derivative of F is the original integrand (with only the variable changed). That is,

$$\frac{d}{dx}[F(x)] = \frac{d}{dx}[\sin x] = \frac{d}{dx}\left[\int_0^x \cos t\, dt\right] = \cos x.$$

This result is generalized in the next theorem, called the **Second Fundamental Theorem of Calculus.**

THEOREM 4.11 The Second Fundamental Theorem of Calculus

If a function f is continuous on an open interval I containing a, then, for every x in the interval,

$$\frac{d}{dx}\left[\int_a^x f(t)\, dt\right] = f(x).$$

Proof Begin by defining F as

$$F(x) = \int_a^x f(t)\, dt.$$

Then, by the definition of the derivative, you can write

$$\begin{aligned} F'(x) &= \lim_{\Delta x \to 0} \frac{F(x + \Delta x) - F(x)}{\Delta x} \\ &= \lim_{\Delta x \to 0} \frac{1}{\Delta x}\left[\int_a^{x+\Delta x} f(t)\, dt - \int_a^x f(t)\, dt\right] \\ &= \lim_{\Delta x \to 0} \frac{1}{\Delta x}\left[\int_a^{x+\Delta x} f(t)\, dt + \int_x^a f(t)\, dt\right] \\ &= \lim_{\Delta x \to 0} \frac{1}{\Delta x}\left[\int_x^{x+\Delta x} f(t)\, dt\right]. \end{aligned}$$

From the Mean Value Theorem for Integrals (assuming $\Delta x > 0$), there exists a number c in the interval $[x, x + \Delta x]$ such that the integral in the expression above is equal to $f(c)\,\Delta x$. Moreover, because $x \le c \le x + \Delta x$, it follows that $c \to x$ as $\Delta x \to 0$. So, you obtain

$$F'(x) = \lim_{\Delta x \to 0}\left[\frac{1}{\Delta x} f(c)\,\Delta x\right] = \lim_{\Delta x \to 0} f(c) = f(x).$$

A similar argument can be made for $\Delta x < 0$. ∎

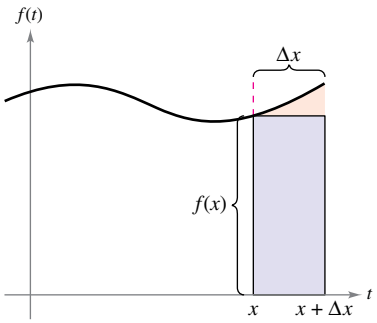
Using the area model for definite integrals, the approximation

$$f(x)\,\Delta x \approx \int_x^{x+\Delta x} f(t)\, dt$$

can be viewed as saying that the area of the rectangle of height $f(x)$ and width Δx is approximately equal to the area of the region lying between the graph of f and the x-axis on the interval

$$[x, x + \Delta x]$$

as shown in the figure at the right.



$$f(x)\,\Delta x \approx \int_x^{x+\Delta x} f(t)\, dt$$

Note that the Second Fundamental Theorem of Calculus tells you that when a function is continuous, you can be sure that it has an antiderivative. This antiderivative need not, however, be an elementary function. (Recall the discussion of elementary functions in Section P.3.)

EXAMPLE 7 The Second Fundamental Theorem of Calculus

Evaluate $\frac{d}{dx}\left[\int_0^x \sqrt{t^2 + 1}\, dt\right]$.

Solution Note that $f(t) = \sqrt{t^2 + 1}$ is continuous on the entire real number line. So, using the Second Fundamental Theorem of Calculus, you can write

$$\frac{d}{dx}\left[\int_0^x \sqrt{t^2 + 1}\, dt\right] = \sqrt{x^2 + 1}.$$

The differentiation shown in Example 7 is a straightforward application of the Second Fundamental Theorem of Calculus. The next example shows how this theorem can be combined with the Chain Rule to find the derivative of a function.

EXAMPLE 8 The Second Fundamental Theorem of Calculus

Find the derivative of $F(x) = \int_{\pi/2}^{x^3} \cos t\, dt$.

Solution Using $u = x^3$, apply the Second Fundamental Theorem of Calculus with the Chain Rule as shown.

$$\begin{aligned}
F'(x) &= \frac{dF}{du}\frac{du}{dx} && \text{Chain Rule} \\
&= \frac{d}{du}[F(x)]\frac{du}{dx} && \text{Definition of } \frac{dF}{du} \\
&= \frac{d}{du}\left[\int_{\pi/2}^{x^3} \cos t\, dt\right]\frac{du}{dx} && \text{Substitute } \int_{\pi/2}^{x^3} \cos t\, dt \text{ for } F(x). \\
&= \frac{d}{du}\left[\int_{\pi/2}^{u} \cos t\, dt\right]\frac{du}{dx} && \text{Substitute } u \text{ for } x^3. \\
&= (\cos u)(3x^2) && \text{Apply Second Fundamental Theorem of Calculus.} \\
&= (\cos x^3)(3x^2) && \text{Rewrite as function of } x.
\end{aligned}$$

Because the integrand in Example 8 is easily integrated, you can verify the derivative as shown below. First, rewrite F as

$$\begin{aligned}
F(x) &= \int_{\pi/2}^{x^3} \cos t\, dt \\
&= \sin t\Big]_{\pi/2}^{x^3} \\
&= \sin x^3 - \sin\frac{\pi}{2} \\
&= \sin x^3 - 1.
\end{aligned}$$

Then, in this form, apply the Chain Rule to verify that the derivative of F is the same as that obtained in Example 8.

$$\frac{d}{dx}[\sin x^3 - 1] = (\cos x^3)(3x^2) \qquad \text{Derivative of } F$$

Net Change Theorem

The Fundamental Theorem of Calculus (Theorem 4.9) states that if a function f is continuous on the closed interval $[a, b]$ and F is an antiderivative of f on $[a, b]$, then

$$\int_a^b f(x)\,dx = F(b) - F(a).$$

But because $F'(x) = f(x)$, this statement can be rewritten as

$$\int_a^b F'(x)\,dx = F(b) - F(a)$$

where the quantity $F(b) - F(a)$ represents the *net change of* $F(x)$ on the interval $[a, b]$.

THEOREM 4.12 The Net Change Theorem

If $F'(x)$ is the rate of change of a quantity $F(x)$, then the definite integral of $F'(x)$ from a to b gives the total change, or **net change,** of $F(x)$ on the interval $[a, b]$.

$$\int_a^b F'(x)\,dx = F(b) - F(a) \qquad \text{Net change of } F(x)$$

EXAMPLE 9 Using the Net Change Theorem

A chemical flows into a storage tank at a rate of $(180 + 3t)$ liters per minute, where t is the time in minutes and $0 \le t \le 60$. Find the amount of the chemical that flows into the tank during the first 20 minutes.

Solution Let $c(t)$ be the amount of the chemical in the tank at time t. Then $c'(t)$ represents the rate at which the chemical flows into the tank at time t. During the first 20 minutes, the amount that flows into the tank is

$$\begin{aligned}\int_0^{20} c'(t)\,dt &= \int_0^{20} (180 + 3t)\,dt \\ &= \left[180t + \frac{3}{2}t^2\right]_0^{20} \\ &= 3600 + 600 \\ &= 4200.\end{aligned}$$

So, the amount of the chemical that flows into the tank during the first 20 minutes is 4200 liters. ■

A common application of the Net Change Theorem is a particle motion problem. Consider a particle moving along a straight line, where $s(t)$ is the position at time t. The velocity of the particle is $v(t) = s'(t)$ and

$$\int_a^b v(t)\,dt = s(b) - s(a) \qquad \text{Displacement on } [a, b]$$

is the net change in position, or **displacement,** of the particle on the time interval $a \le t \le b$.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

A_1, A_2, and A_3 are the areas of the shaded regions.

Figure 4.36

To calculate the **total distance** the particle travels on the time interval $a \le t \le b$, you must consider the intervals where $v(t) < 0$ and the intervals where $v(t) > 0$. When $v(t) < 0$, the particle moves to the left. When $v(t) > 0$, the particle moves to the right. In both cases, the distance is found by integrating the **speed** of the particle, $|v(t)|$.

$$\text{Total distance traveled on } [a, b] = \int_a^b |v(t)|\, dt$$

Figure 4.36 shows how both displacement and total distance traveled can be interpreted as areas under a velocity curve.

$$\text{Displacement on } [a, b] = \int_a^b v(t)\, dt = A_1 - A_2 + A_3$$

$$\text{Total distance traveled on } [a, b] = \int_a^b |v(t)|\, dt = A_1 + A_2 + A_3$$

GO DIGITAL

EXAMPLE 10 Solving a Particle Motion Problem

The velocity (in feet per second) of a particle moving along a line is

$$v(t) = t^3 - 10t^2 + 29t - 20$$

where t is the time in seconds.

a. What is the displacement of the particle on the time interval $1 \le t \le 5$?

b. What is the total distance traveled by the particle on the time interval $1 \le t \le 5$?

Solution

a. The displacement of the particle on $1 \le t \le 5$ is

$$\begin{aligned}\int_1^5 v(t)\, dt &= \int_1^5 (t^3 - 10t^2 + 29t - 20)\, dt \\ &= \left[\frac{1}{4}t^4 - \frac{10}{3}t^3 + \frac{29}{2}t^2 - 20t\right]_1^5 \\ &= \frac{25}{12} - \left(-\frac{103}{12}\right) \\ &= \frac{32}{3} \text{ feet.}\end{aligned}$$

So, the particle moves about 10.667 feet to the right.

b. To find the total distance traveled, calculate $\int_1^5 |v(t)|\, dt$. Using Figure 4.37 and the fact that $v(t)$ can be factored as $(t - 1)(t - 4)(t - 5)$, you can determine that $v(t) > 0$ on the interval $(1, 4)$ and $v(t) < 0$ on the interval $(4, 5)$. So, the total distance traveled on $1 \le t \le 5$ is

$$\begin{aligned}\int_1^5 |v(t)|\, dt &= \int_1^4 v(t)\, dt + \int_4^5 -v(t)\, dt \\ &= \int_1^4 (t^3 - 10t^2 + 29t - 20)\, dt + \int_4^5 -(t^3 - 10t^2 + 29t - 20)\, dt \\ &= \left[\frac{1}{4}t^4 - \frac{10}{3}t^3 + \frac{29}{2}t^2 - 20t\right]_1^4 + \left[-\frac{1}{4}t^4 + \frac{10}{3}t^3 - \frac{29}{2}t^2 + 20t\right]_4^5 \\ &= \frac{45}{4} + \frac{7}{12} \\ &= \frac{71}{6} \text{ feet}\end{aligned}$$

or about 11.833 feet.

Concept Check

1. Explain how to evaluate a definite integral using the Fundamental Theorem of Calculus.
2. Describe the Mean Value Theorem for Integrals.
3. Explain how to find the average value of a function on an interval.
4. Explain why

$$F(x) = \int_0^x f(t)\,dt$$

is considered an accumulation function.

Graphical Reasoning **In Exercises 5–8, use a graphing utility to graph the integrand. Use the graph to determine whether the definite integral is positive, negative, or zero.**

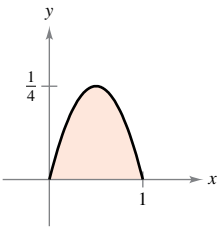
5. $\displaystyle\int_0^{\pi} \frac{4}{x^2+1}\,dx$
6. $\displaystyle\int_0^{\pi} \cos x\,dx$
7. $\displaystyle\int_{-2}^{2} x\sqrt{x^2+1}\,dx$
8. $\displaystyle\int_{-2}^{2} x\sqrt{2-x}\,dx$

Evaluating a Definite Integral **In Exercises 9–36, evaluate the definite integral. Use a graphing utility to verify your result.**

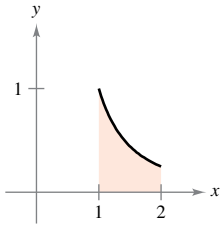
9. $\displaystyle\int_{-1}^{0} (2x-1)\,dx$
10. $\displaystyle\int_{-1}^{2} (7-3t)\,dt$
11. $\displaystyle\int_{-1}^{1} (t^2-5)\,dt$
12. $\displaystyle\int_{1}^{2} (6x^2-3x)\,dx$
13. $\displaystyle\int_{0}^{1} (2t-1)^2\,dt$
14. $\displaystyle\int_{1}^{4} (8x^3-x)\,dx$
15. $\displaystyle\int_{1}^{2} \left(\frac{3}{x^2}-1\right)dx$
16. $\displaystyle\int_{-2}^{-1} \left(u-\frac{1}{u^2}\right)du$
17. $\displaystyle\int_{1}^{4} \frac{u-2}{\sqrt{u}}\,du$
18. $\displaystyle\int_{-8}^{8} x^{1/3}\,dx$
19. $\displaystyle\int_{-1}^{1} \left(\sqrt[3]{t}-2\right)dt$
20. $\displaystyle\int_{1}^{8} \sqrt{\frac{2}{x}}\,dx$
21. $\displaystyle\int_{0}^{1} \frac{x-\sqrt{x}}{3}\,dx$
22. $\displaystyle\int_{0}^{2} (6-t)\sqrt{t}\,dt$
23. $\displaystyle\int_{-1}^{0} (t^{1/3}-t^{2/3})\,dt$
24. $\displaystyle\int_{-8}^{-1} \frac{x-x^2}{2\sqrt[3]{x}}\,dx$
25. $\displaystyle\int_{0}^{5} |2x-5|\,dx$
26. $\displaystyle\int_{1}^{4} (3-|x-3|)\,dx$
27. $\displaystyle\int_{0}^{4} |x^2-9|\,dx$
28. $\displaystyle\int_{0}^{4} |x^2-4x+3|\,dx$
29. $\displaystyle\int_{0}^{\pi} (\sin x-7)\,dx$
30. $\displaystyle\int_{0}^{\pi} (2+\cos x)\,dx$
31. $\displaystyle\int_{0}^{\pi/4} \frac{1-\sin^2\theta}{\cos^2\theta}\,d\theta$
32. $\displaystyle\int_{0}^{\pi/4} \frac{\sec^2\theta}{\tan^2\theta+1}\,d\theta$
33. $\displaystyle\int_{-\pi/6}^{\pi/6} \sec^2 x\,dx$
34. $\displaystyle\int_{\pi/4}^{\pi/2} (2-\csc^2 x)\,dx$
35. $\displaystyle\int_{-\pi/3}^{\pi/3} 4\sec\theta\tan\theta\,d\theta$
36. $\displaystyle\int_{-\pi/2}^{\pi/2} (2\theta+\cos\theta)\,d\theta$

Finding the Area of a Region **In Exercises 37–40, find the area of the given region.**

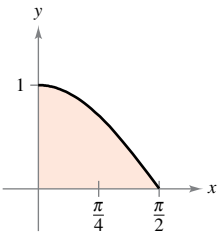
37. $y = x - x^2$



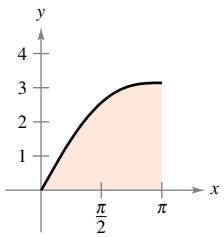
38. $y = \dfrac{1}{x^2}$



39. $y = \cos x$



40. $y = x + \sin x$



Finding the Area of a Region **In Exercises 41–46, find the area of the region bounded by the graphs of the equations.**

41. $y = 5x^2 + 2, \quad x = 0, \quad x = 2, \quad y = 0$
42. $y = x^3 + 6x, \quad x = 2, \quad y = 0$
43. $y = 1 + \sqrt[3]{x}, \quad x = 0, \quad x = 8, \quad y = 0$
44. $y = 2\sqrt{x} - x, \quad y = 0$
45. $y = -x^2 + 4x, \quad y = 0$
46. $y = 1 - x^4, \quad y = 0$

Using the Mean Value Theorem for Integrals **In Exercises 47–52, find the value(s) of c guaranteed by the Mean Value Theorem for Integrals for the function over the given interval.**

47. $f(x) = x^3, \quad [0, 3]$
48. $f(x) = \sqrt{x}, \quad [4, 9]$
49. $y = \dfrac{x^2}{4}, \quad [0, 6]$
50. $f(x) = \dfrac{9}{x^3}, \quad [1, 3]$
51. $f(x) = 2\sec^2 x, \quad \left[-\dfrac{\pi}{4}, \dfrac{\pi}{4}\right]$
52. $f(x) = \cos x, \quad \left[-\dfrac{\pi}{3}, \dfrac{\pi}{3}\right]$

Finding the Average Value of a Function **In Exercises 53–58, find the average value of the function over the given interval and all values of x in the interval for which the function equals its average value.**

53. $f(x) = 4 - x^2, \quad [-2, 2]$

54. $f(x) = \dfrac{4(x^2 + 1)}{x^2}, \quad [1, 3]$

55. $f(x) = x^4 + 7, \quad [0, 2]$

56. $f(x) = 4x^3 - 3x^2, \quad [0, 1]$

57. $f(x) = \sin x, \quad [0, \pi]$

58. $f(x) = \cos x, \quad \left[0, \dfrac{\pi}{2}\right]$

59. Force The force F (in newtons) of a hydraulic cylinder in a press is proportional to the square of $\sec x$, where x is the distance (in meters) that the cylinder is extended in its cycle. The domain of F is $[0, \pi/3]$, and $F(0) = 500$.

(a) Find F as a function of x.

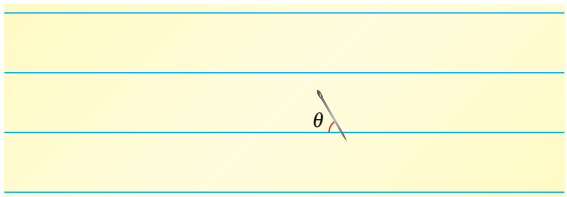
(b) Find the average force exerted by the press over the interval $[0, \pi/3]$.

60. Respiratory Cycle The volume V, in liters, of air in the lungs during a five-second respiratory cycle is approximated by the model $V = 0.1729t + 0.1522t^2 - 0.0374t^3$, where t is the time in seconds. Approximate the average volume of air in the lungs during one cycle.

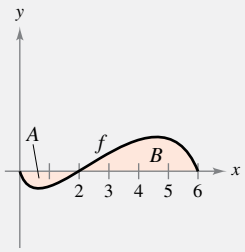
61. Buffon's Needle Experiment A horizontal plane is ruled with parallel lines 2 inches apart. A two-inch needle is tossed randomly onto the plane. The probability that the needle will touch a line is

$$P = \frac{2}{\pi}\int_0^{\pi/2} \sin\theta \, d\theta$$

where θ is the acute angle between the needle and any one of the parallel lines. Find this probability.



62. HOW DO YOU SEE IT? The graph of a function f is shown in the figure. The shaded region A has an area of 1.5, and $\int_0^6 f(x)\,dx = 3.5$. Use this information to fill in the blanks.



(a) $\displaystyle\int_0^2 f(x)\,dx =$ ____

(b) $\displaystyle\int_2^6 f(x)\,dx =$ ____

(c) $\displaystyle\int_0^6 |f(x)|\,dx =$ ____

(d) $\displaystyle\int_0^2 -2f(x)\,dx =$ ____

(e) $\displaystyle\int_0^6 [2 + f(x)]\,dx =$ ____

(f) The average value of f over the interval $[0, 6]$ is ____.

Evaluating a Definite Integral **In Exercises 63 and 64, find F as a function of x and evaluate it at $x = 2$, $x = 5$, and $x = 8$.**

63. $F(x) = \displaystyle\int_1^x \frac{20}{v^2}\,dv$

64. $F(x) = \displaystyle\int_2^x (t^3 + 2t - 2)\,dt$

Evaluating a Definite Integral **In Exercises 65 and 66, find F as a function of x and evaluate it at $x = 0$, $x = \pi/4$, and $x = \pi/2$.**

65. $F(x) = \displaystyle\int_0^x \cos\theta\,d\theta$

66. $F(x) = \displaystyle\int_{-\pi}^x \sin\theta\,d\theta$

67. Analyzing a Function Let

$$g(x) = \int_0^x f(t)\,dt$$

where f is the function whose graph is shown in the figure.

(a) Estimate $g(0)$, $g(2)$, $g(4)$, $g(6)$, and $g(8)$.

(b) Find the largest open interval on which g is increasing. Find the largest open interval on which g is decreasing.

(c) Identify any extrema of g.

(d) Sketch a rough graph of g.

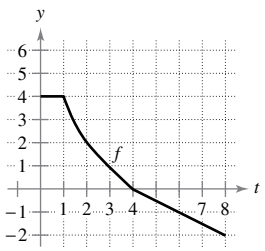


Figure for 67

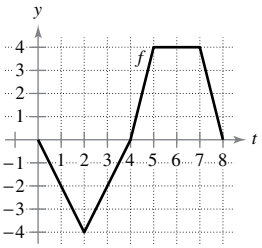

Figure for 68

68. Analyzing a Function Let

$$g(x) = \int_0^x f(t)\,dt$$

where f is the function whose graph is shown in the figure.

(a) Estimate $g(0)$, $g(2)$, $g(4)$, $g(6)$, and $g(8)$.

(b) Find the largest open interval on which g is increasing. Find the largest open interval on which g is decreasing.

(c) Identify any extrema of g.

(d) Sketch a rough graph of g.

Finding and Checking an Integral **In Exercises 69–74, (a) integrate to find F as a function of x, and (b) demonstrate the Second Fundamental Theorem of Calculus by differentiating the result in part (a).**

69. $F(x) = \displaystyle\int_0^x (t + 2)\,dt$

70. $F(x) = \displaystyle\int_0^x t(t^2 + 1)\,dt$

71. $F(x) = \displaystyle\int_8^x \sqrt[3]{t}\,dt$

72. $F(x) = \displaystyle\int_4^x t^{3/2}\,dt$

73. $F(x) = \displaystyle\int_{\pi/4}^x \sec^2 t\,dt$

74. $F(x) = \displaystyle\int_{\pi/3}^x \sec t \tan t\,dt$

Using the Second Fundamental Theorem of Calculus

In Exercises 75–80, use the Second Fundamental Theorem of Calculus to find $F'(x)$.

75. $F(x) = \int_{-2}^{x} (t^2 - 2t)\,dt$

76. $F(x) = \int_{1}^{x} \frac{t^2}{t^2 + 1}\,dt$

77. $F(x) = \int_{-1}^{x} \sqrt{t^4 + 1}\,dt$

78. $F(x) = \int_{1}^{x} \sqrt[4]{t}\,dt$

79. $F(x) = \int_{1}^{x} \sqrt{t}\csc t\,dt$

80. $F(x) = \int_{0}^{x} \sec^3 t\,dt$

Finding a Derivative

In Exercises 81–86, find $F'(x)$.

81. $F(x) = \int_{x}^{x+2} (4t + 1)\,dt$

82. $F(x) = \int_{-x}^{x} t^3\,dt$

83. $F(x) = \int_{0}^{\sin x} \sqrt{t}\,dt$

84. $F(x) = \int_{2}^{x^2} \frac{1}{t^3}\,dt$

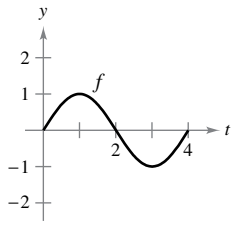
85. $F(x) = \int_{0}^{x^3} \sin t^2\,dt$

86. $F(x) = \int_{0}^{2x} \cos t^4\,dt$

87. Graphical Analysis Sketch an approximate graph of g on the interval $0 \le x \le 4$, where

$$g(x) = \int_{0}^{x} f(t)\,dt.$$

Identify the x-coordinate of an extremum of g. To print an enlarged copy of the graph, go to *MathGraphs.com.*



88. Area The area A between the graph of the function

$$g(t) = 4 - \frac{4}{t^2}$$

and the t-axis over the interval $[1, x]$ is

$$A(x) = \int_{1}^{x} \left(4 - \frac{4}{t^2}\right) dt.$$

(a) Find the horizontal asymptote of the graph of g.

(b) Integrate to find A as a function of x. Does the graph of A have a horizontal asymptote? Explain.

89. Water Flow Water flows from a storage tank at a rate of $(500 - 5t)$ liters per minute. Find the amount of water that flows out of the tank during the first 18 minutes.

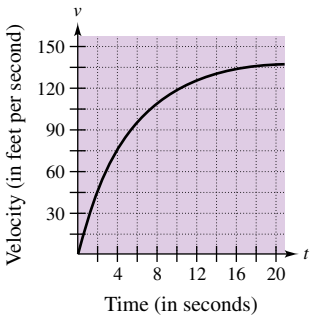
90. Oil Leak At 1:00 P.M., oil begins leaking from a tank at a rate of $(4 + 0.75t)$ gallons per hour.

(a) How much oil is lost from 1:00 P.M. to 4:00 P.M.?

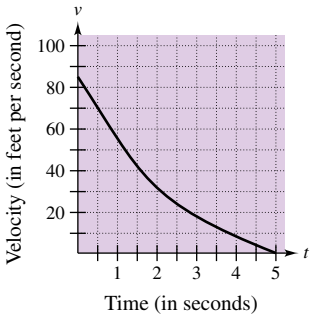
(b) How much oil is lost from 4:00 P.M. to 7:00 P.M.?

(c) Compare your answers to parts (a) and (b). What do you notice?

91. Velocity The graph shows the velocity, in feet per second, of a car accelerating from rest. Use the graph to estimate the distance the car travels in 8 seconds.



92. Velocity The graph shows the velocity, in feet per second, of a decelerating car after the driver applies the brakes. Use the graph to estimate how far the car travels before it comes to a stop.



Particle Motion

In Exercises 93–98, the velocity function, in feet per second, is given for a particle moving along a straight line, where t is the time in seconds. Find (a) the displacement and (b) the total distance that the particle travels over the given interval.

93. $v(t) = 5t - 7, \quad 0 \le t \le 3$

94. $v(t) = t^2 - t - 12, \quad 1 \le t \le 5$

95. $v(t) = t^3 - 10t^2 + 27t - 18, \quad 1 \le t \le 7$

96. $v(t) = t^3 - 8t^2 + 15t, \quad 0 \le t \le 5$

97. $v(t) = \frac{1}{\sqrt{t}}, \quad 1 \le t \le 4$

98. $v(t) = \cos t, \quad 0 \le t \le 3\pi$

99. Average Sales A company fits a model to the monthly sales data for a seasonal product. The model is

$$S(t) = \frac{t}{4} + 1.8 + 0.5\sin\left(\frac{\pi t}{6}\right), \quad 0 \le t \le 24$$

where S is sales in thousands and t is time in months.

(a) Use a graphing utility to graph $f(t) = 0.5\sin(\pi t/6)$ for $0 \le t \le 24$. Use the graph to explain why the average value of $f(t)$ is 0 over the interval.

(b) Use a graphing utility to graph $S(t)$ and the line $g(t) = t/4 + 1.8$ in the same viewing window. Use the graph and the result of part (a) to explain why g is called the *trend line*.

100. Average Value The average value of $g(x)$ on $[-1, 1]$ is 8, and the average value of $g(x)$ on $[1, 6]$ is 7. Find the average value of $g(x)$ on $[-1, 6]$.

Exploring Concepts

101. Describe a situation where the displacement and the total distance traveled for a particle are equal.

102. Let $r'(t)$ represent the rate of growth of a dog in pounds per year. What does $r(t)$ represent? What does $\int_2^6 r'(t)\,dt$ represent about the dog?

103. Explain why the Fundamental Theorem of Calculus cannot be used to integrate

$$f(x) = \frac{1}{x - c}$$

on any interval containing c.

104. Modeling Data An experimental vehicle is tested on a straight track. It starts from rest, and its velocity v (in meters per second) is recorded every 10 seconds for 1 minute (see table).

t	0	10	20	30	40	50	60
v	0	5	21	40	62	78	83

(a) Use a graphing utility to find a model of the form $v = at^3 + bt^2 + ct + d$ for the data.

(b) Use a graphing utility to plot the data and graph the model.

(c) Approximate the distance traveled by the vehicle during the test.

105. Particle Motion A particle is moving along the x-axis. The position of the particle at time t is given by

$$x(t) = t^3 - 6t^2 + 9t - 2, \quad 0 \le t \le 5.$$

Find the total distance the particle travels in 5 units of time.

106. Particle Motion Repeat Exercise 105 for the position function given by

$$x(t) = (t - 1)(t - 3)^2, \quad 0 \le t \le 5.$$

Error Analysis **In Exercises 107–110, describe why the statement is incorrect.**

107. $\displaystyle\int_{-1}^{1} x^{-2}\,dx = \left[-x^{-1}\right]_{-1}^{1} = (-1) - 1 = -2$ ✗

108. $\displaystyle\int_{-2}^{1} \frac{2}{x^3}\,dx = \left[-\frac{1}{x^2}\right]_{-2}^{1} = -\frac{3}{4}$ ✗

109. $\displaystyle\int_{\pi/4}^{3\pi/4} \sec^2 x\,dx = \left[\tan x\right]_{\pi/4}^{3\pi/4} = -2$ ✗

110. $\displaystyle\int_{\pi/2}^{3\pi/2} \csc x \cot x\,dx = \left[-\csc x\right]_{\pi/2}^{3\pi/2} = 2$ ✗

True or False? **In Exercises 111 and 112, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

111. If $F'(x) = G'(x)$ on the interval $[a, b]$, then

$$F(b) - F(a) = G(b) - G(a).$$

112. If $F(b) - F(a) = G(b) - G(a)$, then $F'(x) = G'(x)$ on the interval $[a, b]$.

113. Antiderivative Find an antiderivative of

$$f(x) = |x|.$$

114. Analyzing a Function Show that the function

$$f(x) = \int_0^{1/x} \frac{1}{t^2 + 1}\,dt + \int_0^{x} \frac{1}{t^2 + 1}\,dt$$

is constant for $x > 0$.

115. Finding a Function Find the function $f(x)$ and all values of c such that

$$\int_c^x f(t)\,dt = x^2 + x - 2.$$

116. Using a Function Let $L(x) = \displaystyle\int_1^x \frac{1}{t}\,dt$, $x > 0$.

(a) Find $L(1)$.

(b) Find $L'(x)$ and $L'(1)$.

(c) Use a graphing utility to approximate the value of x (to three decimal places) for which $L(x) = 1$.

(d) Prove that $L(x_1x_2) = L(x_1) + L(x_2)$ for all positive values of x_1 and x_2.

117. Finding Values Let

$$G(x) = \int_0^x \left[s \int_0^s f(t)\,dt \right] ds$$

where f is continuous for all real t. Find (a) $G(0)$, (b) $G'(0)$, (c) $G''(x)$, and (d) $G''(0)$.

118. Proof Prove that

$$\frac{d}{dx}\left[\int_{u(x)}^{v(x)} f(t)\,dt\right] = f(v(x))v'(x) - f(u(x))u'(x).$$

PUTNAM EXAM CHALLENGE

119. For each continuous function $f\colon [0, 1] \to \mathbb{R}$, let

$$I(f) = \int_0^1 x^2 f(x)\,dx$$

and

$$J(f) = \int_0^1 x(f(x))^2\,dx.$$

Find the maximum value of $I(f) - J(f)$ over all such functions f.

This problem was composed by the Committee on the Putnam Prize Competition.

4.5 Integration by Substitution

GO DIGITAL

- **Use pattern recognition to find an indefinite integral.**
- **Use a change of variables to find an indefinite integral.**
- **Use the General Power Rule for Integration to find an indefinite integral.**
- **Use a change of variables to evaluate a definite integral.**
- **Evaluate a definite integral involving an even or odd function.**

Pattern Recognition

In this section, you will study techniques for integrating composite functions. The discussion is split into two parts—*pattern recognition* and *change of variables.* Both techniques involve a ***u*-substitution.** With pattern recognition, you perform the substitution mentally, and with change of variables, you write the substitution steps.

The role of substitution in integration is comparable to the role of the Chain Rule in differentiation. Recall that for the differentiable functions

$$y = F(u) \quad \text{and} \quad u = g(x)$$

the Chain Rule states that

$$\frac{d}{dx}[F(g(x))] = F'(g(x))g'(x).$$

From the definition of an antiderivative, it follows that

$$\int F'(g(x))g'(x)\,dx = F(g(x)) + C.$$

These results are summarized in the next theorem.

REMARK The statement of Theorem 4.13 does not tell how to distinguish between $f(g(x))$ and $g'(x)$ in the integrand. As you become more experienced at integration, your skill in doing this will improve. Of course, part of the key is familiarity with derivatives.

THEOREM 4.13 Antidifferentiation of a Composite Function

Let g be a function whose range is an interval I, and let f be a function that is continuous on I. If g is differentiable on its domain and F is an antiderivative of f on I, then

$$\int f(g(x))g'(x)\,dx = F(g(x)) + C.$$

Letting $u = g(x)$ gives $du = g'(x)\,dx$ and

$$\int f(u)\,du = F(u) + C.$$

Examples 1 and 2 show how to apply Theorem 4.13 *directly*, by recognizing the presence of $f(g(x))$ and $g'(x)$. Note that the composite function in the integrand has an *outside function* f and an *inside function* g. Moreover, the derivative $g'(x)$ is present as a factor of the integrand.

GO DIGITAL

EXAMPLE 1 Recognizing the $f(g(x))g'(x)$ Pattern

Find $\int (x^2 + 1)^2(2x)\,dx$.

Solution Letting $g(x) = x^2 + 1$, you obtain

$$g'(x) = 2x$$ Derivative of g

and

$$f(g(x)) = f(x^2 + 1) = (x^2 + 1)^2.$$ Composition of f with g

From this, you can recognize that the integrand follows the $f(g(x))g'(x)$ pattern. Using the Power Rule for Integration and Theorem 4.13, you can write

$$\int \overbrace{(x^2 + 1)^2}^{f(g(x))}\overbrace{(2x)}^{g'(x)}\,dx = \frac{1}{3}(x^2 + 1)^3 + C.$$

Use the Chain Rule to check that the derivative of $\frac{1}{3}(x^2 + 1)^3 + C$ is the integrand of the original integral.

EXAMPLE 2 Recognizing the $f(g(x))g'(x)$ Pattern

Find $\int 5 \cos 5x\,dx$.

Solution Letting $g(x) = 5x$, you obtain

$$g'(x) = 5$$ Derivative of g

and

$$f(g(x)) = f(5x) = \cos 5x.$$ Composition of f with g

From this, you can recognize that the integrand follows the $f(g(x))g'(x)$ pattern. Using the Cosine Rule for Integration and Theorem 4.13, you can write

$$\int \overbrace{(\cos 5x)}^{f(g(x))}\overbrace{(5)}^{g'(x)}\,dx = \sin 5x + C.$$

Check this result by differentiating $\sin 5x + C$ to obtain the original integrand.

TECHNOLOGY

Use a graphing utility, such as *Maple*, *Mathematica*, or the *TI-Nspire*, to find the integrals given in Examples 1 and 2. Do you obtain the same antiderivatives that are listed in the examples?

Exploration

Recognizing Patterns The integrand in each of the integrals labeled (a)–(c) fits the pattern $f(g(x))g'(x)$. Identify the pattern and use the result to find the integral.

a. $\int 2x(x^2 + 1)^4\,dx$ **b.** $\int 3x^2\sqrt{x^3 + 1}\,dx$ **c.** $\int (\sec^2 x)(\tan x + 3)\,dx$

The integrals labeled (d)–(f) are similar to (a)–(c). Show how you can multiply and divide by a constant to find these integrals.

d. $\int x(x^2 + 1)^4\,dx$ **e.** $\int x^2\sqrt{x^3 + 1}\,dx$ **f.** $\int (2 \sec^2 x)(\tan x + 3)\,dx$

GO DIGITAL

The integrands in Examples 1 and 2 fit the $f(g(x))g'(x)$ pattern exactly—you only had to recognize the pattern. You can extend this technique considerably with the Constant Multiple Rule

$$\int kf(x)\,dx = k\int f(x)\,dx.$$

Many integrands contain the essential part (the variable part) of $g'(x)$ but are missing a constant multiple. In such cases, you can multiply and divide by the necessary constant multiple, as shown in Example 3.

EXAMPLE 3 Multiplying and Dividing by a Constant

Find the indefinite integral.

$$\int x(x^2 + 1)^2\,dx$$

Solution This is similar to the integral given in Example 1, except that the integrand is missing a factor of 2. Recognizing that $2x$ is the derivative of $x^2 + 1$, let

$$g(x) = x^2 + 1.$$

To obtain a factor of 2, multiply and divide the integrand by the constant 2.

$$\int x(x^2 + 1)^2\,dx = \int (x^2 + 1)^2 \left(\frac{1}{2}\right)(2x)\,dx \qquad \text{Multiply and divide by 2.}$$

$$= \frac{1}{2}\int \overbrace{(x^2 + 1)^2}^{f(g(x))}\overbrace{(2x)}^{g'(x)}\,dx \qquad \text{Constant Multiple Rule}$$

$$= \frac{1}{2}\left[\frac{(x^2 + 1)^3}{3}\right] + C \qquad \text{Integrate.}$$

$$= \frac{1}{6}(x^2 + 1)^3 + C \qquad \text{Simplify.}$$

In practice, most people would not write as many steps as are shown in Example 3. For instance, you could evaluate the integral by writing

$$\int x(x^2 + 1)^2\,dx = \frac{1}{2}\int (x^2 + 1)^2\,(2x)\,dx$$

$$= \frac{1}{2}\left[\frac{(x^2 + 1)^3}{3}\right] + C$$

$$= \frac{1}{6}(x^2 + 1)^3 + C.$$

Be sure you see that the *Constant* Multiple Rule applies only to *constants*. You cannot multiply and divide by a variable and then move the variable outside the integral sign. For instance,

$$\int (x^2 + 1)^2\,dx \neq \frac{1}{2x}\int (x^2 + 1)^2\,(2x)\,dx.$$

After all, if it were legitimate to move variable quantities outside the integral sign, you could move the entire integrand out and simplify the whole process. But the result would be incorrect.

Change of Variables for Indefinite Integrals

With a formal **change of variables,** you completely rewrite the integral in terms of u and du (or any other convenient variable). Although this procedure can involve more written steps than the pattern recognition illustrated in Examples 1 through 3, it is useful for complicated integrands. The change of variables technique uses the Leibniz notation for the differential. That is, if $u = g(x)$, then $du = g'(x)\,dx$, and the integral in Theorem 4.13 takes the form

$$\int f(g(x))g'(x)\,dx = \int f(u)\,du = F(u) + C.$$

EXAMPLE 4 Change of Variables

Find $\int \sqrt{2x - 1}\,dx$.

Solution First, let u be the inner function, $u = 2x - 1$. Then calculate the differential du to be $du = 2\,dx$. Now, using $\sqrt{2x - 1} = \sqrt{u}$ and $dx = du/2$, substitute to obtain

$$\begin{aligned}
\int \sqrt{2x - 1}\,dx &= \int \sqrt{u}\left(\frac{du}{2}\right) && \text{Substitute.}\\
&= \frac{1}{2}\int u^{1/2}\,du && \text{Constant Multiple Rule}\\
&= \frac{1}{2}\left(\frac{u^{3/2}}{3/2}\right) + C && \text{Antiderivative in terms of } u\\
&= \frac{1}{3}u^{3/2} + C && \text{Simplify.}\\
&= \frac{1}{3}(2x - 1)^{3/2} + C. && \text{Antiderivative in terms of } x
\end{aligned}$$

REMARK Because integration is usually more difficult than differentiation, you should always check your answer to an integration problem by differentiating. For instance, in Example 4, differentiate $\frac{1}{3}(2x - 1)^{3/2} + C$ to verify that you obtain the original integrand.

EXAMPLE 5 Change of Variables

See LarsonCalculus.com for an interactive version of this type of example.

Find $\int x\sqrt{2x - 1}\,dx$.

Solution As in the previous example, let $u = 2x - 1$ and obtain $dx = du/2$. Because the integrand contains a factor of x, you must also solve for x in terms of u, as shown.

$$u = 2x - 1 \quad \Rightarrow \quad x = \frac{u + 1}{2} \qquad \text{Solve for } x \text{ in terms of } u.$$

Now, using substitution, you obtain

$$\begin{aligned}
\int x\sqrt{2x - 1}\,dx &= \int \left(\frac{u + 1}{2}\right)u^{1/2}\left(\frac{du}{2}\right) && \text{Substitute.}\\
&= \frac{1}{4}\int (u^{3/2} + u^{1/2})\,du\\
&= \frac{1}{4}\left(\frac{u^{5/2}}{5/2} + \frac{u^{3/2}}{3/2}\right) + C\\
&= \frac{1}{10}(2x - 1)^{5/2} + \frac{1}{6}(2x - 1)^{3/2} + C.
\end{aligned}$$

GO DIGITAL

To complete the change of variables in Example 5, you solved for x in terms of u. Sometimes this is very difficult. Fortunately, it is not always necessary, as shown in the next example.

EXAMPLE 6 Change of Variables

Find $\int \sin^2 3x \cos 3x \, dx$.

Solution Because $\sin^2 3x = (\sin 3x)^2$, let $u = \sin 3x$. Then

$du = (\cos 3x)(3)\, dx.$ Differentiate each side.

Now, because $\cos 3x \, dx$ is part of the original integral, you can write

$\frac{du}{3} = \cos 3x \, dx.$ Divide each side by 3.

Substituting u and $du/3$ in the original integral yields

$$\int \sin^2 3x \cos 3x \, dx = \int u^2 \frac{du}{3}$$ Substitute.

$$= \frac{1}{3}\int u^2 \, du$$ Constant Multiple Rule

$$= \frac{1}{3}\left(\frac{u^3}{3}\right) + C$$ Antiderivative in terms of u

$$= \frac{1}{9}\sin^3 3x + C.$$ Antiderivative in terms of x

You can check this by differentiating.

$$\frac{d}{dx}\left[\frac{1}{9}\sin^3 3x + C\right] = \left(\frac{1}{9}\right)(3)(\sin 3x)^2(\cos 3x)(3)$$

$$= \sin^2 3x \cos 3x$$

Because differentiation produces the original integrand, you know that you have obtained the correct antiderivative. ■

REMARK When making a change of variables, be sure that your answer is written using the same variables as in the original integrand. For instance, in Example 6, you should not leave your answer as

$$\frac{1}{9}u^3 + C$$

but rather, you should replace u by $\sin 3x$.

The steps used for integration by substitution are summarized in the following guidelines.

Guidelines for Making a Change of Variables

1. Choose a substitution $u = g(x)$. Usually, it is best to choose the *inner* part of a composite function, such as a quantity raised to a power.
2. Compute $du = g'(x)\, dx$.
3. Rewrite the integral in terms of u and du.
4. Find the resulting integral in terms of u.
5. Replace u by $g(x)$ to obtain an antiderivative in terms of x.
6. Check your answer by differentiating.

So far, you have seen two techniques for applying substitution, and you will see more techniques in the remainder of this section. Each technique differs slightly from the others. You should remember, however, that the goal is the same with each technique—*you are trying to find an antiderivative of the integrand.*

The General Power Rule for Integration

One of the most common u-substitutions involves quantities in the integrand that are raised to a power. Because of the importance of this type of substitution, it is given a special name—the **General Power Rule for Integration.** A proof of this rule follows directly from the (simple) Power Rule for Integration, together with Theorem 4.13.

THEOREM 4.14 The General Power Rule for Integration

If g is a differentiable function of x, then

$$\int [g(x)]^n g'(x)\,dx = \frac{[g(x)]^{n+1}}{n+1} + C, \quad n \neq -1.$$

Equivalently, if $u = g(x)$, then

$$\int u^n\,du = \frac{u^{n+1}}{n+1} + C, \quad n \neq -1.$$

EXAMPLE 7 Substitution and the General Power Rule

a. $\displaystyle\int 3(3x-1)^4\,dx = \int \overbrace{(3x-1)^4}^{u^4}\overbrace{(3)\,dx}^{du} = \overbrace{\frac{(3x-1)^5}{5}}^{u^5/5} + C$

b. $\displaystyle\int (2x+1)(x^2+x)\,dx = \int \overbrace{(x^2+x)^1}^{u^1}\overbrace{(2x+1)\,dx}^{du} = \overbrace{\frac{(x^2+x)^2}{2}}^{u^2/2} + C$

c. $\displaystyle\int 3x^2\sqrt{x^3-2}\,dx = \int \overbrace{(x^3-2)^{1/2}}^{u^{1/2}}\overbrace{(3x^2)\,dx}^{du} = \overbrace{\frac{(x^3-2)^{3/2}}{3/2}}^{u^{3/2}/(3/2)} + C = \frac{2}{3}(x^3-2)^{3/2} + C$

d. $\displaystyle\int \frac{-4x}{(1-2x^2)^2}\,dx = \int \overbrace{(1-2x^2)^{-2}}^{u^{-2}}\overbrace{(-4x)\,dx}^{du} = \overbrace{\frac{(1-2x^2)^{-1}}{-1}}^{u^{-1}/(-1)} + C = -\frac{1}{1-2x^2} + C$

e. $\displaystyle\int \cos^2 x \sin x\,dx = -\int \overbrace{(\cos x)^2}^{u^2}\overbrace{(-\sin x)\,dx}^{du} = -\overbrace{\frac{(\cos x)^3}{3}}^{u^3/3} + C$ ■

REMARK Example 7(b) illustrates a case of the General Power Rule that is sometimes overlooked—when the power is $n = 1$. In this case, the rule takes the form

$$\int u\,du = \frac{u^2}{2} + C.$$

Some integrals whose integrands involve quantities raised to powers cannot be found by the General Power Rule. Consider the two integrals

$$\int x(x^2+1)^2\,dx \quad \text{and} \quad \int (x^2+1)^2\,dx.$$

The substitution

$$u = x^2 + 1$$

works in the first integral but not in the second. In the second, the substitution fails because the integrand lacks the factor x needed for du. Fortunately, *for this particular integral*, you can expand the integrand as

$$(x^2+1)^2 = x^4 + 2x^2 + 1$$

and use the (simple) Power Rule to integrate each term.

Change of Variables for Definite Integrals

When using u-substitution with a definite integral, it is often convenient to determine the limits of integration for the variable u rather than to convert the antiderivative back to the variable x and evaluate at the original limits. This change of variables is stated explicitly in the next theorem. The proof follows from Theorem 4.13 combined with the Fundamental Theorem of Calculus.

THEOREM 4.15 Change of Variables for Definite Integrals

If the function $u = g(x)$ has a continuous derivative on the closed interval $[a, b]$ and the function f is continuous on the range of g, then

$$\int_a^b f(g(x))g'(x)\,dx = \int_{g(a)}^{g(b)} f(u)\,du.$$

EXAMPLE 8 Change of Variables

Evaluate $\int_0^1 x(x^2 + 1)^3\,dx$.

Solution To evaluate this integral, let $u = x^2 + 1$. Then, you obtain

$du = 2x\,dx.$ Differentiate each side.

Before substituting, determine the new upper and lower limits of integration.

Lower Limit	Upper Limit
When $x = 0$, $u = 0^2 + 1 = 1$.	When $x = 1$, $u = 1^2 + 1 = 2$.

Now, substitute to obtain

$$\int_0^1 x(x^2 + 1)^3\,dx = \frac{1}{2}\int_0^1 (x^2 + 1)^3(2x)\,dx$$ Integration limits for x

$$= \frac{1}{2}\int_1^2 u^3\,du$$ Integration limits for u

$$= \frac{1}{2}\left[\frac{u^4}{4}\right]_1^2$$ Antiderivative in terms of u

$$= \frac{1}{2}\left(4 - \frac{1}{4}\right)$$ Apply Fundamental Theorem of Calculus.

$$= \frac{15}{8}.$$ Simplify.

Notice that you obtain the same result when you rewrite the antiderivative $\frac{1}{2}(u^4/4)$ in terms of the variable x and evaluate the definite integral at the original limits of integration, as shown below.

$$\frac{1}{2}\left[\frac{u^4}{4}\right]_1^2 = \frac{1}{2}\left[\frac{(x^2 + 1)^4}{4}\right]_0^1$$ Rewrite in terms of x.

$$= \frac{1}{2}\left(4 - \frac{1}{4}\right)$$ Apply Fundamental Theorem of Calculus.

$$= \frac{15}{8}$$ Simplify. ■

EXAMPLE 9 Change of Variables

Evaluate the definite integral.

$$\int_1^5 \frac{x}{\sqrt{2x-1}}\,dx$$

Solution To evaluate this integral, let $u = \sqrt{2x-1}$. Then, you obtain

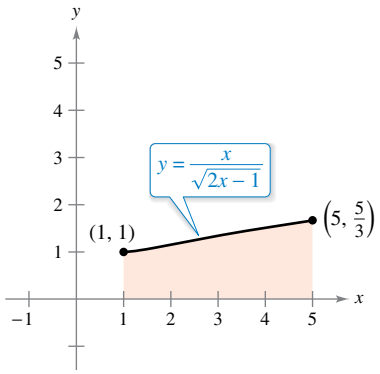
$$\begin{aligned} u^2 &= 2x - 1 && \text{Square each side.}\\ u^2 + 1 &= 2x && \text{Add 1 to each side.}\\ \frac{u^2+1}{2} &= x && \text{Divide each side by 2.}\\ u\,du &= dx. && \text{Differentiate each side.} \end{aligned}$$

Before substituting, determine the new upper and lower limits of integration.

Lower Limit	Upper Limit
When $x = 1$, $u = \sqrt{2-1} = 1$.	When $x = 5$, $u = \sqrt{10-1} = 3$.

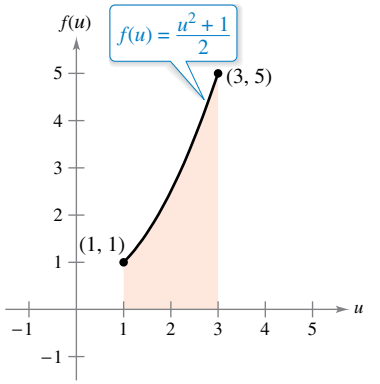
Now, substitute to obtain

$$\begin{aligned} \int_1^5 \frac{x}{\sqrt{2x-1}}\,dx &= \int_1^3 \frac{1}{u}\left(\frac{u^2+1}{2}\right)u\,du && \text{Substitute.}\\ &= \frac{1}{2}\int_1^3 (u^2+1)\,du && \text{Constant Multiple Rule}\\ &= \frac{1}{2}\left[\frac{u^3}{3} + u\right]_1^3 && \text{Antiderivative in terms of } u\\ &= \frac{1}{2}\left(9 + 3 - \frac{1}{3} - 1\right) && \text{Apply Fundamental Theorem of Calculus.}\\ &= \frac{16}{3}. && \text{Simplify.} \end{aligned}$$



The region before substitution has an area of $\frac{16}{3}$.

Figure 4.38



The region after substitution has an area of $\frac{16}{3}$.

Figure 4.39

Geometrically, you can interpret the equation

$$\int_1^5 \frac{x}{\sqrt{2x-1}}\,dx = \int_1^3 \frac{u^2+1}{2}\,du$$

to mean that the two *different* regions shown in Figures 4.38 and 4.39 have the *same* area.

When evaluating definite integrals by substitution, it is possible for the upper limit of integration of the u-variable form to be smaller than the lower limit. When this happens, do not rearrange the limits. Simply evaluate as usual. For example, after substituting $u = \sqrt{1-x}$ in the integral

$$\int_0^1 x^2(1-x)^{1/2}\,dx$$

you obtain $u = \sqrt{1-0} = 1$ when $x = 0$, and $u = \sqrt{1-1} = 0$ when $x = 1$. So, the correct u-variable form of this integral is

$$-2\int_1^0 (1-u^2)^2u^2\,du.$$

Expanding the integrand, you can evaluate this integral as shown.

$$-2\int_1^0 (u^2 - 2u^4 + u^6)\,du = -2\left[\frac{u^3}{3} - \frac{2u^5}{5} + \frac{u^7}{7}\right]_1^0 = -2\left(-\frac{1}{3} + \frac{2}{5} - \frac{1}{7}\right) = \frac{16}{105}$$

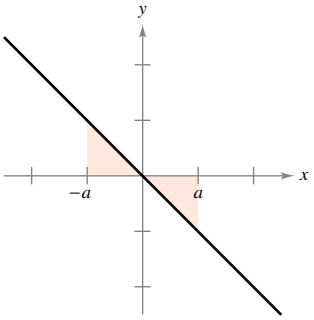
Even function



Odd function

Figure 4.40

Integration of Even and Odd Functions

Even with a change of variables, integration can be difficult. Occasionally, you can simplify the evaluation of a definite integral over an interval that is symmetric about the y-axis or about the origin by recognizing the integrand to be an even or odd function (see Figure 4.40).

THEOREM 4.16 Integration of Even and Odd Functions

Let a function f be integrable on the closed interval $[-a, a]$.

1. If f is an *even* function, then $\int_{-a}^{a} f(x)\,dx = 2\int_{0}^{a} f(x)\,dx$.
2. If f is an *odd* function, then $\int_{-a}^{a} f(x)\,dx = 0$.

Proof Here is the proof of the first property. (The proof of the second property is left to you [see Exercise 103].) Because f is even, you know that

$$f(x) = f(-x).$$ Definition of even function (See Section P.3.)

Using Theorem 4.13 with the substitution $u = -x$ produces

$$\int_{-a}^{0} f(x)\,dx = \int_{a}^{0} f(-u)(-du) = -\int_{a}^{0} f(u)\,du = \int_{0}^{a} f(u)\,du = \int_{0}^{a} f(x)\,dx.$$

Finally, using Theorem 4.6, you obtain

$$\begin{aligned}\int_{-a}^{a} f(x)\,dx &= \int_{-a}^{0} f(x)\,dx + \int_{0}^{a} f(x)\,dx \\ &= \int_{0}^{a} f(x)\,dx + \int_{0}^{a} f(x)\,dx \\ &= 2\int_{0}^{a} f(x)\,dx.\end{aligned}$$

EXAMPLE 10 Integration of an Odd Function

Evaluate the definite integral.

$$\int_{-\pi/2}^{\pi/2} (\sin^3 x \cos x + \sin x \cos x)\,dx$$

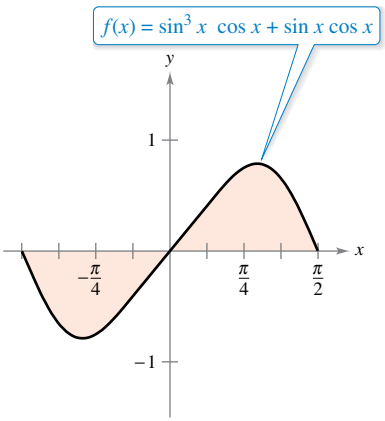
Solution Let $f(x) = \sin^3 x \cos x + \sin x \cos x$. This function is odd because

$$\begin{aligned}f(-x) &= \sin^3(-x)\cos(-x) + \sin(-x)\cos(-x) \\ &= -\sin^3 x \cos x - \sin x \cos x \\ &= -f(x).\end{aligned}$$

Also, the function f is symmetric about the origin over the interval $[-\pi/2, \pi/2]$. This means you can apply Property 2 of Theorem 4.16 to conclude that

$$\int_{-\pi/2}^{\pi/2} (\sin^3 x \cos x + \sin x \cos x)\,dx = 0.$$

Figure 4.41 shows that the two regions on either side of the y-axis have the same area. However, because one lies below the x-axis and one lies above it, integration produces a cancellation effect. (More will be said about areas below the x-axis in Section 7.1.)



Because f is an odd function, $\int_{-\pi/2}^{\pi/2} f(x)\,dx = 0$.

Concept Check

1. Explain how to use the Constant Multiple Rule when finding an indefinite integral.
2. Summarize the guidelines for making a change of variables when finding an indefinite integral.
3. Describe the General Power Rule for Integration.
4. Without integrating, explain why
$$\int_{-2}^{2} x(x^2 + 1)^2\,dx = 0.$$

Recognizing Patterns In Exercises 5–8, complete the table by identifying u and du for the integral.

$\int f(g(x))g'(x)\,dx$	$u = g(x)$	$du = g'(x)\,dx$
5. $\int (5x^2 + 1)^2(10x)\,dx$		
6. $\int x^2\sqrt{x^3 + 1}\,dx$		
7. $\int \tan^2 x \sec^2 x\,dx$		
8. $\int \frac{\cos x}{\sin^2 x}\,dx$		

Finding an Indefinite Integral In Exercises 9–30, find the indefinite integral and check the result by differentiation.

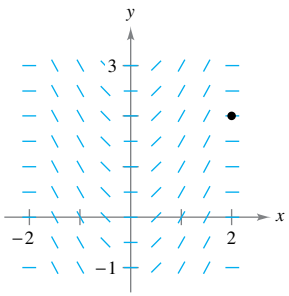
9. $\int (1 + 6x)^4(6)\,dx$
10. $\int (x^2 - 9)^3(2x)\,dx$
11. $\int \sqrt{25 - x^2}\,(-2x)\,dx$
12. $\int \sqrt[3]{3 - 4x^2}(-8x)\,dx$
13. $\int x^3(x^4 + 3)^2\,dx$
14. $\int x^2(6 - x^3)^5\,dx$
15. $\int x^2(2x^3 - 1)^4\,dx$
16. $\int x(5x^2 + 4)^3\,dx$
17. $\int t\sqrt{t^2 + 2}\,dt$
18. $\int t^3\sqrt{2t^4 + 3}\,dt$
19. $\int 5x\sqrt[3]{1 - x^2}\,dx$
20. $\int 6u^6\sqrt{u^7 + 8}\,du$
21. $\int \frac{7x}{(1 - x^2)^3}\,dx$
22. $\int \frac{x^3}{(1 + x^4)^2}\,dx$
23. $\int \frac{x^2}{(1 + x^3)^2}\,dx$
24. $\int \frac{6x^2}{(4x^3 - 9)^3}\,dx$
25. $\int \frac{x}{\sqrt{1 - x^2}}\,dx$
26. $\int \frac{x^3}{\sqrt{1 + x^4}}\,dx$
27. $\int \left(1 + \frac{1}{t}\right)^3\left(\frac{1}{t^2}\right)dt$
28. $\int \left(8 - \frac{1}{t^4}\right)^2\left(\frac{1}{t^5}\right)dt$
29. $\int \frac{1}{\sqrt{2x}}\,dx$
30. $\int \frac{x}{\sqrt[3]{5x^2}}\,dx$

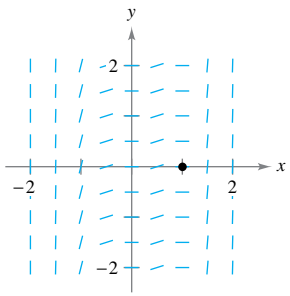
Differential Equation In Exercises 31–34, find the general solution of the differential equation.

31. $\frac{dy}{dx} = 4x + \frac{4x}{\sqrt{16 - x^2}}$
32. $\frac{dy}{dx} = \frac{10x^2}{\sqrt{1 + x^3}}$
33. $\frac{dy}{dx} = \frac{x + 1}{(x^2 + 2x - 3)^2}$
34. $\frac{dy}{dx} = \frac{18 - 6x^2}{\sqrt{x^3 - 9x + 7}}$

Slope Field In Exercises 35 and 36, a differential equation, a point, and a slope field are given. A *slope field* (or *direction field*) consists of line segments with slopes given by the differential equation. These line segments give a visual perspective of the slopes of the solutions of the differential equation. (a) Sketch two approximate solutions of the differential equation on the slope field, one of which passes through the given point. (To print an enlarged copy of the graph, go to *MathGraphs.com*.) (b) Use integration and the given point to find the particular solution of the differential equation and use a graphing utility to graph the solution. Compare the result with the sketch in part (a) that passes through the given point.

35. $\frac{dy}{dx} = x\sqrt{4 - x^2}$, $(2, 2)$
36. $\frac{dy}{dx} = x^2(x^3 - 1)^2$, $(1, 0)$





Differential Equation In Exercises 37 and 38, the graph of a function f is shown. Use the differential equation and the given point to find an equation of the function.

37. $\frac{dy}{dx} = 18x^2(2x^3 + 1)^2$
38. $\frac{dy}{dx} = \frac{-48}{(3x + 5)^3}$

Finding an Indefinite Integral **In Exercises 39–48, find the indefinite integral.**

39. $\int \pi \sin \pi x \, dx$

40. $\int \sin 4x \, dx$

41. $\int \cos 6x \, dx$

42. $\int \csc^2\left(\frac{x}{2}\right) dx$

43. $\int \frac{1}{\theta^2} \cos \frac{1}{\theta} \, d\theta$

44. $\int x \sin x^2 \, dx$

45. $\int \sin 2x \cos 2x \, dx$

46. $\int \sqrt[3]{\tan x} \sec^2 x \, dx$

47. $\int \frac{\csc^2 x}{\cot^3 x} \, dx$

48. $\int \frac{\sin x}{\cos^3 x} \, dx$

Finding an Equation **In Exercises 49–52, find an equation for the function f that has the given derivative and whose graph passes through the given point.**

Derivative	Point
49. $f'(x) = -\sin \frac{x}{2}$	$(0, 6)$
50. $f'(x) = \sec^2 2x$	$\left(\frac{\pi}{2}, 2\right)$
51. $f'(x) = 2x(4x^2 - 10)^2$	$(2, 10)$
52. $f'(x) = -2x\sqrt{8 - x^2}$	$(2, 7)$

Change of Variables **In Exercises 53–60, find the indefinite integral by making a change of variables.**

53. $\int x\sqrt{x + 6} \, dx$

54. $\int x\sqrt{3x - 4} \, dx$

55. $\int x^2\sqrt{1 - x} \, dx$

56. $\int (x + 1)\sqrt{2 - x} \, dx$

57. $\int \frac{x^2 - 1}{\sqrt{2x - 1}} \, dx$

58. $\int \frac{2x + 1}{\sqrt{x + 4}} \, dx$

59. $\int \cos^3 2x \sin 2x \, dx$

60. $\int \sec^5 7x \tan 7x \, dx$

Evaluating a Definite Integral **In Exercises 61–70, evaluate the definite integral. Use a graphing utility to verify your result.**

61. $\int_{-1}^{1} x(x^2 + 1)^3 \, dx$

62. $\int_{0}^{1} x^3(2x^4 + 1)^2 \, dx$

63. $\int_{1}^{2} 2x^2\sqrt{x^3 + 1} \, dx$

64. $\int_{-1}^{0} x\sqrt{1 - x^2} \, dx$

65. $\int_{0}^{4} \frac{1}{\sqrt{2x + 1}} \, dx$

66. $\int_{0}^{2} \frac{x}{\sqrt{1 + 2x^2}} \, dx$

67. $\int_{1}^{9} \frac{1}{\sqrt{x}\left(1 + \sqrt{x}\right)^2} \, dx$

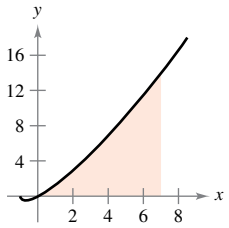
68. $\int_{4}^{5} \frac{x}{\sqrt{2x - 6}} \, dx$

69. $2\pi \int_{0}^{1} (x + 1)\sqrt{1 - x} \, dx$

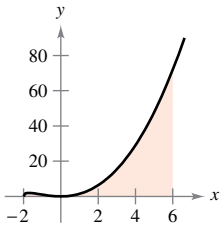
70. $2\pi \int_{-1}^{0} x^2\sqrt{x + 1} \, dx$

Finding the Area of a Region **In Exercises 71–74, find the area of the region. Use a graphing utility to verify your result.**

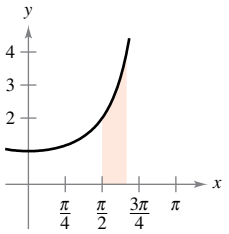
71. $\int_{0}^{7} x\sqrt[3]{x + 1} \, dx$



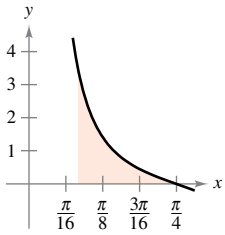
72. $\int_{-2}^{6} x^2\sqrt[3]{x + 2} \, dx$



73. $\int_{\pi/2}^{2\pi/3} \sec^2\left(\frac{x}{2}\right) dx$



74. $\int_{\pi/12}^{\pi/4} \csc 2x \cot 2x \, dx$



Even and Odd Functions **In Exercises 75–78, evaluate the integral using the properties of even and odd functions as an aid.**

75. $\int_{-2}^{2} x^2(x^2 + 1) \, dx$

76. $\int_{-2}^{2} x(x^2 + 1)^3 \, dx$

77. $\int_{-\pi/2}^{\pi/2} \sin x \cos x \, dx$

78. $\int_{-\pi/2}^{\pi/2} \sin^2 x \cos x \, dx$

79. Using an Even Function Use $\int_0^6 x^2 \, dx = 72$ to evaluate each definite integral without using the Fundamental Theorem of Calculus.

(a) $\int_{-6}^{6} x^2 \, dx$

(b) $\int_{-6}^{0} x^2 \, dx$

(c) $\int_{0}^{6} -2x^2 \, dx$

(d) $\int_{-6}^{6} 3x^2 \, dx$

80. Using Symmetry Use the symmetry of the graphs of the sine and cosine functions as an aid in evaluating each definite integral.

(a) $\int_{-\pi/4}^{\pi/4} \sin x \, dx$

(b) $\int_{-\pi/4}^{\pi/4} \cos x \, dx$

(c) $\int_{-\pi/2}^{\pi/2} \cos x \, dx$

(d) $\int_{-\pi/2}^{\pi/2} \sin x \cos x \, dx$

Even and Odd Functions **In Exercises 81 and 82, write the integral as the sum of the integral of an odd function and the integral of an even function. Use this simplification to evaluate the integral.**

81. $\int_{-3}^{3} (x^3 + 4x^2 - 3x - 6) \, dx$

82. $\int_{-\pi/2}^{\pi/2} (\sin 4x + \cos 4x) \, dx$

Exploring Concepts

83. You are asked to find one of the integrals. Which one would you choose? Explain.

(a) $\int \sqrt{x^3 + 1}\, dx$ or $\int x^2\sqrt{x^3 + 1}\, dx$

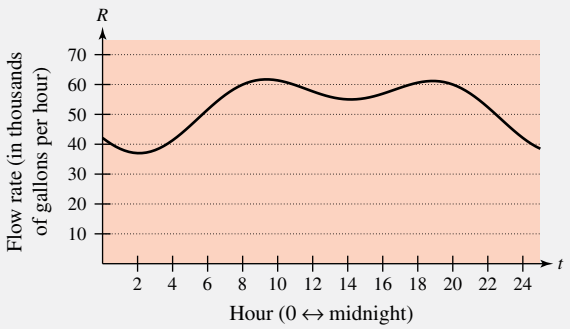
(b) $\int \cot 2x\, dx$ or $\int \cot^3 2x \csc^2 2x\, dx$

84. Find the indefinite integral in two ways. Explain any difference in the forms of the answers.

(a) $\int (2x - 1)^2\, dx$ (b) $\int \sin x \cos x\, dx$

85. Depreciation The rate of depreciation dV/dt of a machine is inversely proportional to the square of $(t + 1)$, where V is the value of the machine t years after it was purchased. The initial value of the machine was \$500,000, and its value decreased \$100,000 in the first year. Estimate its value after 4 years.

86. HOW DO YOU SEE IT? The graph shows the flow rate of water at a pumping station for one day.



(a) Approximate the maximum flow rate at the pumping station. At what time does this occur?

(b) Explain how you can find the amount of water used during the day.

(c) Approximate the two-hour period when the least amount of water is used. Explain your reasoning.

87. Sales The sales S (in thousands of units) of a seasonal product are given by the model

$$S = 74.50 + 43.75 \sin \frac{\pi t}{6}$$

where t is the time in months, with $t = 1$ corresponding to January. Find the average sales for each time period.

(a) The first quarter $(0 \le t \le 3)$

(b) The second quarter $(3 \le t \le 6)$

(c) The entire year $(0 \le t \le 12)$

88. Electricity

The oscillating current in an electrical circuit is

$$I = 2 \sin(60\pi t) + \cos(120\pi t)$$

where I is measured in amperes and t is measured in seconds. Find the average current for each time interval.

(a) $0 \le t \le \frac{1}{60}$

(b) $0 \le t \le \frac{1}{240}$

(c) $0 \le t \le \frac{1}{30}$

TWStock/Shutterstock.com

89. Graphical Analysis Consider the functions f and g, where

$$f(x) = 6 \sin x \cos^2 x \quad \text{and} \quad g(t) = \int_0^t f(x)\, dx.$$

(a) Use a graphing utility to graph f and g in the same viewing window.

(b) Explain why g is nonnegative.

(c) Identify the points on the graph of g that correspond to the extrema of f.

(d) Does each of the zeros of f correspond to an extremum of g? Explain.

(e) Consider the function

$$h(t) = \int_{\pi/2}^t f(x)\, dx.$$

Use a graphing utility to graph h. What is the relationship between g and h? Verify your conjecture.

90. Finding a Limit Using a Definite Integral Find

$$\lim_{n\to\infty} \sum_{i=1}^{n} \frac{\sin(i\pi/n)}{n}$$

by evaluating an appropriate definite integral over the interval $[0, 1]$.

91. Rewriting Integrals

(a) Show that $\int_0^1 x^3(1 - x)^8\, dx = \int_0^1 x^8(1 - x)^3\, dx$.

(b) Show that $\int_0^1 x^a(1 - x)^b\, dx = \int_0^1 x^b(1 - x)^a\, dx$.

92. Rewriting Integrals

(a) Show that $\int_0^{\pi/2} \sin^2 x\, dx = \int_0^{\pi/2} \cos^2 x\, dx$.

(b) Show that

$$\int_0^{\pi/2} \sin^n x\, dx = \int_0^{\pi/2} \cos^n x\, dx$$

where n is a positive integer.

True or False? **In Exercises 93–98, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

93. $\int 3x^2(x^3 + 5)^{-2}\,dx = -(x^3 + 5)^{-1} + C$

94. $\int x(x^2 + 1)\,dx = \frac{1}{2}x^2\left(\frac{1}{3}x^3 + x\right) + C$

95. $\int_{-10}^{10} (ax^3 + bx^2 + cx + d)\,dx = 2\int_{0}^{10} (bx^2 + d)\,dx$

96. $\int_a^b \sin x\,dx = \int_a^{b+2\pi} \sin x\,dx$

97. $4\int \sin x \cos x\,dx = -\cos 2x + C$

98. $\int \sin^2 2x \cos 2x\,dx = \frac{1}{3}\sin^3 2x + C$

99. Rewriting Integrals Assume that the function f is continuous everywhere and that c is a constant. Show that

$$\int_{ca}^{cb} f(x)\,dx = c\int_a^b f(cx)\,dx.$$

100. Integration and Differentiation

(a) Verify that $\sin u - u\cos u + C = \int u \sin u\,du$.

(b) Use part (a) to show that $\int_0^{\pi^2} \sin\sqrt{x}\,dx = 2\pi$.

101. Proof Prove the second property of Theorem 4.16.

102. Rewriting Integrals Show that if the function f is continuous on the entire real number line, then

$$\int_a^b f(x + h)\,dx = \int_{a+h}^{b+h} f(x)\,dx.$$

PUTNAM EXAM CHALLENGE

103. If $a_0, a_1, \ldots, a_n$ are real numbers satisfying

$$\frac{a_0}{1} + \frac{a_1}{2} + \cdots + \frac{a_n}{n+1} = 0,$$

show that the equation

$$a_0 + a_1x + a_2x^2 + \cdots + a_nx^n = 0$$

has at least one real root.

104. Find all the continuous positive functions $f(x)$, for $0 \le x \le 1$, such that

$$\int_0^1 f(x)\,dx = 1$$

$$\int_0^1 f(x)x\,dx = \alpha$$

$$\int_0^1 f(x)x^2\,dx = \alpha^2$$

where α is a given real number.

SECTION PROJECT

Probability

The function $f(x) = kx^n(1 - x)^m$, where $0 \le x \le 1$, $n > 0$, $m > 0$, and k is a constant, can be used to represent various probability distributions. If k is chosen such that

$$\int_0^1 f(x)dx = 1$$

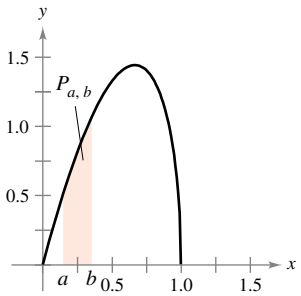
then the probability that x will fall between a and b $(0 \le a \le b \le 1)$ is

$$P_{a,b} = \int_a^b f(x)\,dx.$$

(a) The probability that a person will remember between $100a\%$ and $100b\%$ of material learned in an experiment is

$$P_{a,b} = \int_a^b \frac{15}{4}x\sqrt{1 - x}\,dx$$

where x represents the proportion remembered. (See figure.)

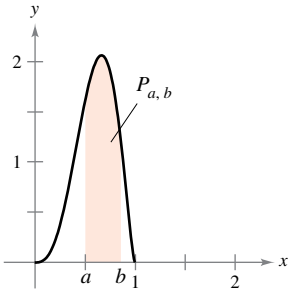


For a randomly chosen individual, what is the probability that they will recall between 50% and 75% of the material? What is the median percent recall? That is, for what value of b is it true that the probability of recalling 0 to b is 0.5?

(b) The probability that ore samples taken from a region contain between $100a\%$ and $100b\%$ iron is

$$P_{a,b} = \int_a^b \frac{1155}{32}x^3(1 - x)^{3/2}\,dx$$

where x represents the proportion of iron. (See figure.)



Find the probability that a sample will contain between 0% and 25% iron. Find the probability that a sample will contain between 50% and 100% iron.

Review Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Exploring Concepts

In Chapters 2 and 3, you studied the first major theme of calculus, the derivative. In this chapter, you studied the second major theme, integration. The relationship between these two concepts is stated in the most important theorem in all of calculus, the Fundamental Theorem of Calculus. The importance of the inverse relationship between differentiation and integration cannot be overstated.

$$\int_a^b f(x)\,dx = F(b) - F(a) \quad \text{and} \quad \frac{d}{dx}\left[\int_a^x f(t)\,dt\right] = f(x).$$

1. Consider the functions

$f(x) = \sin^2 x$ and $g(x) = \cos^2 x$.

(a) What do you notice about the derivatives of f and g?

(b) What can you conclude about the relationship between f and g?

2. Determine whether the function

$$f(x) = \frac{1}{x-4}$$

is integrable on the interval $[0, 5]$. Explain your reasoning.

3. Determine which value best approximates

$$\int_0^9 \left(1 + \sqrt{x}\right) dx.$$

Make your selection on the basis of a sketch.

(a) -3 (b) 9

(c) 27 (d) 3

4. Consider the function

$$F(x) = \int_{-3}^{x} (t^2 + 3t + 2)\,dt.$$

(a) Integrate to find F as a function of x.

(b) Demonstrate the Second Fundamental Theorem of Calculus by differentiating the result in part (a).

5. Let $v(t)$ represent the velocity (in feet per second) of a particle moving along a straight line at time t (in seconds). The graph of v is shown in the figure. Describe what each expression represents in the context of the situation.

(a) $v'(t)$ (b) $\displaystyle\int_a^c v(t)\,dt$

(c) $\displaystyle\int_a^c |v(t)|\,dt$ (d) $\displaystyle\frac{d}{dx}\left[\int_a^x v(t)\,dt\right]$

(e) $A - B$

(f) $\displaystyle\int_a^b v(t)\,dt + \int_b^c v(t)\,dt$

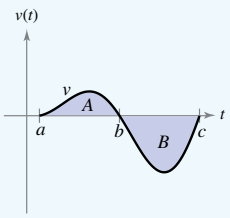

Figure for 5

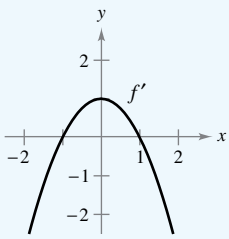

Figure for 6

6. The graph of the derivative of f is shown in the figure. Sketch the graphs of *two* functions that have the given derivative. (There is more than one correct answer.) To print an enlarged copy of the graph, go to *MathGraphs.com*.

Finding an Indefinite Integral **In Exercises 7–10, find the indefinite integral and check the result by differentiation.**

7. $\displaystyle\int (x^3 + 4)\,dx$ **8.** $\displaystyle\int (4x^2 + x + 3)\,dx$

9. $\displaystyle\int \frac{6}{\sqrt[3]{x}}\,dx$ **10.** $\displaystyle\int (2\csc^2 x - 9\sin x)\,dx$

Finding a Particular Solution **In Exercises 11 and 12, find the particular solution of the differential equation that satisfies the initial condition(s).**

11. $f'(x) = -6x,\ f(1) = -2$

12. $f''(x) = 24x,\ f'(-1) = 7,\ f(1) = -4$

13. Vertical Motion A ball is launched vertically upward from ground level with an initial velocity of 96 feet per second. Assume the acceleration of the ball is $a(t) = -32$ feet per second per second. (Neglect air resistance.)

(a) How long will it take the ball to rise to its maximum height? What is the maximum height?

(b) After how many seconds is the velocity of the ball one-half the initial velocity?

(c) What is the height of the ball when its velocity is one-half the initial velocity?

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

14. Vertical Motion With what initial velocity must an object be thrown upward (from a height of 3 meters) to reach a maximum height of 150 meters? Assume the acceleration of the object is $a(t) = 9.8$ meters per second per second. (Neglect air resistance.)

Finding a Sum **In Exercises 15 and 16, find the sum by adding each term together. Use the summation capabilities of a graphing utility to verify your result.**

15. $\sum_{i=1}^{5} (5i - 3)$

16. $\sum_{k=0}^{3} (k^2 + 1)$

Using Sigma Notation **In Exercises 17 and 18, use sigma notation to write the sum.**

17. $\frac{1}{5(3)} + \frac{2}{5(4)} + \frac{3}{5(5)} + \cdots + \frac{10}{5(12)}$

18. $\left(\frac{3}{n}\right)\left(\frac{1+1}{n}\right)^2 + \left(\frac{3}{n}\right)\left(\frac{2+1}{n}\right)^2 + \cdots + \left(\frac{3}{n}\right)\left(\frac{n+1}{n}\right)^2$

Evaluating a Sum **In Exercises 19–24, use the properties of summation and Theorem 4.2 to evaluate the sum. Use the summation capabilities of a graphing utility to verify your result.**

19. $\sum_{i=1}^{24} 8$

20. $\sum_{i=1}^{75} 5i$

21. $\sum_{i=1}^{20} 2i$

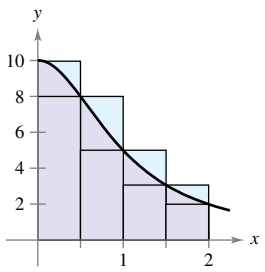
22. $\sum_{i=1}^{30} (3i - 4)$

23. $\sum_{i=1}^{20} (i + 1)^2$

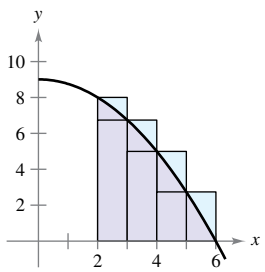
24. $\sum_{i=1}^{12} i(i^2 - 1)$

Finding Upper and Lower Sums for a Region **In Exercises 25 and 26, use upper and lower sums to approximate the area of the region using the given number of subintervals (of equal width).**

25. $y = \frac{10}{x^2 + 1}$



26. $y = 9 - \frac{1}{4}x^2$



Finding Upper and Lower Sums for a Region **In Exercises 27 and 28, find the upper and lower sums for the region bounded by the graph of the function and the x-axis on the given interval. Leave your answer in terms of n, the number of subintervals.**

Function	Interval
27. $f(x) = 4x + 1$	$[2, 3]$
28. $f(x) = 7x^2$	$[0, 3]$

Finding Area by the Limit Definition **In Exercises 29–32, use the limit process to find the area of the region bounded by the graph of the function and the x-axis over the given interval. Sketch the region.**

29. $y = 8 - 2x, \quad [0, 3]$

30. $y = x^2 + 3, \quad [0, 2]$

31. $y = 5 - x^2, \quad [-2, 1]$

32. $y = \frac{1}{4}x^3, \quad [2, 4]$

Approximating Area with the Midpoint Rule **In Exercises 33 and 34, use the Midpoint Rule with $n = 4$ to approximate the area of the region bounded by the graph of the function and the x-axis over the given interval.**

33. $f(x) = 16 - x^2, \quad [0, 4]$

34. $f(x) = \sin \pi x, \quad [0, 1]$

Evaluating a Definite Integral as a Limit **In Exercises 35 and 36, evaluate the definite integral by the limit definition.**

35. $\int_{-3}^{5} 6x \, dx$

36. $\int_{0}^{3} (1 - 2x^2) \, dx$

Evaluating a Definite Integral Using a Geometric Formula **In Exercises 37 and 38, sketch the region whose area is given by the definite integral. Then use a geometric formula to evaluate the integral ($a > 0, r > 0$).**

37. $\int_{0}^{5} (5 - |x - 5|) \, dx$

38. $\int_{-6}^{6} \sqrt{36 - x^2} \, dx$

39. Using Properties of Definite Integrals Given $\int_4^8 f(x) \, dx = 12$ and $\int_4^8 g(x) \, dx = 5$, evaluate

(a) $\int_4^8 [f(x) + g(x)] \, dx$. (b) $\int_4^8 [f(x) - g(x)] \, dx$.

(c) $\int_4^8 [2f(x) - 3g(x)] \, dx$. (d) $\int_4^8 7f(x) \, dx$.

40. Using Properties of Definite Integrals Given $\int_0^2 f(x) \, dx = 2$ and $\int_2^5 f(x) = -5$, evaluate

(a) $\int_0^5 f(x) \, dx$. (b) $\int_5^2 f(x) \, dx$.

(c) $\int_3^5 f(x) \, dx$. (d) $\int_2^5 -8f(x) \, dx$.

Evaluating a Definite Integral **In Exercises 41–46, use the Fundamental Theorem of Calculus to evaluate the definite integral. Use a graphing utility to verify your result.**

41. $\int_0^6 (x - 1) \, dx$

42. $\int_{-2}^{1} (4x^4 - x) \, dx$

43. $\int_4^9 x\sqrt{x} \, dx$

44. $\int_1^4 \left(\frac{1}{x^3} + x\right) dx$

45. $\int_0^{3\pi/4} \sin\theta \, d\theta$

46. $\int_{-\pi/4}^{\pi/4} \sec^2 t \, dt$

Finding the Area of a Region **In Exercises 47 and 48, find the area of the region bounded by the function and the x-axis on the interval $[0, \pi/2]$.**

47. $y = \sin x$

48. $y = x + \cos x$

Finding the Area of a Region **In Exercises 49–52, find the area of the region bounded by the graphs of the equations.**

49. $y = 8 - x,\ x = 0,\ x = 6,\ y = 0$

50. $y = -x^2 + x + 6,\ y = 0$

51. $y = x - x^3,\ x = 0,\ x = 1,\ y = 0$

52. $y = \sqrt{x}(1 - x),\ y = 0$

Using the Mean Value Theorem for Integrals **In Exercises 53 and 54, find the value(s) of c guaranteed by the Mean Value Theorem for Integrals for the function over the given interval.**

53. $f(x) = 3x^2,\quad [1, 3]$

54. $f(x) = \sin x,\quad [0, \pi]$

Finding the Average Value of a Function **In Exercises 55 and 56, find the average value of the function over the given interval and all values of x in the interval for which the function equals its average value.**

55. $f(x) = \dfrac{1}{\sqrt{x}},\quad [4, 9]$ **56.** $f(x) = x^3,\quad [0, 2]$

Using the Second Fundamental Theorem of Calculus **In Exercises 57 and 58, use the Second Fundamental Theorem of Calculus to find $F'(x)$.**

57. $F(x) = \displaystyle\int_0^x t^2\sqrt{1 + t^3}\,dt$ **58.** $F(x) = \displaystyle\int_1^x \frac{1}{t^2}\,dt$

Finding an Indefinite Integral **In Exercises 59–66, find the indefinite integral.**

59. $\displaystyle\int x(1 - 3x^2)^4\,dx$ **60.** $\displaystyle\int 6x^3\sqrt{3x^4 + 2}\,dx$

61. $\displaystyle\int \sin^3 x \cos x\,dx$ **62.** $\displaystyle\int x \sin 3x^2\,dx$

63. $\displaystyle\int \frac{\cos\theta}{\sqrt{1 - \sin\theta}}\,d\theta$ **64.** $\displaystyle\int \frac{\sin x}{\sqrt{\cos x}}\,dx$

65. $\displaystyle\int x\sqrt{8 - x}\,dx$ **66.** $\displaystyle\int \sqrt{1 + \sqrt{x}}\,dx$

Evaluating a Definite Integral **In Exercises 67–70, evaluate the definite integral. Use a graphing utility to verify your result.**

67. $\displaystyle\int_0^1 (3x + 1)^5\,dx$ **68.** $\displaystyle\int_0^1 x^2(x^3 - 2)^3\,dx$

69. $\displaystyle\int_0^3 \frac{1}{\sqrt{1 + x}}\,dx$ **70.** $\displaystyle\int_3^6 \frac{x}{3\sqrt{x^2 - 8}}\,dx$

Finding the Area of a Region **In Exercises 71 and 72, find the area of the region under the curve by evaluating the definite integral with the given bounds. Use a graphing utility to verify your result.**

71. $\displaystyle\int_1^9 x\sqrt[3]{x - 1}\,dx$ **72.** $\displaystyle\int_0^{\pi/2} (\cos x + \sin 2x)\,dx$

Even and Odd Functions **In Exercises 73 and 74, evaluate the integral using the properties of even and odd functions as an aid.**

73. $\displaystyle\int_{-2}^{2} (x^3 - 2x)\,dx$ **74.** $\displaystyle\int_{-\pi}^{\pi} (\cos x + x^2)\,dx$

Building on Concepts

75. Consider the function

$$F(x) = \int_0^x \sin^2 t\,dt.$$

(a) Evaluate F at $x = 0, \pi/6, \pi/3, \pi/2, 2\pi/3, 5\pi/6$, and π. Are the values of F increasing or decreasing? Explain.

(b) Use the integration capabilities of a graphing utility to graph F and $y_1 = \sin^2 t$ on the interval $0 \le t \le \pi$.

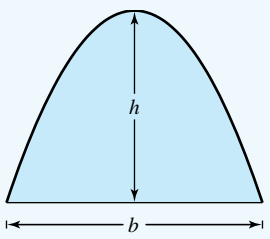
(c) Use the differentiation capabilities of a graphing utility to graph F'. How is this graph related to the graph in part (b)?

(d) Verify that $\sin^2 t$ is the derivative of

$$y = \frac{1}{2}t - \frac{1}{4}\sin 2t.$$

Graph y and write a short paragraph about how this graph is related to those in parts (b) and (c).

76. Archimedes showed that the area of a parabolic arch is equal to $\frac{2}{3}$ the product of the base and the height (see figure).



(a) Graph the parabolic arch bounded by $y = 9 - x^2$ and the x-axis. Use an appropriate integral to find the area A.

(b) Find the base and height of the arch and verify Archimedes's formula.

(c) Prove Archimedes's formula for a general parabola.

P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Evaluating a Sum and a Limit **In Exercises 1 and 2, (a) write the area under the graph of the given function defined on the given interval as a limit. Then (b) evaluate the sum in part (a), and (c) evaluate the limit using the result of part (b).**

1. $y = x^4 - 4x^3 + 4x^2, \quad [0, 2]$

$$\left(\textit{Hint: } \sum_{i=1}^{n} i^4 = \frac{n(n+1)(2n+1)(3n^2+3n-1)}{30}\right)$$

2. $y = \frac{1}{2}x^5 + 2x^3, \quad [0, 2]$

$$\left(\textit{Hint: } \sum_{i=1}^{n} i^5 = \frac{n^2(n+1)^2(2n^2+2n-1)}{12}\right)$$

3. Fresnel Function The **Fresnel function** S is defined by the integral

$$S(x) = \int_0^x \sin\frac{\pi t^2}{2}\,dt.$$

(a) Graph the function $y = \sin\dfrac{\pi x^2}{2}$ on the interval $[0, 3]$.

(b) Use the graph in part (a) to sketch the graph of S on the interval $[0, 3]$.

(c) Locate all relative extrema of S on the interval $(0, 3)$.

(d) Locate all points of inflection of S on the interval $(0, 3)$.

4. Approximation The **Two-Point Gaussian Quadrature Approximation** for f is

$$\int_{-1}^{1} f(x)\,dx \approx f\left(-\frac{1}{\sqrt{3}}\right) + f\left(\frac{1}{\sqrt{3}}\right).$$

(a) Use this formula to approximate

$$\int_{-1}^{1} \cos x\,dx.$$

Find the error of the approximation.

(b) Use this formula to approximate

$$\int_{-1}^{1} \frac{1}{1+x^2}\,dx.$$

(c) Prove that the Two-Point Gaussian Quadrature Approximation is exact for all polynomials of degree 3 or less.

5. Falling Objects Galileo Galilei (1564–1642) stated the following proposition concerning falling objects:

> *The time in which any space is traversed by a uniformly accelerating body is equal to the time in which that same space would be traversed by the same body moving at a uniform speed whose value is the mean of the highest speed of the accelerating body and the speed just before acceleration began.*

Use the techniques of this chapter to verify this proposition.

6. Extrema and Points of Inflection The graph of the function f consists of the three line segments joining the points $(0, 0)$, $(2, -2)$, $(6, 2)$, and $(8, 3)$. The function F is defined by the integral

$$F(x) = \int_0^x f(t)\,dt.$$

(a) Sketch the graph of f.

(b) Complete the table.

x	0	1	2	3	4	5	6	7	8
$F(x)$									

(c) Find the extrema of F on the interval $[0, 8]$.

(d) Determine all points of inflection of F on the interval $(0, 8)$.

7. Proof Prove $\displaystyle\int_0^x f(t)(x-t)\,dt = \int_0^x \left(\int_0^t f(v)\,dv\right) dt.$

8. Proof Prove $\displaystyle\int_a^b f(x)f'(x)\,dx = \tfrac{1}{2}([f(b)]^2 - [f(a)]^2).$

9. Riemann Sum Use an appropriate Riemann sum to evaluate the limit

$$\lim_{n\to\infty} \frac{\sqrt{1} + \sqrt{2} + \sqrt{3} + \cdots + \sqrt{n}}{n^{3/2}}.$$

10. Using a Continuous Function Let the function f be continuous on the interval $[0, b]$, where $f(x) + f(b - x) \neq 0$ on $[0, b]$.

(a) Show that $\displaystyle\int_0^b \frac{f(x)}{f(x) + f(b-x)}\,dx = \frac{b}{2}$.

(b) Use the result in part (a) to evaluate

$$\int_0^1 \frac{\sin x}{\sin(1-x) + \sin x}\,dx.$$

(c) Use the result in part (a) to evaluate

$$\int_0^3 \frac{\sqrt{x}}{\sqrt{x} + \sqrt{3-x}}\,dx.$$

11. Minimizing an Integral Determine the limits of integration where $a \leq b$ such that $\int_a^b (x^2 - 16)\,dx$ has minimal value.

12. Upper and Lower Sums Consider the region bounded by $y = mx$, $y = 0$, $x = 0$, and $x = b$.

(a) Find the upper and lower sums to approximate the area of the region when $\Delta x = b/4$.

(b) Find the upper and lower sums to approximate the area of the region when $\Delta x = b/n$.

(c) Find the area of the region by letting n approach infinity in both sums in part (b). Show that, in each case, you obtain the formula for the area of a triangle.

5.1 The Natural Logarithmic Function: Differentiation

GO DIGITAL

- **Define the natural logarithmic function and use its properties.**
- **Define the number *e*.**
- **Find derivatives of functions involving the natural logarithmic function.**

Big Ideas of Calculus

You can use calculus to define the natural logarithmic function $\ln x$ as an integral. Then, you can define the inverse of $\ln x$ as the natural exponential function e^x. The function e^x is one of the most interesting functions in calculus—its derivative and its integral are equal to itself! With these definitions and other properties, you will develop differentiation and integration rules for logarithmic, exponential, inverse trigonometric, and hyperbolic functions.

The Natural Logarithmic Function

Recall that the General Power Rule

$$\int x^n\,dx = \frac{x^{n+1}}{n+1} + C, \quad n \neq -1$$ General Power Rule

does not apply when $n = -1$. Consequently, you have not yet found an antiderivative for the function $f(x) = 1/x$. In this section, you will use the Second Fundamental Theorem of Calculus to *define* such a function. This antiderivative is a function that you have not encountered previously in the text. It is neither algebraic nor trigonometric but falls into a new class of functions called *logarithmic functions.* This particular function is the **natural logarithmic function.**

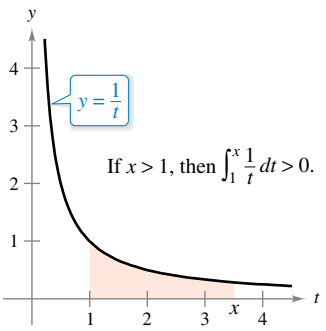
Definition of the Natural Logarithmic Function

The **natural logarithmic function** is defined by

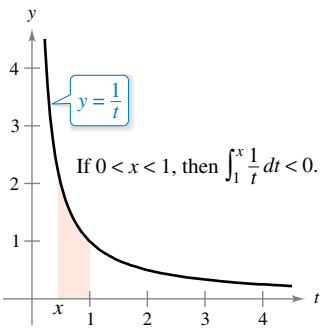
$$\ln x = \int_1^x \frac{1}{t}\,dt, \quad x > 0.$$

The domain of the natural logarithmic function is the set of all positive real numbers.

In the definition of the natural logarithmic function, note that $\ln x$ is positive for $x > 1$ and negative for $0 < x < 1$, as shown in Figure 5.1. Moreover, $\ln 1 = 0$, because the upper and lower limits of integration are equal when $x = 1$.



If $x > 1$, then $\ln x > 0$.



If $0 < x < 1$, then $\ln x < 0$.

Figure 5.1

JOHN NAPIER (1550–1617)

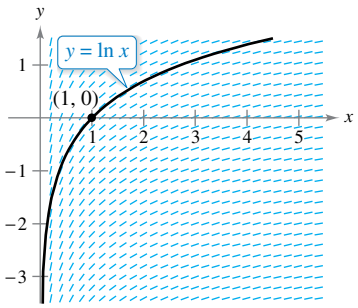
Logarithms were invented by the Scottish mathematician John Napier. Napier coined the term *logarithm*, from the two Greek words *logos* (or ratio) and *arithmos* (or number), to describe the theory that he spent 20 years developing and that first appeared in the book *Mirifici Logarithmorum Canonis Descriptio* (A Description of the Marvelous Rule of Logarithms). Although he did not introduce the *natural* logarithmic function, it is sometimes called the *Napierian* logarithm.

See LarsonCalculus.com to read more of this biography.

To sketch the graph of $y = \ln x$, you can think of the natural logarithmic function as an *antiderivative* given by the differential equation

$$\frac{dy}{dx} = \frac{1}{x}.$$ Differential equation

Figure 5.2 is a computer-generated graph, called a *slope field (or direction field)*, showing small line segments of slope $1/x$. The graph of $y = \ln x$ is the solution that passes through the point $(1, 0)$. (You will study slope fields in Section 6.1.)



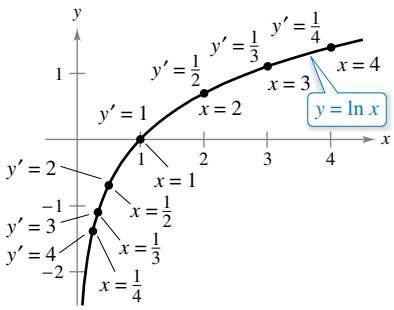
Each small line segment has a slope of $\frac{1}{x}$.

Figure 5.2

THEOREM 5.1 Properties of the Natural Logarithmic Function

The natural logarithmic function has three important properties.

1. The domain is $(0, \infty)$ and the range is $(-\infty, \infty)$.
2. The function is continuous, increasing, and one-to-one.
3. The graph is concave downward.



The natural logarithmic function is increasing, and its graph is concave downward.

Figure 5.3

Proof The domain of $f(x) = \ln x$ is $(0, \infty)$ by definition. Moreover, the function is continuous because it is differentiable. It is increasing because its derivative

$$f'(x) = \frac{1}{x}$$ First derivative

is positive for $x > 0$, as shown in Figure 5.3. It is concave downward because its second derivative

$$f''(x) = -\frac{1}{x^2}$$ Second derivative

is negative for $x > 0$. The proof that f is one-to-one is given in Appendix A. The next two limits imply that the range of f is the entire real number line.

$$\lim_{x \to 0^+} \ln x = -\infty$$

and

$$\lim_{x \to \infty} \ln x = \infty$$

Verification of these two limits is given in Appendix A. ∎

Using the definition of the natural logarithmic function, you can prove several important properties involving operations with natural logarithms. If you are already familiar with logarithms, you will recognize that the properties listed on the next page are characteristic of all logarithms.

THEOREM 5.2 Logarithmic Properties

If a and b are positive numbers and n is rational, then the four properties below are true.

1. $\ln 1 = 0$

2. $\ln(ab) = \ln a + \ln b$

3. $\ln(a^n) = n \ln a$

4. $\ln\left(\frac{a}{b}\right) = \ln a - \ln b$

Proof The first property has already been discussed. The proof of the second property follows from the fact that two antiderivatives of the same function differ at most by a constant. From the Second Fundamental Theorem of Calculus and the definition of the natural logarithmic function, you know that

$$\frac{d}{dx}[\ln x] = \frac{d}{dx}\left[\int_1^x \frac{1}{t}\,dt\right] = \frac{1}{x}.$$ Apply Second Fundamental Theorem of Calculus.

So, consider the two derivatives

$$\frac{d}{dx}[\ln(ax)] = \frac{a}{ax} = \frac{1}{x}$$

and

$$\frac{d}{dx}[\ln a + \ln x] = 0 + \frac{1}{x} = \frac{1}{x}.$$

Because $\ln(ax)$ and $(\ln a + \ln x)$ are both antiderivatives of $1/x$, they must differ at most by a constant, $\ln(ax) = \ln a + \ln x + C$. By letting $x = 1$, you can see that $C = 0$. The third property can be proved similarly by comparing the derivatives of $\ln(x^n)$ and $n \ln x$. Finally, use the second and third properties to prove the fourth property.

$$\ln\left(\frac{a}{b}\right) = \ln[a(b^{-1})] = \ln a + \ln(b^{-1}) = \ln a - \ln b$$ ■

EXAMPLE 1 Expanding Logarithmic Expressions

a. $\ln\frac{10}{9} = \ln 10 - \ln 9$ Property 4

b. $\ln\sqrt{3x+2} = \ln(3x+2)^{1/2}$ Rewrite with rational exponent.

$= \frac{1}{2}\ln(3x+2)$ Property 3

c. $\ln\frac{6x}{5} = \ln(6x) - \ln 5$ Property 4

$= \ln 6 + \ln x - \ln 5$ Property 2

d. $\ln\frac{(x^2+3)^2}{x\sqrt[3]{x^2+1}} = \ln(x^2+3)^2 - \ln\left(x\sqrt[3]{x^2+1}\right)$

$= 2\ln(x^2+3) - [\ln x + \ln(x^2+1)^{1/3}]$

$= 2\ln(x^2+3) - \ln x - \ln(x^2+1)^{1/3}$

$= 2\ln(x^2+3) - \ln x - \frac{1}{3}\ln(x^2+1)$ ■

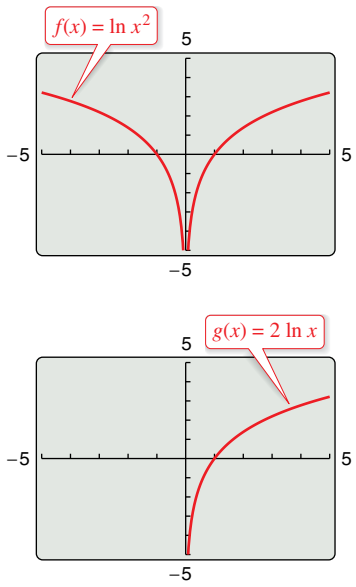

Figure 5.4

When using the properties of logarithms to rewrite logarithmic functions, you must check to see whether the domain of the rewritten function is the same as the domain of the original. For instance, the domain of $f(x) = \ln x^2$ is all real numbers except $x = 0$, and the domain of $g(x) = 2 \ln x$ is all positive real numbers. (See Figure 5.4.)

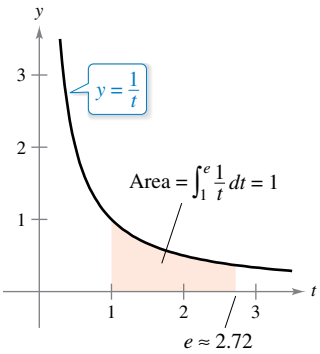
The Number e

It is likely that you have studied logarithms in an algebra course. There, without the benefit of calculus, logarithms would have been defined in terms of a **base** number. For example, common logarithms have a base of 10 and so $\log_{10} 10 = 1$. (You will learn more about this in Section 5.5.)

The **base for the natural logarithm** is defined using the fact that the natural logarithmic function is continuous, is one-to-one, and has a range of $(-\infty, \infty)$. So, there must be a unique real number x such that $\ln x = 1$, as shown in Figure 5.5. This number is denoted by the letter e. It can be shown that e is irrational and has the decimal approximation



e is the base for the natural logarithm because $\ln e = 1$.
Figure 5.5

$$e \approx 2.71828182846$$

when rounded to 11 decimal places.

THE NUMBER e

The symbol e was first used by mathematician Leonhard Euler to represent the base of natural logarithms in a letter to another mathematician, Christian Goldbach, in 1731.

Definition of e

The letter e denotes the positive real number such that

$$\ln e = \int_1^e \frac{1}{t}\,dt = 1.$$

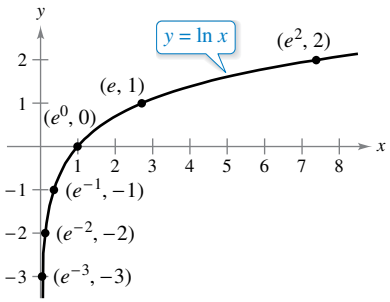
Once you know that $\ln e = 1$, you can use logarithmic properties to evaluate the natural logarithms of several other numbers. For example, by using the property

$$\ln(e^n) = n \ln e = n(1) = n$$

you can evaluate $\ln(e^n)$ for various values of n, as shown in the table and in Figure 5.6. The logarithms shown in the table are convenient because the x-values are integer powers of e. Most logarithmic expressions are, however, best evaluated with a calculator. For example, $\ln 2 \approx 0.693$ and $\ln(0.1) \approx -2.303$.

FOR FURTHER INFORMATION
To learn more about the number e, see the article "Unexpected Occurrences of the Number e" by Harris S. Shultz and Bill Leonard in *Mathematics Magazine*. To view this article, go to *MathArticles.com*.

x	$\frac{1}{e^3} \approx 0.050$	$\frac{1}{e^2} \approx 0.135$	$\frac{1}{e} \approx 0.368$	$e^0 = 1$	$e \approx 2.718$	$e^2 \approx 7.389$
$\ln x$	-3	-2	-1	0	1	2



If $x = e^n$, then $\ln x = n$.

The Derivative of the Natural Logarithmic Function

The derivative of the natural logarithmic function is given in Theorem 5.3. The first part of the theorem follows from the definition of the natural logarithmic function as an antiderivative. The second part of the theorem is simply the Chain Rule version of the first part.

THEOREM 5.3 Derivative of the Natural Logarithmic Function

Let u be a differentiable function of x.

1. $\dfrac{d}{dx}[\ln x] = \dfrac{1}{x}, \quad x > 0$
2. $\dfrac{d}{dx}[\ln u] = \dfrac{1}{u}\dfrac{du}{dx} = \dfrac{u'}{u}, \quad u > 0$

EXAMPLE 2 Differentiation of Logarithmic Functions

See LarsonCalculus.com for an interactive version of this type of example.

a. $\dfrac{d}{dx}[\ln 2x] = \dfrac{u'}{u} = \dfrac{2}{2x} = \dfrac{1}{x}$ $u = 2x$

b. $\dfrac{d}{dx}[\ln(x^2 + 1)] = \dfrac{u'}{u} = \dfrac{2x}{x^2 + 1}$ $u = x^2 + 1$

c. $\dfrac{d}{dx}[x \ln x] = x\left(\dfrac{d}{dx}[\ln x]\right) + (\ln x)\left(\dfrac{d}{dx}[x]\right)$ Product Rule

$= x\left(\dfrac{1}{x}\right) + (\ln x)(1)$

$= 1 + \ln x$

d. $\dfrac{d}{dx}[(\ln x)^3] = 3(\ln x)^2 \dfrac{d}{dx}[\ln x]$ Chain Rule

$= 3(\ln x)^2 \dfrac{1}{x}$ ■

Napier used logarithmic properties to simplify *calculations* involving products, quotients, and powers. Of course, given the availability of calculators, there is now little need for this particular application of logarithms. However, there is great value in using logarithmic properties to simplify *differentiation* involving products, quotients, and powers.

EXAMPLE 3 Logarithmic Properties as Aids to Differentiation

Differentiate $f(x) = \ln\sqrt{x + 1}$.

Solution To help with the differentiation, rewrite the radical with a rational exponent. Then use the logarithmic property $\ln x^z = z \ln x$ to rewrite the function as

$$f(x) = \ln\sqrt{x + 1} = \ln(x + 1)^{1/2} = \frac{1}{2}\ln(x + 1).$$ Rewrite before differentiating.

Next, find the first derivative of f with respect to x.

$$f'(x) = \frac{1}{2}\left(\frac{1}{x + 1}\right) = \frac{1}{2(x + 1)}$$ Differentiate. ■

GO DIGITAL

EXAMPLE 4 Logarithmic Properties as Aids to Differentiation

Differentiate $f(x) = \ln \dfrac{x(x^2 + 1)^2}{\sqrt{2x^3 - 1}}$.

Solution First, use logarithmic properties to rewrite the function.

$$f(x) = \ln \frac{x(x^2 + 1)^2}{\sqrt{2x^3 - 1}}$$ Write original function.

$$= \ln x + 2\ln(x^2 + 1) - \frac{1}{2}\ln(2x^3 - 1)$$ Rewrite before differentiating.

Next, find the first derivative of f with respect to x.

$$f'(x) = \frac{1}{x} + 2\left(\frac{2x}{x^2 + 1}\right) - \frac{1}{2}\left(\frac{6x^2}{2x^3 - 1}\right)$$ Differentiate.

$$= \frac{1}{x} + \frac{4x}{x^2 + 1} - \frac{3x^2}{2x^3 - 1}$$ Simplify.

REMARK In Example 4, notice how the logarithmic properties

$$\ln xy = \ln x + \ln y,$$

$$\ln \frac{x}{y} = \ln x - \ln y,$$

and

$$\ln x^z = z \ln x$$

are used to rewrite the function before differentiating.

In Examples 3 and 4, be sure you see the benefit of applying logarithmic properties *before* differentiating. Consider, for instance, the difficulty of direct differentiation of the function given in Example 4.

On occasion, it is convenient to use logarithms as aids in differentiating *nonlogarithmic* functions. This procedure is called **logarithmic differentiation.** In general, use logarithmic differentiation when differentiating (1) a function involving many factors or (2) a function having both a variable base and a variable exponent [see Section 5.5, Example 5(d)].

EXAMPLE 5 Logarithmic Differentiation

Find the derivative of $y = \dfrac{(x - 2)^2}{\sqrt{x^2 + 1}}, \quad x \neq 2.$

Solution Note that $y > 0$ for all $x \neq 2$. So, $\ln y$ is defined. Begin by taking the natural logarithm of each side of the equation. Then apply logarithmic properties and differentiate implicitly. Finally, solve for y'.

$$y = \frac{(x - 2)^2}{\sqrt{x^2 + 1}}, \quad x \neq 2$$ Write original equation.

$$\ln y = \ln \frac{(x - 2)^2}{\sqrt{x^2 + 1}}$$ Take natural log of each side.

$$\ln y = 2\ln(x - 2) - \frac{1}{2}\ln(x^2 + 1)$$ Logarithmic properties

$$\frac{y'}{y} = 2\left(\frac{1}{x - 2}\right) - \frac{1}{2}\left(\frac{2x}{x^2 + 1}\right)$$ Differentiate.

$$\frac{y'}{y} = \frac{x^2 + 2x + 2}{(x - 2)(x^2 + 1)}$$ Simplify.

$$y' = y\left[\frac{x^2 + 2x + 2}{(x - 2)(x^2 + 1)}\right]$$ Solve for y'.

$$y' = \frac{(x - 2)^2}{\sqrt{x^2 + 1}}\left[\frac{x^2 + 2x + 2}{(x - 2)(x^2 + 1)}\right]$$ Substitute for y.

$$y' = \frac{(x - 2)(x^2 + 2x + 2)}{(x^2 + 1)^{3/2}}$$ Simplify.

REMARK You could also solve the problem in Example 5 without using logarithmic differentiation by using the Power and Quotient Rules. Use these rules to find the derivative and show that the result is equivalent to the one in Example 5. Which method do you prefer?

GO DIGITAL

Because the natural logarithm is undefined for negative numbers, you will often encounter expressions of the form $\ln|u|$. The next theorem states that you can differentiate functions of the form $y = \ln|u|$ as though the absolute value notation was not present.

THEOREM 5.4 Derivative Involving Absolute Value

If u is a differentiable function of x such that $u \neq 0$, then

$$\frac{d}{dx}[\ln|u|] = \frac{u'}{u}.$$

Proof If $u > 0$, then $|u| = u$, and the result follows from Theorem 5.3. If $u < 0$, then $|u| = -u$, and you have

$$\frac{d}{dx}[\ln|u|] = \frac{d}{dx}[\ln(-u)] \qquad \text{For } u < 0,\ |u| = -u.$$

$$= \frac{-u'}{-u} \qquad \text{Apply Theorem 5.3.}$$

$$= \frac{u'}{u}. \qquad \text{Simplify.}$$

EXAMPLE 6 Derivative Involving Absolute Value

Find the derivative of

$$f(x) = \ln|\cos x|.$$

Solution Using Theorem 5.4, let $u = \cos x$ and write

$$\frac{d}{dx}[\ln|\cos x|] = \frac{u'}{u} \qquad \frac{d}{dx}[\ln|u|] = \frac{u'}{u}$$

$$= \frac{-\sin x}{\cos x} \qquad u = \cos x$$

$$= -\tan x. \qquad \text{Simplify.}$$

The next example shows how to use the techniques of Chapter 3 to find the relative extrema of a logarithmic function.

EXAMPLE 7 Finding Relative Extrema

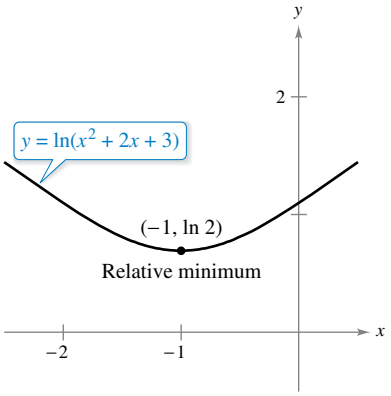
Locate the relative extrema of

$$y = \ln(x^2 + 2x + 3).$$

Solution Differentiating y, you obtain

$$\frac{dy}{dx} = \frac{2x + 2}{x^2 + 2x + 3}.$$

Because $dy/dx = 0$ when $x = -1$, you can apply the First Derivative Test and conclude that a relative minimum occurs at the point $(-1, \ln 2)$. Because there are no other critical points, it follows that this is the only relative extremum, as shown in the figure.



The derivative of y changes from negative to positive at $x = -1$.

GO DIGITAL

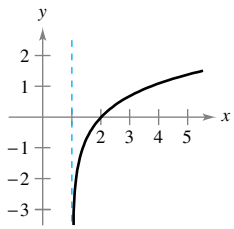
Concept Check

1. Explain why $\ln x$ is positive for $x > 1$ and negative for $0 < x < 1$.
2. Find the value of n.

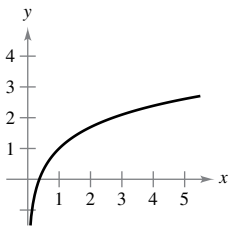
   $\ln 4 + \ln(n^{-1}) = \ln 4 - \ln 7$
3. Define the number e.
4. State the Chain Rule version of the derivative of the natural logarithmic function.

Matching In Exercises 5–8, match the function with its graph. [The graphs are labeled (a), (b), (c), and (d).]

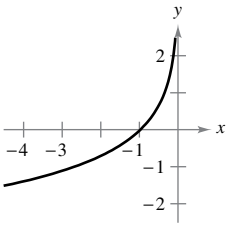
(a)



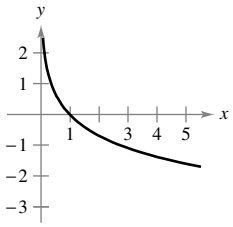
(b)



(c)



(d)



5. $f(x) = \ln x + 1$
6. $f(x) = -\ln x$
7. $f(x) = \ln(x - 1)$
8. $f(x) = -\ln(-x)$

Sketching a Graph In Exercises 9–14, sketch the graph of the function and state its domain.

9. $f(x) = 3 \ln x$
10. $f(x) = -2 \ln x$
11. $f(x) = \ln 2x$
12. $f(x) = \ln|x|$
13. $f(x) = \ln(x - 3)$
14. $f(x) = \ln x - 4$

Using Properties of Logarithms In Exercises 15 and 16, use the properties of logarithms to approximate the indicated logarithms, given that $\ln 2 \approx 0.6931$ and $\ln 3 \approx 1.0986$.

15. (a) $\ln 6$ (b) $\ln \frac{2}{3}$ (c) $\ln 81$ (d) $\ln \sqrt{3}$
16. (a) $\ln 0.25$ (b) $\ln 24$ (c) $\ln \sqrt[3]{12}$ (d) $\ln \frac{1}{72}$

Expanding a Logarithmic Expression In Exercises 17–26, use the properties of logarithms to expand the logarithmic expression.

17. $\ln \frac{x}{4}$
18. $\ln \sqrt{x^5}$
19. $\ln \frac{xy}{z}$
20. $\ln(xyz)$
21. $\ln\left(x\sqrt{x^2 + 5}\right)$
22. $x \ln \sqrt{x - 4}$
23. $\ln \sqrt{\frac{x - 1}{x}}$
24. $\ln(3e^2)$
25. $\ln z(z - 1)^2$
26. $\ln \frac{z}{e}$

Condensing a Logarithmic Expression In Exercises 27–32, write the expression as a logarithm of a single quantity.

27. $\ln(x - 2) - \ln(x + 2)$
28. $3 \ln x + 2 \ln y - 4 \ln z$
29. $\frac{1}{3}[2 \ln(x + 3) + \ln x - \ln(x^2 - 1)]$
30. $2[\ln x - \ln(x + 1) - \ln(x - 1)]$
31. $4 \ln 2 - \frac{1}{2} \ln(x^3 + 6x)$
32. $\frac{3}{2}[\ln(x^2 + 1) - \ln(x + 1) - \ln(x - 1)]$

Verifying Properties of Logarithms In Exercises 33 and 34, (a) verify that $f = g$ by using a graphing utility to graph f and g in the same viewing window and (b) verify that $f = g$ algebraically.

33. $f(x) = \ln \frac{x^2}{4}$, $x > 0$, $g(x) = 2 \ln x - \ln 4$
34. $f(x) = \ln \sqrt{x(x^2 + 1)}$, $g(x) = \frac{1}{2}[\ln x + \ln(x^2 + 1)]$

Finding a Limit In Exercises 35–38, find the limit.

35. $\lim_{x \to 3^+} \ln(x - 3)$
36. $\lim_{x \to 6^-} \ln(6 - x)$
37. $\lim_{x \to 2^-} \ln[x^2(3 - x)]$
38. $\lim_{x \to 5^+} \ln \frac{x}{\sqrt{x - 4}}$

Finding a Derivative In Exercises 39–62, find the derivative of the function.

39. $f(x) = \ln 3x$
40. $f(x) = \ln(x - 1)$
41. $f(x) = \ln(x^2 + 3)$
42. $h(x) = \ln(2x^2 + 1)$
43. $y = (\ln x)^4$
44. $y = x^2 \ln x$
45. $y = \ln(t + 1)^2$
46. $y = \ln \sqrt{x^2 - 4}$
47. $y = \ln\left(x\sqrt{x^2 - 1}\right)$
48. $y = \ln[t(t^2 + 3)^3]$
49. $f(x) = \ln \frac{x}{x^2 + 1}$
50. $f(x) = \ln \frac{2x}{x + 3}$
51. $g(t) = \frac{\ln t}{t^2}$
52. $h(t) = \frac{\ln t}{t^3 + 5}$
53. $y = \ln(\ln x^2)$
54. $y = \ln(\ln x)$

55. $y = \ln\sqrt{\dfrac{x+1}{x-1}}$ **56.** $y = \ln\sqrt[3]{\dfrac{x-1}{x+1}}$

57. $f(x) = \ln\dfrac{\sqrt{4+x^2}}{x}$ **58.** $f(x) = \ln\left(x + \sqrt{4+x^2}\right)$

59. $y = \ln|\sin x|$ **60.** $y = \ln|\csc x|$

61. $y = \ln\left|\dfrac{\cos x}{\cos x - 1}\right|$ **62.** $y = \ln|\sec x + \tan x|$

Finding an Equation of a Tangent Line **In Exercises 63–70, (a) find an equation of the tangent line to the graph of the function at the given point, (b) use a graphing utility to graph the function and its tangent line at the point, and (c) use the *tangent* feature of a graphing utility to verify your results.**

63. $y = \ln x^4, \quad (1, 0)$ **64.** $y = \ln x^{2/3}, \quad (-1, 0)$

65. $f(x) = 3x^2 - \ln x, \quad (1, 3)$

66. $f(x) = 4 - x^2 - \ln\left(\frac{1}{2}x + 1\right), \quad (0, 4)$

67. $f(x) = \ln\sqrt{1+\sin^2 x}, \quad \left(\dfrac{\pi}{4}, \ln\sqrt{\dfrac{3}{2}}\right)$

68. $f(x) = \sin 2x \ln x^2, \quad (1, 0)$

69. $y = x^3 \ln x^4, \quad (-1, 0)$

70. $f(x) = \dfrac{1}{2}x \ln x^2, \quad (-1, 0)$

Logarithmic Differentiation **In Exercises 71–76, use logarithmic differentiation to find dy/dx.**

71. $y = x\sqrt{x^2+1}, \quad x > 0$

72. $y = \sqrt{x^2(x+1)(x+2)}, \quad x > 0$

73. $y = \dfrac{x^2\sqrt{3x-2}}{(x+1)^2}, \quad x > \dfrac{2}{3}$ **74.** $y = \sqrt{\dfrac{x^2-1}{x^2+1}}, \quad x > 1$

75. $y = \dfrac{x(x-1)^{3/2}}{\sqrt{x+1}}, \quad x > 1$ **76.** $y = \dfrac{(x+1)(x-2)}{(x-1)(x+2)}, \quad x > 2$

Implicit Differentiation **In Exercises 77–80, use implicit differentiation to find dy/dx.**

77. $x^2 - 3\ln y + y^2 = 10$ **78.** $\ln xy + 5x = 30$

79. $4x^3 + \ln y^2 + 2y = 2x$ **80.** $4xy + \ln x^2 y = 7$

Differential Equation **In Exercises 81 and 82, verify that the function is a solution of the differential equation.**

Function	Differential Equation
81. $y = 2\ln x + 3$	$xy'' + y' = 0$
82. $y = x\ln x - 4x$	$x + y - xy' = 0$

Relative Extrema and Points of Inflection **In Exercises 83–88, locate any relative extrema and points of inflection. Use a graphing utility to confirm your results.**

83. $y = \dfrac{x^2}{2} - \ln x$ **84.** $y = 2x - \ln 2x$

85. $y = x\ln x$ **86.** $y = \dfrac{\ln x}{x}$

87. $y = \dfrac{x}{\ln x}$ **88.** $y = x^2 \ln\dfrac{x}{4}$

Using Newton's Method **In Exercises 89 and 90, use Newton's Method to approximate, to three decimal places, the x-coordinate of the point of intersection of the graphs of the two equations. Use a graphing utility to verify your result.**

89. $y = \ln x, \quad y = -x$ **90.** $y = \ln x, \quad y = 3 - x$

Exploring Concepts

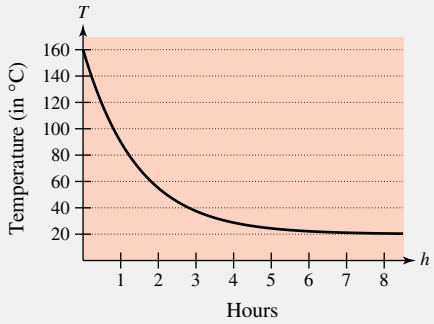
In Exercises 91 and 92, let f be a function that is positive and differentiable on the entire real number line and let $g(x) = \ln f(x)$.

91. When g is increasing, must f be increasing? Explain.

92. When the graph of f is concave upward, must the graph of g be concave upward? Explain.

93. Is $\ln xy = \ln x \ln y$ a valid property of logarithms, where $x > 0$ and $y > 0$? Explain.

94. HOW DO YOU SEE IT? The graph shows the temperature T (in degrees Celsius) of an object h hours after it is removed from a furnace.



(a) Find $\lim_{h\to\infty} T$. What does this limit represent?

(b) When is the temperature changing most rapidly?

True or False? **In Exercises 95–98, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

95. $\ln(a^{n+m}) = n\ln a + m\ln a$, where $a > 0$ and m and n are rational.

96. $\dfrac{d}{dx}[\ln(cx)] = \dfrac{d}{dx}[\ln x]$, where $c > 0$

97. If $y = \ln\pi$, then $y' = 1/\pi$. **98.** If $y = \ln e$, then $y' = 1$.

99. Logarithmic Equation Solve for x.

$$\frac{\ln x}{x} = \frac{\ln 2}{2}$$

100. Proof Use a graphing utility to graph the equations $y_1 = x - 1$, $y_2 = \ln x$, and $y_3 = 1 - (1/x)$, $x > 0$. Note that $x - 1 \geq \ln x \geq 1 - (1/x)$. Prove this inequality by analyzing the functions $f(x) = x - 1 - \ln x$ and $g(x) = 1 - (1/x) - \ln x$.

101. Home Mortgage The term t (in years) of a \$200,000 home mortgage at 7.5% interest can be approximated by

$$t = 13.375 \ln\left(\frac{x}{x - 1250}\right), \quad x > 1250$$

where x is the monthly payment in dollars.

(a) Use a graphing utility to graph the model.

(b) Use the model to approximate the term of a home mortgage for which the monthly payment is \$1398.43. What is the total amount paid?

(c) Use the model to approximate the term of a home mortgage for which the monthly payment is \$1611.19. What is the total amount paid?

(d) Find the instantaneous rates of change of t with respect to x when $x = \$1398.43$ and $x = \$1611.19$.

(e) Write a short paragraph describing the benefit of the higher monthly payment.

102. Sound Intensity

The relationship between the number of decibels β and the intensity of a sound I in watts per centimeter squared is $\beta = \frac{10}{\ln 10} \ln\left(\frac{I}{10^{-16}}\right)$.

(a) Use the properties of logarithms to write the formula in simpler form.

(b) Determine the number of decibels of a sound with an intensity of 10^{-5} watt per square centimeter.

103. Modeling Data The table shows the temperatures T (in degrees Fahrenheit) at which water boils at selected pressures p (in pounds per square inch). (*Source: Standard Handbook of Mechanical Engineers*)

p	5	10	14.696 (1 atm)	20
T	162.24	193.21	212.00	227.96

p	30	40	60	80	100
T	250.33	267.25	292.71	312.03	327.81

A model that approximates the data is

$$T = 87.97 + 34.96 \ln p + 7.91\sqrt{p}.$$

(a) Use a graphing utility to plot the data and graph the model.

(b) Find the rates of change of T with respect to p when $p = 10$ and $p = 70$.

(c) Use a graphing utility to graph T'. Find $\lim_{p \to \infty} T'(p)$ and interpret the result in the context of the problem.

104. Modeling Data The atmospheric pressure decreases with increasing altitude. At sea level, the average air pressure is one atmosphere (1.033227 kilograms per square centimeter). The table shows the pressures p (in atmospheres) at selected altitudes h (in kilometers).

h	0	5	10	15	20	25
p	1	0.55	0.25	0.12	0.06	0.02

(a) Use a graphing utility to find a model of the form $p = a + b \ln h$ for the data. Explain why the result is an error message.

(b) Use a graphing utility to find the logarithmic model $h = a + b \ln p$ for the data.

(c) Use a graphing utility to plot the data and graph the model from part (b).

(d) Use the model to estimate the altitude when $p = 0.75$.

(e) Use the model to estimate the pressure when $h = 13$.

(f) Use the model to find the rates of change of pressure when $h = 5$ and $h = 20$. Interpret the results.

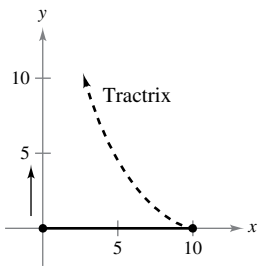
105. Tractrix A person walking along a dock drags a boat by a 10-meter rope. The boat travels along a path known as a *tractrix* (see figure). The equation of this path is

$$y = 10 \ln\left(\frac{10 + \sqrt{100 - x^2}}{x}\right) - \sqrt{100 - x^2}.$$

(a) Use a graphing utility to graph the function.

(b) What are the slopes of this path when $x = 5$ and $x = 9$?

(c) What does the slope of the path approach as x approaches 10 from the left?



106. Prime Number Theorem There are 25 prime numbers less than 100. The **Prime Number Theorem** states that the number of primes less than x approaches

$$p(x) \approx \frac{x}{\ln x}.$$

Use this approximation to estimate the rate (in primes per 100 integers) at which the prime numbers occur when

(a) $x = 1000$.

(b) $x = 1{,}000{,}000$.

(c) $x = 1{,}000{,}000{,}000$.

107. Conjecture Use a graphing utility to graph f and g in the same viewing window and determine which is increasing at the greater rate for large values of x. What can you conclude about the rate of growth of the natural logarithmic function?

(a) $f(x) = \ln x, \quad g(x) = \sqrt{x}$

(b) $f(x) = \ln x, \quad g(x) = \sqrt[4]{x}$

5.2 The Natural Logarithmic Function: Integration

GO DIGITAL

- Use the Log Rule for Integration to integrate a rational function.
- Integrate trigonometric functions.

Log Rule for Integration

The differentiation rules

$$\frac{d}{dx}[\ln|x|] = \frac{1}{x} \quad \text{and} \quad \frac{d}{dx}[\ln|u|] = \frac{u'}{u}$$

that you studied in the preceding section produce the **Log Rule for Integration.**

THEOREM 5.5 Log Rule for Integration

Let u be a differentiable function of x.

1. $\displaystyle\int \frac{1}{x}\,dx = \ln|x| + C$
2. $\displaystyle\int \frac{1}{u}\,du = \ln|u| + C$

Because $du = u'\,dx$, the second formula can also be written as

$$\int \frac{u'}{u}\,dx = \ln|u| + C. \qquad \text{Alternative form of Log Rule}$$

EXAMPLE 1 Using the Log Rule for Integration

$$\begin{aligned}\int \frac{2}{x}\,dx &= 2\int \frac{1}{x}\,dx && \text{Constant Multiple Rule}\\ &= 2\ln|x| + C && \text{Log Rule for Integration}\\ &= \ln x^2 + C && \text{Property of logarithms}\end{aligned}$$

Because x^2 cannot be negative, the absolute value notation is unnecessary in the final form of the antiderivative.

EXAMPLE 2 Using the Log Rule with a Change of Variables

Find $\displaystyle\int \frac{1}{4x-1}\,dx$.

Solution If you let $u = 4x - 1$, then $du = 4\,dx$. To introduce the missing factor of 4 in the integrand, multiply and divide by 4.

$$\begin{aligned}\int \frac{1}{4x-1}\,dx &= \frac{1}{4}\int \left(\frac{1}{4x-1}\right)4\,dx && \text{Multiply and divide by 4.}\\ &= \frac{1}{4}\int \frac{1}{u}\,du && \text{Substitute: } u = 4x-1.\\ &= \frac{1}{4}\ln|u| + C && \text{Apply Log Rule.}\\ &= \frac{1}{4}\ln|4x-1| + C && \text{Back-substitute.}\end{aligned}$$

Exploration

Integrating Rational Functions

Early in Chapter 4, you learned rules that allowed you to integrate *any* polynomial function. The Log Rule presented in this section goes a long way toward enabling you to integrate rational functions. For instance, each function below can be integrated with the Log Rule.

$\frac{2}{x}$	Example 1
$\frac{1}{4x-1}$	Example 2
$\frac{x}{x^2+1}$	Example 3
$\frac{3x^2+1}{x^3+x}$	Example 4(a)
$\frac{x+1}{x^2+2x}$	Example 4(c)
$\frac{1}{3x+2}$	Example 4(d)
$\frac{x^2+x+1}{x^2+1}$	Example 5
$\frac{2x}{(x+1)^2}$	Example 6

There are still some rational functions that cannot be integrated using the Log Rule. Give examples of these functions and explain your reasoning.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

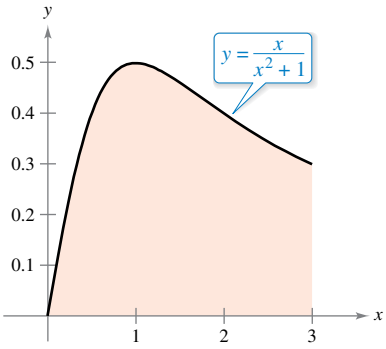
Example 3 uses the alternative form of the Log Rule. To apply this rule, look for quotients in which the numerator is the derivative of the denominator.

EXAMPLE 3 Finding Area with the Log Rule

Find the area of the region bounded by the graph of

$$y = \frac{x}{x^2 + 1}$$

the x-axis, and the line $x = 3$.



Area $= \int_0^3 \frac{x}{x^2 + 1}\,dx$

The area of the region bounded by the graph of y, the x-axis, and $x = 3$ is $\frac{1}{2}\ln 10$.

Figure 5.7

Solution In Figure 5.7, you can see that the area of the region is given by the definite integral

$$\int_0^3 \frac{x}{x^2 + 1}\,dx. \qquad \text{Area of region}$$

If you let $u = x^2 + 1$, then $u' = 2x$. To apply the Log Rule, multiply and divide by 2 as shown.

$$\int_0^3 \frac{x}{x^2 + 1}\,dx = \frac{1}{2}\int_0^3 \frac{2x}{x^2 + 1}\,dx \qquad \text{Multiply and divide by 2.}$$

$$= \frac{1}{2}\Big[\ln(x^2 + 1)\Big]_0^3 \qquad \int \frac{u'}{u}\,dx = \ln|u| + C$$

$$= \frac{1}{2}(\ln 10 - \ln 1)$$

$$= \frac{1}{2}\ln 10 \qquad \ln 1 = 0$$

$$\approx 1.151$$

The area of the region is about 1.151 square units.

EXAMPLE 4 Recognizing Quotient Forms of the Log Rule

a. $\int \frac{3x^2 + 1}{x^3 + x}\,dx = \ln|x^3 + x| + C \qquad u = x^3 + x$

b. $\int \frac{\sec^2 x}{\tan x}\,dx = \ln|\tan x| + C \qquad u = \tan x$

c. $\int \frac{x + 1}{x^2 + 2x}\,dx = \frac{1}{2}\int \frac{2x + 2}{x^2 + 2x}\,dx \qquad u = x^2 + 2x$

$$= \frac{1}{2}\ln|x^2 + 2x| + C$$

d. $\int \frac{1}{3x + 2}\,dx = \frac{1}{3}\int \frac{3}{3x + 2}\,dx \qquad u = 3x + 2$

$$= \frac{1}{3}\ln|3x + 2| + C$$

With antiderivatives involving logarithms, it is easy to obtain forms that look quite different but are still equivalent. For instance, both

$$\ln|(3x + 2)^{1/3}| + C$$

and

$$\ln|3x + 2|^{1/3} + C$$

are equivalent to the antiderivative listed in Example 4(d).

GO DIGITAL

Integrals to which the Log Rule can be applied often appear in disguised form. For instance, when a rational function has a *numerator of degree greater than or equal to that of the denominator*, division may reveal a form to which you can apply the Log Rule. This is shown in Example 5.

EXAMPLE 5 Using Long Division Before Integrating

See LarsonCalculus.com for an interactive version of this type of example.

Find the indefinite integral.

$$\int \frac{x^2 + x + 1}{x^2 + 1}\,dx$$

Solution Begin by using long division to rewrite the integrand.

$$\frac{x^2 + x + 1}{x^2 + 1} \quad \Rightarrow \quad x^2 + 1\overline{)\,x^2 + x + 1}\;\begin{array}{r}1\\ x^2 + 1\\ \hline x\end{array} \quad \Rightarrow \quad 1 + \frac{x}{x^2 + 1}$$

Now, integrate to obtain

$$\begin{aligned}\int \frac{x^2 + x + 1}{x^2 + 1}\,dx &= \int \left(1 + \frac{x}{x^2 + 1}\right)dx && \text{Rewrite using long division.}\\ &= \int dx + \frac{1}{2}\int \frac{2x}{x^2 + 1}\,dx && \text{Rewrite as two integrals.}\\ &= x + \frac{1}{2}\ln(x^2 + 1) + C. && \text{Integrate.}\end{aligned}$$

Check this result by differentiating to obtain the original integrand. ■

The next example presents another instance in which the use of the Log Rule is disguised. In this case, a change of variables helps you recognize the Log Rule.

EXAMPLE 6 Change of Variables with the Log Rule

Find the indefinite integral.

$$\int \frac{2x}{(x + 1)^2}\,dx$$

Solution If you let $u = x + 1$, then $du = dx$ and $x = u - 1$.

$$\begin{aligned}\int \frac{2x}{(x + 1)^2}\,dx &= \int \frac{2(u - 1)}{u^2}\,du && \text{Substitute.}\\ &= 2\int \left(\frac{u}{u^2} - \frac{1}{u^2}\right)du && \text{Rewrite as two fractions.}\\ &= 2\int \frac{du}{u} - 2\int u^{-2}\,du && \text{Rewrite as two integrals.}\\ &= 2\ln|u| - 2\left(\frac{u^{-1}}{-1}\right) + C && \text{Integrate.}\\ &= 2\ln|u| + \frac{2}{u} + C && \text{Simplify.}\\ &= 2\ln|x + 1| + \frac{2}{x + 1} + C && \text{Back-substitute.}\end{aligned}$$

Check this result by differentiating to obtain the original integrand. ■

TECHNOLOGY Use a graphing utility to find the indefinite integrals in Examples 5 and 6. How does the form of the antiderivative that it gives you compare with that given in Examples 5 and 6?

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. WCN 02-200-322

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The methods shown in Examples 5 and 6 involve rewriting a disguised integrand so that it fits one or more of the basic integration formulas. Throughout the remaining sections of Chapter 5 and in Chapter 8, much time will be devoted to integration techniques. To master these techniques, you must recognize the "form-fitting" nature of integration. In this sense, integration is not nearly as straightforward as differentiation. Differentiation takes the form

"Here is the question; what is the answer?"

Integration is more like

"Here is the answer; what is the question?"

Below are some guidelines you can use for integration.

Guidelines for Integration

1. Learn a basic list of integration formulas.
2. Find an integration formula that resembles all or part of the integrand and, by trial and error, find a choice of u that will make the integrand conform to the formula.
3. When you cannot find a u-substitution that works, try altering the integrand. You might try a trigonometric identity, multiplication and division by the same quantity, addition and subtraction of the same quantity, or long division. Be creative.
4. If you have a graphing utility that finds antiderivatives symbolically, use it.
5. Check your result by differentiating to obtain the original integrand.

EXAMPLE 7 ***u*-Substitution and the Log Rule**

Solve the differential equation

$$\frac{dy}{dx} = \frac{1}{x \ln x}.$$

Solution The solution can be written as an indefinite integral.

$$y = \int \frac{1}{x \ln x}\, dx$$

Because the integrand is a quotient whose denominator is raised to the first power, you should try the Log Rule. There are three basic choices for u. Two of the choices,

$$u = x \quad \text{and} \quad u = x \ln x$$

fail to fit the u'/u form of the Log Rule. The third choice, $u = \ln x$, does fit. Letting $u = \ln x$ produces $u' = 1/x$. Now, find the indefinite integral.

$$\begin{aligned}
\int \frac{1}{x \ln x}\, dx &= \int \frac{1/x}{\ln x}\, dx && \text{Divide numerator and denominator by } x. \\
&= \int \frac{u'}{u}\, du && \text{Substitute: } u = \ln x. \\
&= \ln|u| + C && \text{Apply Log Rule.} \\
&= \ln|\ln x| + C && \text{Back-substitute.}
\end{aligned}$$

So, the solution of the differential equation is $y = \ln|\ln x| + C$. ■

REMARK Keep in mind that you can check your answer to an integration problem by differentiating the answer. For instance, in Example 7, the derivative of $y = \ln|\ln x| + C$ is $y' = 1/(x \ln x)$.

Integrals of Trigonometric Functions

In Section 4.1, you studied six trigonometric integration rules—the six that correspond directly to differentiation rules. With the Log Rule, you can now complete the set of basic trigonometric integration formulas.

EXAMPLE 8 Using a Trigonometric Identity

Find $\int \tan x \, dx$.

Solution This integral does not seem to fit any formulas on the basic list. By using a trigonometric identity, however, you obtain

$$\int \tan x \, dx = \int \frac{\sin x}{\cos x} \, dx. \qquad \tan x = \frac{\sin x}{\cos x}$$

Knowing that $D_x[\cos x] = -\sin x$, let $u = \cos x$ and $u' = -\sin x$. So, you can conclude that

$$\begin{aligned} \int \tan x \, dx &= -\int \frac{-\sin x}{\cos x} \, dx && \text{Apply trigonometric identity and multiply and divide by } -1. \\ &= -\int \frac{u'}{u} \, du && \text{Substitute: } u = \cos x. \\ &= -\ln|u| + C && \text{Apply Log Rule.} \\ &= -\ln|\cos x| + C. && \text{Back-substitute.} \end{aligned}$$

Example 8 used a trigonometric identity to derive an integration rule for the tangent function. The next example takes a rather unusual step (multiplying and dividing by the same quantity) to derive an integration rule for the secant function.

EXAMPLE 9 Derivation of the Secant Formula

Find $\int \sec x \, dx$.

Solution Consider the procedure shown below.

$$\begin{aligned} \int \sec x \, dx &= \int (\sec x)\left(\frac{\sec x + \tan x}{\sec x + \tan x}\right) dx && \text{Multiply and divide by } \sec x + \tan x. \\ &= \int \frac{\sec^2 x + \sec x \tan x}{\sec x + \tan x} \, dx \end{aligned}$$

Letting u be the denominator of this quotient produces

$$u = \sec x + \tan x$$

and

$$u' = \sec x \tan x + \sec^2 x.$$

So, you can conclude that

$$\begin{aligned} \int \sec x \, dx &= \int \frac{\sec^2 x + \sec x \tan x}{\sec x + \tan x} \, dx && \text{Rewrite integrand.} \\ &= \int \frac{u'}{u} \, du && \text{Substitute: } u = \sec x + \tan x. \\ &= \ln|u| + C && \text{Apply Log Rule.} \\ &= \ln|\sec x + \tan x| + C. && \text{Back-substitute.} \end{aligned}$$

GO DIGITAL

With the results of Examples 8 and 9, you now have integration formulas for $\sin x$, $\cos x$, $\tan x$, and $\sec x$. The integrals of the six basic trigonometric functions are summarized below. [The proofs of $\cot u$ and $\csc u$ are left as exercises (see Exercises 85 and 86).]

Integrals of the Six Basic Trigonometric Functions

$$\int \sin u\,du = -\cos u + C \qquad \int \cos u\,du = \sin u + C$$

$$\int \tan u\,du = -\ln|\cos u| + C \qquad \int \cot u\,du = \ln|\sin u| + C$$

$$\int \sec u\,du = \ln|\sec u + \tan u| + C \qquad \int \csc u\,du = -\ln|\csc u + \cot u| + C$$

REMARK Using trigonometric identities and properties of logarithms, you could rewrite these six integration rules in other forms. For instance, you could write

$$\int \csc u\,du = \ln|\csc u - \cot u| + C.$$

(See Exercises 87–90.)

EXAMPLE 10 Integrating a Trigonometric Function

Evaluate $\displaystyle\int_0^{\pi/4} \sqrt{1 + \tan^2 x}\,dx$.

Solution This integral does not fit any formulas on the basic list. To obtain an integrand involving only $\sec x$, use the trigonometric identity $1 + \tan^2 x = \sec^2 x$.

$$\begin{aligned}
\int_0^{\pi/4} \sqrt{1 + \tan^2 x}\,dx &= \int_0^{\pi/4} \sqrt{\sec^2 x}\,dx && \text{Apply trigonometric identity.}\\
&= \int_0^{\pi/4} \sec x\,dx && \sec x \geq 0 \text{ for } 0 \leq x \leq \frac{\pi}{4}.\\
&= \ln|\sec x + \tan x|\Big]_0^{\pi/4} && \text{Integrate.}\\
&= \ln\left(\sqrt{2} + 1\right) - \ln 1\\
&\approx 0.881.
\end{aligned}$$

EXAMPLE 11 Finding an Average Value

Find the average value of $f(x) = \tan x$ on the interval $\left[0, \frac{\pi}{4}\right]$.

Solution

$$\begin{aligned}
\text{Average value} &= \frac{1}{(\pi/4) - 0}\int_0^{\pi/4} \tan x\,dx && \text{Average value} = \frac{1}{b-a}\int_a^b f(x)\,dx\\
&= \frac{4}{\pi}\int_0^{\pi/4} \tan x\,dx && \text{Simplify.}\\
&= \frac{4}{\pi}\Big[-\ln|\cos x|\Big]_0^{\pi/4} && \text{Integrate.}\\
&= -\frac{4}{\pi}\left(\ln\frac{\sqrt{2}}{2} - \ln 1\right)\\
&= -\frac{4}{\pi}\ln\frac{\sqrt{2}}{2}\\
&\approx 0.441
\end{aligned}$$

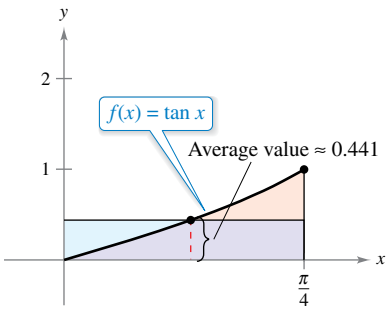

Figure 5.8

The average value is about 0.441, as shown in Figure 5.8.

5.2 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Can you use the Log Rule to find the integral below? Explain.

$$\int \frac{x}{(x^2 - 4)^3}\,dx$$

2. Explain when to use long division before applying the Log Rule.
3. Describe two ways to rewrite an integrand so that it fits an integration formula.
4. Integrating which trigonometric function results in $\ln|\sin x| + C$?

Finding an Indefinite Integral **In Exercises 5–28, find the indefinite integral.**

5. $\int \frac{5}{x}\,dx$
6. $\int \frac{1}{x - 5}\,dx$
7. $\int \frac{1}{2x + 5}\,dx$
8. $\int \frac{9}{5 - 4x}\,dx$
9. $\int \frac{x}{x^2 - 3}\,dx$
10. $\int \frac{x^2}{5 - x^3}\,dx$
11. $\int \frac{4x^3 + 3}{x^4 + 3x}\,dx$
12. $\int \frac{x^2 - 2x}{x^3 - 3x^2}\,dx$
13. $\int \frac{x^2 - 7}{7x}\,dx$
14. $\int \frac{x^3 - 8x}{x^2}\,dx$
15. $\int \frac{x^2 + 2x + 3}{x^3 + 3x^2 + 9x}\,dx$
16. $\int \frac{x^2 + 4x}{x^3 + 6x^2 + 5}\,dx$
17. $\int \frac{x^2 - 3x + 2}{x + 1}\,dx$
18. $\int \frac{2x^2 + 7x - 3}{x - 2}\,dx$
19. $\int \frac{x^3 - 3x^2 + 5}{x - 3}\,dx$
20. $\int \frac{x^3 - 6x - 20}{x + 5}\,dx$
21. $\int \frac{x^4 + x - 4}{x^2 + 2}\,dx$
22. $\int \frac{x^3 - 4x^2 - 4x + 20}{x^2 - 5}\,dx$
23. $\int \frac{(\ln x)^2}{x}\,dx$
24. $\int \frac{dx}{x(\ln x^2)^3}$
25. $\int \frac{1}{\sqrt{x}(1 - 3\sqrt{x})}\,dx$
26. $\int \frac{1}{x^{2/3}(1 + x^{1/3})}\,dx$
27. $\int \frac{6x}{(x - 5)^2}\,dx$
28. $\int \frac{x(x - 2)}{(x - 1)^3}\,dx$

Change of Variables **In Exercises 29–32, find the indefinite integral by making a change of variables. (*Hint:* Let u be the denominator of the integrand.)**

29. $\int \frac{1}{1 + \sqrt{2x}}\,dx$
30. $\int \frac{4}{1 + \sqrt{5x}}\,dx$
31. $\int \frac{\sqrt{x}}{\sqrt{x} - 3}\,dx$
32. $\int \frac{\sqrt[3]{x}}{\sqrt[3]{x} - 1}\,dx$

Finding an Indefinite Integral of a Trigonometric Function **In Exercises 33–42, find the indefinite integral.**

33. $\int \cot\frac{\theta}{3}\,d\theta$
34. $\int \theta \tan 2\theta^2\,d\theta$
35. $\int \csc 2x\,dx$
36. $\int \sec\frac{x}{2}\,dx$
37. $\int (5 - \cos 3\theta)\,d\theta$
38. $\int \left(2 - \tan\frac{\theta}{4}\right)d\theta$
39. $\int \frac{\cos t}{1 + \sin t}\,dt$
40. $\int \frac{\csc^2 t}{\cot t}\,dt$
41. $\int \frac{\sec x \tan x}{\sec x - 1}\,dx$
42. $\int (\sec 2x + \tan 2x)\,dx$

Differential Equation **In Exercises 43–46, find the general solution of the differential equation. Use a graphing utility to graph three solutions, one of which passes through the given point.**

43. $\frac{dy}{dx} = \frac{3}{2 - x}$, $(1, 0)$
44. $\frac{dy}{dx} = \frac{x - 2}{x}$, $(-1, 0)$
45. $\frac{dy}{dx} = \frac{2x}{x^2 - 9}$, $(0, 4)$
46. $\frac{dr}{dt} = \frac{\sec^2 t}{\tan t + 1}$, $(\pi, 4)$

Finding a Particular Solution **In Exercises 47 and 48, find the particular solution of the differential equation that satisfies the initial conditions.**

47. $f''(x) = \frac{2}{x^2}$, $f'(1) = 1$, $f(1) = 1$, $x > 0$
48. $f''(x) = -\frac{4}{(x - 1)^2} - 2$, $f'(2) = 0$, $f(2) = 3$, $x > 1$

Slope Field **In Exercises 49 and 50, a differential equation, a point, and a slope field are given. (a) Sketch two approximate solutions of the differential equation on the slope field, one of which passes through the given point. (To print an enlarged copy of the graph, go to *MathGraphs.com*.) (b) Use integration and the given point to find the particular solution of the differential equation and use a graphing utility to graph the solution. Compare the result with the sketch in part (a) that passes through the given point.**

49. $\frac{dy}{dx} = \frac{1}{x + 2}$, $(0, 1)$
50. $\frac{dy}{dx} = \frac{\ln x}{x}$, $(1, -2)$

Evaluating a Definite Integral **In Exercises 51–58, evaluate the definite integral. Use a graphing utility to verify your result.**

51. $\int_0^4 \frac{5}{3x+1}\,dx$

52. $\int_{-1}^1 \frac{1}{2x+3}\,dx$

53. $\int_1^e \frac{(1+\ln x)^2}{x}\,dx$

54. $\int_e^{e^2} \frac{1}{x \ln x}\,dx$

55. $\int_0^2 \frac{x^2-2}{x+1}\,dx$

56. $\int_0^1 \frac{x-1}{x+1}\,dx$

57. $\int_1^2 \frac{1-\cos\theta}{\theta-\sin\theta}\,d\theta$

58. $\int_{\pi/8}^{\pi/4} (\csc 2\theta - \cot 2\theta)\,d\theta$

Finding an Integral Using Technology **In Exercises 59 and 60, use a graphing utility to find or evaluate the integral.**

59. $\int \frac{1-\sqrt{x}}{1+\sqrt{x}}\,dx$

60. $\int_{-\pi/4}^{\pi/4} \frac{\sin^2 x - \cos^2 x}{\cos x}\,dx$

Finding a Derivative **In Exercises 61–64, find $F'(x)$.**

61. $F(x) = \int_1^x \frac{1}{t}\,dt$

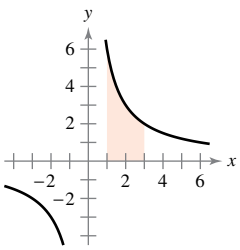
62. $F(x) = \int_0^x \tan t\,dt$

63. $F(x) = \int_1^{4x} \cot t\,dt$

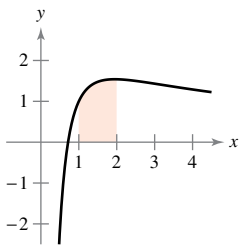
64. $F(x) = \int_0^{x^2} \frac{3}{t+1}\,dt$

Area **In Exercises 65–68, find the area of the given region. Use a graphing utility to verify your result.**

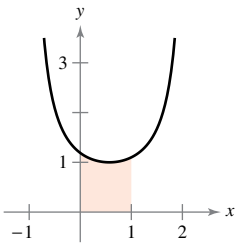
65. $y = \frac{6}{x}$



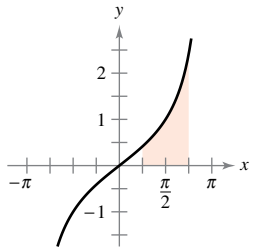
66. $y = \frac{1+\ln x^3}{x}$



67. $y = \csc(x+1)$



68. $y = \frac{\sin x}{1+\cos x}$



Area **In Exercises 69–72, find the area of the region bounded by the graphs of the equations. Use a graphing utility to verify your result.**

69. $y = \frac{x^2+4}{x}, \quad x = 1, \quad x = 4, \quad y = 0$

70. $y = \frac{5x}{x^2+2}, \quad x = 1, \quad x = 5, \quad y = 0$

71. $y = 2\sec\frac{\pi x}{6}, \quad x = 0, \quad x = 2, \quad y = 0$

72. $y = 2x - \tan 0.3x, \quad x = 1, \quad x = 4, \quad y = 0$

Finding the Average Value of a Function **In Exercises 73–76, find the average value of the function over the given interval.**

73. $f(x) = \frac{8}{x^2}, \quad [2, 4]$

74. $f(x) = \frac{4(x+1)}{x^2}, \quad [2, 4]$

75. $f(x) = \frac{2\ln x}{x}, \quad [1, e]$

76. $f(x) = \sec\frac{\pi x}{6}, \quad [0, 2]$

Midpoint Rule **In Exercises 77 and 78, use the Midpoint Rule with $n = 4$ to approximate the value of the definite integral. Use a graphing utility to verify your result.**

77. $\int_1^3 \frac{12}{x}\,dx$

78. $\int_0^{\pi/4} \sec x\,dx$

Exploring Concepts

In Exercises 79 and 80, determine which value best approximates the area of the region between the x-axis and the graph of the function over the given interval. Make your selection on the basis of a sketch of the region, not by performing calculations.

79. $f(x) = \sec x, \quad [0, 1]$

(a) 6 (b) -6 (c) $\frac{1}{2}$ (d) 1.25 (e) 3

80. $f(x) = \frac{2x}{x^2+1}, \quad [0, 4]$

(a) 3 (b) 7 (c) -2 (d) 5 (e) 1

81. Napier's Inequality For $0 < x < y$, use the Mean Value Theorem to show that

$$\frac{1}{y} < \frac{\ln y - \ln x}{y - x} < \frac{1}{x}.$$

82. Think About It Is the function

$$F(x) = \int_x^{2x} \frac{1}{t}\,dt$$

constant, increasing, or decreasing on the interval $(0, \infty)$? Explain.

83. Finding a Value Find a value of x such that

$$\int_1^x \frac{3}{t}\,dt = \int_{1/4}^x \frac{1}{t}\,dt.$$

84. Finding a Value Find a value of x such that

$$\int_1^x \frac{1}{t}\,dt$$

is equal to (a) $\ln 5$ and (b) 1.

85. Proof Prove that

$$\int \cot u\, du = \ln|\sin u| + C.$$

86. Proof Prove that

$$\int \csc u\, du = -\ln|\csc u + \cot u| + C.$$

Using Properties of Logarithms and Trigonometric Identities **In Exercises 87–90, show that the two formulas are equivalent.**

87. $\int \tan x\, dx = -\ln|\cos x| + C$

$\int \tan x\, dx = \ln|\sec x| + C$

88. $\int \cot x\, dx = \ln|\sin x| + C$

$\int \cot x\, dx = -\ln|\csc x| + C$

89. $\int \sec x\, dx = \ln|\sec x + \tan x| + C$

$\int \sec x\, dx = -\ln|\sec x - \tan x| + C$

90. $\int \csc x\, dx = -\ln|\csc x + \cot x| + C$

$\int \csc x\, dx = \ln|\csc x - \cot x| + C$

91. Biology A population of bacteria P is changing at a rate of

$$\frac{dP}{dt} = \frac{3000}{1 + 0.25t}$$

where t is the time in days. The initial population (when $t = 0$) is 1000.

(a) Write an equation that gives the population at any time t.

(b) Find the population when $t = 3$ days.

92. Sales The rate of change in sales S is inversely proportional to time t ($t > 1$), measured in weeks. Find S as a function of t when the sales after 2 and 4 weeks are 200 units and 300 units, respectively.

93. Heat Transfer

Find the time required for an object to cool from 300°F to 250°F by evaluating

$$t = \frac{10}{\ln 2}\int_{250}^{300} \frac{1}{T - 100}\, dT$$

where t is time in minutes.

Benoit Daoust/Shutterstock.com

94. Average Price The demand equation for a product is

$$p = \frac{90{,}000}{400 + 3x}$$

where p is the price (in dollars) and x is the number of units (in thousands). Find the average price p on the interval $40 \le x \le 50$.

95. Area and Slope Graph the function

$$f(x) = \frac{x}{1 + x^2}$$

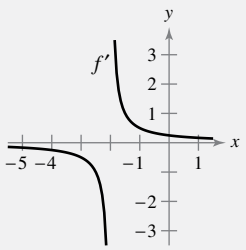
on the interval $[0, \infty)$.

(a) Find the area bounded by the graph of f and the line $y = \frac{1}{2}x$.

(b) Determine the values of the slope m such that the line $y = mx$ and the graph of f enclose a finite region.

(c) Calculate the area of this region as a function of m.

96. HOW DO YOU SEE IT? Use the graph of f' shown in the figure to answer the following.



(a) Approximate the slope of f at $x = -1$. Explain.

(b) Approximate any open intervals on which the graph of f is increasing and any open intervals on which it is decreasing. Explain.

True or False? **In Exercises 97–100, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

97. $\ln|x^4| = \ln x^4$

98. $\ln|\cos\theta^2| = \ln(\cos\theta^2)$

99. $\int \frac{1}{x}dx = \ln|cx|, \quad c \neq 0$

100. $\int_{-1}^{2} \frac{1}{x}dx = \left[\ln|x|\right]_{-1}^{2} = \ln 2 - \ln 1 = \ln 2$

PUTNAM EXAM CHALLENGE

101. Suppose that f is a function on the interval $[1, 3]$ such that $-1 \le f(x) \le 1$ for all x and $\int_1^3 f(x)\, dx = 0$. How large can $\int_1^3 \frac{f(x)}{x}dx$ be?

This problem was composed by the Committee on the Putnam Prize Competition.

5.3 Inverse Functions

GO DIGITAL

- **Verify that one function is the inverse function of another function.**
- **Determine whether a function has an inverse function.**
- **Find the derivative of an inverse function.**

Inverse Functions

Recall from Section P.3 that a function can be represented by a set of ordered pairs. For instance, the function $f(x) = x + 3$ from $A = \{1, 2, 3, 4\}$ to $B = \{4, 5, 6, 7\}$ can be written as

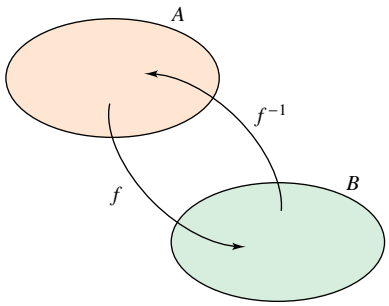
$$f: \{(1, 4), (2, 5), (3, 6), (4, 7)\}.$$

By interchanging the first and second coordinates of each ordered pair, you can form the **inverse function** of f. This function is denoted by f^{-1}, which is read as "f inverse." It is a function from B to A and can be written as

$$f^{-1}: \{(4, 1), (5, 2), (6, 3), (7, 4)\}.$$

Note that the domain of f is equal to the range of f^{-1}, and vice versa, as shown in Figure 5.9. The functions f and f^{-1} have the effect of "undoing" each other. That is, when you form the composition of f with f^{-1} or the composition of f^{-1} with f, you obtain the identity function.

$$f(f^{-1}(x)) = x \quad \text{and} \quad f^{-1}(f(x)) = x$$



Domain of f = range of f^{-1}
Domain of f^{-1} = range of f
Figure 5.9

REMARK Although the notation used to denote an inverse function resembles *exponential notation*, it is a different use of -1 as a superscript. That is, in general,

$$f^{-1}(x) \neq \frac{1}{f(x)}.$$

Exploration

Finding Inverse Functions
Explain how to "undo" each of the functions below. Then use your explanation to write the inverse function of f.

a. $f(x) = x - 5$
b. $f(x) = 6x$
c. $f(x) = \frac{x}{2}$
d. $f(x) = 3x + 2$
e. $f(x) = x^3$
f. $f(x) = 4(x - 2)$

Use a graphing utility with a square setting to graph each function and its inverse function in the same viewing window. What observation can you make about each pair of graphs?

Definition of Inverse Function

A function g is the **inverse function** of the function f when

$$f(g(x)) = x \text{ for each } x \text{ in the domain of } g$$

and

$$g(f(x)) = x \text{ for each } x \text{ in the domain of } f.$$

The function g is denoted by f^{-1}.

Here are some important observations about inverse functions.

1. If g is the inverse function of f, then f is the inverse function of g.
2. The domain of f^{-1} is equal to the range of f, and the range of f^{-1} is equal to the domain of f.
3. A function need not have an inverse function, but when it does, the inverse function is unique (see Exercise 90).

You can think of f^{-1} as undoing what has been done by f. For example, subtraction can be used to undo addition, and division can be used to undo multiplication. So,

$$f(x) = x + c \quad \text{and} \quad f^{-1}(x) = x - c$$ Subtraction can be used to undo addition.

are inverse functions of each other and

$$f(x) = cx \quad \text{and} \quad f^{-1}(x) = \frac{x}{c}, \quad c \neq 0$$ Division can be used to undo multiplication.

are inverse functions of each other, where c is a constant.

GO DIGITAL

REMARK In Example 1, try comparing the functions f and g verbally.

For f: First cube x, then multiply by 2, then subtract 1.

For g: First add 1, then divide by 2, then take the cube root.

Do you see the "undoing pattern"?

EXAMPLE 1 Verifying Inverse Functions

Show that the functions are inverse functions of each other.

$$f(x) = 2x^3 - 1 \quad \text{and} \quad g(x) = \sqrt[3]{\frac{x+1}{2}}$$

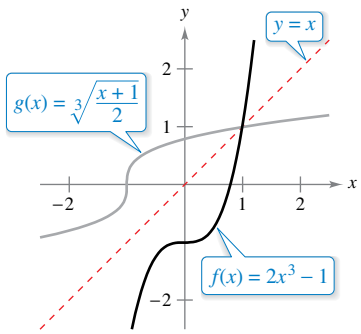
Solution Because the domains and ranges of both f and g consist of all real numbers, you can conclude that both composite functions exist for all x. The composition of f with g is

$$\begin{aligned} f(g(x)) &= f\left(\sqrt[3]{\frac{x+1}{2}}\right) && \text{Substitute for } g(x). \\ &= 2\left(\sqrt[3]{\frac{x+1}{2}}\right)^3 - 1 && \text{Definition of } f(x) \\ &= 2\left(\frac{x+1}{2}\right) - 1 && \text{Property of radicals} \\ &= x + 1 - 1 && \text{Multiply.} \\ &= x. && \text{Simplify.} \end{aligned}$$

The composition of g with f is

$$g(f(x)) = \sqrt[3]{\frac{(2x^3 - 1) + 1}{2}} = \sqrt[3]{\frac{2x^3}{2}} = \sqrt[3]{x^3} = x.$$

Because $f(g(x)) = x$ and $g(f(x)) = x$, you can conclude that f and g are inverse functions of each other (see Figure 5.10).



f and g are inverse functions of each other.
Figure 5.10

In Figure 5.10, the graphs of f and $g = f^{-1}$ appear to be mirror images of each other with respect to the line $y = x$. The graph of f^{-1} is a **reflection** of the graph of f in the line $y = x$. This idea is generalized in the next theorem.

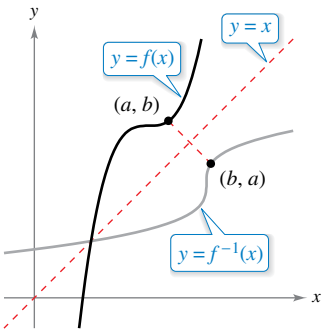
THEOREM 5.6 Reflective Property of Inverse Functions

The graph of f contains the point (a, b) if and only if the graph of f^{-1} contains the point (b, a).

Proof If (a, b) is on the graph of f, then $f(a) = b$, and you can write

$$f^{-1}(b) = f^{-1}(f(a)) = a.$$

So, (b, a) is on the graph of f^{-1}, as shown in Figure 5.11. A similar argument will prove the theorem in the other direction.



The graph of f^{-1} is a reflection of the graph of f in the line $y = x$.

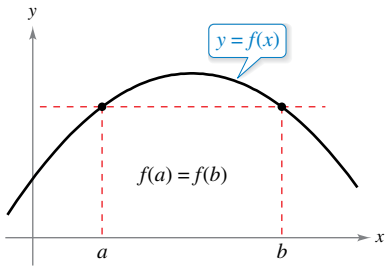
Existence of an Inverse Function

Not every function has an inverse function, and Theorem 5.6 suggests a graphical test for those that do—the **Horizontal Line Test** for an inverse function. This test states that a function f has an inverse function if and only if every horizontal line intersects the graph of f at most once (see Figure 5.12). The next theorem formally states why the Horizontal Line Test is valid. (Recall from Section 3.3 that a function is *strictly monotonic* when it is either increasing on its entire domain or decreasing on its entire domain.)



If a horizontal line intersects the graph of f twice, then f is not one-to-one.
Figure 5.12

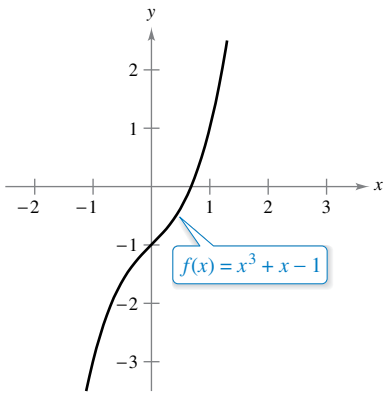
THEOREM 5.7 The Existence of an Inverse Function

1. A function has an inverse function if and only if it is one-to-one.
2. If f is strictly monotonic on its entire domain, then it is one-to-one and therefore has an inverse function.

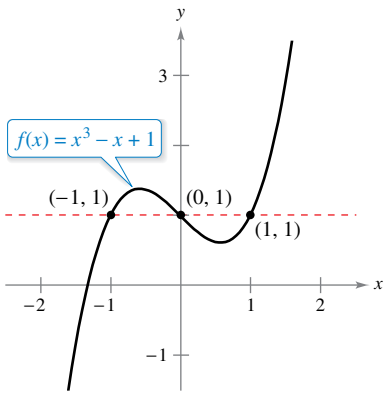
Proof The proof of the first part of the theorem is left as an exercise (see Exercise 91). To prove the second part of the theorem, recall from Section P.3 that f is one-to-one when for x_1 and x_2 in its domain

$$x_1 \neq x_2 \quad \Rightarrow \quad f(x_1) \neq f(x_2).$$

Now, choose x_1 and x_2 in the domain of f. If $x_1 \neq x_2$, then, because f is strictly monotonic, it follows that either $f(x_1) < f(x_2)$ or $f(x_1) > f(x_2)$. In either case, $f(x_1) \neq f(x_2)$. So, f is one-to-one on the interval. ■



(a) Because f is increasing over its entire domain, it has an inverse function.



(b) Because f is not one-to-one, it does not have an inverse function.
Figure 5.13

EXAMPLE 2 The Existence of an Inverse Function

a. From the graph of $f(x) = x^3 + x - 1$ shown in Figure 5.13(a), it appears that f is increasing over its entire domain. To verify this, note that the derivative, $f'(x) = 3x^2 + 1$, is positive for all real values of x. So, f is strictly monotonic, and it must have an inverse function.

b. From the graph of $f(x) = x^3 - x + 1$ shown in Figure 5.13(b), you can see that the function does not pass the Horizontal Line Test. In other words, it is not one-to-one. For instance, f has the same value when $x = -1$, 0, and 1.

$$f(-1) = f(1) = f(0) = 1 \qquad \text{Not one-to-one}$$

So, by Theorem 5.7, f does not have an inverse function. ■

Often, it is easier to prove that a function *has* an inverse function than to find the inverse function. For instance, it would be difficult algebraically to find the inverse function of the function in Example 2(a).

Guidelines for Finding an Inverse Function

1. Use Theorem 5.7 to determine whether the function $y = f(x)$ has an inverse function.
2. Solve for x as a function of y: $x = g(y) = f^{-1}(y)$.
3. Interchange x and y. The resulting equation is $y = f^{-1}(x)$.
4. Define the domain of f^{-1} as the range of f.
5. Verify that $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$.

The domain of f^{-1}, $[0, \infty)$, is the range of f.
Figure 5.14

GO DIGITAL

EXAMPLE 3 Finding an Inverse Function

Find the inverse function of $f(x) = \sqrt{2x - 3}$.

Solution From the graph of f in Figure 5.14, it appears that f is increasing over its entire domain, $[3/2, \infty)$. To verify this, note that

$$f'(x) = \frac{1}{\sqrt{2x - 3}} \qquad \text{Derivative of } f$$

is positive on the domain of f. So, f is strictly monotonic, and it must have an inverse function. To find an equation for the inverse function, let $y = f(x)$, and solve for x in terms of y.

$$\begin{aligned}
\sqrt{2x - 3} &= y && \text{Let } y = f(x).\\
2x - 3 &= y^2 && \text{Square each side.}\\
x &= \frac{y^2 + 3}{2} && \text{Solve for } x.\\
y &= \frac{x^2 + 3}{2} && \text{Interchange } x \text{ and } y.\\
f^{-1}(x) &= \frac{x^2 + 3}{2} && \text{Replace } y \text{ by } f^{-1}(x).
\end{aligned}$$

The domain of f^{-1} is the range of f, which is $[0, \infty)$. You can verify this result as shown.

$$f(f^{-1}(x)) = \sqrt{2\left(\frac{x^2 + 3}{2}\right) - 3} = \sqrt{x^2} = x, \quad x \geq 0$$

$$f^{-1}(f(x)) = \frac{\left(\sqrt{2x - 3}\right)^2 + 3}{2} = \frac{2x - 3 + 3}{2} = x, \quad x \geq \frac{3}{2}$$

Theorem 5.7 is useful in the next type of problem. You are given a function that is *not* one-to-one on its domain. By restricting the domain to an interval on which the function is strictly monotonic, you can conclude that the new function *is* one-to-one on the restricted domain.

EXAMPLE 4 Testing Whether a Function Is One-to-One

See LarsonCalculus.com for an interactive version of this type of example.

Show that the sine function

$$f(x) = \sin x$$

is not one-to-one on the entire real number line. Then show that $[-\pi/2, \pi/2]$ is the largest interval, centered at the origin, on which f is strictly monotonic.

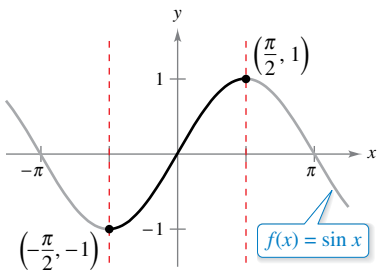
Solution It is clear that f is not one-to-one, because many different x-values yield the same y-value. For instance,

$$\sin 0 = 0 = \sin \pi.$$

Moreover, f is increasing on the open interval $(-\pi/2, \pi/2)$, because its derivative

$$f'(x) = \cos x$$

is positive there. Finally, because the left and right endpoints correspond to relative extrema of the sine function, you can conclude that f is increasing on the closed interval $[-\pi/2, \pi/2]$ *and* that on any larger interval the function is not strictly monotonic (see Figure 5.15).



f is one-to-one on the interval $[-\pi/2, \pi/2]$.

Derivative of an Inverse Function

The next two theorems discuss the derivative of an inverse function. The reasonableness of Theorem 5.8 follows from the reflective property of inverse functions, as shown in Figure 5.11.

THEOREM 5.8 Continuity and Differentiability of Inverse Functions

Let f be a function whose domain is an interval I. If f has an inverse function, then the following statements are true.

1. If f is continuous on its domain, then f^{-1} is continuous on its domain.
2. If f is increasing on its domain, then f^{-1} is increasing on its domain.
3. If f is decreasing on its domain, then f^{-1} is decreasing on its domain.
4. If f is differentiable on an interval containing c and $f'(c) \neq 0$, then f^{-1} is differentiable at $f(c)$.

A proof of this theorem is given in Appendix A.

Exploration

Graph the inverse functions $f(x) = x^3$ and $g(x) = x^{1/3}$. Calculate the slopes of f at (1, 1), (2, 8), and (3, 27), and the slopes of g at (1, 1), (8, 2), and (27, 3). What do you observe? What happens at (0, 0)?

THEOREM 5.9 The Derivative of an Inverse Function

Let f be a function that is differentiable on an interval I. If f has an inverse function g, then g is differentiable at any x for which $f'(g(x)) \neq 0$. Moreover,

$$g'(x) = \frac{1}{f'(g(x))}, \quad f'(g(x)) \neq 0.$$

A proof of this theorem is given in Appendix A.

EXAMPLE 5 Evaluating the Derivative of an Inverse Function

Let $f(x) = \frac{1}{4}x^3 + x - 1$, where $f(2) = 3$. Without writing a formula for $f^{-1}(x)$, find (a) $f^{-1}(3)$ and (b) $(f^{-1})'(3)$.

Solution Notice that the derivative, $f'(x) = (3/4)x^2 + 1$, is positive for all real values of x. So, f is strictly monotonic and must have an inverse function.

a. Because $f(2) = 3$, you know that $f^{-1}(3) = 2$.

b. Because the function f is differentiable and has an inverse function, you can apply Theorem 5.9 (with $g = f^{-1}$) to write

$$(f^{-1})'(3) = \frac{1}{f'(f^{-1}(3))} = \frac{1}{f'(2)}.$$

Moreover, using $f'(x) = (3/4)x^2 + 1$, you can conclude that

$$(f^{-1})'(3) = \frac{1}{f'(2)} = \frac{1}{(3/4)(2^2) + 1} = \frac{1}{4}.$$

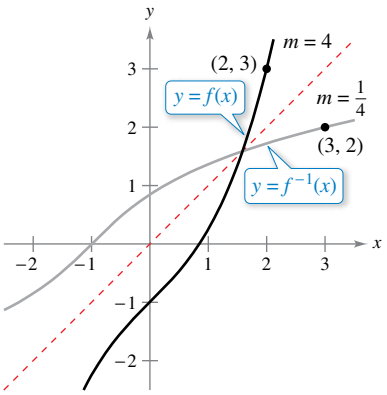
Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



The graphs of the inverse functions f and f^{-1} have reciprocal slopes at points (a, b) and (b, a).
Figure 5.16

In Example 5, note that at the point $(2, 3)$, the slope of the graph of f is $m = 4$, and at the point $(3, 2)$, the slope of the graph of f^{-1} is

$$m = \frac{1}{4}.$$ Slope of the graph of f^{-1} at $(3, 2)$

(See Figure 5.16.) In general, if $y = g(x) = f^{-1}(x)$, then $f(y) = x$ and $f'(y) = dx/dy$. It follows from Theorem 5.9 that

$$g'(x) = \frac{dy}{dx} = \frac{1}{f'(g(x))} = \frac{1}{f'(y)} = \frac{1}{(dx/dy)}.$$

This reciprocal relationship is sometimes written in Leibniz notation as

$$\frac{dy}{dx} = \frac{1}{dx/dy}.$$

EXAMPLE 6 Graphs of Inverse Functions Have Reciprocal Slopes

Let $f(x) = x^2$ (for $x \geq 0$), and let $f^{-1}(x) = \sqrt{x}$. Show that the slopes of the graphs of f and f^{-1} are reciprocals at each pair of points.

a. $(2, 4)$ and $(4, 2)$ **b.** $(3, 9)$ and $(9, 3)$

Solution The derivatives of f and f^{-1} are

$$f'(x) = 2x \quad \text{and} \quad (f^{-1})'(x) = \frac{1}{2\sqrt{x}}.$$ Find the derivatives of f and f^{-1}.

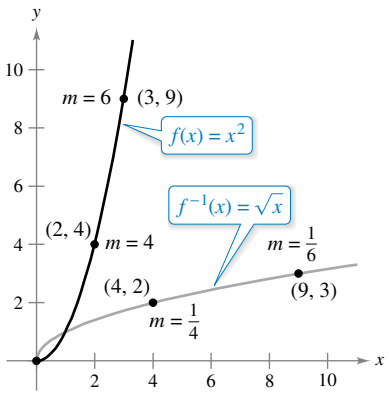
a. At $(2, 4)$, the slope of the graph of f is $f'(2) = 2(2) = 4$. At $(4, 2)$, the slope of the graph of f^{-1} is

$$(f^{-1})'(4) = \frac{1}{2\sqrt{4}} = \frac{1}{2(2)} = \frac{1}{4}.$$ Slope of the graph of f^{-1} at $(4, 2)$

b. At $(3, 9)$, the slope of the graph of f is $f'(3) = 2(3) = 6$. At $(9, 3)$, the slope of the graph of f^{-1} is

$$(f^{-1})'(9) = \frac{1}{2\sqrt{9}} = \frac{1}{2(3)} = \frac{1}{6}.$$ Slope of the graph of f^{-1} at $(9, 3)$

So, in both cases, the slopes of the graphs of f and f^{-1} are reciprocals, as shown in the figure below.



At $(0, 0)$, the derivative of f is 0, and the derivative of f^{-1} does not exist.

5.3 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Describe what it means to say that the function g is the inverse function of the function f.
2. Describe the relationship between the graph of a function and the graph of its inverse function.
3. The function f has an inverse function, f^{-1}. Is the domain of f the same as the domain of f^{-1}? Explain.
4. The function f is decreasing on its domain and has an inverse function, f^{-1}. Is f^{-1} increasing, decreasing, or constant on its domain?

Verifying Inverse Functions **In Exercises 5–12, show that f and g are inverse functions (a) analytically and (b) graphically.**

5. $f(x) = 5x + 1$, $g(x) = \dfrac{x - 1}{5}$
6. $f(x) = 3 - 4x$, $g(x) = \dfrac{3 - x}{4}$
7. $f(x) = x^3$, $g(x) = \sqrt[3]{x}$
8. $f(x) = 1 - x^3$, $g(x) = \sqrt[3]{1 - x}$
9. $f(x) = \sqrt{x - 4}$, $g(x) = x^2 + 4, \quad x \geq 0$
10. $f(x) = 16 - x^2, \quad x \geq 0$, $g(x) = \sqrt{16 - x}$
11. $f(x) = \dfrac{1}{x}$, $g(x) = \dfrac{1}{x}$
12. $f(x) = \dfrac{1}{1 + x}, \quad x \geq 0$, $g(x) = \dfrac{1 - x}{x}, \quad 0 < x \leq 1$

Using the Horizontal Line Test **In Exercises 13–22, use a graphing utility to graph the function. Then use the Horizontal Line Test to determine whether the function is one-to-one on its entire domain and therefore has an inverse function.**

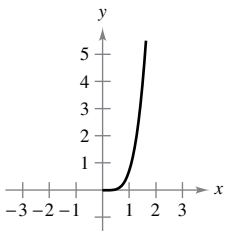
13. $f(x) = \frac{3}{4}x + 6$
14. $f(x) = 1 - x^3$
15. $f(\theta) = \sin\theta$
16. $f(x) = x\cos x$
17. $h(s) = \dfrac{1}{s - 2} - 3$
18. $g(t) = \dfrac{1}{\sqrt{t^2 + 1}}$
19. $f(x) = 5x\sqrt{x - 1}$
20. $g(x) = (x + 5)^3$
21. $f(x) = \ln x$
22. $h(x) = \ln x^2$

Determining Whether a Function Has an Inverse Function **In Exercises 23–28, use the derivative to determine whether the function is strictly monotonic on its entire domain and therefore has an inverse function.**

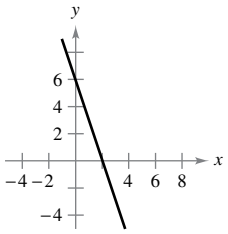
23. $f(x) = 2 - x - x^3$
24. $f(x) = x^3 - 6x^2 + 12x$
25. $f(x) = 8x^3 + x^2 - 1$
26. $f(x) = 1 - x^3 - 6x^5$
27. $f(x) = \ln(x - 3)$
28. $f(x) = \cos\dfrac{3x}{2}$

Matching **In Exercises 29–32, match the graph of the function with the graph of its inverse function. [The graphs of the inverse functions are labeled (a), (b), (c), and (d).]**

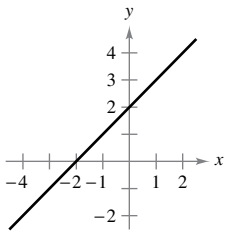
(a)



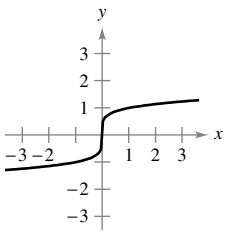
(b)



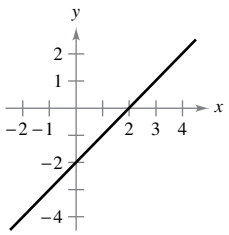
(c)



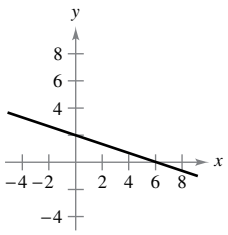
(d)



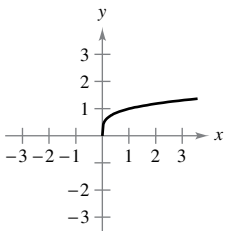
29.



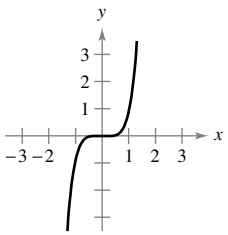
30.



31.



32.



Verifying a Function Has an Inverse Function **In Exercises 33–38, show that f is strictly monotonic on the given interval and therefore has an inverse function on that interval.**

33. $f(x) = (x - 4)^2, \quad [4, \infty)$
34. $f(x) = |x + 2|, \quad [-2, \infty)$
35. $f(x) = \cot x, \quad (0, \pi)$
36. $f(x) = \dfrac{4}{x^2}, \quad (0, \infty)$
37. $f(x) = \cos x, \quad [0, \pi]$
38. $f(x) = \sec x, \quad \left[0, \dfrac{\pi}{2}\right)$

Finding an Inverse Function **In Exercises 39–50, (a) find the inverse function of f, (b) graph f and f^{-1} on the same set of coordinate axes, (c) describe the relationship between the graphs, and (d) state the domains and ranges of f and f^{-1}.**

39. $f(x) = 2x - 3$

40. $f(x) = 9 - 5x$

41. $f(x) = x^5$

42. $f(x) = x^3 - 1$

43. $f(x) = \sqrt{x}$

44. $f(x) = x^4, \quad x \geq 0$

45. $f(x) = \sqrt{4 - x^2}, \quad 0 \leq x \leq 2$

46. $f(x) = \sqrt{x^2 - 4}, \quad x \geq 2$

47. $f(x) = \sqrt[3]{x - 1}$

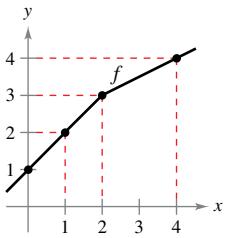
48. $f(x) = x^{2/3}, \quad x \geq 0$

49. $f(x) = \dfrac{x}{\sqrt{x^2 + 7}}$

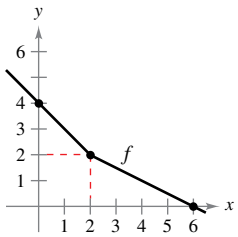
50. $f(x) = \dfrac{x + 2}{x}$

Finding an Inverse Function **In Exercises 51 and 52, use the graph of the function f to make a table of values for the given points. Then make a second table that can be used to find f^{-1} and sketch the graph of f^{-1}. To print an enlarged copy of the graph, go to *MathGraphs.com*.**

51.



52.



53. Cost You need a total of 50 pounds of two commodities costing \$1.25 and \$2.75 per pound.

(a) Verify that the total cost is $y = 1.25x + 2.75(50 - x)$, where x is the number of pounds of the less expensive commodity.

(b) Find the inverse function of the cost function. What does each variable represent in the inverse function?

(c) What is the domain of the inverse function? Validate or explain your answer using the context of the problem.

(d) Determine the number of pounds of the less expensive commodity purchased when the total cost is \$73.

54. Temperature The formula $C = \frac{5}{9}(F - 32)$, where $F \geq -459.6$, represents Celsius temperature C as a function of Fahrenheit temperature F.

(a) Find the inverse function of C.

(b) What does the inverse function represent?

(c) What is the domain of the inverse function? Validate or explain your answer using the context of the problem.

(d) The temperature is 22°C. What is the corresponding temperature in degrees Fahrenheit?

Testing Whether a Function Is One-to-One **In Exercises 55–58, determine whether the function is one-to-one. If it is, find its inverse function.**

55. $f(x) = \sqrt{x - 2}$

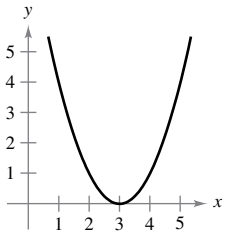
56. $f(x) = -3$

57. $f(x) = |x - 2|, \quad x \leq 2$

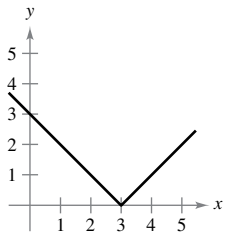
58. $f(x) = ax + b, \quad a \neq 0$

Making a Function One-to-One **In Exercises 59–62, the function is not one-to-one. Delete part of the domain so that the function that remains is one-to-one. Find the inverse function of the remaining function and give the domain of the inverse function. (*Note:* There is more than one correct answer.)**

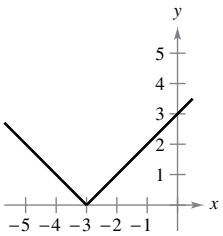
59. $f(x) = (x - 3)^2$



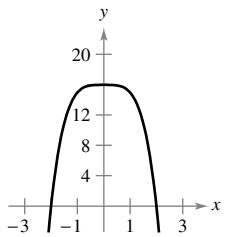
60. $f(x) = |x - 3|$



61. $f(x) = |x + 3|$



62. $f(x) = 16 - x^4$



Think About It **In Exercises 63–66, decide whether the function has an inverse function. If so, describe what the inverse function represents.**

63. $g(t)$ is the volume of water that has passed through a water line t minutes after a control valve is opened.

64. $h(t)$ is the height of the tide t hours after midnight, where $0 \leq t < 24$.

65. $C(t)$ is the cost of a long-distance phone call lasting t minutes.

66. $A(r)$ is the area of a circle of radius r.

Evaluating the Derivative of an Inverse Function **In Exercises 67–72, verify that f has an inverse function. Then use the function f and the given function value $f(x) = a$ to find $(f^{-1})'(a)$. (*Hint:* See Example 5.)**

67. $f(x) = 5 - 2x^3, \quad f(-1) = 7$

68. $f(x) = \frac{1}{27}(x^5 + 2x^3), \quad f(-3) = -11$

69. $f(x) = \sqrt{x - 4}, \quad f(8) = 2$

70. $f(x) = \sin x, \quad -\dfrac{\pi}{2} \leq x \leq \dfrac{\pi}{2}, \quad f\left(\dfrac{\pi}{6}\right) = \dfrac{1}{2}$

71. $f(x) = \cos 2x, \quad 0 \leq x \leq \dfrac{\pi}{2}, \quad f(0) = 1$

72. $f(x) = \dfrac{x + 6}{x - 2}, \quad x > 2, \quad f(6) = 3$

Using Inverse Functions **In Exercises 73–76, (a) find the domains of f and f^{-1}, (b) find the ranges of f and f^{-1}, (c) graph f and f^{-1}, and (d) show that the slopes of the graphs of f and f^{-1} are reciprocals at the given points.**

Functions	Point
73. $f(x) = x^3$	$\left(\frac{1}{2}, \frac{1}{8}\right)$
$f^{-1}(x) = \sqrt[3]{x}$	$\left(\frac{1}{8}, \frac{1}{2}\right)$
74. $f(x) = 3 - 4x$	$(1, -1)$
$f^{-1}(x) = \dfrac{3 - x}{4}$	$(-1, 1)$
75. $f(x) = \sqrt{x - 4}$	$(5, 1)$
$f^{-1}(x) = x^2 + 4, \quad x \geq 0$	$(1, 5)$
76. $f(x) = \dfrac{4}{1 + x^2}, \quad x \geq 0$	$(1, 2)$
$f^{-1}(x) = \sqrt{\dfrac{4 - x}{x}}$	$(2, 1)$

Using Composite and Inverse Functions **In Exercises 77–80, use the functions $f(x) = \frac{1}{8}x - 3$ and $g(x) = x^3$ to find the given value or function.**

77. $(f^{-1} \circ g^{-1})(1)$ **78.** $(g^{-1} \circ g^{-1})(8)$

79. $g^{-1} \circ f^{-1}$ **80.** $(f \circ g)^{-1}$

Exploring Concepts

81. Consider the function $f(x) = x^n$, where n is odd. Does f^{-1} exist? Explain.

82. Does adding a constant term to a function affect the existence of an inverse function? Explain.

In Exercises 83 and 84, the derivative of the function has the same sign for all x in its domain, but the function is not one-to-one. Explain why the function is not one-to-one.

83. $f(x) = \tan x$ **84.** $f(x) = \dfrac{x}{x^2 - 4}$

True or False? **In Exercises 85 and 86, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

85. If f is an even function, then f^{-1} exists.

86. If the inverse function of f exists, then the y-intercept of f is an x-intercept of f^{-1}.

87. Making a Function One-to-One

(a) Show that $f(x) = 2x^3 + 3x^2 - 36x$ is not one-to-one on $(-\infty, \infty)$.

(b) Determine the greatest value c such that f is one-to-one on $(-c, c)$.

88. Proof Let f and g be one-to-one functions. Prove that

(a) $f \circ g$ is one-to-one.

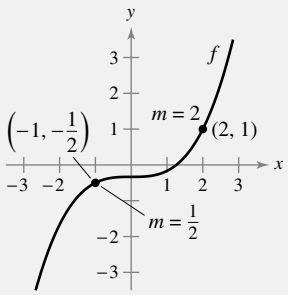
(b) $(f \circ g)^{-1}(x) = (g^{-1} \circ f^{-1})(x)$.

89. Proof Prove that if f has an inverse function, then $(f^{-1})^{-1} = f$.

90. Proof Prove that if a function has an inverse function, then the inverse function is unique.

91. Proof Prove that a function has an inverse function if and only if it is one-to-one.

92. HOW DO YOU SEE IT? Use the information in the graph of f below.



(a) What is the slope of the tangent line to the graph of f^{-1} at the point $\left(-\frac{1}{2}, -1\right)$? Explain.

(b) What is the slope of the tangent line to the graph of f^{-1} at the point $(1, 2)$? Explain.

93. Inverse Function Let

$$f(x) = \frac{x - 2}{x - 1}.$$

Show that f is its own inverse function. What can you conclude about the graph of f? Explain.

94. Using Theorem 5.7 Is the converse of the second part of Theorem 5.7 true? That is, if a function is one-to-one (and therefore has an inverse function), then must the function be strictly monotonic? If so, prove it. If not, give a counterexample.

95. Derivative of an Inverse Function Show that

$$f(x) = \int_2^x \sqrt{1 + t^2}\, dt$$

is one-to-one and find $(f^{-1})'(0)$.

96. Derivative of an Inverse Function Show that

$$f(x) = \int_2^x \frac{dt}{\sqrt{1 + t^4}}$$

is one-to-one and find $(f^{-1})'(0)$.

97. Concavity Let f be twice-differentiable and one-to-one on an open interval I. Show that its inverse function g satisfies

$$g''(x) = -\frac{f''(g(x))}{[f'(g(x))]^3}.$$

When f is increasing and concave downward, what is the concavity of g?

98. Using a Function Let $f(x) = \dfrac{ax + b}{cx + d}$.

(a) Show that f is one-to-one if and only if $bc - ad \neq 0$.

(b) Given $bc - ad \neq 0$, find f^{-1}.

(c) Determine the values of a, b, c, and d such that $f = f^{-1}$.

5.4 Exponential Functions: Differentiation and Integration

GO DIGITAL

- **Develop properties of the natural exponential function.**
- **Differentiate natural exponential functions.**
- **Integrate natural exponential functions.**

The Natural Exponential Function

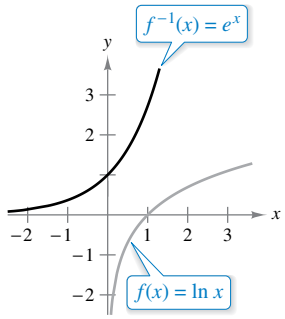
The function $f(x) = \ln x$ is increasing on its entire domain, and therefore it has an inverse function f^{-1}. The domain of f^{-1} is the set of all real numbers, and the range is the set of positive real numbers, as shown in Figure 5.17. So, for any real number x,

$$f(f^{-1}(x)) = \ln[f^{-1}(x)] = x. \qquad x \text{ is any real number.}$$

If x is rational, then

$$\ln(e^x) = x \ln e = x(1) = x. \qquad x \text{ is a rational number.}$$

Because the natural logarithmic function is one-to-one, you can conclude that $f^{-1}(x)$ and e^x agree for *rational* values of x. The next definition extends the meaning of e^x to include *all* real values of x.



The inverse function of the natural logarithmic function is the natural exponential function.

Figure 5.17

Definition of the Natural Exponential Function

The inverse function of the natural logarithmic function $f(x) = \ln x$ is called the **natural exponential function** and is denoted by

$$f^{-1}(x) = e^x.$$

That is, $y = e^x$ if and only if $x = \ln y$.

The inverse relationship between the natural logarithmic function and the natural exponential function can be summarized as shown.

$$\ln(e^x) = x \quad \text{and} \quad e^{\ln x} = x \qquad \text{Inverse relationship}$$

EXAMPLE 1 Solving an Exponential Equation

Solve $7 = e^{x+1}$.

Solution You can convert from exponential form to logarithmic form by *taking the natural logarithm of each side* of the equation.

$$\begin{aligned} 7 &= e^{x+1} && \text{Write original equation.} \\ \ln 7 &= \ln(e^{x+1}) && \text{Take natural logarithm of each side.} \\ \ln 7 &= x + 1 && \text{Apply inverse property.} \\ -1 + \ln 7 &= x && \text{Solve for } x. \end{aligned}$$

So, the solution is $-1 + \ln 7 \approx 0.946$. Figure 5.18, which shows the graphs of the left and right sides of the original equation, supports this result. An algebraic check of the answer is shown below.

$$\begin{aligned} 7 &= e^{x+1} && \text{Write original equation.} \\ 7 &\stackrel{?}{=} e^{(-1+\ln 7)+1} && \text{Substitute } -1 + \ln 7 \text{ for } x \text{ in original equation.} \\ 7 &\stackrel{?}{=} e^{\ln 7} && \text{Simplify.} \\ 7 &= 7 \ \checkmark && \text{Solution checks.} \end{aligned}$$

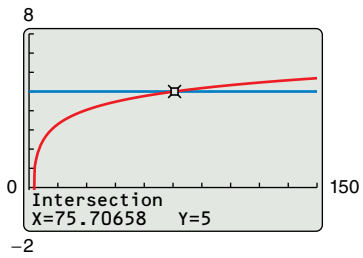
TECHNOLOGY

You can use a graphing utility to check a solution of an equation. One way to do this is to graph the left and right sides of the equation and then use the *intersect* feature. For instance, to check the solution to Example 2, enter $y_1 = \ln(2x - 3)$ and $y_2 = 5$. The solution of the original equation is the x-value of each point of intersection (see figure). So the solution of the original equation is $x \approx 75.707$.



EXAMPLE 2 Solving a Logarithmic Equation

Solve $\ln(2x - 3) = 5$.

Solution To convert from logarithmic form to exponential form, you can *exponentiate each side* of the logarithmic equation.

$$\ln(2x - 3) = 5 \qquad \text{Write original equation.}$$
$$e^{\ln(2x-3)} = e^5 \qquad \text{Exponentiate each side.}$$
$$2x - 3 = e^5 \qquad \text{Apply inverse property.}$$
$$x = \tfrac{1}{2}(e^5 + 3) \qquad \text{Solve for } x.$$
$$x \approx 75.707 \qquad \text{Use a calculator.}$$

The familiar rules for operating with rational exponents can be extended to the natural exponential function, as shown in the next theorem.

THEOREM 5.10 Operations with Exponential Functions

Let a and b be any real numbers.

1. $e^a e^b = e^{a+b}$
2. $\dfrac{e^a}{e^b} = e^{a-b}$

Proof To prove Property 1, consider $\ln(e^a e^b)$. Use Theorem 5.2 to write

$$\ln(e^a e^b) = \ln(e^a) + \ln(e^b) = a + b = \ln(e^{a+b}).$$

Because the natural logarithmic function is one-to-one, you can conclude that

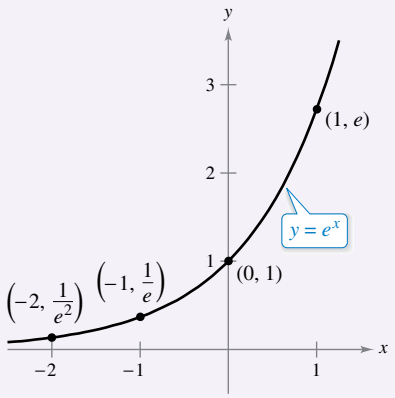
$$e^a e^b = e^{a+b}.$$

The proof of the other property is given in Appendix A.

In Section 5.3, you learned that an inverse function f^{-1} shares many properties with f. So, the natural exponential function inherits the properties listed below from the natural logarithmic function.

Properties of the Natural Exponential Function

1. The domain of $f(x) = e^x$ is
   $$(-\infty, \infty)$$
   and the range is
   $$(0, \infty).$$
2. The function $f(x) = e^x$ is continuous, increasing, and one-to-one on its entire domain.
3. The graph of $f(x) = e^x$ is concave upward on its entire domain.
4. $\lim_{x \to -\infty} e^x = 0$
5. $\lim_{x \to \infty} e^x = \infty$



The natural exponential function is increasing, and its graph is concave upward.

GO DIGITAL

Derivatives of Exponential Functions

One of the most intriguing (and useful) characteristics of the natural exponential function is that *it is its own derivative*. In other words, it is a solution of the differential equation $y' = y$. This result is stated in the next theorem.

REMARK You can interpret this theorem geometrically by saying that the slope of the graph of $f(x) = e^x$ at any point (x, e^x) is equal to the y-coordinate of the point.

THEOREM 5.11 Derivatives of the Natural Exponential Function

Let u be a differentiable function of x.

1. $\dfrac{d}{dx}[e^x] = e^x$
2. $\dfrac{d}{dx}[e^u] = e^u \dfrac{du}{dx}$

Proof To prove the first part of this theorem, use the fact that $\ln e^x = x$ and differentiate each side of the equation.

$$\ln e^x = x \qquad \text{Definition of exponential function}$$

$$\frac{d}{dx}[\ln e^x] = \frac{d}{dx}[x] \qquad \text{Differentiate each side with respect to } x.$$

$$\frac{1}{e^x}\frac{d}{dx}[e^x] = 1 \qquad \frac{d}{dx}[\ln u] = \frac{1}{u}\frac{du}{dx}$$

$$\frac{d}{dx}[e^x] = e^x \qquad \text{Multiply each side by } e^x.$$

The derivative of e^u follows from the Chain Rule. ∎

EXAMPLE 3 Differentiating Exponential Functions

a. $\dfrac{d}{dx}[e^{2x-1}] = e^u \dfrac{du}{dx} = 2e^{2x-1}$ $\qquad u = 2x - 1$

b. $\dfrac{d}{dx}[e^{-3/x}] = e^u \dfrac{du}{dx} = \left(\dfrac{3}{x^2}\right)e^{-3/x} = \dfrac{3e^{-3/x}}{x^2}$ $\qquad u = -\dfrac{3}{x}$

c. $\dfrac{d}{dx}[x^2e^x] = x^2(e^x) + e^x(2x) = xe^x(x + 2)$ $\qquad$ Product Rule and Theorem 5.11

d. $\dfrac{d}{dx}\left[\dfrac{e^{3x}}{e^x + 1}\right] = \dfrac{(e^x + 1)(3e^{3x}) - e^{3x}(e^x)}{(e^x + 1)^2} = \dfrac{3e^{4x} + 3e^{3x} - e^{4x}}{(e^x + 1)^2} = \dfrac{e^{3x}(2e^x + 3)}{(e^x + 1)^2}$

EXAMPLE 4 Locating Relative Extrema

Find the relative extrema of

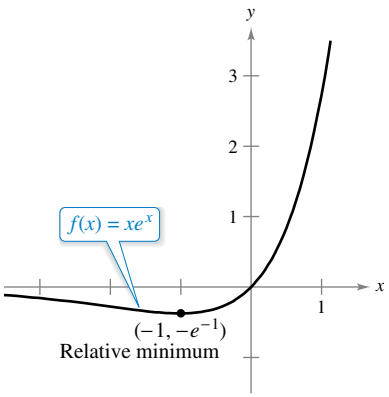
$$f(x) = xe^x.$$

Solution The derivative of f is

$$f'(x) = x(e^x) + e^x(1) \qquad \text{Product Rule}$$

$$= e^x(x + 1). \qquad \text{Factor.}$$

Because e^x is never 0, the derivative is 0 only when $x = -1$. Moreover, by the First Derivative Test, you can determine that $x = -1$ corresponds to a relative minimum, as shown in Figure 5.19. Because the derivative $f'(x) = e^x(x + 1)$ is defined for all x, there are no other critical points. ∎



The derivative of f changes from negative to positive at $x = -1$.

GO DIGITAL

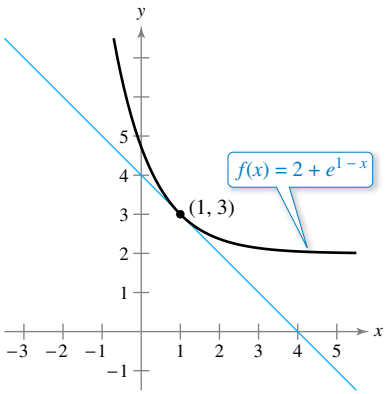

Figure 5.20

EXAMPLE 5 Finding an Equation of a Tangent Line

Find an equation of the tangent line to the graph of $f(x) = 2 + e^{1-x}$ at the point $(1, 3)$.

Solution Begin by finding $f'(x)$.

$$f(x) = 2 + e^{1-x}$$ Write original function.

$$f'(x) = e^{1-x}(-1)$$ $u = 1 - x$

$$= -e^{1-x}$$ First derivative

To find the slope of the tangent line at $(1, 3)$, evaluate $f'(1)$.

$$f'(1) = -e^{1-1} = -e^0 = -1$$ Slope of tangent line at $(1, 3)$

Now, use the point-slope form of the equation of a line to write

$$y - y_1 = m(x - x_1)$$ Point-slope form

$$y - 3 = -1(x - 1)$$ Substitute for y_1, m, and x_1.

$$y = -x + 4.$$ Equation of tangent line at $(1, 3)$

The graph of f and its tangent line at $(1, 3)$ are shown in Figure 5.20.

EXAMPLE 6 The Standard Normal Probability Density Function

See LarsonCalculus.com for an interactive version of this type of example.

Show that the *standard normal probability density function*

$$f(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$$

has points of inflection when $x = \pm 1$.

Solution To locate possible points of inflection, find the x-values for which the second derivative is 0.

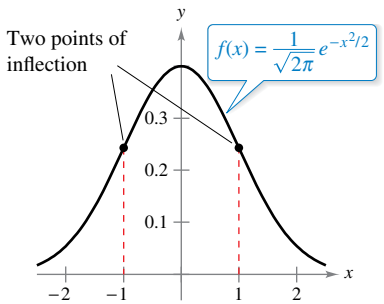
$$f(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2}$$ Write original function.

$$f'(x) = \frac{1}{\sqrt{2\pi}}(-x)e^{-x^2/2}$$ First derivative

$$f''(x) = \frac{1}{\sqrt{2\pi}}[(-x)(-x)e^{-x^2/2} + (-1)e^{-x^2/2}]$$ Product Rule

$$= \frac{1}{\sqrt{2\pi}}(e^{-x^2/2})(x^2 - 1)$$ Second derivative

So, $f''(x) = 0$ when $x = \pm 1$, and you can apply the techniques of Chapter 3 to conclude that these values yield the two points of inflection shown in the figure below.



The bell-shaped curve given by the standard normal probability density function

REMARK The general form of a normal probability density function (whose mean is 0) is

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}}e^{-x^2/(2\sigma^2)}$$

where σ is the standard deviation (σ is the lowercase Greek letter sigma). This "bell-shaped curve" has points of inflection when $x = \pm\sigma$.

FOR FURTHER INFORMATION To learn about derivatives of exponential functions of order 1/2, see the article "A Child's Garden of Fractional Derivatives" by Marcia Kleinz and Thomas J. Osler in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

Integrals of Exponential Functions

Each differentiation formula in Theorem 5.11 has a corresponding integration formula.

THEOREM 5.12 Integration Rules for Exponential Functions

Let u be a differentiable function of x.

1. $\int e^x\,dx = e^x + C$
2. $\int e^u\,du = e^u + C$

EXAMPLE 7 Integrating Exponential Functions

Find $\int e^{3x+1}\,dx$.

Solution If you let $u = 3x + 1$, then $du = 3\,dx$. To introduce the missing factor of 3 in the integrand, multiply and divide by 3.

$$\int e^{3x+1}\,dx = \frac{1}{3}\int e^{3x+1}(3)\,dx \qquad \text{Multiply and divide by 3.}$$

$$= \frac{1}{3}\int e^u\,du \qquad \text{Substitute: } u = 3x + 1.$$

$$= \frac{1}{3}e^u + C \qquad \text{Apply Exponential Rule.}$$

$$= \frac{e^{3x+1}}{3} + C \qquad \text{Back-substitute.}$$

REMARK In Example 7, the missing *constant* factor 3 was introduced to create $du = 3\,dx$. Remember, however, that you cannot introduce a missing *variable* factor in the integrand. For instance,

$$\int e^{-x^2}\,dx \neq \frac{1}{x}\int e^{-x^2}(x\,dx).$$

EXAMPLE 8 Integrating Exponential Functions

Find the indefinite integral.

$$\int 5xe^{-x^2}\,dx$$

Solution If you let $u = -x^2$, then $du = -2x\,dx$ or $x\,dx = -du/2$.

$$\int 5xe^{-x^2}\,dx = \int 5e^{-x^2}(x\,dx) \qquad \text{Regroup integrand.}$$

$$= \int 5e^u\left(-\frac{du}{2}\right) \qquad \text{Substitute: } u = -x^2.$$

$$= -\frac{5}{2}\int e^u\,du \qquad \text{Constant Multiple Rule}$$

$$= -\frac{5}{2}e^u + C \qquad \text{Apply Exponential Rule.}$$

$$= -\frac{5}{2}e^{-x^2} + C \qquad \text{Back-substitute.}$$

EXAMPLE 9 Integrating Exponential Functions

Find each indefinite integral.

a. $\int \frac{e^{1/x}}{x^2}\,dx$ **b.** $\int \sin x\, e^{\cos x}\,dx$

Solution

a. $\int \frac{e^{1/x}}{x^2}\,dx = -\int \overbrace{e^{1/x}}^{e^u}\overbrace{\left(-\frac{1}{x^2}\right)\,dx}^{du}$ $u = \frac{1}{x}$

$= -e^{1/x} + C$

b. $\int \sin x\, e^{\cos x}\,dx = -\int \overbrace{e^{\cos x}}^{e^u}\overbrace{(-\sin x)\,dx}^{du}$ $u = \cos x$

$= -e^{\cos x} + C$

EXAMPLE 10 Finding Areas Bounded by Exponential Functions

Evaluate each definite integral.

a. $\int_0^1 e^{-x}\,dx$ **b.** $\int_0^1 \frac{e^x}{1+e^x}\,dx$ **c.** $\int_{-1}^0 e^x \cos(e^x)\,dx$

Solution

a. $\int_0^1 e^{-x}\,dx = -e^{-x}\Big]_0^1$ See Figure 5.21(a).

$= -e^{-1} - (-1)$

$= 1 - \frac{1}{e}$

≈ 0.632

b. $\int_0^1 \frac{e^x}{1+e^x}\,dx = \ln(1+e^x)\Big]_0^1$ See Figure 5.21(b).

$= \ln(1+e) - \ln 2$

≈ 0.620

c. $\int_{-1}^0 e^x \cos(e^x)\,dx = \sin(e^x)\Big]_{-1}^0$ See Figure 5.21(c).

$= \sin 1 - \sin(e^{-1})$

≈ 0.482

REMARK In Example 10, the integration rules

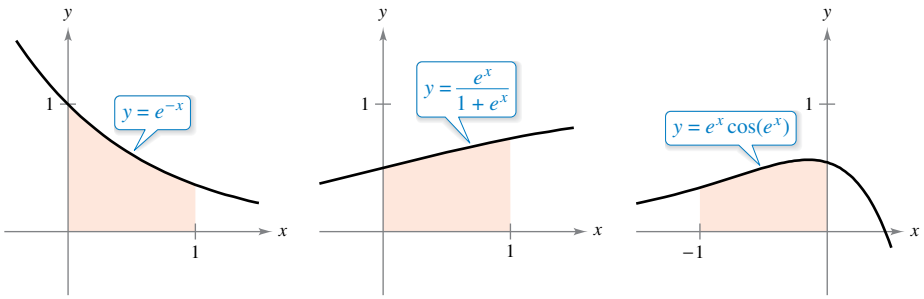
$$\int \frac{du}{u} = \ln|u| + C$$

$$\int \cos u\,du = \sin u + C$$

and

$$\int e^u\,du = e^u + C$$

were used to solve parts (a)–(c). In each case, what value of u was used?



(a) **(b)** **(c)**

5.4 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Describe the graph of $f(x) = e^x$.
2. Which of the following functions are their own derivative?
   $y = e^x + 4$ $\quad y = e^x$ $\quad y = e^{4x}$ $\quad y = 4e^x$

Solving an Exponential or Logarithmic Equation In Exercises 3–18, solve for x accurate to three decimal places.

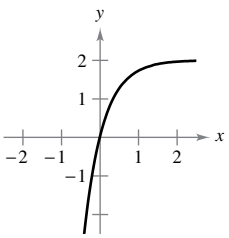
3. $e^{\ln x} = 4$
4. $e^{\ln 3x} = 24$
5. $e^x = 12$
6. $5e^x = 36$
7. $9 - 2e^x = 7$
8. $8e^x - 12 = 7$
9. $50e^{-x} = 30$
10. $100e^{-2x} = 35$
11. $\dfrac{800}{100 - e^{x/2}} = 50$
12. $\dfrac{5000}{1 + e^{2x}} = 2$
13. $\ln x = 2$
14. $\ln x^2 = -8$
15. $\ln(x - 3) = 2$
16. $\ln 4x = 1$
17. $\ln\sqrt{x + 2} = 1$
18. $\ln(x - 2)^2 = 12$

Sketching a Graph In Exercises 19–24, sketch the graph of the function.

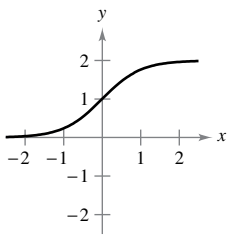
19. $y = e^{-x}$
20. $y = \frac{1}{3}e^x$
21. $y = e^x + 1$
22. $y = -e^{x-1}$
23. $y = e^{-x^2}$
24. $y = e^{-x/2}$

Matching In Exercises 25–28, match the equation with the correct graph. Assume that a and C are positive real numbers. [The graphs are labeled (a), (b), (c), and (d).]

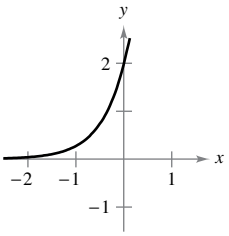
(a)



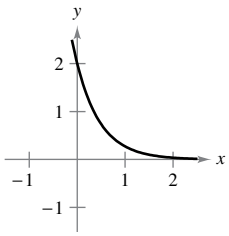
(b)



(c)



(d)



25. $y = Ce^{ax}$
26. $y = Ce^{-ax}$
27. $y = C(1 - e^{-ax})$
28. $y = \dfrac{C}{1 + e^{-ax}}$

Inverse Functions In Exercises 29–32, illustrate that the functions are inverse functions of each other by sketching their graphs on the same set of coordinate axes.

29. $f(x) = e^{2x}$, $g(x) = \ln\sqrt{x}$
30. $f(x) = e^{x/3}$, $g(x) = \ln x^3$
31. $f(x) = e^x - 1$, $g(x) = \ln(x + 1)$
32. $f(x) = e^{x-1}$, $g(x) = 1 + \ln x$

Finding a Derivative In Exercises 33–54, find the derivative of the function.

33. $y = e^{5x}$
34. $y = e^{-8x}$
35. $y = e^{\sqrt{x}}$
36. $y = e^{-2x^3}$
37. $y = e^{x-4}$
38. $y = 5e^{x^2+5}$
39. $y = e^x \ln x$
40. $y = xe^{4x}$
41. $y = (x + 1)^2e^x$
42. $y = x^2e^{-x}$
43. $g(t) = (e^{-t} + e^t)^3$
44. $g(t) = e^{-3/t^2}$
45. $y = \ln(2 - e^{5x})$
46. $y = \ln\left(\dfrac{1 + e^x}{1 - e^x}\right)$
47. $y = \dfrac{2}{e^x + e^{-x}}$
48. $y = \dfrac{e^x - e^{-x}}{2}$
49. $y = \dfrac{e^x + 1}{e^x - 1}$
50. $y = \dfrac{e^{2x}}{e^{2x} + 1}$
51. $y = e^x(\sin x + \cos x)$
52. $y = e^{2x}\tan 2x$
53. $F(x) = \displaystyle\int_{\pi}^{\ln x} \cos e^t\, dt$
54. $F(x) = \displaystyle\int_{0}^{e^{2x}} \ln(t + 1)\, dt$

Finding an Equation of a Tangent Line In Exercises 55–62, find an equation of the tangent line to the graph of the function at the given point.

55. $f(x) = e^{3x}$, $(0, 1)$
56. $f(x) = e^{-x} - 6$, $(0, -5)$
57. $y = e^{3x-x^2}$, $(3, 1)$
58. $y = e^{-2x+x^2}$, $(2, 1)$
59. $f(x) = e^{-x}\ln x$, $(1, 0)$
60. $y = \ln\dfrac{e^x + e^{-x}}{2}$, $(0, 0)$
61. $y = x^2e^x - 2xe^x + 2e^x$, $(1, e)$
62. $y = xe^x - e^x$, $(1, 0)$

Implicit Differentiation In Exercises 63 and 64, use implicit differentiation to find dy/dx.

63. $xe^y - 10x + 3y = 0$
64. $e^{xy} + x^2 - y^2 = 10$

Finding the Equation of a Tangent Line In Exercises 65 and 66, use implicit differentiation to find an equation of the tangent line to the graph of the equation at the given point.

65. $xe^y + ye^x = 1$, $(0, 1)$
66. $1 + \ln xy = e^{x-y}$, $(1, 1)$

Finding a Second Derivative **In Exercises 67 and 68, find the second derivative of the function.**

67. $f(x) = (3 + 2x)e^{-3x}$

68. $g(x) = \sqrt{x} + e^x \ln x$

Differential Equation **In Exercises 69 and 70, show that the function $y = f(x)$ is a solution of the differential equation.**

69. $y = 4e^{-x}$
$y'' - y = 0$

70. $y = e^{3x} + e^{-3x}$
$y'' - 9y = 0$

Relative Extrema and Points of Inflection **In Exercises 71–78, find the relative extrema and the points of inflection (if any exist) of the function. Use a graphing utility to graph the function and confirm your results.**

71. $f(x) = \dfrac{e^x + e^{-x}}{2}$

72. $f(x) = \dfrac{e^x - e^{-x}}{2}$

73. $g(x) = \dfrac{1}{\sqrt{2\pi}} e^{-(x-2)^2/2}$

74. $g(x) = \dfrac{1}{\sqrt{2\pi}} e^{-(x-3)^2/2}$

75. $f(x) = (2 - x)e^x$

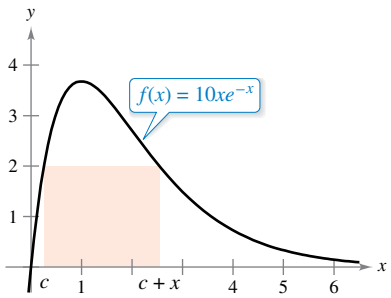
76. $f(x) = xe^{-x}$

77. $g(t) = 1 + (2 + t)e^{-t}$

78. $f(x) = -2 + e^{3x}(4 - 2x)$

79. Area Find the area of the largest rectangle that can be inscribed under the curve $y = e^{-x^2}$ in the first and second quadrants.

80. Area Perform the following steps to find the maximum area of the rectangle shown in the figure.



(a) Solve for c in the equation $f(c) = f(c + x)$.

(b) Use the result in part (a) to write the area A as a function of x. [*Hint:* $A = xf(c)$]

(c) Use a graphing utility to graph the area function. Use the graph to approximate the dimensions of the rectangle of maximum area. Determine the maximum area.

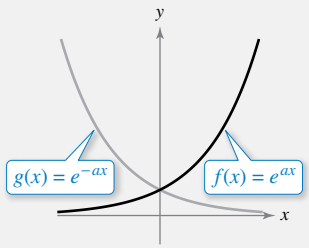
(d) Use a graphing utility to graph the expression for c found in part (a). Use the graph to approximate

$$\lim_{x \to 0^+} c \quad \text{and} \quad \lim_{x \to \infty} c.$$

Use this result to describe the changes in dimensions and position of the rectangle for $0 < x < \infty$.

81. Finding an Equation of a Tangent Line Find the point on the graph of the function $f(x) = e^{2x}$ such that the tangent line to the graph at that point passes through the origin. Use a graphing utility to graph f and the tangent line in the same viewing window.

82. HOW DO YOU SEE IT? The figure shows the graphs of f and g, where a is a positive real number. Identify the open interval(s) on which the graphs of f and g are (a) increasing or decreasing and (b) concave upward or concave downward.



83. Depreciation The value V of an item t years after it is purchased is $V = 15{,}000e^{-0.6286t}$, $0 \le t \le 10$.

(a) Use a graphing utility to graph the function.

(b) Find the rates of change of V with respect to t when $t = 1$ and $t = 5$.

(c) Use a graphing utility to graph the tangent lines to the function when $t = 1$ and $t = 5$.

84. Harmonic Motion The displacement from equilibrium of a mass oscillating on the end of a spring suspended from a ceiling is $y = 1.56e^{-0.22t} \cos 4.9t$, where y is the displacement (in feet) and t is the time (in seconds). Use a graphing utility to graph the displacement function on the interval $[0, 10]$. Find a value of t past which the displacement is less than 3 inches from equilibrium.

85. Atmospheric Pressure

A meteorologist measures the atmospheric pressure P (in millibars) at altitude h (in kilometers). The data are shown below.

h	0	5	10	15	20
P	1013.2	547.5	233.0	121.6	50.7

(a) Use a graphing utility to plot the points $(h, \ln P)$. Use the regression capabilities of the graphing utility to find a linear model for the revised data points.

(b) The line in part (a) has the form $\ln P = ah + b$. Write the equation in exponential form.

(c) Use a graphing utility to plot the original data and graph the exponential model in part (b).

(d) Find the rates of change of the pressure when $h = 5$ and $h = 18$.

86. Modeling Data The table lists the approximate values V of a mid-sized sedan for the years 2014 through 2020. The variable t represents the time (in years), with $t = 14$ corresponding to 2014.

t	14	15	16	17
V	\$23,046	\$20,596	\$18,851	\$17,001

t	18	19	20
V	\$15,226	\$14,101	\$12,841

(a) Use the regression capabilities of a graphing utility to fit linear and quadratic models to the data. Plot the data and graph the models.

(b) What does the slope represent in the linear model in part (a)?

(c) Use the regression capabilities of a graphing utility to fit an exponential model to the data.

(d) Determine the horizontal asymptote of the exponential model found in part (c). Interpret its meaning in the context of the problem.

(e) Use the exponential model to find the rates of decrease in the value of the sedan when $t = 16$ and $t = 19$.

Linear and Quadratic Approximation **In Exercises 87 and 88, use a graphing utility to graph the function. Then graph**

$$P_1(x) = f(0) + f'(0)(x - 0) \quad \text{and}$$

$$P_2(x) = f(0) + f'(0)(x - 0) + \tfrac{1}{2}f''(0)(x - 0)^2$$

in the same viewing window. Compare the values of f, P_1, P_2, and their first derivatives at $x = 0$.

87. $f(x) = e^x$ **88.** $f(x) = e^{x/2}$

Stirling's Formula **For large values of n,**

$$n! = 1 \cdot 2 \cdot 3 \cdot 4 \cdot \cdots (n - 1) \cdot n$$

can be approximated by Stirling's Formula,

$$n! \approx \left(\frac{n}{3}\right)^n \sqrt{2\pi n}.$$

In Exercises 89 and 90, find the exact value of $n!$ and then approximate $n!$ using Stirling's Formula.

89. $n = 12$ **90.** $n = 15$

Finding an Indefinite Integral **In Exercises 91–108, find the indefinite integral.**

91. $\int e^{5x}(5)\,dx$ **92.** $\int e^{-x^4}(-4x^3)\,dx$

93. $\int e^{5x-3}\,dx$ **94.** $\int e^{1-3x}\,dx$

95. $\int (2x + 1)e^{x^2+x}\,dx$ **96.** $\int e^x(e^x + 1)^2\,dx$

97. $\int \frac{e^{\sqrt{x}}}{\sqrt{x}}\,dx$ **98.** $\int \frac{e^{1/x^2}}{x^3}\,dx$

99. $\int \frac{e^{-x}}{1 + e^{-x}}\,dx$ **100.** $\int \frac{e^{2x}}{1 + e^{2x}}\,dx$

101. $\int e^x\sqrt{1 - e^x}\,dx$ **102.** $\int \frac{e^x - e^{-x}}{e^x + e^{-x}}\,dx$

103. $\int \frac{e^x + e^{-x}}{e^x - e^{-x}}\,dx$ **104.** $\int \frac{2e^x - 2e^{-x}}{(e^x + e^{-x})^2}\,dx$

105. $\int \frac{5 - e^x}{e^{2x}}\,dx$ **106.** $\int \frac{e^{-3x} + 2e^{2x} + 3}{e^x}\,dx$

107. $\int e^{-x}\tan(e^{-x})\,dx$ **108.** $\int e^{2x}\csc(e^{2x})\,dx$

Evaluating a Definite Integral **In Exercises 109–118, evaluate the definite integral. Use a graphing utility to verify your result.**

109. $\int_0^1 e^{-3x}\,dx$ **110.** $\int_{-1}^1 e^{1+4x}\,dx$

111. $\int_0^1 xe^{-x^2}\,dx$ **112.** $\int_{-2}^0 x^2e^{x^3/2}\,dx$

113. $\int_1^3 \frac{e^{3/x}}{x^2}\,dx$ **114.** $\int_0^{\sqrt{2}} xe^{-x^2/2}\,dx$

115. $\int_0^2 \frac{e^{4x}}{1 + e^{4x}}\,dx$ **116.** $\int_{-2}^0 \frac{e^{x+1}}{7 - e^{x+1}}\,dx$

117. $\int_0^{\pi/2} e^{\sin \pi x}\cos \pi x\,dx$ **118.** $\int_{\pi/3}^{\pi/2} e^{\sec 2x}\sec 2x \tan 2x\,dx$

Differential Equation **In Exercises 119 and 120, find the general solution of the differential equation.**

119. $\frac{dy}{dx} = xe^{9x^2}$

120. $\frac{dy}{dx} = (e^x - e^{-x})^2$

Differential Equation **In Exercises 121 and 122, find the particular solution of the differential equation that satisfies the initial conditions.**

121. $f''(x) = \frac{1}{2}(e^x + e^{-x})$, $f(0) = 1$, $f'(0) = 0$

122. $f''(x) = \sin x + e^{2x}$, $f(0) = \frac{1}{4}$, $f'(0) = \frac{1}{2}$

Area **In Exercises 123–126, find the area of the region bounded by the graphs of the equations. Use a graphing utility to verify your result.**

123. $y = e^x$, $y = 0$, $x = 0$, $x = 6$

124. $y = e^{-2x}$, $y = 0$, $x = -1$, $x = 3$

125. $y = xe^{-x^2/4}$, $y = 0$, $x = 0$, $x = \sqrt{6}$

126. $y = e^{-5x} + 2$, $y = 0$, $x = 0$, $x = 2$

Midpoint Rule **In Exercises 127 and 128, use the Midpoint Rule with $n = 12$ to approximate the value of the definite integral. Use a graphing utility to verify your result.**

127. $\int_0^4 \sqrt{x}\,e^x\,dx$ **128.** $\int_0^2 2xe^{-x}\,dx$

Exploring Concepts

129. Compare the asymptotes of the natural exponential function with those of the natural logarithmic function.

130. Use a graphing utility to graph $f(x) = e^x$ and the given function in the same viewing window. How are the two graphs related?

(a) $g(x) = e^{x-2}$ (b) $h(x) = -\frac{1}{2}e^x$

(c) $q(x) = e^{-x} + 3$ (d) $p(x) = 5e^x$

True or False? **In Exercises 131–134, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

131. If $f(x) = g(x)e^x$, then $f'(x) = g'(x)e^x$.

132. If $f(x) = \ln x$, then $f(e^{n+1}) - f(e^n) = 1$ for any value of n.

133. The graphs of $f(x) = e^x$ and $g(x) = e^{-x}$ meet at right angles.

134. If $f(x) = g(x)e^x$, then the only zeros of f are the zeros of g.

135. Probability A car battery has an average lifetime of 48 months with a standard deviation of 6 months. The battery lives are normally distributed. The probability that a given battery will last between 48 months and 60 months is

$$0.0065 \int_{48}^{60} e^{-0.0139(t-48)^2}\,dt.$$

Use the integration capabilities of a graphing utility to approximate the integral. Interpret the resulting probability.

136. Probability The median waiting time (in minutes) for people waiting for service in a convenience store is given by the solution of the equation

$$\int_0^x 0.3e^{-0.3t}\,dt = \frac{1}{2}.$$

What is the median waiting time?

137. Modeling Data A valve on a storage tank is opened for 4 hours to release a chemical in a manufacturing process. The flow rate R (in liters per hour) at time t (in hours) is given in the table.

t	0	1	2	3	4
R	425	240	118	71	36

(a) Use the regression capabilities of a graphing utility to find a linear model for the points $(t, \ln R)$. Write the resulting equation of the form $\ln R = at + b$ in exponential form.

(b) Use a graphing utility to plot the data and graph the exponential model.

(c) Use a definite integral to approximate the number of liters of chemical released during the 4 hours.

138. Using the Area of a Region Find the value of a such that the area bounded by $y = e^{-x}$, the x-axis, $x = -a$, and $x = a$ is $\frac{8}{3}$.

139. Analyzing a Graph Consider the function

$$f(x) = \frac{2}{1 + e^{1/x}}.$$

(a) Use a graphing utility to graph f.

(b) Write a short paragraph explaining why the graph has a horizontal asymptote at $y = 1$ and why the function has a nonremovable discontinuity at $x = 0$.

140. Horizontal Motion The position function of a particle moving along the x-axis is $x(t) = Ae^{kt} + Be^{-kt}$, where A, B, and k are positive constants.

(a) During what times t is the particle closest to the origin?

(b) Show that the acceleration of the particle is proportional to the position of the particle. What is the constant of proportionality?

141. Deriving an Inequality Given $e^x \geq 1$ for $x \geq 0$, it follows that

$$\int_0^x e^t\,dt \geq \int_0^x 1\,dt.$$

Perform this integration to derive the inequality

$$e^x \geq 1 + x$$

for $x \geq 0$.

142. Solving an Equation Find, to three decimal places, the value of x such that $e^{-x} = x$. (Use Newton's Method or the *zero* or *root* feature of a graphing utility.)

143. Analyzing a Graph Consider

$$f(x) = xe^{-kx}$$

for $k > 0$. Find the relative extrema and the points of inflection of the function.

144. Finding the Maximum Rate of Change Verify that the function

$$y = \frac{L}{1 + ae^{-x/b}}, \quad a > 0, \quad b > 0, \quad L > 0$$

increases at a maximum rate when $y = L/2$.

PUTNAM EXAM CHALLENGE

145. Let S be a class of functions from $[0, \infty)$ to $[0, \infty)$ that satisfies:

(i) The functions $f_1(x) = e^x - 1$ and $f_2(x) = \ln(x + 1)$ are in S;

(ii) If $f(x)$ and $g(x)$ are in S, the functions $f(x) + g(x)$ and $f(g(x))$ are in S;

(iii) If $f(x)$ and $g(x)$ are in S and $f(x) \geq g(x)$ for all $x \geq 0$, then the function $f(x) - g(x)$ is in S.

Prove that if $f(x)$ and $g(x)$ are in S, then the function $f(x)g(x)$ is also in S.

This problem was composed by the Committee on the Putnam Prize Competition.

5.5 Bases Other than *e* and Applications

GO DIGITAL

- Define exponential functions that have bases other than e.
- Differentiate and integrate exponential functions that have bases other than e.
- Use exponential functions to model compound interest and exponential growth.

Bases Other than e

The **base** of the natural exponential function is e. This "natural" base can be used to assign a meaning to a general base a.

Definition of Exponential Function to Base *a*

If a is a positive real number ($a \neq 1$) and x is any real number, then the **exponential function to the base *a*** is denoted by a^x and is defined by

$$a^x = e^{(\ln a)x}.$$

If $a = 1$, then $y = 1^x = 1$ is a constant function.

REMARK Remember, base $a = 1$ is excluded because it yields $f(x) = 1^x = 1$. This is a *constant* function, not an *exponential* function.

Exponential functions obey the usual laws of exponents. For instance, here are some familiar properties.

1. $a^0 = 1$ **2.** $a^x a^y = a^{x+y}$ **3.** $\dfrac{a^x}{a^y} = a^{x-y}$ **4.** $(a^x)^y = a^{xy}$

When modeling the half-life of a radioactive sample, it is convenient to use $\frac{1}{2}$ as the base of the exponential model. (*Half-life* is the number of years required for half of the atoms in a sample of radioactive material to decay.)

Carbon dating uses the radioactive isotope carbon-14 to estimate the age of dead organic materials. The method is based on the decay rate of carbon-14 (see Example 1), a compound organisms take in when they are alive.

Alexander Rieber/EyeEm/Getty Images

EXAMPLE 1 **Radioactive Half-Life Model**

The half-life of carbon-14 is about 5715 years. A sample contains 1 gram of carbon-14. How much will be present in 10,000 years?

Solution Let $t = 0$ represent the present time and let y represent the amount (in grams) of carbon-14 in the sample. Using a base of $\frac{1}{2}$, you can model y by the equation

$$y = \left(\frac{1}{2}\right)^{t/5715}.$$

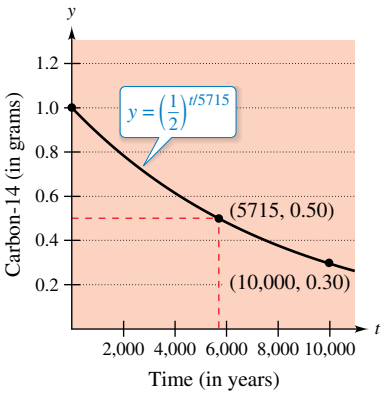
Notice that when $t = 5715$, the amount is reduced to half of the original amount.

$$y = \left(\frac{1}{2}\right)^{5715/5715} = \frac{1}{2} \text{ gram}$$

When $t = 11{,}430$, the amount is reduced to a quarter of the original amount and so on. To find the amount of carbon-14 after 10,000 years, substitute 10,000 for t.

$$y = \left(\frac{1}{2}\right)^{10{,}000/5715} \approx 0.30 \text{ gram}$$

The graph of y is shown at the right.



The half-life of carbon-14 is about 5715 years.

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Logarithmic functions to bases other than e can be defined in much the same way as exponential functions to other bases are defined.

Definition of Logarithmic Function to Base *a*

If a is a positive real number ($a \neq 1$) and x is any positive real number, then the **logarithmic function to the base *a*** is denoted by $\log_a x$ and is defined as

$$\log_a x = \frac{1}{\ln a} \ln x.$$

REMARK In precalculus, you learned that $\log_a x$ is the value to which a must be raised to produce x. This agrees with the definition at the right because

$$\begin{aligned} a^{\log_a x} &= a^{(1/\ln a)\ln x} \\ &= (e^{\ln a})^{(1/\ln a)\ln x} \\ &= e^{(\ln a/\ln a)\ln x} \\ &= e^{\ln x} \\ &= x. \end{aligned}$$

Logarithmic functions to the base a have properties similar to those of the natural logarithmic function given in Theorem 5.2. (Assume x and y are positive numbers and n is rational.)

1. $\log_a 1 = 0$ Log of 1
2. $\log_a xy = \log_a x + \log_a y$ Log of a product
3. $\log_a x^n = n \log_a x$ Log of a power
4. $\log_a \frac{x}{y} = \log_a x - \log_a y$ Log of a quotient

GO DIGITAL

From the definitions of the exponential and logarithmic functions to the base a, it follows that $f(x) = a^x$ and $g(x) = \log_a x$ are inverse functions of each other.

Properties of Inverse Functions

1. $y = a^x$ if and only if $x = \log_a y$
2. $a^{\log_a x} = x$, for $x > 0$
3. $\log_a a^x = x$, for all x

The logarithmic function to the base 10 is called the **common logarithmic function.** So, for common logarithms,

$$y = 10^x \quad \text{if and only if} \quad x = \log_{10} y.$$ Property of inverse functions

EXAMPLE 2 Bases Other than *e*

Solve for x in each equation.

a. $3^x = \frac{1}{81}$ **b.** $\log_2 x = -4$

Solution

a. To solve this equation, you can apply the logarithmic function to the base 3 to each side of the equation.

$$\begin{aligned} 3^x &= \frac{1}{81} \\ \log_3 3^x &= \log_3 \frac{1}{81} \\ x &= \log_3 3^{-4} \\ x &= -4 \end{aligned}$$

b. To solve this equation, you can apply the exponential function to the base 2 to each side of the equation.

$$\begin{aligned} \log_2 x &= -4 \\ 2^{\log_2 x} &= 2^{-4} \\ x &= \frac{1}{2^4} \\ x &= \frac{1}{16} \end{aligned}$$

REMARK In Example 2, the strategy used to solve for x is to operate on each side of the equation with the *inverse* function. For instance, in part (a), the equation has an exponential function with base 3. So, to solve for x, apply the logarithmic function to the base 3 to each side of the equation.

GO DIGITAL

Differentiation and Integration

To differentiate exponential and logarithmic functions to other bases, you have three options: (1) use the definitions of a^x and $\log_a x$ and differentiate using the rules for the natural exponential and logarithmic functions, (2) use logarithmic differentiation, or (3) use the differentiation rules for bases other than e given in the next theorem.

THEOREM 5.13 Derivatives for Bases Other than *e*

Let a be a positive real number $(a \neq 1)$, and let u be a differentiable function of x.

1. $\dfrac{d}{dx}[a^x] = (\ln a)a^x$
2. $\dfrac{d}{dx}[a^u] = (\ln a)a^u \dfrac{du}{dx}$
3. $\dfrac{d}{dx}[\log_a x] = \dfrac{1}{(\ln a)x}$
4. $\dfrac{d}{dx}[\log_a u] = \dfrac{1}{(\ln a)u}\dfrac{du}{dx}$

REMARK These differentiation rules are similar to those for the natural exponential function and the natural logarithmic function. In fact, they differ only by the constant factors $\ln a$ and $1/\ln a$. This points out one reason why, for calculus, e is the most convenient base.

Proof By definition, $a^x = e^{(\ln a)x}$. So, you can prove the first rule by letting $u = (\ln a)x$ and differentiating with base e to obtain

$$\frac{d}{dx}[a^x] = \frac{d}{dx}[e^{(\ln a)x}] = e^u\frac{du}{dx} = e^{(\ln a)x}(\ln a) = (\ln a)a^x.$$

To prove the third rule, you can write

$$\frac{d}{dx}[\log_a x] = \frac{d}{dx}\left[\frac{1}{\ln a}\ln x\right] = \frac{1}{\ln a}\left(\frac{1}{x}\right) = \frac{1}{(\ln a)x}.$$

The second and fourth rules are simply the Chain Rule versions of the first and third rules. ■

EXAMPLE 3 Differentiating Functions to Other Bases

Find the derivative of each function.

a. $y = 2^x$ **b.** $y = 2^{3x}$ **c.** $y = \log_{10}\cos x$ **d.** $y = \log_3 \dfrac{\sqrt{x}}{2x+5}$

Solution

a. $y' = \dfrac{d}{dx}[2^x] = (\ln 2)2^x$

b. $y' = \dfrac{d}{dx}[2^{3x}] = (\ln 2)2^{3x}(3) = (3\ln 2)2^{3x}$

REMARK Write 2^{3x} as 8^x and differentiate. Is the result the same as the one in Example 3(b)?

c. $y' = \dfrac{d}{dx}[\log_{10}\cos x] = \dfrac{-\sin x}{(\ln 10)\cos x} = -\dfrac{1}{\ln 10}\tan x$

d. Before differentiating, rewrite the function using logarithmic properties.

$$y = \log_3 \frac{\sqrt{x}}{2x+5} = \frac{1}{2}\log_3 x - \log_3(2x+5)$$

Next, apply Theorem 5.13 to differentiate the function.

$$y' = \frac{d}{dx}\left[\frac{1}{2}\log_3 x - \log_3(2x+5)\right]$$ Differentiate with respect to x.

$$= \frac{1}{2(\ln 3)x} - \frac{1}{(\ln 3)(2x+5)}(2)$$ Theorem 5.13, Properties 3 and 4

$$= \frac{5-2x}{2(\ln 3)x(2x+5)}$$ Simplify. ■

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Occasionally, an integrand involves an exponential function to a base other than e. When this occurs, there are two options: (1) convert to base e using the formula $a^x = e^{(\ln a)x}$ and then integrate, or (2) integrate directly, using the integration formula

$$\int a^x\,dx = \left(\frac{1}{\ln a}\right)a^x + C$$

which follows from Theorem 5.13.

EXAMPLE 4 Integrating an Exponential Function to Another Base

Find $\int 2^x\,dx$.

Solution

$$\int 2^x\,dx = \frac{1}{\ln 2}2^x + C$$

When the Power Rule, $D_x[x^n] = nx^{n-1}$, was introduced in Chapter 2, the exponent n was required to be a rational number. Now the rule is extended to cover any real value of n. Try to prove this theorem using logarithmic differentiation.

THEOREM 5.14 The Power Rule for Real Exponents

Let n be any real number, and let u be a differentiable function of x.

1. $\dfrac{d}{dx}[x^n] = nx^{n-1}$ **2.** $\dfrac{d}{dx}[u^n] = nu^{n-1}\dfrac{du}{dx}$

The next example compares the derivatives of four types of functions. Each function uses a different differentiation formula, depending on whether the base and the exponent are constants or variables.

EXAMPLE 5 Comparing Variables and Constants

a. $\dfrac{d}{dx}[e^e] = 0$ Constant Rule

b. $\dfrac{d}{dx}[e^x] = e^x$ Exponential Rule

c. $\dfrac{d}{dx}[x^e] = ex^{e-1}$ Power Rule

d.

$y = x^x$	Use logarithmic differentiation.
$\ln y = \ln x^x$	Take natural log of each side.
$\ln y = x \ln x$	Property of logarithms
$\dfrac{y'}{y} = x\left(\dfrac{1}{x}\right) + (\ln x)(1)$	Differentiate.
$\dfrac{y'}{y} = 1 + \ln x$	Simplify.
$y' = y(1 + \ln x)$	Solve for y'.
$y' = x^x(1 + \ln x)$	Substitute for y.

REMARK Be sure you understand that there is no simple differentiation rule for calculating the derivative of $y = x^x$. In general, when $y = u(x)^{v(x)}$, you need to use logarithmic differentiation.

Applications of Exponential Functions

An amount of P dollars is deposited in an account at an annual interest rate r (in decimal form). What is the balance in the account at the end of 1 year? The answer depends on the number of times n the interest is compounded according to the formula

$$A = P\left(1 + \frac{r}{n}\right)^n.$$

For instance, the result for a deposit of \$1000 at 8% interest compounded n times a year is shown in the table at the right.

n	A
1	\$1080.00
2	\$1081.60
4	\$1082.43
12	\$1083.00
365	\$1083.28

As n increases, the balance A approaches a limit. To develop this limit, use the next theorem. To test the reasonableness of this theorem, try evaluating

$$\left(\frac{x + 1}{x}\right)^x$$

for several values of x, as shown in the table at the left.

x	$\left(\frac{x+1}{x}\right)^x$
10	2.59374
100	2.70481
1000	2.71692
10,000	2.71815
100,000	2.71827
1,000,000	2.71828

THEOREM 5.15 A Limit Involving e

$$\lim_{x\to\infty}\left(1 + \frac{1}{x}\right)^x = \lim_{x\to\infty}\left(\frac{x + 1}{x}\right)^x = e$$

A proof of this theorem is given in Appendix A.

Given Theorem 5.15, take another look at the formula for the balance A in an account in which the interest is compounded n times per year. By taking the limit as n approaches infinity, you obtain

$$\begin{aligned} A &= \lim_{n\to\infty} P\left(1 + \frac{r}{n}\right)^n && \text{Take limit as } n\to\infty. \\ &= P\lim_{n\to\infty}\left[\left(1 + \frac{1}{n/r}\right)^{n/r}\right]^r && \text{Rewrite.} \\ &= P\left[\lim_{x\to\infty}\left(1 + \frac{1}{x}\right)^x\right]^r && \text{Let } x = n/r. \text{ Then } x\to\infty \text{ as } n\to\infty. \\ &= Pe^r. && \text{Apply Theorem 5.15.} \end{aligned}$$

This limit produces the balance after 1 year of **continuous compounding.** So, for a deposit of \$1000 at 8% interest compounded continuously, the balance at the end of 1 year would be

$$A = 1000e^{0.08} \approx \$1083.29.$$

REMARK The interest rate r in the formulas for compound interest should be written in decimal form. For instance, an interest rate of 2.5% is written as $r = 0.025$.

Summary of Compound Interest Formulas

In the formulas below, P is the amount deposited, t is the number of years, A is the balance after t years, r is the annual interest rate (in decimal form), and n is the number of compoundings per year.

1. Compounded n times per year: $A = P\left(1 + \frac{r}{n}\right)^{nt}$
2. Compounded continuously: $A = Pe^{rt}$

EXAMPLE 6 Continuous, Quarterly, and Monthly Compounding

See LarsonCalculus.com for an interactive version of this type of example.

A deposit of \$2500 is made in an account that pays an annual interest rate of 5%. Find the balance in the account at the end of 5 years when the interest is compounded (a) quarterly, (b) monthly, and (c) continuously.

Solution

a. $A = P\left(1 + \frac{r}{n}\right)^{nt}$ Compounded quarterly

$= 2500\left(1 + \frac{0.05}{4}\right)^{4(5)}$

$= 2500(1.0125)^{20}$

$= \$3205.09$

b. $A = P\left(1 + \frac{r}{n}\right)^{nt}$ Compounded monthly

$= 2500\left(1 + \frac{0.05}{12}\right)^{12(5)}$

$\approx 2500(1.0041667)^{60}$

$= \$3208.40$

c. $A = Pe^{rt}$ Compounded continuously

$= 2500\left[e^{0.05(5)}\right]$

$= 2500e^{0.25}$

$= \$3210.06$

EXAMPLE 7 Bacterial Culture Growth

A bacterial culture is growing according to the *logistic growth function*

$$y = \frac{1.25}{1 + 0.25e^{-0.4t}}, \quad t \geq 0$$

where y is the weight of the culture in grams and t is the time in hours. Find the weight of the culture after (a) 0 hours, (b) 1 hour, and (c) 10 hours. (d) What is the limit as t approaches infinity?

Solution

a. When $t = 0$, $y = \frac{1.25}{1 + 0.25e^{-0.4(0)}}$

$= 1$ gram.

b. When $t = 1$, $y = \frac{1.25}{1 + 0.25e^{-0.4(1)}}$

≈ 1.071 grams.

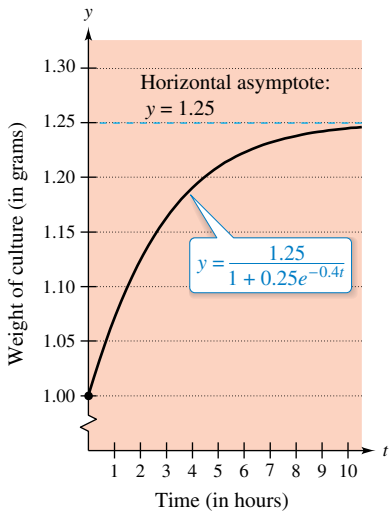
c. When $t = 10$, $y = \frac{1.25}{1 + 0.25e^{-0.4(10)}}$

≈ 1.244 grams.

d. Taking the limit as t approaches infinity, you obtain

$$\lim_{t\to\infty} \frac{1.25}{1 + 0.25e^{-0.4t}} = \frac{1.25}{1 + 0} = 1.25 \text{ grams.}$$

The graph of the function is shown in Figure 5.22. In the figure, notice that the line $y = 1.25$ is a horizontal asymptote to the right.



The limit of the weight of the culture as $t \to \infty$ is 1.25 grams.

Figure 5.22

5.5 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Find the values of a and b.

$$\frac{d}{dx}[6^{4x}] = a(\ln b)6^{4x}.$$

2. Explain two different ways to find the indefinite integral below.

$$\int 5^t\,dt$$

3. Explain when it is necessary to use logarithmic differentiation to find the derivative of an exponential function.

4. Explain how to choose which compound interest formula to use to find the balance of a deposit.

Evaluating a Logarithmic Expression **In Exercises 5–10, evaluate the expression without using a calculator.**

5. $\log_2 \frac{1}{8}$
6. $\log_3 81$
7. $\log_7 1$
8. $\log_a \frac{1}{a}$
9. $\log_{64} 32$
10. $\log_{27} \frac{1}{9}$

Exponential and Logarithmic Forms of Equations **In Exercises 11–14, write the exponential equation as a logarithmic equation or vice versa.**

11. (a) $2^3 = 8$
    (b) $3^{-1} = \frac{1}{3}$
12. (a) $27^{2/3} = 9$
    (b) $16^{3/4} = 8$
13. (a) $\log_{10} 0.01 = -2$
    (b) $\log_{0.5} 8 = -3$
14. (a) $\log_3 \frac{1}{9} = -2$
    (b) $49^{1/2} = 7$

Sketching a Graph **In Exercises 15–20, sketch the graph of the function.**

15. $y = 2^x$
16. $y = 4^{x-1}$
17. $y = \left(\frac{1}{3}\right)^x$
18. $y = 2^{x^2}$
19. $h(x) = 5^{x-2}$
20. $y = 3^{-|x|}$

Solving an Equation **In Exercises 21–26, solve for x.**

21. (a) $\log_{10} 1000 = x$
    (b) $\log_{10} 0.1 = x$
22. (a) $\log_3 \frac{1}{81} = x$
    (b) $\log_6 36 = x$
23. (a) $\log_3 x = -1$
    (b) $\log_2 x = -4$
24. (a) $\log_4 x = -2$
    (b) $\log_5 x = 3$
25. (a) $x^2 - x = \log_5 25$
    (b) $3x + 5 = \log_2 64$
26. (a) $\log_3 x + \log_3(x - 2) = 1$
    (b) $\log_{10}(x + 3) - \log_{10} x = 1$

Solving an Equation **In Exercises 27–36, solve the equation accurate to three decimal places.**

27. $3^{2x} = 75$
28. $6^{-2x} = 74$
29. $2^{3-z} = 625$
30. $3(5^{x-1}) = 86$
31. $\left(1 + \frac{0.09}{12}\right)^{12t} = 3$
32. $\left(1 + \frac{0.10}{365}\right)^{365t} = 2$
33. $\log_2(x - 1) = 5$
34. $\log_{10}(t - 3) = 2.6$
35. $\log_7 x^3 = 1.9$
36. $\log_5 \sqrt{x - 4} = 3.2$

Inverse Functions **In Exercises 37 and 38, illustrate that the functions are inverse functions of each other by sketching their graphs on the same set of coordinate axes.**

37. $f(x) = 4^x$, $g(x) = \log_4 x$
38. $f(x) = 3^x$, $g(x) = \log_3 x$

Finding a Derivative **In Exercises 39–60, find the derivative of the function.**

39. $f(x) = 4^x$
40. $f(x) = 3^{4x}$
41. $y = 5^{-4x}$
42. $y = 6^{3x-4}$
43. $f(x) = x\,9^x$
44. $y = -7x(8^{-2x})$
45. $f(t) = \frac{-2t^2}{8^t}$
46. $f(t) = \frac{3^{2t}}{t}$
47. $h(\theta) = 2^{-\theta}\cos \pi\theta$
48. $g(\alpha) = 5^{-\alpha/2}\sin 2\alpha$
49. $y = \log_4(6x + 1)$
50. $y = \log_3(x^2 - 3x)$
51. $h(t) = \log_5(4 - t)^2$
52. $g(t) = \log_2(t^2 + 7)^3$
53. $y = \log_5 \sqrt{x^2 - 1}$
54. $f(x) = \log_2 \sqrt[3]{2x + 1}$
55. $f(x) = \log_2 \frac{x^2}{x - 1}$
56. $y = \log_{10} \frac{x^2 - 1}{x}$
57. $h(x) = \log_3 \frac{x\sqrt{x - 1}}{2}$
58. $g(x) = \log_5 \frac{4}{x^2\sqrt{1 - x}}$
59. $g(t) = \frac{10 \log_4 t}{t}$
60. $f(t) = t^{3/2}\log_2 \sqrt{t + 1}$

Finding an Equation of a Tangent Line **In Exercises 61–64, find an equation of the tangent line to the graph of the function at the given point.**

61. $y = 2^{-x}$, $(-1, 2)$
62. $y = 5^{x-2}$, $(2, 1)$
63. $y = \log_3 x$, $(27, 3)$
64. $y = \log_{10} 2x$, $(5, 1)$

Logarithmic Differentiation **In Exercises 65–68, use logarithmic differentiation to find dy/dx.**

65. $y = x^{2/x}$
66. $y = x^{x-1}$
67. $y = (x - 2)^{x+1}$
68. $y = (1 + x)^{1/x}$

Finding an Indefinite Integral **In Exercises 69–76, find the indefinite integral.**

69. $\int 3^x\,dx$

70. $\int 2^{-x}\,dx$

71. $\int (x^2 + 2^{-x})\,dx$

72. $\int (x^4 + 5^x)\,dx$

73. $\int x(5^{-x^2})\,dx$

74. $\int (4 - x)6^{(4-x)^2}\,dx$

75. $\int \frac{3^{2x}}{1 + 3^{2x}}\,dx$

76. $\int 2^{\sin x}\cos x\,dx$

Evaluating a Definite Integral **In Exercises 77–80, evaluate the definite integral. Use a graphing utility to verify your result.**

77. $\int_{-1}^{2} 2^x\,dx$

78. $\int_{-4}^{4} 3^{x/4}\,dx$

79. $\int_{0}^{1} (5^x - 3^x)\,dx$

80. $\int_{1}^{3} (4^{x+1} + 2^x)\,dx$

Area **In Exercises 81 and 82, find the area of the region bounded by the graphs of the equations. Use a graphing utility to verify your result.**

81. $y = \dfrac{\log_4 x}{x}$, $y = 0$, $x = 1$, $x = 5$

82. $y = 3^{\cos x}\sin x$, $y = 0$, $x = 0$, $x = \pi$

Exploring Concepts

83. Explain how the rate of change of the exponential function $y = a^x$ is affected as a becomes larger.

84. Explain how the rate of change of the logarithmic function $y = \log_a x$ is affected as a becomes larger.

85. Analyzing a Logarithmic Equation Consider the function $f(x) = \log_{10} x$.

(a) What is the domain of f?

(b) Find f^{-1}.

(c) Let x be a real number between 1000 and 10,000. Determine the interval in which $f(x)$ will be found.

(d) Determine the interval in which x will be found if $f(x)$ is negative.

(e) When $f(x)$ is increased by one unit, x must have been increased by what factor?

(f) Find the ratio of x_1 to x_2 given that $f(x_1) = 3n$ and $f(x_2) = n$.

86. Comparing Rates of Growth Order the functions

$f(x) = \log_2 x$, $g(x) = x^x$, $h(x) = x^2$, and $k(x) = 2^x$

from the one with the greatest rate of growth to the one with the least rate of growth for large values of x.

87. Analyzing a Graph Use a graphing utility to determine whether (a) $y = (1/2)^x$ and $y = x$ intersect and (b) $y = 2^x$ and $y = x$ intersect.

88. Analyzing a Graph Use the results of Exercise 87 to find all positive values of a such that $y = a^x$ and $y = x$ intersect.

89. Inflation When the annual rate of inflation averages 5% over the next 10 years, the approximate cost C of goods or services during any year in that decade is

$$C(t) = P(1.05)^t$$

where t is the time in years and P is the present cost.

(a) The price of an oil change for your car is presently \$24.95. Estimate the price 10 years from now.

(b) Find the rates of change of C with respect to t when $t = 1$ and $t = 8$.

(c) Verify that the rate of change of C is proportional to C. What is the constant of proportionality?

90. Depreciation After t years, the value of a car purchased for \$25,000 is

$$V(t) = 25{,}000\left(\tfrac{3}{4}\right)^t.$$

(a) Use a graphing utility to graph the function and determine the value of the car 2 years after it was purchased.

(b) Find the rates of change of V with respect to t when $t = 1$ and $t = 4$.

(c) Use a graphing utility to graph $V'(t)$ and determine the horizontal asymptote of $V'(t)$. Interpret its meaning in the context of the problem.

Compound Interest **In Exercises 91–94, complete the table by determining the balance A for P dollars invested at rate r for t years and compounded n times per year.**

n	1	2	4	12	365	Continuous Compounding
A						

91. $P = \$1000$, $r = 3\frac{1}{2}\%$, $t = 10$ years

92. $P = \$2500$, $r = 6\%$, $t = 20$ years

93. $P = \$7500$, $r = 4.8\%$, $t = 30$ years

94. $P = \$4000$, $r = 4\%$, $t = 15$ years

Compound Interest **In Exercises 95–98, complete the table by determining the amount of money P (present value) that should be invested at rate r to produce a balance of \$100,000 in t years.**

t	1	10	20	30	40	50
P						

95. $r = 4\%$, Compounded continuously

96. $r = 0.6\%$, Compounded continuously

97. $r = 5\%$, Compounded monthly

98. $r = 2\%$, Compounded daily

99. Compound Interest Assume that you can earn 6% on an investment, compounded daily. Which of the following options would yield the greatest balance after 8 years?

(a) \$20,000 now (b) \$30,000 after 8 years

(c) \$8000 now and \$20,000 after 4 years

(d) \$9000 now, \$9000 after 4 years, and \$9000 after 8 years

100. Compound Interest Consider a deposit of \$100 placed in an account for 20 years at $r\%$ compounded continuously. Use a graphing utility to graph the exponential functions describing the growth of the investment over the 20 years for the following interest rates. Compare the ending balances.

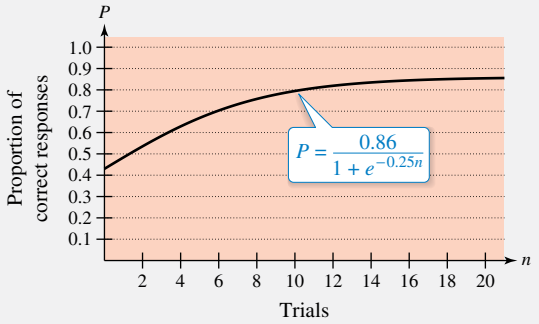
(a) $r = 3\%$ (b) $r = 5\%$ (c) $r = 6\%$

101. Timber Yield The yield V (in millions of cubic feet per acre) for a stand of timber at age t is $V = 0.75e^{-48.1/0.5t}$, where t is measured in years.

(a) Find the limiting volume of wood per acre as t approaches infinity.

(b) Find the rates at which the yield is changing when $t = 20$ and $t = 60$.

102. HOW DO YOU SEE IT? The graph shows the proportion P of correct responses after n trials in a group project in learning theory.



(a) What is the limiting proportion of correct responses as n approaches infinity?

(b) What happens to the rate of change of the proportion in the long run?

103. Population Growth A lake is stocked with 500 fish, and the population p is growing according to the logistic curve

$$p(t) = \frac{10{,}000}{1 + 19e^{-t/5}}$$

where t is measured in months.

(a) Use a graphing utility to graph the function.

(b) Find the fish populations after 6 months, 12 months, 24 months, 36 months, and 48 months. What is the limiting size of the fish population?

(c) Find the rates at which the fish population is changing after 1 month and after 10 months.

(d) After how many months is the population increasing most rapidly?

104. Modeling Data

The breaking strengths B (in tons) of steel cables of various diameters d (in inches) are shown in the table.

d	0.50	0.75	1.00	1.25	1.50	1.75
B	9.85	21.8	38.3	59.2	84.4	114.0

(a) Use the regression capabilities of a graphing utility to fit an exponential model to the data.

(b) Use a graphing utility to plot the data and graph the model.

(c) Find the rates of growth of the model when $d = 0.8$ and $d = 1.5$.

105. Comparing Models The cumulative numbers of deaths from the Ebola virus during an outbreak in West Africa in 2014 are shown in the table, where x is the number of months after the beginning of the outbreak. *(Source: Centers for Disease Control and Prevention)*

x	1	2	3	4	5
y	147	183	338	660	1422

x	6	7	8	9	10
y	2909	4912	5674	7573	8626

(a) Use the regression capabilities of a graphing utility to find the following models for the data.

$y_1 = ax + b$ $y_2 = a + b \ln x$

$y_3 = ab^x$ $y_4 = ax^b$

(b) Use a graphing utility to plot the data and graph each of the models. Which model do you think best fits the data?

(c) Find the rate of change of each of the models in part (a) 5 months after the beginning of the outbreak. Which model is increasing at the greatest rate at this time?

106. An Approximation of e Complete the table to demonstrate that e can also be defined as

$$\lim_{x \to 0^+} (1 + x)^{1/x}.$$

x	1	10^{-1}	10^{-2}	10^{-4}	10^{-6}
$(1 + x)^{1/x}$					

Using Properties of Exponents **In Exercises 107–110, find the exact value of the expression.**

107. $5^{1/\ln 5}$ **108.** $6^{(\ln 10)/\ln 6}$

109. $9^{1/\ln 3}$ **110.** $32^{1/\ln 2}$

Modeling Data **In Exercises 111 and 112, find an exponential function that fits the experimental data collected over time t.**

111.

t	0	1	2	3	4
y	1200.00	720.00	432.00	259.20	155.52

112.

t	0	1	2	3	4
y	600.00	630.00	661.50	694.58	729.30

113. Comparing Functions

(a) Show that $(2^3)^2 \neq 2^{(3^2)}$.

(b) Are $f(x) = (x^x)^x$ and $g(x) = x^{(x^x)}$ the same function? Why or why not?

(c) Find $f'(x)$ and $g'(x)$.

114. Finding an Inverse Function Let

$$f(x) = \frac{a^x - 1}{a^x + 1}$$

for $a > 0$, $a \neq 1$. Show that f has an inverse function. Then find f^{-1}.

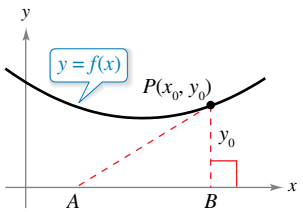
115. Logistic Differential Equation Show that solving the logistic differential equation

$$\frac{dy}{dt} = \frac{8}{25}y\left(\frac{5}{4} - y\right), \quad y(0) = 1$$

results in the logistic growth function in Example 7.

$$\left[\textit{Hint: } \frac{1}{y\left(\frac{5}{4} - y\right)} = \frac{4}{5}\left(\frac{1}{y} + \frac{1}{\frac{5}{4} - y}\right)\right]$$

116. The Subtangent Let $P = (x_0, y_0)$ be a point on the graph of $y = f(x)$. Assume that the tangent line at P intersects the x-axis at A (see figure). If $B = (x_0, 0)$, then the line segment AB is the *subtangent* at P.



Let $y = x^x$, $x > 0$.

(a) Find $f'(x)$ and the length of the subtangent at $P = (x, y)$.

(b) Find the length of the subtangent when $x = e$.

(c) Explain why the subtangent is not defined at $x = 1/e$.

117. Tangent Lines

(a) Determine y' given $y^x = x^y$.

(b) Find the slope of the tangent line to the graph of $y^x = x^y$ at each of the following points.

(i) (c, c) (ii) $(2, 4)$ (iii) $(4, 2)$

(c) At what points on the graph of $y^x = x^y$ does the tangent line not exist?

118. Using Properties of Exponents Given the exponential function $f(x) = a^x$, show that

(a) $f(u + v) = f(u) \cdot f(v)$.

(b) $f(2x) = [f(x)]^2$.

PUTNAM EXAM CHALLENGE

119. Which is greater

$$\left(\sqrt{n}\right)^{\sqrt{n+1}} \quad \text{or} \quad \left(\sqrt{n+1}\right)^{\sqrt{n}}$$

where $n > 8$?

120. Show that if x is positive, then

$$\log_e\left(1 + \frac{1}{x}\right) > \frac{1}{1 + x}.$$

These problems were composed by the Committee on the Putnam Prize Competition. © The Mathematical Association of America. All rights reserved.

SECTION PROJECT

Using a Graphing Utility to Estimate Slope

Let $f(x) = \begin{cases} |x|^x, & x \neq 0 \\ 1, & x = 0. \end{cases}$

(a) Use a graphing utility to graph f in the viewing window $-3 \leq x \leq 3$, $-2 \leq y \leq 2$. What is the domain of f?

(b) Use the *zoom* and *trace* features of a graphing utility to estimate $\lim_{x \to 0} f(x)$.

(c) Write a short paragraph explaining why the function f is continuous for all real numbers.

(d) Visually estimate the slope of f at the point $(0, 1)$.

(e) Explain why the derivative of a function can be approximated by the formula

$$\frac{f(x + \Delta x) - f(x - \Delta x)}{2\Delta x}$$

for small values of Δx. Use this formula to approximate the slope of f at the point $(0, 1)$.

$$f'(0) \approx \frac{f(0 + \Delta x) - f(0 - \Delta x)}{2\Delta x}$$

$$= \frac{f(\Delta x) - f(-\Delta x)}{2\Delta x}$$

What do you think the slope of the graph of f is at $(0, 1)$?

(f) Find a formula for the derivative of f and determine $f'(0)$. Write a short paragraph explaining how a graphing utility might lead you to approximate the slope of a graph incorrectly.

(g) Use your formula for the derivative of f to find the relative extrema of f. Verify your answer using a graphing utility.

FOR FURTHER INFORMATION For more information on using a graphing utility to estimate slope, see the article "Computer-Aided Delusions" by Richard L. Hall in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

5.6 Indeterminate Forms and L'Hôpital's Rule

GO DIGITAL

- **Recognize limits that produce indeterminate forms.**
- **Apply L'Hôpital's Rule to evaluate a limit.**

Indeterminate Forms

Recall from Chapters 1 and 3 that the forms $0/0$ and ∞/∞ are called *indeterminate* because they do not guarantee that a limit exists, nor do they indicate what the limit is, if one does exist. When you encountered one of these indeterminate forms earlier in the text, you attempted to rewrite the expression by using various algebraic techniques.

Indeterminate Form	Limit	Algebraic Technique
$\frac{0}{0}$	$\lim_{x\to -1}\frac{2x^2-2}{x+1}=\lim_{x\to -1}2(x-1)=-4$	Divide numerator and denominator by $(x+1)$.
$\frac{\infty}{\infty}$	$\lim_{x\to \infty}\frac{3x^2-1}{2x^2+1}=\lim_{x\to \infty}\frac{3-(1/x^2)}{2+(1/x^2)}=\frac{3}{2}$	Divide numerator and denominator by x^2.

Occasionally, you can extend these algebraic techniques to find limits of transcendental functions. For instance, the limit

$$\lim_{x\to 0}\frac{e^{2x}-1}{e^x-1}$$

produces the indeterminate form $0/0$. Factoring and then dividing produces

$$\lim_{x\to 0}\frac{e^{2x}-1}{e^x-1}=\lim_{x\to 0}\frac{(e^x+1)(e^x-1)}{e^x-1}$$ Factor.

$$=\lim_{x\to 0}(e^x+1)$$ Divide out common factor.

$$=2.$$ Use direct substitution.

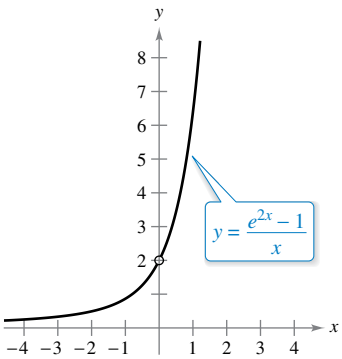
Not all indeterminate forms, however, can be evaluated by algebraic manipulation. This is often true when *both* algebraic and transcendental functions are involved. For instance, the limit

$$\lim_{x\to 0}\frac{e^{2x}-1}{x}$$

produces the indeterminate form $0/0$. Rewriting the expression to obtain

$$\lim_{x\to 0}\left(\frac{e^{2x}}{x}-\frac{1}{x}\right)$$ Rewrite as two fractions.

merely produces another indeterminate form, $\infty-\infty$. Of course, you could use technology to estimate the limit, as shown in the table and in Figure 5.23. From the table and the graph, the limit appears to be 2. (This limit will be verified in Example 1.)



The limit as x approaches 0 appears to be 2.

Figure 5.23

x	-1	-0.1	-0.01	-0.001	0	0.001	0.01	0.1	1
$\frac{e^{2x}-1}{x}$	0.865	1.813	1.980	1.998	?	2.002	2.020	2.214	6.389

GUILLAUME L'HÔPITAL (1661–1704)

L'Hôpital's Rule is named after the French mathematician Guillaume François Antoine de L'Hôpital. L'Hôpital is credited with writing the first text on differential calculus (in 1696) in which the rule publicly appeared. It was recently discovered that the rule and its proof were written in a letter from John Bernoulli to L'Hôpital. "… I acknowledge that I owe very much to the bright minds of the Bernoulli brothers. … I have made free use of their discoveries …," said L'Hôpital.

See LarsonCalculus.com to read more of this biography.

L'Hôpital's Rule

To find the limit illustrated in Figure 5.23, you can use a theorem called **L'Hôpital's Rule.** This theorem states that under certain conditions, the limit of the quotient $f(x)/g(x)$ is determined by the limit of the quotient of the derivatives

$$\frac{f'(x)}{g'(x)}.$$ Differentiate numerator and denominator.

To prove this theorem, you can use a more general result called the **Extended Mean Value Theorem.**

THEOREM 5.16 The Extended Mean Value Theorem

If f and g are differentiable on an open interval (a, b) and continuous on $[a, b]$ such that $g'(x) \neq 0$ for any x in (a, b), then there exists a point c in (a, b) such that

$$\frac{f'(c)}{g'(c)} = \frac{f(b) - f(a)}{g(b) - g(a)}.$$

A proof of this theorem is given in Appendix A.

To see why Theorem 5.16 is called the Extended Mean Value Theorem, consider the special case in which $g(x) = x$. For this case, you obtain the "standard" Mean Value Theorem as presented in Section 3.2.

THEOREM 5.17 L'Hôpital's Rule

Let f and g be functions that are differentiable on an open interval (a, b) containing c, except possibly at c itself. Assume that $g'(x) \neq 0$ for all x in (a, b), except possibly at c itself. If the limit of $f(x)/g(x)$ as x approaches c produces the indeterminate form $0/0$, then

$$\lim_{x \to c} \frac{f(x)}{g(x)} = \lim_{x \to c} \frac{f'(x)}{g'(x)}$$

provided the limit on the right exists (or is infinite). This result also applies when the limit of $f(x)/g(x)$ as x approaches c produces any one of the indeterminate forms ∞/∞, $(-\infty)/\infty$, $\infty/(-\infty)$, or $(-\infty)/(-\infty)$.
A proof of this theorem is given in Appendix A.

People occasionally use L'Hôpital's Rule incorrectly by applying the Quotient Rule to $f(x)/g(x)$. Be sure you understand that the rule involves

$$\frac{f'(x)}{g'(x)}$$ Derivative of f divided by derivative of g

not the derivative of $f(x)/g(x)$.

L'Hôpital's Rule can also be applied to one-sided limits. For instance, if the limit of $f(x)/g(x)$ as x approaches c *from the right* produces the indeterminate form $0/0$, then

$$\lim_{x \to c^+} \frac{f(x)}{g(x)} = \lim_{x \to c^+} \frac{f'(x)}{g'(x)}$$

provided the limit exists (or is infinite).

FOR FURTHER INFORMATION

To enhance your understanding of the necessity of the restriction that $g'(x)$ be nonzero for all x in (a, b), except possibly at c, see the article "Counterexamples to L'Hôpital's Rule" by R. P. Boas in *The American Mathematical Monthly.* To view this article, go to *MathArticles.com.*

Exploration

Numerical and Graphical Approaches Use a numerical or a graphical approach to approximate each limit.

a. $\lim_{x\to 0}\dfrac{2^{2x}-1}{x}$

b. $\lim_{x\to 0}\dfrac{3^{2x}-1}{x}$

c. $\lim_{x\to 0}\dfrac{4^{2x}-1}{x}$

d. $\lim_{x\to 0}\dfrac{5^{2x}-1}{x}$

What pattern do you observe? Does an analytic approach have an advantage for determining these limits? If so, explain your reasoning.

EXAMPLE 1 Indeterminate Form 0/0

Evaluate $\lim_{x\to 0}\dfrac{e^{2x}-1}{x}$.

Solution Because direct substitution results in the indeterminate form $0/0$

$$\lim_{x\to 0}\frac{e^{2x}-1}{x}\quad\begin{cases}\lim_{x\to 0}(e^{2x}-1)=0\\ \lim_{x\to 0}x=0\end{cases}$$

apply L'Hôpital's Rule, as shown below.

$$\lim_{x\to 0}\frac{e^{2x}-1}{x}=\lim_{x\to 0}\frac{\frac{d}{dx}[e^{2x}-1]}{\frac{d}{dx}[x]}$$ Apply L'Hôpital's Rule.

$$=\lim_{x\to 0}\frac{2e^{2x}}{1}$$ Differentiate numerator and denominator.

$$=2$$ Evaluate the limit. ■

In the solution to Example 1, note that you actually do not know that the first limit is equal to the second limit until you have shown that the second limit exists. In other words, if the second limit had not existed, then it would not have been permissible to apply L'Hôpital's Rule.

Another form of L'Hôpital's Rule states that if the limit of $f(x)/g(x)$ as x approaches ∞ (or $-\infty$) produces the indeterminate form $0/0$ or ∞/∞, then

$$\lim_{x\to\infty}\frac{f(x)}{g(x)}=\lim_{x\to\infty}\frac{f'(x)}{g'(x)}$$

provided the limit on the right exists.

EXAMPLE 2 Indeterminate Form ∞/∞

Evaluate $\lim_{x\to\infty}\dfrac{\ln x}{x}$.

Solution Because direct substitution results in the indeterminate form ∞/∞, apply L'Hôpital's Rule to obtain

$$\lim_{x\to\infty}\frac{\ln x}{x}=\lim_{x\to\infty}\frac{\frac{d}{dx}[\ln x]}{\frac{d}{dx}[x]}$$ Apply L'Hôpital's Rule.

$$=\lim_{x\to\infty}\frac{1}{x}$$ Differentiate numerator and denominator.

$$=0.$$ Evaluate the limit. ■

TECHNOLOGY Use a graphing utility to graph $y_1=\ln x$ and $y_2=x$ in the same viewing window. Which function grows faster as x approaches ∞? How is this observation related to Example 2?

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

GO DIGITAL

Occasionally it is necessary to apply L'Hôpital's Rule more than once to remove an indeterminate form, as shown in Example 3.

EXAMPLE 3 Applying L'Hôpital's Rule More than Once

Evaluate $\lim_{x\to-\infty} \frac{x^2}{e^{-x}}$.

FOR FURTHER INFORMATION To read about the connection between Leonhard Euler and Guillaume L'Hôpital, see the article "When Euler Met l'Hôpital" by William Dunham in *Mathematics Magazine*. To view this article, go to *MathArticles.com*.

Solution Because direct substitution results in the indeterminate form ∞/∞, apply L'Hôpital's Rule.

$$\lim_{x\to-\infty} \frac{x^2}{e^{-x}} = \lim_{x\to-\infty} \frac{\frac{d}{dx}[x^2]}{\frac{d}{dx}[e^{-x}]} = \lim_{x\to-\infty} \frac{2x}{-e^{-x}}$$

This limit yields the indeterminate form $(-\infty)/(-\infty)$, so apply L'Hôpital's Rule again to obtain

$$\lim_{x\to-\infty} \frac{2x}{-e^{-x}} = \lim_{x\to-\infty} \frac{\frac{d}{dx}[2x]}{\frac{d}{dx}[-e^{-x}]} = \lim_{x\to-\infty} \frac{2}{e^{-x}} = 0.$$

In addition to the forms $0/0$ and ∞/∞, there are other indeterminate forms such as $0 \cdot \infty$, 1^∞, ∞^0, 0^0, and $\infty - \infty$. For example, consider the four limits that lead to the indeterminate form $0 \cdot \infty$.

$$\underbrace{\lim_{x\to0}\left(\frac{1}{x}\right)(x)}_{\text{Limit is 1.}}, \quad \underbrace{\lim_{x\to0}\left(\frac{2}{x}\right)(x)}_{\text{Limit is 2.}}, \quad \underbrace{\lim_{x\to\infty}\left(\frac{1}{e^x}\right)(x)}_{\text{Limit is 0.}}, \quad \underbrace{\lim_{x\to\infty}\left(\frac{1}{x}\right)(e^x)}_{\text{Limit is } \infty.}$$

Because each limit is different, it is clear that the form $0 \cdot \infty$ is indeterminate in the sense that it does not determine the value (or even the existence) of the limit. The remaining examples in this section show methods for evaluating some of the other indeterminate forms. Basically, you attempt to convert each form to $0/0$ or ∞/∞ so that L'Hôpital's Rule can be applied.

EXAMPLE 4 Indeterminate Form $0 \cdot \infty$

Evaluate $\lim_{x\to\infty} e^{-x}\sqrt{x}$.

Solution Because direct substitution produces the indeterminate form $0 \cdot \infty$, try to rewrite the limit to fit the form $0/0$ or ∞/∞. In this case, rewrite the limit to fit the second form.

$$\lim_{x\to\infty} e^{-x}\sqrt{x} = \lim_{x\to\infty} \frac{\sqrt{x}}{e^x}$$

Now, by L'Hôpital's Rule, you have

$$\lim_{x\to\infty} \frac{\sqrt{x}}{e^x} = \lim_{x\to\infty} \frac{1/(2\sqrt{x})}{e^x} \qquad \text{Differentiate numerator and denominator.}$$

$$= \lim_{x\to\infty} \frac{1}{2\sqrt{x}e^x} \qquad \text{Simplify.}$$

$$= 0. \qquad \text{Evaluate the limit.}$$

GO DIGITAL

When rewriting a limit in one of the forms $0/0$ or ∞/∞ does not seem to work, try the other form. For instance, in Example 4, you can write the limit as

$$\lim_{x\to\infty} e^{-x}\sqrt{x} = \lim_{x\to\infty} \frac{e^{-x}}{x^{-1/2}}$$

which yields the indeterminate form $0/0$. As it happens, applying L'Hôpital's Rule to this limit produces

$$\lim_{x\to\infty} \frac{e^{-x}}{x^{-1/2}} = \lim_{x\to\infty} \frac{-e^{-x}}{-1/(2x^{3/2})}$$

which also yields the indeterminate form $0/0$.

The indeterminate forms 1^∞, ∞^0, and 0^0 arise from limits of functions that have variable bases and variable exponents. When you previously encountered this type of function, you used logarithmic differentiation to find the derivative. You can use a similar procedure when taking limits, as shown in the next example.

EXAMPLE 5 Indeterminate Form 1^∞

Evaluate $\lim_{x\to\infty} \left(1 + \frac{1}{x}\right)^x$.

REMARK Note that the solution to Example 5 is an alternate proof of Theorem 5.15.

Solution Because direct substitution yields the indeterminate form 1^∞, you can proceed as follows. To begin, assume that the limit exists and is equal to y.

$$y = \lim_{x\to\infty} \left(1 + \frac{1}{x}\right)^x$$

Taking the natural logarithm of each side produces

$$\ln y = \ln\left[\lim_{x\to\infty} \left(1 + \frac{1}{x}\right)^x\right].$$

Because the natural logarithmic function is continuous, you can write

$$\begin{aligned}
\ln y &= \lim_{x\to\infty} \left[x \ln\left(1 + \frac{1}{x}\right)\right] && \text{Indeterminate form } \infty \cdot 0 \\
&= \lim_{x\to\infty} \left(\frac{\ln[1 + (1/x)]}{1/x}\right) && \text{Indeterminate form } 0/0 \\
&= \lim_{x\to\infty} \left(\frac{(-1/x^2)\{1/[1 + (1/x)]\}}{-1/x^2}\right) && \text{L'Hôpital's Rule} \\
&= \lim_{x\to\infty} \frac{1}{1 + (1/x)} && \text{Simplify.} \\
&= 1. && \text{Evaluate the limit.}
\end{aligned}$$

Now, because you have shown that

$$\ln y = 1$$

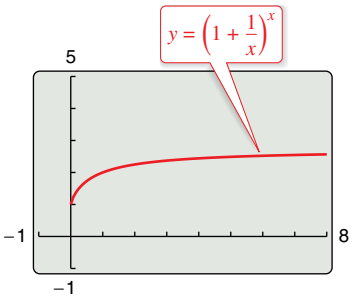
you can conclude that

$$y = e$$

and obtain

$$\lim_{x\to\infty} \left(1 + \frac{1}{x}\right)^x = e.$$

You can use a graphing utility to support this result, as shown in Figure 5.24.



The limit of $[1 + (1/x)]^x$ as x approaches infinity is e.
Figure 5.24

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

L'Hôpital's Rule can also be applied to one-sided limits, as demonstrated in Examples 6 and 7.

EXAMPLE 6 Indeterminate Form 0^0

See LarsonCalculus.com for an interactive version of this type of example.

Evaluate $\lim_{x\to 0^+} (\sin x)^x$.

Solution Because direct substitution produces the indeterminate form 0^0, you can proceed as shown below. To begin, assume that the limit exists and is equal to y.

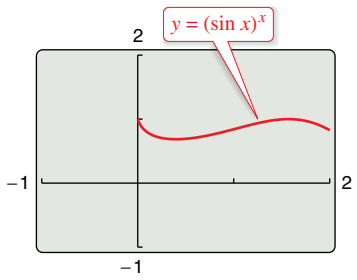
$$\begin{aligned}
y &= \lim_{x\to 0^+} (\sin x)^x && \text{Indeterminate form } 0^0\\
\ln y &= \ln\left[\lim_{x\to 0^+} (\sin x)^x\right] && \text{Take natural log of each side.}\\
&= \lim_{x\to 0^+} \left[\ln(\sin x)^x\right] && \text{Continuity}\\
&= \lim_{x\to 0^+} \left[x \ln(\sin x)\right] && \text{Indeterminate form } 0 \cdot (-\infty)\\
&= \lim_{x\to 0^+} \frac{\ln(\sin x)}{1/x} && \text{Indeterminate form } -\infty/\infty\\
&= \lim_{x\to 0^+} \frac{\cot x}{-1/x^2} && \text{L'Hôpital's Rule}\\
&= \lim_{x\to 0^+} \frac{-x^2}{\tan x} && \text{Indeterminate form } 0/0\\
&= \lim_{x\to 0^+} \frac{-2x}{\sec^2 x} && \text{L'Hôpital's Rule}\\
&= 0 && \text{Evaluate the limit.}
\end{aligned}$$

Now, because $\ln y = 0$, you can conclude that $y = e^0 = 1$, and it follows that

$$\lim_{x\to 0^+} (\sin x)^x = 1.$$

TECHNOLOGY When evaluating complicated limits such as the one in Example 6, it is helpful to check the reasonableness of the solution with a graphing utility. For instance, the calculations in the table and the graph in the figure (see below) are consistent with the conclusion that $(\sin x)^x$ approaches 1 as x approaches 0 from the right.

x	1	0.1	0.01	0.001	0.0001	0.00001
$(\sin x)^x$	0.8415	0.7942	0.9550	0.9931	0.9991	0.9999



The limit of $(\sin x)^x$ is 1 as x approaches 0 from the right.

Use a graphing utility to estimate the limits $\lim_{x\to 0} (1 - \cos x)^x$ and $\lim_{x\to 0^+} (\tan x)^x$. Then try to verify your estimates analytically.

GO DIGITAL

EXAMPLE 7 Indeterminate Form $\infty - \infty$

Evaluate $\lim_{x \to 1^+} \left(\frac{1}{\ln x} - \frac{1}{x - 1} \right)$.

Solution Because direct substitution yields the indeterminate form $\infty - \infty$, try to rewrite the expression to produce a form to which you can apply L'Hôpital's Rule. In this case, you can combine the two fractions to obtain

$$\lim_{x \to 1^+} \left(\frac{1}{\ln x} - \frac{1}{x - 1} \right) = \lim_{x \to 1^+} \frac{x - 1 - \ln x}{(x - 1) \ln x}.$$

Now, because direct substitution produces the indeterminate form $0/0$, apply L'Hôpital's Rule to obtain

$$\begin{aligned} \lim_{x \to 1^+} \frac{x - 1 - \ln x}{(x - 1) \ln x} &= \lim_{x \to 1^+} \frac{\frac{d}{dx}[x - 1 - \ln x]}{\frac{d}{dx}[(x - 1) \ln x]} \\ &= \lim_{x \to 1^+} \frac{1 - (1/x)}{(x - 1)(1/x) + \ln x} \\ &= \lim_{x \to 1^+} \frac{x - 1}{x - 1 + x \ln x}. \end{aligned}$$

This limit also yields the indeterminate form $0/0$, so apply L'Hôpital's Rule again.

$$\lim_{x \to 1^+} \frac{x - 1}{x - 1 + x \ln x} = \lim_{x \to 1^+} \frac{1}{1 + x(1/x) + \ln x} = \frac{1}{2}$$

You can check the reasonableness of this solution using a table, as shown at the left.

Table for Example 7

x	$\frac{1}{\ln x} - \frac{1}{x - 1}$
2	0.44270
1.5	0.46630
1.1	0.49206
1.01	0.49917
1.001	0.49992
1.0001	0.49999
1.00001	0.50000

The forms $0/0$, ∞/∞, $\infty - \infty$, $0 \cdot \infty$, 0^0, 1^∞, and ∞^0 have been identified as *indeterminate*. There are similar forms that you should recognize as "determinate."

$\infty + \infty \to \infty$ Limit is positive infinity.

$-\infty - \infty \to -\infty$ Limit is negative infinity.

$0^\infty \to 0$ Limit is zero.

$0^{-\infty} \to \infty$ Limit is positive infinity.

REMARK You are asked to verify that 0^∞ and $0^{-\infty}$ are "determinate" in Exercises 112 and 113, respectively.

As a final comment, remember that L'Hôpital's Rule can be applied only to quotients leading to the indeterminate forms $0/0$ and ∞/∞. For instance, the application of L'Hôpital's Rule shown below is *incorrect*.

$$\lim_{x \to 0} \frac{e^x}{x} \overset{\text{(=)}}{=} \lim_{x \to 0} \frac{e^x}{1} = 1$$

Incorrect use of L'Hôpital's Rule

The reason this application is incorrect is that, even though the limit of the denominator is 0, the limit of the numerator is 1, which means that the hypotheses of L'Hôpital's Rule have not been satisfied.

Exploration

In each example in this section, L'Hôpital's Rule is used to find a limit that exists. It can also be used to conclude that a limit is infinite. For instance, use L'Hôpital's Rule to show that $\lim_{x \to \infty} e^x/x = \infty$.

5.6 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain the benefit of L'Hôpital's Rule.
2. For each limit, use direct substitution. Then identify the form of the limit as either indeterminate or not.

(a) $\lim_{x\to 0} \frac{x^2}{\sin 2x}$ (b) $\lim_{x\to\infty} (e^x + x^2)$

(c) $\lim_{x\to\infty} (\ln x - e^x)$ (d) $\lim_{x\to 0^+} \left(\ln x^2 - \frac{1}{x}\right)$

Numerical and Graphical Analysis **In Exercises 3–6, complete the table and use the result to estimate the limit. Use a graphing utility to graph the function to confirm your result.**

3. $\lim_{x\to 0} \frac{\sin 4x}{\sin 3x}$

x	-0.1	-0.01	-0.001	0	0.001	0.01	0.1
$f(x)$				?			

4. $\lim_{x\to 0} \frac{1 - e^x}{x}$

x	-0.1	-0.01	-0.001	0	0.001	0.01	0.1
$f(x)$				?			

5. $\lim_{x\to\infty} x^5 e^{-x/100}$

x	1	10	10^2	10^3	10^4	10^5
$f(x)$						

6. $\lim_{x\to\infty} \frac{6x}{\sqrt{3x^2 - 2x}}$

x	1	10	10^2	10^3	10^4	10^5
$f(x)$						

Using Two Methods **In Exercises 7–14, evaluate the limit (a) using techniques from Chapters 1 and 3 and (b) using L'Hôpital's Rule.**

7. $\lim_{x\to 4} \frac{3(x-4)}{x^2 - 16}$
8. $\lim_{x\to -4} \frac{2x^2 + 13x + 20}{x + 4}$
9. $\lim_{x\to 6} \frac{\sqrt{x+10} - 4}{x - 6}$
10. $\lim_{x\to -1} \left(\frac{1 - \sqrt{x+2}}{x+1}\right)$
11. $\lim_{x\to 0} \left(\frac{2 - 2\cos x}{6x}\right)$
12. $\lim_{x\to 0} \frac{\sin 6x}{4x}$
13. $\lim_{x\to\infty} \frac{5x^2 - 3x + 1}{3x^2 - 5}$
14. $\lim_{x\to\infty} \frac{x^3 + 2x}{4 - x}$

Evaluating a Limit **In Exercises 15–42, evaluate the limit, using L'Hôpital's Rule if necessary.**

15. $\lim_{x\to 3} \frac{x^2 - 2x - 3}{x - 3}$
16. $\lim_{x\to -2} \frac{x^2 - 3x - 10}{x + 2}$
17. $\lim_{x\to 0} \frac{\sqrt{25 - x^2} - 5}{x}$
18. $\lim_{x\to 5^-} \frac{\sqrt{25 - x^2}}{x - 5}$
19. $\lim_{x\to 0^+} \frac{e^x - (1 + x)}{x^3}$
20. $\lim_{x\to 1} \frac{\ln x^3}{x^2 - 1}$
21. $\lim_{x\to 1} \frac{x^{11} - 1}{x^4 - 1}$
22. $\lim_{x\to 1} \frac{x^a - 1}{x^b - 1}$, where $a, b \neq 0$
23. $\lim_{x\to 0} \frac{\sin 3x}{\sin 5x}$
24. $\lim_{x\to 0} \frac{\sin ax}{\sin bx}$, where $a, b \neq 0$
25. $\lim_{x\to\infty} \frac{7x^3 - 2x + 1}{6x^3 + 1}$
26. $\lim_{x\to\infty} \frac{8 - x}{x^3}$
27. $\lim_{x\to\infty} \frac{x^2 + 4x + 7}{x - 6}$
28. $\lim_{x\to\infty} \frac{x^3}{x + 2}$
29. $\lim_{x\to\infty} \frac{x^3}{e^{x/2}}$
30. $\lim_{x\to\infty} \frac{e^{x^2}}{1 - x^3}$
31. $\lim_{x\to\infty} \frac{x}{\sqrt{x^2 + 1}}$
32. $\lim_{x\to\infty} \frac{x^2}{\sqrt{x^2 + 1}}$
33. $\lim_{x\to\infty} \frac{\cos x}{x}$
34. $\lim_{x\to\infty} \frac{\sin x}{x - \pi}$
35. $\lim_{x\to\infty} \frac{\ln x}{x^2}$
36. $\lim_{x\to\infty} \frac{\ln x^4}{x^3}$
37. $\lim_{x\to\infty} \frac{e^x}{x^4}$
38. $\lim_{x\to\infty} \frac{e^{2x-9}}{3x}$
39. $\lim_{x\to 0} \frac{\sin 5x}{\tan 9x}$
40. $\lim_{x\to 1} \frac{\ln x}{\sin \pi x}$
41. $\lim_{x\to\infty} \frac{\int_1^x \ln(e^{4t-1})\, dt}{x}$
42. $\lim_{x\to 1^+} \frac{\int_1^x \cos\theta\, d\theta}{x - 1}$

Evaluating a Limit **In Exercises 43–62, (a) describe the type of indeterminate form (if any) that is obtained by direct substitution. (b) Evaluate the limit, using L'Hôpital's Rule if necessary. (c) Use a graphing utility to graph the function and verify the result in part (b).**

43. $\lim_{x\to\infty} x \ln x$
44. $\lim_{x\to 0^+} x^3 \cot x$
45. $\lim_{x\to\infty} x \sin \frac{1}{x}$
46. $\lim_{x\to\infty} x \tan \frac{1}{x}$
47. $\lim_{x\to 0^+} (e^x + x)^{2/x}$
48. $\lim_{x\to 0^+} \left(1 + \frac{1}{x}\right)^x$
49. $\lim_{x\to\infty} x^{1/x}$
50. $\lim_{x\to 0^+} x^{1/x}$
51. $\lim_{x\to 0^+} (1 + x)^{1/x}$
52. $\lim_{x\to\infty} (1 + x)^{1/x}$

Exploring Concepts

63. Find differentiable functions f and g that satisfy the specified condition such that

$$\lim_{x\to 5} f(x) = 0 \quad \text{and} \quad \lim_{x\to 5} g(x) = 0.$$

Explain how you obtained your answers. (*Note:* There are many correct answers.)

(a) $\lim_{x\to 5} \frac{f(x)}{g(x)} = 10$

(b) $\lim_{x\to 5} \frac{f(x)}{g(x)} = 0$

(c) $\lim_{x\to 5} \frac{f(x)}{g(x)} = \infty$

64. Find differentiable functions f and g such that

$$\lim_{x\to \infty} f(x) = \lim_{x\to \infty} g(x) = \infty \text{ and } \lim_{x\to \infty} [f(x) - g(x)] = 25.$$

Explain how you obtained your answers. (Note: There are many correct answers.)

65. Determine which of the following limits can be evaluated using L'Hôpital's Rule. Explain your reasoning. Do not evaluate the limit.

(a) $\lim_{x\to 2} \frac{x-2}{x^3-x-6}$

(b) $\lim_{x\to 0} \frac{x^2-4x}{2x-1}$

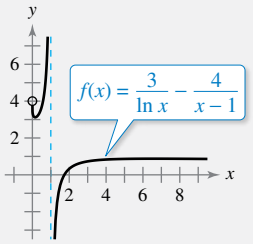
(c) $\lim_{x\to \infty} \frac{x^3}{e^x}$

(d) $\lim_{x\to 3} \frac{e^{x^2}-e^9}{x-3}$

(e) $\lim_{x\to 1} \frac{\cos \pi x}{\ln x}$

(f) $\lim_{x\to 1} \frac{1 + x(\ln x - 1)}{(x-1)\ln x}$

66. HOW DO YOU SEE IT? Use the graph of f to find each limit.



(a) $\lim_{x\to 1^-} f(x)$ (b) $\lim_{x\to 1^+} f(x)$ (c) $\lim_{x\to 1} f(x)$

67. Numerical Analysis Complete the table to show that x eventually "overpowers" $(\ln x)^4$.

x	10	10^2	10^4	10^6	10^8	10^{10}
$\frac{(\ln x)^4}{x}$						

68. Numerical Analysis Complete the table to show that e^x eventually "overpowers" x^5.

x	1	5	10	20	30	40	50	100
$\frac{e^x}{x^5}$								

Comparing Functions **In Exercises 69–74, use L'Hôpital's Rule to determine the comparative rates of increase of the functions $f(x) = x^m$, $g(x) = e^{nx}$, and $h(x) = (\ln x)^n$, where $n > 0$, $m > 0$, and $x \to \infty$.**

69. $\lim_{x\to \infty} \frac{x^2}{e^{5x}}$

70. $\lim_{x\to \infty} \frac{x^3}{e^{2x}}$

71. $\lim_{x\to \infty} \frac{(\ln x)^3}{x}$

72. $\lim_{x\to \infty} \frac{(\ln x)^2}{x^3}$

73. $\lim_{x\to \infty} \frac{(\ln x)^n}{x^m}$

74. $\lim_{x\to \infty} \frac{x^m}{e^{nx}}$

Asymptotes and Relative Extrema **In Exercises 75–78, find any asymptotes and relative extrema that may exist and use a graphing utility to graph the function.**

75. $y = x^{1/x}, \ x > 0$

76. $y = x^x, \ x > 0$

77. $y = 2xe^{-x}$

78. $y = \frac{\ln x}{x}$

Think About It **In Exercises 79–82, L'Hôpital's Rule is used incorrectly. Describe the error.**

79. $\lim_{x\to 2} \frac{3x^2+4x+1}{x^2-x-2} = \lim_{x\to 2} \frac{6x+4}{2x-1} = \lim_{x\to 2} \frac{6}{2} = 3$ ✗

80.
$$\lim_{x\to 0} \frac{e^{2x}-1}{e^x} = \lim_{x\to 0} \frac{2e^{2x}}{e^x}$$
$$= \lim_{x\to 0} 2e^x$$
$$= 2$$
✗

81.
$$\lim_{x\to 0} \frac{1-e^x}{x-x^2} = \lim_{x\to 0} \frac{-e^x}{1-2x}$$
$$= \lim_{x\to 0} \frac{-e^x}{-2}$$
$$= \frac{1}{2}$$
✗

82.
$$\lim_{x\to \infty} x \cos\frac{1}{x} = \lim_{x\to \infty} \frac{\cos(1/x)}{1/x}$$
$$= \lim_{x\to \infty} \frac{[-\sin(1/x)](1/x^2)}{-1/x^2}$$
$$= \lim_{x\to \infty} \sin\frac{1}{x}$$
$$= 0$$
✗

Evaluating a Limit **In Exercises 83 and 84, evaluate the limit using L'Hôpital's Rule if necessary.**

83. $\lim_{x\to 0} \dfrac{e^x - 1 - x - \frac{x^2}{2}}{x^3}$

84. $\lim_{x\to 0} \dfrac{\ln(1+x) - x + \frac{x^2}{2}}{x^3}$

Analytic and Graphical Analysis **In Exercises 85 and 86, (a) explain why L'Hôpital's Rule cannot be used to find the limit, (b) find the limit analytically, and (c) use a graphing utility to graph the function and approximate the limit from the graph. Compare the result with that in part (b).**

85. $\lim_{x\to\infty} \dfrac{x}{\sqrt{x^2+1}}$

86. $\lim_{x\to \pi/2^-} \dfrac{\tan x}{\sec x}$

Graphical Analysis **In Exercises 87 and 88, graph $f(x)/g(x)$ and $f'(x)/g'(x)$ near $x = 0$. What do you notice about these ratios as $x \to 0$? How does this illustrate L'Hôpital's Rule?**

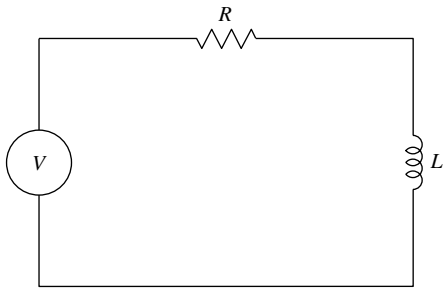
87. $f(x) = \sin 3x,\ g(x) = \sin 4x$

88. $f(x) = e^{3x} - 1,\ g(x) = x$

89. Electric Circuit The diagram shows a simple electric circuit consisting of a power source, a resistor, and an inductor. If voltage V is first applied at time $t = 0$, then the current I flowing through the circuit at time t is given by

$$I = \frac{V}{R}(1 - e^{-Rt/L})$$

where L is the inductance and R is the resistance. Use L'Hôpital's Rule to find the formula for the current by fixing V and L and letting R approach 0 from the right.



90. Velocity in a Resisting Medium The velocity v of an object falling through a resisting medium such as air or water is given by

$$v = \frac{32}{k}\left(1 - e^{-kt} + \frac{v_0 k e^{-kt}}{32}\right)$$

where v_0 is the initial velocity, t is the time in seconds, and k is the resistance constant of the medium. Use L'Hôpital's Rule to find the formula for the velocity of a falling body in a vacuum by fixing v_0 and t and letting k approach zero. (Assume that the downward direction is positive.)

91. The Gamma Function The gamma function $\Gamma(n)$ is defined in terms of the integral of the function given by $f(x) = x^{n-1}e^{-x}$, $n > 0$. Show that for any fixed value of n, the limit of $f(x)$ as x approaches infinity is zero.

92. Compound Interest The formula for the amount A in a savings account compounded n times per year for t years at an interest rate r and an initial deposit of P is given by

$$A = P\left(1 + \frac{r}{n}\right)^{nt}.$$

Use L'Hôpital's Rule to show that the limiting formula as the number of compoundings per year approaches infinity is given by $A = Pe^{rt}$.

Extended Mean Value Theorem **In Exercises 93–96, verify that the Extended Mean Value Theorem can be applied to the functions f and g on the closed interval $[a, b]$. Then find all values c in the open interval (a, b) such that**

$$\frac{f'(c)}{g'(c)} = \frac{f(b) - f(a)}{g(b) - g(a)}.$$

	Functions	Interval
93.	$f(x) = x^3,\ g(x) = x^2 + 1$	$[0, 1]$
94.	$f(x) = \dfrac{1}{x},\ g(x) = x^2 - 4$	$[1, 2]$
95.	$f(x) = \sin x,\ g(x) = \cos x$	$\left[0, \dfrac{\pi}{2}\right]$
96.	$f(x) = \ln x,\ g(x) = x^3$	$[1, 4]$

True or False? **In Exercises 97–102, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

97. A limit of the form $\infty/0$ is indeterminate.

98. A limit of the form $\infty \cdot \infty$ is indeterminate.

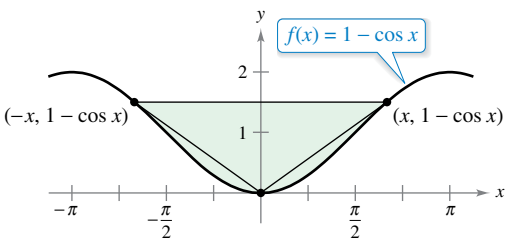
99. An indeterminate form does not guarantee the existence of a limit.

100. $\lim_{x\to 0} \dfrac{x^2 + x + 1}{x} = \lim_{x\to 0} \dfrac{2x + 1}{1} = 1$

101. If $p(x)$ is a polynomial, then $\lim_{x\to\infty} \dfrac{p(x)}{e^x} = 0$.

102. If $\lim_{x\to\infty} \dfrac{f(x)}{g(x)} = 1$, then $\lim_{x\to\infty} [f(x) - g(x)] = 0$.

103. Area Find the limit, as x approaches 0, of the ratio of the area of the triangle to the total shaded area in the figure.



104. Evaluating a Limit Evaluate the limit.

$$\lim_{x\to 0} \frac{\sin 5x \sin 7x}{x \sin 4x}$$

Use a graphing utility to verify the result.

Continuous Function **In Exercises 105 and 106, find the value of c that makes the function continuous at $x = 0$.**

105. $f(x) = \begin{cases} \dfrac{4x - 2\sin 2x}{2x^3}, & x \neq 0 \\ c, & x = 0 \end{cases}$

106. $f(x) = \begin{cases} (e^x + x)^{1/x}, & x \neq 0 \\ c, & x = 0 \end{cases}$

107. Finding Values Find the values of a and b such that

$$\lim_{x\to 0} \frac{a - \cos bx}{x^2} = 2.$$

108. Evaluating a Limit Use a graphing utility to graph

$$f(x) = \frac{x^k - 1}{k}$$

for $k = 1$, 0.1, and 0.01. Then evaluate the limit

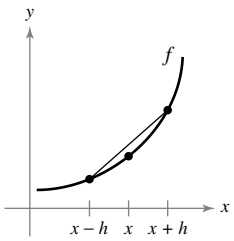
$$\lim_{k\to 0^+} \frac{x^k - 1}{k}.$$

109. Finding a Derivative

(a) Let $f'(x)$ be continuous. Show that

$$\lim_{h\to 0} \frac{f(x + h) - f(x - h)}{2h} = f'(x).$$

(b) Explain the result of part (a) graphically.



110. Finding a Second Derivative Let $f''(x)$ be continuous. Show that

$$\lim_{h\to 0} \frac{f(x + h) - 2f(x) + f(x - h)}{h^2} = f''(x).$$

111. Evaluating a Limit Consider the limit

$$\lim_{x\to 0^+} (-x \ln x).$$

(a) Describe the type of indeterminate form that is obtained by direct substitution.

(b) Evaluate the limit. Use a graphing utility to verify the result.

FOR FURTHER INFORMATION For a geometric approach to this exercise, see the article "A Geometric Proof of $\lim_{d\to 0^+} (-d \ln d) = 0$" by John H. Mathews in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

112. Proof Prove that if $f(x) \geq 0$, $\lim_{x\to a} f(x) = 0$, and $\lim_{x\to a} g(x) = \infty$, then $\lim_{x\to a} f(x)^{g(x)} = 0$.

113. Proof Prove that if $f(x) \geq 0$, $\lim_{x\to a} f(x) = 0$, and $\lim_{x\to a} g(x) = -\infty$, then $\lim_{x\to a} f(x)^{g(x)} = \infty$.

114. Think About It Use two different methods to find the limit

$$\lim_{x\to\infty} \frac{\ln x^m}{\ln x^n}$$

where $m > 0$, $n > 0$, and $x > 0$.

115. Indeterminate Forms Show that the indeterminate forms 0^0, ∞^0, and 1^∞ do not always have a value of 1 by evaluating each limit.

(a) $\lim_{x\to 0^+} x^{(\ln 2)/(1 + \ln x)}$

(b) $\lim_{x\to\infty} x^{(\ln 2)/(1 + \ln x)}$

(c) $\lim_{x\to 0} (x + 1)^{(\ln 2)/x}$

116. Calculus History In L'Hôpital's 1696 calculus textbook, he illustrated his rule using the limit of the function

$$f(x) = \frac{\sqrt{2a^3x - x^4} - a\sqrt[3]{a^2x}}{a - \sqrt[4]{ax^3}}$$

as x approaches a, $a > 0$. Find this limit.

117. Finding a Limit Consider the function

$$h(x) = \frac{x + \sin x}{x}.$$

(a) Use a graphing utility to graph the function. Then use the *zoom* and *trace* features to investigate $\lim_{x\to\infty} h(x)$.

(b) Find $\lim_{x\to\infty} h(x)$ analytically by writing

$$h(x) = \frac{x}{x} + \frac{\sin x}{x}.$$

(c) Can you use L'Hôpital's Rule to find $\lim_{x\to\infty} h(x)$? Explain your reasoning.

118. Evaluating a Limit Let $f(x) = x + x\sin x$ and $g(x) = x^2 - 4$.

(a) Show that $\lim_{x\to\infty} \frac{f(x)}{g(x)} = 0$.

(b) Show that $\lim_{x\to\infty} f(x) = \infty$ and $\lim_{x\to\infty} g(x) = \infty$.

(c) Evaluate the limit

$$\lim_{x\to\infty} \frac{f'(x)}{g'(x)}.$$

What do you notice?

(d) Do your answers to parts (a) through (c) contradict L'Hôpital's Rule? Explain your reasoning.

PUTNAM EXAM CHALLENGE

119. Evaluate $\lim_{x\to\infty} \left[\frac{1}{x} \cdot \frac{a^x - 1}{a - 1}\right]^{1/x}$ where $a > 0$, $a \neq 1$.

This problem was composed by the Committee on the Putnam Prize Competition.

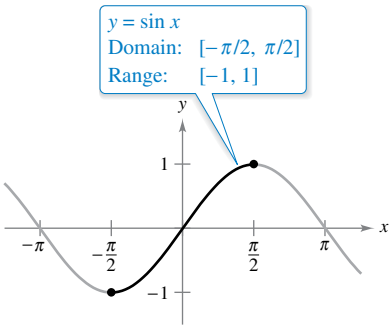
5.7 Inverse Trigonometric Functions: Differentiation

GO DIGITAL

- **Define the six inverse trigonometric functions and use their properties.**
- **Differentiate an inverse trigonometric function.**
- **Review the basic differentiation rules for elementary functions.**



The sine function is one-to-one on $[-\pi/2, \pi/2]$.
Figure 5.25

Inverse Trigonometric Functions

This section begins with a rather surprising statement: *None of the six basic trigonometric functions has an inverse function.* This statement is true because all six trigonometric functions are periodic and therefore are not one-to-one. In this section, you will examine these six functions to determine whether their domains can be redefined in such a way that they will have inverse functions on the *restricted domains.*

In Example 4 of Section 5.3, you learned that the sine function is increasing (and therefore is one-to-one) on the interval

$$\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$$

as shown in Figure 5.25. On this interval, the inverse of the *restricted* sine function is defined as

$$y = \arcsin x \quad \text{if and only if} \quad \sin y = x$$

where $-1 \le x \le 1$ and $-\pi/2 \le \arcsin x \le \pi/2$.

Under suitable restrictions, each of the six trigonometric functions is one-to-one and so has an inverse function, as shown in the next definition. (Note that the term "iff" is used to represent the phrase "if and only if.")

REMARK The notation $\arcsin x$ is read as "the arcsine of x" or sometimes "the angle whose sine is x." An alternative notation for the inverse sine function is $\sin^{-1} x$, which is consistent with the inverse function notation $f^{-1}(x)$.

Definitions of Inverse Trigonometric Functions

Function	Domain	Range
$y = \arcsin x$ iff $\sin y = x$	$-1 \le x \le 1$	$-\frac{\pi}{2} \le y \le \frac{\pi}{2}$
$y = \arccos x$ iff $\cos y = x$	$-1 \le x \le 1$	$0 \le y \le \pi$
$y = \arctan x$ iff $\tan y = x$	$-\infty < x < \infty$	$-\frac{\pi}{2} < y < \frac{\pi}{2}$
$y = \operatorname{arccot} x$ iff $\cot y = x$	$-\infty < x < \infty$	$0 < y < \pi$
$y = \operatorname{arcsec} x$ iff $\sec y = x$	$\lvert x\rvert \ge 1$	$0 \le y \le \pi, \quad y \ne \frac{\pi}{2}$
$y = \operatorname{arccsc} x$ iff $\csc y = x$	$\lvert x\rvert \ge 1$	$-\frac{\pi}{2} \le y \le \frac{\pi}{2}, \quad y \ne 0$

Exploration

The Inverse Secant Function In this text, the inverse secant function is defined by restricting the domain of the secant function to the intervals $[0, \pi/2) \cup (\pi/2, \pi]$. Most other texts and reference books use this domain, but some do not. What other domains might make sense? Explain your reasoning graphically. Some calculators do not have a key for the inverse secant function. In such cases, how can you use the calculator to evaluate the inverse secant function?

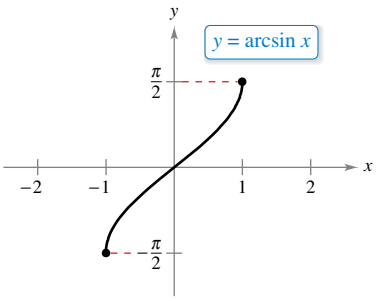
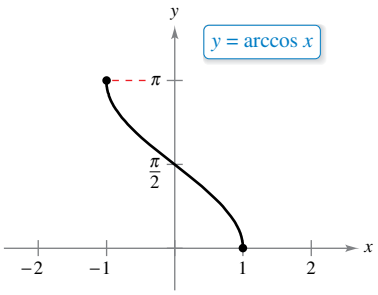
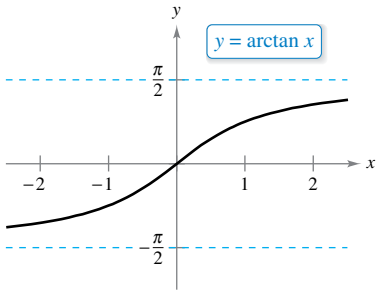
The graphs of the six inverse trigonometric functions are shown in Figure 5.26.



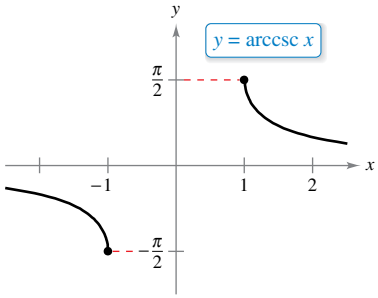
Domain: $[-1, 1]$
Range: $[-\pi/2, \pi/2]$



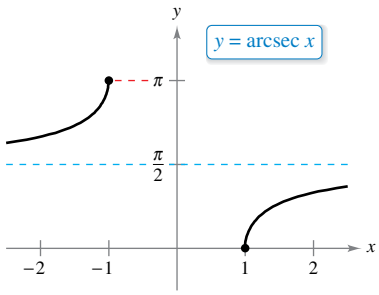
Domain: $[-1, 1]$
Range: $[0, \pi]$



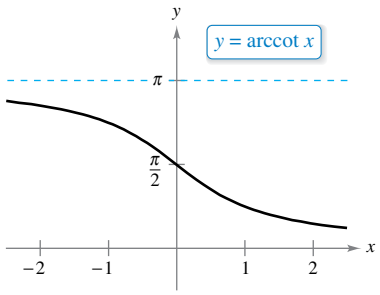
Domain: $(-\infty, \infty)$
Range: $(-\pi/2, \pi/2)$



Domain: $(-\infty, -1] \cup [1, \infty)$
Range: $[-\pi/2, 0) \cup (0, \pi/2]$



Domain: $(-\infty, -1] \cup [1, \infty)$
Range: $[0, \pi/2) \cup (\pi/2, \pi]$



Domain: $(-\infty, \infty)$
Range: $(0, \pi)$

Figure 5.26

When evaluating inverse trigonometric functions, remember that they denote angles in *radian measure*. (For a review of radian measure, see Section P.4.)

EXAMPLE 1 Evaluating Inverse Trigonometric Functions

Evaluate each function.

a. $\arcsin\left(-\frac{1}{2}\right)$ **b.** $\arccos 0$ **c.** $\arctan \sqrt{3}$ **d.** $\arcsin(0.3)$

Solution

a. By definition, $y = \arcsin\left(-\frac{1}{2}\right)$ implies that $\sin y = -\frac{1}{2}$. In the interval $[-\pi/2, \pi/2]$, the correct value of y is $-\pi/6$.

$$\arcsin\left(-\frac{1}{2}\right) = -\frac{\pi}{6}$$

b. By definition, $y = \arccos 0$ implies that $\cos y = 0$. In the interval $[0, \pi]$, you have $y = \pi/2$.

$$\arccos 0 = \frac{\pi}{2}$$

c. By definition, $y = \arctan \sqrt{3}$ implies that $\tan y = \sqrt{3}$. In the interval $(-\pi/2, \pi/2)$, you have $y = \pi/3$.

$$\arctan \sqrt{3} = \frac{\pi}{3}$$

d. Using a calculator set in *radian* mode produces

$$\arcsin(0.3) \approx 0.305.$$

GO DIGITAL

Inverse functions have the properties $f(f^{-1}(x)) = x$ and $f^{-1}(f(x)) = x$. When applying these properties to inverse trigonometric functions, remember that the trigonometric functions have inverse functions only in restricted domains. For x-values outside these domains, these two properties do not hold. For example, $\arcsin(\sin \pi)$ is equal to 0, not π.

REMARK When using these inverse properties, remember that the domains are restricted. For example,

$$\tan^{-1}\left(\tan \frac{3\pi}{4}\right) \neq \frac{3\pi}{4}$$

because $3\pi/4$ is not in the interval $(-\pi/2, \pi/2)$. Rather,

$$\tan^{-1}\left(\tan \frac{3\pi}{4}\right) = \tan^{-1}(-1) = -\frac{\pi}{4}.$$

Properties of Inverse Trigonometric Functions

If $-1 \leq x \leq 1$ and $-\pi/2 \leq y \leq \pi/2$, then

$$\sin(\arcsin x) = x \quad \text{and} \quad \arcsin(\sin y) = y.$$

If $-\pi/2 < y < \pi/2$, then

$$\tan(\arctan x) = x \quad \text{and} \quad \arctan(\tan y) = y.$$

If $|x| \geq 1$ and $0 \leq y < \pi/2$ or $\pi/2 < y \leq \pi$, then

$$\sec(\operatorname{arcsec} x) = x \quad \text{and} \quad \operatorname{arcsec}(\sec y) = y.$$

Similar properties hold for the other inverse trigonometric functions.

EXAMPLE 2 Solving an Equation

$$\arctan(2x - 3) = \frac{\pi}{4} \qquad \text{Original equation}$$

$$\tan[\arctan(2x - 3)] = \tan\frac{\pi}{4} \qquad \text{Take tangent of each side.}$$

$$2x - 3 = 1 \qquad \tan(\arctan x) = x$$

$$x = 2 \qquad \text{Solve for } x.$$

Some problems in calculus require that you evaluate expressions such as $\cos(\arcsin x)$, as shown in Example 3.

REMARK To review the right triangle definitions of trigonometric functions, see Section P.4.

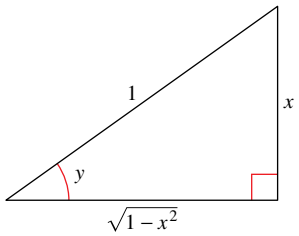
EXAMPLE 3 Using Right Triangles

a. Given $y = \arcsin x$, where $0 < y < \pi/2$, find $\cos y$.

b. Given $y = \operatorname{arcsec}(\sqrt{5}/2)$, find $\tan y$.

Solution

a. Because $y = \arcsin x$, you know that $\sin y = x$. This relationship between x and y can be represented by a right triangle, as shown in the figure at the right.

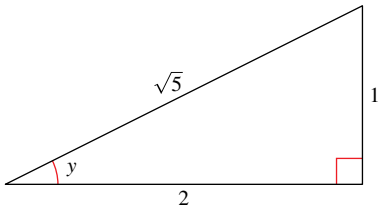


$y = \arcsin x$

$$\cos y = \cos(\arcsin x) = \frac{\text{adj}}{\text{hyp}} = \sqrt{1 - x^2}$$

(This result is also valid for $-\pi/2 < y < 0$.)

b. Use the right triangle shown in the figure at the left.



$y = \operatorname{arcsec}\dfrac{\sqrt{5}}{2}$

$$\tan y = \tan\left(\operatorname{arcsec}\frac{\sqrt{5}}{2}\right) = \frac{\text{opp}}{\text{adj}} = \frac{1}{2}$$

Derivatives of Inverse Trigonometric Functions

In Section 5.1, you learned that the derivative of the *transcendental* function $f(x) = \ln x$ is the *algebraic* function $f'(x) = 1/x$. You will now learn that the derivatives of the inverse trigonometric functions also are algebraic (even though the inverse trigonometric functions are themselves transcendental).

The next theorem lists the derivatives of the six inverse trigonometric functions. Note that the derivatives of arccos u, arccot u, and arccsc u are the *negatives* of the derivatives of arcsin u, arctan u, and arcsec u, respectively.

REMARK There is no common agreement on the definition of arcsec x (or arccsc x) for negative values of x. For the definition of arcsec x in this text, the range was chosen to preserve the reciprocal identity

$$\operatorname{arcsec} x = \arccos \frac{1}{x}.$$

One consequence of this definition is that its graph has a positive slope at every x-value in its domain. (See Figure 5.26.) This accounts for the absolute value sign in the formula for the derivative of arcsec x.

THEOREM 5.18 Derivatives of Inverse Trigonometric Functions

Let u be a differentiable function of x.

$$\frac{d}{dx}[\arcsin u] = \frac{u'}{\sqrt{1-u^2}} \qquad \frac{d}{dx}[\arccos u] = \frac{-u'}{\sqrt{1-u^2}}$$

$$\frac{d}{dx}[\arctan u] = \frac{u'}{1+u^2} \qquad \frac{d}{dx}[\operatorname{arccot} u] = \frac{-u'}{1+u^2}$$

$$\frac{d}{dx}[\operatorname{arcsec} u] = \frac{u'}{|u|\sqrt{u^2-1}} \qquad \frac{d}{dx}[\operatorname{arccsc} u] = \frac{-u'}{|u|\sqrt{u^2-1}}$$

Proofs for arcsin u and arccos u are given in Appendix A. [The proofs for the other rules are left as an exercise (see Exercise 94).]

TECHNOLOGY Some graphing utilities do not have the arcsecant function. In such cases, use

$$f(x) = \operatorname{arcsec} x = \arccos \frac{1}{x}.$$

EXAMPLE 4 Differentiating Inverse Trigonometric Functions

a. $\dfrac{d}{dx}[\arcsin(2x)] = \dfrac{2}{\sqrt{1-(2x)^2}} = \dfrac{2}{\sqrt{1-4x^2}}$ $u = 2x$

b. $\dfrac{d}{dx}[\arctan(3x)] = \dfrac{3}{1+(3x)^2} = \dfrac{3}{1+9x^2}$ $u = 3x$

c. $\dfrac{d}{dx}[\arcsin\sqrt{x}] = \dfrac{(1/2)x^{-1/2}}{\sqrt{1-x}} = \dfrac{1}{2\sqrt{x}\sqrt{1-x}} = \dfrac{1}{2\sqrt{x-x^2}}$ $u = \sqrt{x} = x^{1/2}$

d. $\dfrac{d}{dx}[\operatorname{arcsec} e^{2x}] = \dfrac{2e^{2x}}{e^{2x}\sqrt{(e^{2x})^2-1}} = \dfrac{2}{\sqrt{e^{4x}-1}}$ $u = e^{2x}$

The absolute value sign is not necessary because $e^{2x} > 0$.

EXAMPLE 5 A Derivative That Can Be Simplified

$$\begin{aligned} y &= \arcsin x + x\sqrt{1-x^2} \\ y' &= \frac{1}{\sqrt{1-x^2}} + x\left(\frac{1}{2}\right)(-2x)(1-x^2)^{-1/2} + \sqrt{1-x^2} \\ &= \frac{1}{\sqrt{1-x^2}} - \frac{x^2}{\sqrt{1-x^2}} + \sqrt{1-x^2} \\ &= \sqrt{1-x^2} + \sqrt{1-x^2} \\ &= 2\sqrt{1-x^2} \end{aligned}$$

Example 5 shows one of the benefits of inverse trigonometric functions—they can be used to integrate common algebraic functions. For instance, from the result shown in the example, it follows that

$$\int \sqrt{1-x^2}\,dx = \frac{1}{2}\left(\arcsin x + x\sqrt{1-x^2}\right).$$

The graph of $y = (\arctan x)^2$ has a horizontal asymptote at $y = \pi^2/4$.
Figure 5.27

EXAMPLE 6 Analyzing an Inverse Trigonometric Graph

Analyze the graph of $y = (\arctan x)^2$.

Solution By examining the derivative of y with respect to x

$$y' = 2(\arctan x)\left(\frac{1}{1 + x^2}\right) \qquad \text{Differentiate with respect to } x.$$

$$= \frac{2 \arctan x}{1 + x^2} \qquad \text{Simplify.}$$

you can determine that the only critical number is $x = 0$. By the First Derivative Test, this value corresponds to a relative minimum at $(0, 0)$. From the first derivative, it follows that the graph is decreasing on the interval $(-\infty, 0)$ and increasing on $(0, \infty)$. From the second derivative

$$y'' = \frac{(1 + x^2)\left(\frac{2}{1 + x^2}\right) - (2 \arctan x)(2x)}{(1 + x^2)^2} \qquad \text{Differentiate with respect to } x.$$

$$= \frac{2(1 - 2x \arctan x)}{(1 + x^2)^2} \qquad \text{Simplify.}$$

it follows that points of inflection occur when $2x \arctan x = 1$. Using Newton's Method, these points occur when $x \approx \pm 0.765$. Finally, because

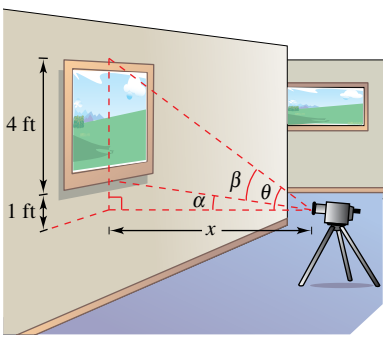
$$\lim_{x \to \pm\infty} (\arctan x)^2 = \frac{\pi^2}{4} \qquad \text{Limit as } x \text{ approaches } -\infty \text{ and } +\infty$$

it follows that the graph has a horizontal asymptote at $y = \pi^2/4$. The graph is shown in Figure 5.27.

EXAMPLE 7 Maximizing an Angle

See LarsonCalculus.com for an interactive version of this type of example.

A photographer is taking a picture of a painting hung in an art gallery. The height of the painting is 4 feet. The camera lens is 1 foot below the lower edge of the painting, as shown in the figure at the right. How far should the camera be from the painting to maximize the angle subtended by the camera lens?



Not drawn to scale

The camera should be 2.236 feet from the painting to maximize the angle β.

Solution In the figure, let β be the angle to be maximized.

$$\beta = \theta - \alpha = \operatorname{arccot} \frac{x}{5} - \operatorname{arccot} x$$

Differentiating with respect to x produces

$$\frac{d\beta}{dx} = \frac{-1/5}{1 + (x^2/25)} - \frac{-1}{1 + x^2}$$

$$= \frac{-5}{25 + x^2} + \frac{1}{1 + x^2}$$

$$= \frac{4(5 - x^2)}{(25 + x^2)(1 + x^2)}.$$

Because $d\beta/dx = 0$ when $x = \sqrt{5}$, you can conclude from the First Derivative Test that this distance yields a maximum value of β. So, the distance is $x \approx 2.236$ feet and the angle is $\beta \approx 0.7297$ radian $\approx 41.81°$.

REMARK In Example 7, you could also let $\theta = \operatorname{arctan}(5/x)$ and $\alpha = \operatorname{arctan}(1/x)$. Although these expressions are more difficult to use than those in Example 7, you should obtain the same answer. Try verifying this.

GALILEO GALILEI (1564–1642)

Galileo's approach to science departed from the accepted Aristotelian view that nature had describable *qualities*, such as "fluidity" and "potentiality." He chose to describe the physical world in terms of measurable *quantities*, such as time, distance, force, and mass. *See LarsonCalculus.com to read more of this biography.*

Review of Basic Differentiation Rules

In the 1600s, Europe was ushered into the scientific age by such great thinkers as Descartes, Galileo, Huygens, Newton, and Kepler. These men believed that nature is governed by basic laws—laws that can, for the most part, be written in terms of mathematical equations. One of the most influential publications of this period—*Dialogue on the Great World Systems*, by Galileo Galilei—has become a classic description of modern scientific thought.

As mathematics has developed during the past few hundred years, a small number of elementary functions have proven sufficient for modeling most* phenomena in physics, chemistry, biology, engineering, economics, and a variety of other fields. An **elementary function** is a function from the following list or one that can be formed as the sum, product, quotient, or composition of functions in the list.

Algebraic Functions	**Transcendental Functions**
Polynomial functions	Logarithmic functions
Rational functions	Exponential functions
Functions involving radicals	Trigonometric functions
	Inverse trigonometric functions

With the differentiation rules introduced so far in the text, you can differentiate *any* elementary function. For convenience, these differentiation rules are summarized below.

Basic Differentiation Rules for Elementary Functions

1. $\frac{d}{dx}[cu] = cu'$
2. $\frac{d}{dx}[u \pm v] = u' \pm v'$
3. $\frac{d}{dx}[uv] = uv' + vu'$
4. $\frac{d}{dx}\left[\frac{u}{v}\right] = \frac{vu' - uv'}{v^2}$
5. $\frac{d}{dx}[c] = 0$
6. $\frac{d}{dx}[u^n] = nu^{n-1}u'$
7. $\frac{d}{dx}[x] = 1$
8. $\frac{d}{dx}[|u|] = \frac{u}{|u|}(u'), \quad u \neq 0$
9. $\frac{d}{dx}[\ln u] = \frac{u'}{u}$
10. $\frac{d}{dx}[e^u] = e^u u'$
11. $\frac{d}{dx}[\log_a u] = \frac{u'}{(\ln a)u}$
12. $\frac{d}{dx}[a^u] = (\ln a)a^u u'$
13. $\frac{d}{dx}[\sin u] = (\cos u)u'$
14. $\frac{d}{dx}[\cos u] = -(\sin u)u'$
15. $\frac{d}{dx}[\tan u] = (\sec^2 u)u'$
16. $\frac{d}{dx}[\cot u] = -(\csc^2 u)u'$
17. $\frac{d}{dx}[\sec u] = (\sec u \tan u)u'$
18. $\frac{d}{dx}[\csc u] = -(\csc u \cot u)u'$
19. $\frac{d}{dx}[\arcsin u] = \frac{u'}{\sqrt{1 - u^2}}$
20. $\frac{d}{dx}[\arccos u] = \frac{-u'}{\sqrt{1 - u^2}}$
21. $\frac{d}{dx}[\arctan u] = \frac{u'}{1 + u^2}$
22. $\frac{d}{dx}[\operatorname{arccot} u] = \frac{-u'}{1 + u^2}$
23. $\frac{d}{dx}[\operatorname{arcsec} u] = \frac{u'}{|u|\sqrt{u^2 - 1}}$
24. $\frac{d}{dx}[\operatorname{arccsc} u] = \frac{-u'}{|u|\sqrt{u^2 - 1}}$

FOR FURTHER INFORMATION

For more on the derivative of the arctangent function, see the article "Differentiating the Arctangent Directly" by Eric Key in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

* Some important functions used in engineering and science (such as Bessel functions and gamma functions) are not elementary functions.

5.7 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

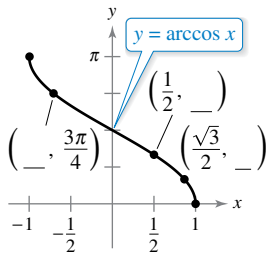
Concept Check

1. Describe the meaning of $\arccos x$.
2. Give the definition of a restricted domain. Why are restricted domains necessary to define inverse trigonometric functions?
3. Which inverse trigonometric function has a range of $0 < y < \pi$?
4. Find the missing value.

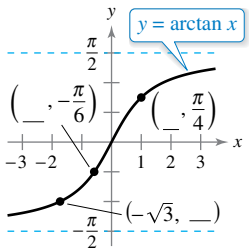
$$\frac{d}{dx}[\operatorname{arccsc} x^3] = \frac{\square}{|x^3|\sqrt{x^6 - 1}}$$

Finding Coordinates In Exercises 5 and 6, determine the missing coordinates of the points on the graph of the function.

5.



6.



Evaluating Inverse Trigonometric Functions In Exercises 7–14, evaluate the expression without using a calculator.

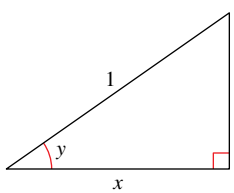
7. $\arcsin \frac{1}{2}$
8. $\arcsin 0$
9. $\arccos \frac{1}{2}$
10. $\arccos(-1)$
11. $\arctan \frac{\sqrt{3}}{3}$
12. $\operatorname{arccot}(-\sqrt{3})$
13. $\operatorname{arccsc}(-\sqrt{2})$
14. $\operatorname{arcsec} 2$

Approximating Inverse Trigonometric Functions In Exercises 15–18, use a calculator to approximate the value. Round your answer to two decimal places.

15. $\arccos(0.051)$
16. $\arcsin(-0.39)$
17. $\operatorname{arcsec} 1.269$
18. $\operatorname{arccsc}(-4.487)$

Using a Right Triangle In Exercises 19–24, use the figure to write the expression in algebraic form given $y = \arccos x$, where $0 < y < \pi/2$.

19. $\cos y$
20. $\sin y$
21. $\tan y$
22. $\cot y$
23. $\sec y$
24. $\csc y$



Evaluating an Expression In Exercises 25–28, evaluate each expression without using a calculator. (*Hint:* Sketch a right triangle, as demonstrated in Example 3.)

25. (a) $\sin\left(\arctan \frac{3}{4}\right)$ (b) $\sec\left(\arcsin \frac{4}{5}\right)$
26. (a) $\tan\left(\arccos \frac{\sqrt{2}}{2}\right)$ (b) $\cos\left(\arcsin \frac{5}{13}\right)$
27. (a) $\cot\left[\arcsin\left(-\frac{1}{2}\right)\right]$ (b) $\csc\left[\arctan\left(-\frac{5}{12}\right)\right]$
28. (a) $\sec\left[\arctan\left(-\frac{3}{5}\right)\right]$ (b) $\tan\left[\arcsin\left(-\frac{5}{6}\right)\right]$

Simplifying an Expression Using a Right Triangle In Exercises 29–36, write the expression in algebraic form. (*Hint:* Sketch a right triangle, as demonstrated in Example 3.)

29. $\cos(\arcsin 2x)$
30. $\sec(\arctan 6x)$
31. $\sin(\operatorname{arcsec} x)$
32. $\cos(\operatorname{arccot} x)$
33. $\tan\left(\operatorname{arcsec} \frac{x}{3}\right)$
34. $\sec[\arcsin(x - 1)]$
35. $\csc\left(\arctan \frac{x}{\sqrt{2}}\right)$
36. $\cos\left(\arcsin \frac{x - h}{r}\right)$

Solving an Equation In Exercises 37–40, solve the equation for x.

37. $\arcsin(3x - \pi) = \frac{1}{2}$
38. $\arctan(2x - 5) = -1$
39. $\arcsin \sqrt{2x} = \arccos \sqrt{x}$
40. $\arccos x = \operatorname{arcsec} x$

Finding a Derivative In Exercises 41–56, find the derivative of the function.

41. $f(x) = \arcsin(x - 1)$
42. $f(t) = \operatorname{arccsc}(-t^2)$
43. $g(x) = 3 \arccos \frac{x}{2}$
44. $f(x) = \operatorname{arcsec} 2x$
45. $f(x) = \arctan e^x$
46. $f(x) = \operatorname{arccot} \sqrt{x}$
47. $g(x) = \dfrac{\arcsin 3x}{x}$
48. $h(x) = x^2 \arctan 5x$
49. $h(t) = \sin(\arccos t)$
50. $f(x) = \arcsin x + \arccos x$
51. $y = 2x \arccos x - 2\sqrt{1 - x^2}$
52. $y = x \arctan 2x - \frac{1}{4}\ln(1 + 4x^2)$
53. $y = \frac{1}{2}\left(\frac{1}{2}\ln\dfrac{x + 1}{x - 1} + \arctan x\right)$
54. $y = \frac{1}{2}\left[x\sqrt{4 - x^2} + 4 \arcsin \frac{x}{2}\right]$
55. $y = 8 \arcsin \dfrac{x}{4} - \dfrac{x\sqrt{16 - x^2}}{2}$
56. $y = \arctan x + \dfrac{x}{1 + x^2}$

Finding an Equation of a Tangent Line **In Exercises 57–62, find an equation of the tangent line to the graph of the function at the given point.**

57. $y = 2 \arcsin x, \quad \left(\frac{1}{2}, \frac{\pi}{3}\right)$

58. $y = -\frac{1}{4} \arccos x, \quad \left(-\frac{1}{2}, -\frac{\pi}{6}\right)$

59. $y = \arctan \frac{x}{2}, \quad \left(2, \frac{\pi}{4}\right)$

60. $y = \operatorname{arcsec} 4x, \quad \left(\frac{\sqrt{2}}{4}, \frac{\pi}{4}\right)$

61. $y = 4x \arccos(x - 1), \quad (1, 2\pi)$

62. $y = 3x \arcsin x, \quad \left(\frac{1}{2}, \frac{\pi}{4}\right)$

Finding Relative Extrema **In Exercises 63–66, find any relative extrema of the function.**

63. $f(x) = \operatorname{arcsec} x - x$

64. $f(x) = \arcsin x - 2x$

65. $f(x) = \arctan x - \arctan(x - 4)$

66. $h(x) = \arcsin x - 2 \arctan x$

Analyzing an Inverse Trigonometric Graph **In Exercises 67–70, analyze and sketch a graph of the function. Identify any relative extrema, points of inflection, and asymptotes. Use a graphing utility to verify your results.**

67. $f(x) = \arcsin(x - 1)$

68. $f(x) = \arctan x + \frac{\pi}{2}$

69. $f(x) = \operatorname{arcsec} 2x$

70. $f(x) = \arccos \frac{x}{4}$

Implicit Differentiation **In Exercises 71–74, use implicit differentiation to find an equation of the tangent line to the graph of the equation at the given point.**

71. $x^2 + x \arctan y = y - 1, \quad \left(-\frac{\pi}{4}, 1\right)$

72. $\arctan(xy) = \arcsin(x + y), \quad (0, 0)$

73. $\arcsin x + \arcsin y = \frac{\pi}{2}, \quad \left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$

74. $\arctan(x + y) = y^2 + \frac{\pi}{4}, \quad (1, 0)$

75. Finding Values

(a) Use a graphing utility to evaluate $\arcsin(\arcsin 0.5)$ and $\arcsin(\arcsin 1)$.

(b) Let

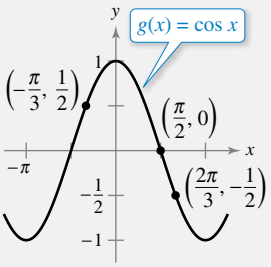
$$f(x) = \arcsin(\arcsin x).$$

Find the values of x in the interval $-1 \le x \le 1$ such that $f(x)$ is a real number.

76. HOW DO YOU SEE IT? The graph of $g(x) = \cos x$ is shown below. Explain whether the points

$$\left(-\frac{1}{2}, \frac{2\pi}{3}\right), \quad \left(0, \frac{\pi}{2}\right), \quad \text{and} \quad \left(\frac{1}{2}, -\frac{\pi}{3}\right)$$

lie on the graph of $y = \arccos x$.



Exploring Concepts

77. Determine whether

$$\frac{\arcsin x}{\arccos x} = \arctan x.$$

78. Determine whether each inverse trigonometric function can be defined as shown. Explain.

(a) $y = \operatorname{arcsec} x$, Domain: $x > 1$, Range: $-\frac{\pi}{2} < y < \frac{\pi}{2}$

(b) $y = \operatorname{arccsc} x$, Domain: $x > 1$, Range: $0 < y < \pi$

79. Explain why $\sin 2\pi = 0$ does not imply that $\arcsin 0 = 2\pi$.

80. Explain why $\tan \pi = 0$ does not imply that $\arctan 0 = \pi$.

Verifying Identities **In Exercises 81 and 82, verify each identity.**

81. (a) $\operatorname{arccsc} x = \arcsin \frac{1}{x}, \quad |x| \ge 1$

(b) $\arctan x + \arctan \frac{1}{x} = \frac{\pi}{2}, \quad x > 0$

82. (a) $\arcsin(-x) = -\arcsin x, \quad |x| \le 1$

(b) $\arccos(-x) = \pi - \arccos x, \quad |x| \le 1$

True or False? **In Exercises 83–86, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

83. The slope of the graph of the inverse tangent function is positive for all x.

84. The range of $y = \arcsin x$ is $[0, \pi]$.

85. $\frac{d}{dx}[\arctan(\tan x)] = 1$ for all x in the domain.

86. $\arcsin^2 x + \arccos^2 x = 1$

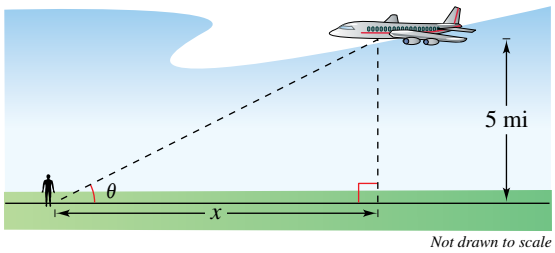
87. Angular Rate of Change An airplane flies at an altitude of 5 miles toward a point directly over an observer. Consider θ and x as shown in the figure.



(a) Write θ as a function of x.

(b) The speed of the plane is 400 miles per hour. Find $d\theta/dt$ when $x = 10$ miles and $x = 3$ miles.

88. Writing Repeat Exercise 87 for an altitude of 3 miles and describe how the altitude affects the rate of change of θ.

89. Angular Rate of Change In a free-fall experiment, an object is dropped from a height of 256 feet. A camera on the ground 500 feet from the point of impact records the fall of the object (see figure).

(a) Find the position function that yields the height of the object at time t, assuming the object is released at time $t = 0$. At what time will the object reach ground level?

(b) Find the rates of change of the angle of elevation of the camera when $t = 1$ and $t = 2$.

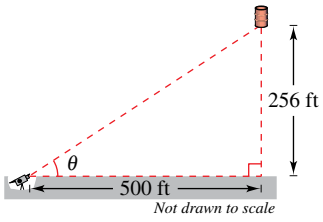


Figure for 89

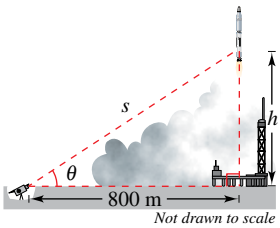

Figure for 90

90. Angular Rate of Change A television camera at ground level is filming the liftoff of a rocket at a point 800 meters from the launch pad. Let θ be the angle of elevation of the rocket and let s be the distance between the camera and the rocket (see figure). Write θ as a function of s for the period of time when the rocket is moving vertically. Differentiate the result to find $d\theta/dt$ in terms of s and ds/dt.

91. Maximizing an Angle A billboard 85 feet wide is perpendicular to a straight road and is 40 feet from the road (see figure). Find the point on the road at which the angle θ subtended by the billboard is a maximum.

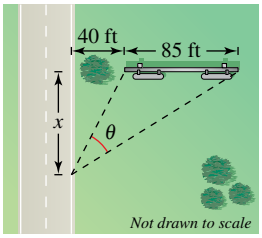

Figure for 91

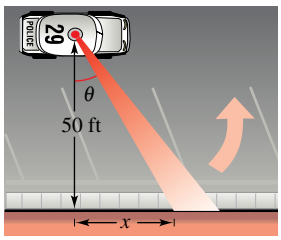

Figure for 92

92. Angular Speed A patrol car is parked 50 feet from a long warehouse (see figure). The revolving light on top of the car turns at a rate of 30 revolutions per minute. Write θ as a function of x. Use inverse trigonometric functions to find how fast the light beam is moving along the wall when the beam makes an angle of $\theta = 45°$ with the line perpendicular from the light to the wall.

93. Proof

Prove that $\arctan x + \arctan y = \arctan \dfrac{x + y}{1 - xy}$, $xy \neq 1$.

94. Proof Prove each differentiation formula.

(a) $\dfrac{d}{dx}[\arctan u] = \dfrac{u'}{1 + u^2}$

(b) $\dfrac{d}{dx}[\operatorname{arccot} u] = \dfrac{-u'}{1 + u^2}$

(c) $\dfrac{d}{dx}[\operatorname{arcsec} u] = \dfrac{u'}{|u|\sqrt{u^2 - 1}}$

(d) $\dfrac{d}{dx}[\operatorname{arccsc} u] = \dfrac{-u'}{|u|\sqrt{u^2 - 1}}$

95. Describing a Graph Use a graphing utility to graph the function $f(x) = \arccos x + \arcsin x$ on the interval $[-1, 1]$.

(a) Describe the graph of f.

(b) Verify the result of part (a) analytically.

96. Think About It Use a graphing utility to graph $f(x) = \sin x$ and $g(x) = \arcsin(\sin x)$.

(a) Explain why the graph of g is not the line $y = x$.

(b) Determine the extrema of g.

97. Maximizing an Angle In the figure, find the value of c in the interval $[0, 4]$ on the x-axis that maximizes angle θ.

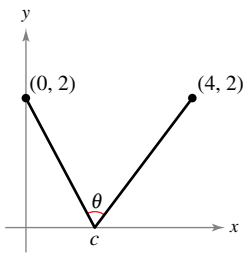

Figure for 97

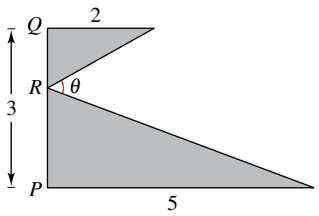

Figure for 98

98. Finding a Distance In the figure, find PR such that $0 \leq PR \leq 3$ and $m\angle\theta$ is a maximum.

99. Inverse Secant Function Some calculus textbooks define the inverse secant function using the range $[0, \pi/2) \cup [\pi, 3\pi/2)$.

(a) Sketch the graph $y = \operatorname{arcsec} x$ using this range.

(b) Show that $y' = \dfrac{1}{x\sqrt{x^2 - 1}}$.

100. Proof Prove that $\arcsin x = \arctan \dfrac{x}{\sqrt{1 - x^2}}$, $|x| < 1$.

5.8 Inverse Trigonometric Functions: Integration

GO DIGITAL

- Integrate functions whose antiderivatives involve inverse trigonometric functions.
- Use the method of completing the square to integrate a function.
- Review the basic integration rules involving elementary functions.

Integrals Involving Inverse Trigonometric Functions

The derivatives of the six inverse trigonometric functions fall into three pairs. In each pair, the derivative of one function is the negative of the other. For example,

$$\frac{d}{dx}[\arcsin x] = \frac{1}{\sqrt{1 - x^2}}$$

and

$$\frac{d}{dx}[\arccos x] = -\frac{1}{\sqrt{1 - x^2}}.$$

When listing the *antiderivative* that corresponds to each of the inverse trigonometric functions, you need to use only one member from each pair. It is conventional to use $\arcsin x$ as the antiderivative of $1/\sqrt{1 - x^2}$, rather than $-\arccos x$. The next theorem gives one antiderivative formula for each of the three pairs. The proofs of these integration rules are left to you (see Exercises 75–77).

FOR FURTHER INFORMATION
For a detailed proof of rule 2 of Theorem 5.19, see the article "A Direct Proof of the Integral Formula for Arctangent" by Arnold J. Insel in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

THEOREM 5.19 Integrals Involving Inverse Trigonometric Functions

Let u be a differentiable function of x, and let $a > 0$.

1. $\displaystyle\int \frac{du}{\sqrt{a^2 - u^2}} = \arcsin\frac{u}{a} + C$
2. $\displaystyle\int \frac{du}{a^2 + u^2} = \frac{1}{a}\arctan\frac{u}{a} + C$
3. $\displaystyle\int \frac{du}{u\sqrt{u^2 - a^2}} = \frac{1}{a}\operatorname{arcsec}\frac{|u|}{a} + C$

EXAMPLE 1 Integration with Inverse Trigonometric Functions

a. $\displaystyle\int \frac{dx}{\sqrt{4 - x^2}} = \arcsin\frac{x}{2} + C$ $\quad u = x,\ a = 2$

b. $\displaystyle\int \frac{dx}{2 + 9x^2} = \frac{1}{3}\int \frac{3\,dx}{(\sqrt{2})^2 + (3x)^2}$ $\quad u = 3x,\ a = \sqrt{2}$

$$= \frac{1}{3\sqrt{2}}\arctan\frac{3x}{\sqrt{2}} + C$$

c. $\displaystyle\int \frac{dx}{x\sqrt{4x^2 - 9}} = \int \frac{2\,dx}{2x\sqrt{(2x)^2 - 3^2}}$ $\quad u = 2x,\ a = 3$

$$= \frac{1}{3}\operatorname{arcsec}\frac{|2x|}{3} + C$$

The integrals in Example 1 are fairly straightforward applications of integration formulas. Unfortunately, this is not typical. The integration formulas for inverse trigonometric functions can be disguised in many ways.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

EXAMPLE 2 **Integration by Substitution**

Find $\int \frac{dx}{\sqrt{e^{2x} - 1}}$.

Solution As it stands, this integral does not fit any of the three inverse trigonometric formulas. Using the substitution $u = e^x$, however, produces

$$u = e^x \quad \Rightarrow \quad du = e^x\,dx \quad \Rightarrow \quad dx = \frac{du}{e^x} = \frac{du}{u}.$$

With this substitution, you can integrate as shown.

$$\begin{aligned}
\int \frac{dx}{\sqrt{e^{2x} - 1}} &= \int \frac{dx}{\sqrt{(e^x)^2 - 1}} && \text{Write } e^{2x} \text{ as } (e^x)^2. \\
&= \int \frac{du/u}{\sqrt{u^2 - 1}} && \text{Substitute.} \\
&= \int \frac{du}{u\sqrt{u^2 - 1}} && \text{Rewrite to fit Arcsecant Rule.} \\
&= \operatorname{arcsec} \frac{|u|}{1} + C && \text{Apply Arcsecant Rule.} \\
&= \operatorname{arcsec} e^x + C && \text{Back-substitute.}
\end{aligned}$$

Note that the absolute value sign is not necessary in the final answer because $e^x > 0$.

TECHNOLOGY A graphing utility can be useful for integrating functions such as the one in Example 2. In some cases, the utility may fail to find an antiderivative, often for two reasons. First, some elementary functions do not have antiderivatives that are elementary functions. Second, every utility has limitations—you might have entered a function that the utility was not programmed to find. Also, remember that antiderivatives can be written in many different forms. For instance, one utility found the integral in Example 2 to be

$$\int \frac{dx}{\sqrt{e^{2x} - 1}} = \arctan \sqrt{e^{2x} - 1} + C.$$

Show that this antiderivative is equivalent to the one found in Example 2.

EXAMPLE 3 **Rewriting as the Sum of Two Quotients**

Find $\int \frac{x + 2}{\sqrt{4 - x^2}}\,dx$.

Solution This integral does not appear to fit any of the basic integration formulas. By splitting the integrand into two parts, however, notice that the first part can be found with the Power Rule and the second part yields an inverse sine function.

$$\begin{aligned}
\int \frac{x + 2}{\sqrt{4 - x^2}}\,dx &= \int \frac{x}{\sqrt{4 - x^2}}\,dx + \int \frac{2}{\sqrt{4 - x^2}}\,dx \\
&= -\frac{1}{2}\int (4 - x^2)^{-1/2}(-2x)\,dx + 2\int \frac{1}{\sqrt{4 - x^2}}\,dx \\
&= -\frac{1}{2}\left[\frac{(4 - x^2)^{1/2}}{1/2}\right] + 2 \arcsin \frac{x}{2} + C \\
&= -\sqrt{4 - x^2} + 2 \arcsin \frac{x}{2} + C
\end{aligned}$$

GO DIGITAL

Completing the Square

Completing the square helps when quadratic functions are involved in the integrand. For example, the quadratic $x^2 + bx + c$ can be written as the difference of two squares by adding and subtracting $(b/2)^2$.

$$x^2 + bx + c = x^2 + bx + \left(\frac{b}{2}\right)^2 - \left(\frac{b}{2}\right)^2 + c = \left(x + \frac{b}{2}\right)^2 - \left(\frac{b}{2}\right)^2 + c$$

EXAMPLE 4 Completing the Square

See LarsonCalculus.com for an interactive version of this type of example.

Find $\displaystyle\int \frac{dx}{x^2 - 4x + 7}$.

Solution First, rewrite the denominator as the sum of two squares, as shown.

$$x^2 - 4x + 7 = (x^2 - 4x + 4) - 4 + 7 = (x - 2)^2 + 3 = u^2 + a^2$$

Now, in this completed square form, let $u = x - 2$ and $a = \sqrt{3}$.

$$\int \frac{dx}{x^2 - 4x + 7} = \int \frac{dx}{(x - 2)^2 + 3} = \frac{1}{\sqrt{3}} \arctan \frac{x - 2}{\sqrt{3}} + C$$

When the leading coefficient is not 1, it helps to factor before completing the square. For example, to complete the square for $2x^2 - 8x + 10$, factor out 2 first.

$$2x^2 - 8x + 10 = 2(x^2 - 4x + 5) = 2(x^2 - 4x + 4 - 4 + 5) = 2\left[(x - 2)^2 + 1\right]$$

To complete the square when the coefficient of x^2 is negative, use the same factoring process shown above. For instance, you can complete the square for $3x - x^2$ as shown.

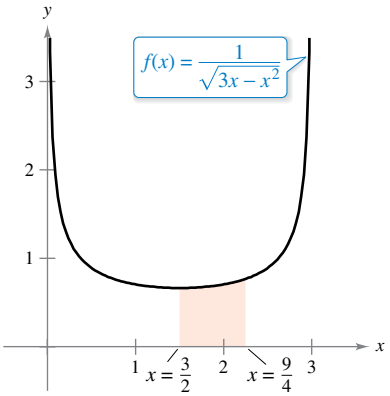
$$3x - x^2 = -(x^2 - 3x) = -\left[x^2 - 3x + \left(\frac{3}{2}\right)^2 - \left(\frac{3}{2}\right)^2\right] = \left(\frac{3}{2}\right)^2 - \left(x - \frac{3}{2}\right)^2$$

EXAMPLE 5 Completing the Square

Find the area of the region bounded by the graph of

$$f(x) = \frac{1}{\sqrt{3x - x^2}}$$

the x-axis, and the lines $x = \frac{3}{2}$ and $x = \frac{9}{4}$.



The area of the region bounded by the graph of f, the x-axis, $x = \frac{3}{2}$, and $x = \frac{9}{4}$ is $\pi/6$.

Figure 5.28

Solution In Figure 5.28, you can see that the area is

$$\begin{aligned}
\text{Area} &= \int_{3/2}^{9/4} \frac{1}{\sqrt{3x - x^2}}\,dx \\
&= \int_{3/2}^{9/4} \frac{dx}{\sqrt{(3/2)^2 - [x - (3/2)]^2}} && \text{Use completed square form derived above.} \\
&= \arcsin \frac{x - (3/2)}{3/2}\Bigg]_{3/2}^{9/4} \\
&= \arcsin \frac{1}{2} - \arcsin 0 \\
&= \frac{\pi}{6} \\
&\approx 0.524.
\end{aligned}$$

Review of Basic Integration Rules

You have now completed the introduction of the **basic integration rules.** With enough practice, you will become more efficient at applying these rules.

Basic Integration Rules ($a > 0$)

1. $\int kf(u)\,du = k\int f(u)\,du$
2. $\int [f(u) \pm g(u)]\,du = \int f(u)\,du \pm \int g(u)\,du$
3. $\int du = u + C$
4. $\int u^n\,du = \frac{u^{n+1}}{n+1} + C, \quad n \neq -1$
5. $\int \frac{du}{u} = \ln|u| + C$
6. $\int e^u\,du = e^u + C$
7. $\int a^u\,du = \left(\frac{1}{\ln a}\right)a^u + C$
8. $\int \sin u\,du = -\cos u + C$
9. $\int \cos u\,du = \sin u + C$
10. $\int \tan u\,du = -\ln|\cos u| + C$
11. $\int \cot u\,du = \ln|\sin u| + C$
12. $\int \sec u\,du = \ln|\sec u + \tan u| + C$
13. $\int \csc u\,du = -\ln|\csc u + \cot u| + C$
14. $\int \sec^2 u\,du = \tan u + C$
15. $\int \csc^2 u\,du = -\cot u + C$
16. $\int \sec u \tan u\,du = \sec u + C$
17. $\int \csc u \cot u\,du = -\csc u + C$
18. $\int \frac{du}{\sqrt{a^2 - u^2}} = \arcsin\frac{u}{a} + C$
19. $\int \frac{du}{a^2 + u^2} = \frac{1}{a}\arctan\frac{u}{a} + C$
20. $\int \frac{du}{u\sqrt{u^2 - a^2}} = \frac{1}{a}\operatorname{arcsec}\frac{|u|}{a} + C$

You can learn a lot about the nature of integration by comparing this list with the summary of differentiation rules given in the preceding section. For differentiation, you now have rules that allow you to differentiate *any* elementary function. For integration, this is far from true.

The integration rules listed above are primarily those that were discovered during the development of differentiation rules. So far, you have not learned any rules or techniques for finding the antiderivative of a general product or quotient, the natural logarithmic function, or the inverse trigonometric functions. More important, you cannot apply any of the rules in this list unless you can create the proper du corresponding to the u in the formula. The point is that you need to work more on integration techniques, which you will do in Chapter 8. The next two examples should give you a better feeling for the integration problems that you *can* and *cannot* solve with the techniques and rules you now know.

EXAMPLE 6 Comparing Integration Problems

Use the formulas and techniques you have studied so far in this text to find each integral, if possible.

a. $\int \frac{dx}{x\sqrt{x^2-4}}$ **b.** $\int \frac{x\,dx}{\sqrt{x^2-4}}$ **c.** $\int \frac{dx}{\sqrt{x^2-4}}$

Solution

a. You *can* find this integral (it fits the Arcsecant Rule).

$$\int \frac{dx}{x\sqrt{x^2-4}} = \frac{1}{2}\operatorname{arcsec}\left|\frac{x}{2}\right| + C \qquad u = x,\ a = 2$$

b. You *can* find this integral (it fits the Power Rule).

$$\begin{aligned}\int \frac{x\,dx}{\sqrt{x^2-4}} &= \frac{1}{2}\int (x^2-4)^{-1/2}(2x)\,dx \qquad u = x^2-4\\ &= \frac{1}{2}\left[\frac{(x^2-4)^{1/2}}{1/2}\right] + C\\ &= \sqrt{x^2-4} + C\end{aligned}$$

c. You *cannot* find this integral using the techniques you have studied so far. (You should scan the list of basic integration rules to verify this conclusion.)

EXAMPLE 7 Comparing Integration Problems

Use the formulas and techniques you have studied so far in this text to find each integral, if possible.

a. $\int \frac{dx}{x\ln x}$ **b.** $\int \frac{\ln x\,dx}{x}$ **c.** $\int \ln x\,dx$

Solution

a. You *can* find this integral (it fits the Log Rule).

$$\begin{aligned}\int \frac{dx}{x\ln x} &= \int \frac{1/x}{\ln x}\,dx \qquad u = \ln x\\ &= \ln|\ln x| + C\end{aligned}$$

b. You *can* find this integral (it fits the Power Rule).

$$\begin{aligned}\int \frac{\ln x\,dx}{x} &= \int \left(\frac{1}{x}\right)(\ln x)^1\,dx \qquad u = \ln x\\ &= \frac{(\ln x)^2}{2} + C\end{aligned}$$

c. You *cannot* find this integral using the techniques you have studied so far. ■

Note in Examples 6 and 7 that the *simplest* functions are those you cannot yet integrate. In Chapter 8, you will learn that the integral in Example 6(c) can be found using *trigonometric substitution* (see Section 8.4, Exercise 20). The integral in Example 7(c) can be found using *integration by parts* (see Section 8.2, Example 3), and the result is shown below. Verify this result by differentiating the antiderivative.

$$\int \ln x\,dx = x\ln x - x + C$$

5.8 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Decide whether you can find each integral using the formulas and techniques you have studied so far. Explain. Do not integrate.

(a) $\int \frac{2\,dx}{\sqrt{x^2+4}}$ (b) $\int \frac{dx}{x\sqrt{x^2-9}}$

2. Describe the process of completing the square of a quadratic function. Explain when completing the square is useful for finding an integral.

Finding an Indefinite Integral

In Exercises 3–22, find the indefinite integral.

3. $\int \frac{dx}{\sqrt{9-x^2}}$
4. $\int \frac{dx}{\sqrt{1-4x^2}}$
5. $\int \frac{1}{x\sqrt{4x^2-1}}\,dx$
6. $\int \frac{12}{1+9x^2}\,dx$
7. $\int \frac{1}{\sqrt{1-(x+1)^2}}\,dx$
8. $\int \frac{7}{4+(3-x)^2}\,dx$
9. $\int \frac{t}{\sqrt{1-t^4}}\,dt$
10. $\int \frac{1}{x\sqrt{x^4-4}}\,dx$
11. $\int \frac{t}{t^4+25}\,dt$
12. $\int \frac{1}{x\sqrt{1-(\ln x)^2}}\,dx$
13. $\int \frac{e^{2x}}{4+e^{4x}}\,dx$
14. $\int \frac{5}{x\sqrt{9x^2-11}}\,dx$
15. $\int \frac{-\csc x\cot x}{\sqrt{25-\csc^2 x}}\,dx$
16. $\int \frac{\sin x}{7+\cos^2 x}\,dx$
17. $\int \frac{1}{\sqrt{x}\sqrt{1-x}}\,dx$
18. $\int \frac{3}{2\sqrt{x}(1+x)}\,dx$
19. $\int \frac{x-3}{x^2+1}\,dx$
20. $\int \frac{x^2+8}{x\sqrt{x^2-4}}\,dx$
21. $\int \frac{x+5}{\sqrt{9-(x-3)^2}}\,dx$
22. $\int \frac{x-2}{(x+1)^2+4}\,dx$

Evaluating a Definite Integral

In Exercises 23–34, evaluate the definite integral.

23. $\int_0^{1/6} \frac{3}{\sqrt{1-9x^2}}\,dx$
24. $\int_0^{\sqrt{2}} \frac{1}{\sqrt{4-x^2}}\,dx$
25. $\int_0^{\sqrt{3}/2} \frac{1}{1+4x^2}\,dx$
26. $\int_{\sqrt{3}}^{3} \frac{1}{x\sqrt{4x^2-9}}\,dx$
27. $\int_1^7 \frac{1}{9+(x+2)^2}\,dx$
28. $\int_1^4 \frac{1}{x\sqrt{16x^2-5}}\,dx$
29. $\int_0^{\ln 5} \frac{e^x}{1+e^{2x}}\,dx$
30. $\int_{\ln 2}^{\ln 4} \frac{e^{-x}}{\sqrt{1-e^{-2x}}}\,dx$
31. $\int_{\pi/2}^{\pi} \frac{\sin x}{1+\cos^2 x}\,dx$
32. $\int_0^{\pi/2} \frac{\cos x}{1+\sin^2 x}\,dx$
33. $\int_0^{1/\sqrt{2}} \frac{\arcsin x}{\sqrt{1-x^2}}\,dx$
34. $\int_0^{1/\sqrt{2}} \frac{\arccos x}{\sqrt{1-x^2}}\,dx$

Completing the Square

In Exercises 35–44, find or evaluate the integral by completing the square.

35. $\int_0^2 \frac{dx}{x^2-2x+2}$
36. $\int_{-2}^3 \frac{dx}{x^2+4x+8}$
37. $\int \frac{2x}{x^2+6x+13}\,dx$
38. $\int \frac{2x-5}{x^2+2x+2}\,dx$
39. $\int \frac{dx}{\sqrt{-2x^2+8x+4}}$
40. $\int \frac{dx}{3x^2-6x+12}$
41. $\int \frac{1}{\sqrt{-x^2-4x}}\,dx$
42. $\int \frac{2}{\sqrt{-x^2+4x}}\,dx$
43. $\int_2^3 \frac{2x-3}{\sqrt{4x-x^2}}\,dx$
44. $\int_3^4 \frac{1}{(x-1)\sqrt{x^2-2x}}\,dx$

Integration by Substitution

In Exercises 45–48, use the specified substitution to find or evaluate the integral.

45. $\int \sqrt{e^t-3}\,dt$, $u=\sqrt{e^t-3}$
46. $\int \frac{\sqrt{x-2}}{x+1}\,dx$, $u=\sqrt{x-2}$
47. $\int_1^3 \frac{dx}{\sqrt{x}(1+x)}$, $u=\sqrt{x}$
48. $\int_0^1 \frac{dx}{2\sqrt{3-x}\sqrt{x+1}}$, $u=\sqrt{x+1}$

Comparing Integration Problems

In Exercises 49–52, find the indefinite integrals, if possible, using the formulas and techniques you have studied so far in the text.

49. (a) $\int \frac{1}{\sqrt{1-x^2}}\,dx$
(b) $\int \frac{x}{\sqrt{1-x^2}}\,dx$
(c) $\int \frac{1}{x\sqrt{1-x^2}}\,dx$

50. (a) $\int e^{x^2}\,dx$
(b) $\int xe^{x^2}\,dx$
(c) $\int \frac{1}{x^2}e^{1/x}\,dx$

51. (a) $\int \sqrt{x-1}\,dx$
(b) $\int x\sqrt{x-1}\,dx$
(c) $\int \frac{x}{\sqrt{x-1}}\,dx$

52. (a) $\int \frac{1}{1+x^4}\,dx$
(b) $\int \frac{x}{1+x^4}\,dx$
(c) $\int \frac{x^3}{1+x^4}\,dx$

Exploring Concepts

In Exercises 53 and 54, show that the antiderivatives are equivalent.

53. $\int \frac{3x^2}{\sqrt{1-x^6}}\,dx = \arcsin x^3 + C$ or $\arccos\sqrt{1-x^6} + C$

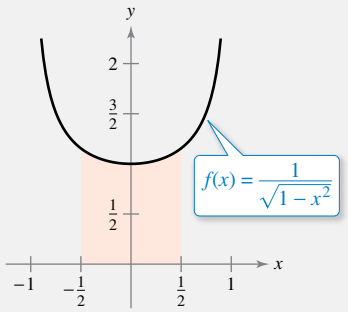
54. $\int \frac{6}{4+9x^2}\,dx = \arctan\frac{3x}{2} + C$ or $\operatorname{arccsc}\frac{\sqrt{4+9x^2}}{3x} + C$

55. The antiderivative of

$$\int \frac{1}{\sqrt{1-x^2}}\,dx$$

can be either $\arcsin x + C$ or $-\arccos x + C$. Does this mean that $\arcsin x = -\arccos x$? Explain.

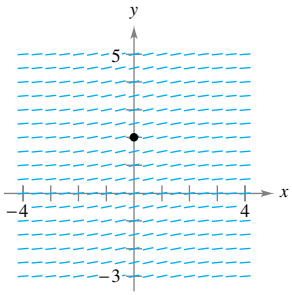
56. HOW DO YOU SEE IT? Using the graph, which value best approximates the area of the region between the x-axis and the function over the interval $\left[-\frac{1}{2}, \frac{1}{2}\right]$? Explain.



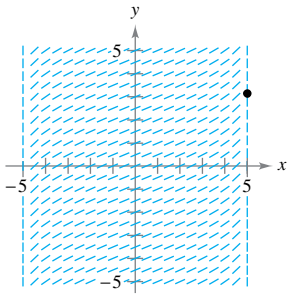
(a) -3 (b) $\frac{1}{2}$ (c) 1 (d) 2 (e) 4

Slope Field **In Exercises 57 and 58, a differential equation, a point, and a slope field are given. (a) Sketch two approximate solutions of the differential equation on the slope field, one of which passes through the given point. (To print an enlarged copy of the graph, go to *MathGraphs.com*.) (b) Use integration and the given point to find the particular solution of the differential equation and use a graphing utility to graph the solution. Compare the result with the sketch in part (a) that passes through the given point.**

57. $\frac{dy}{dx} = \frac{2}{9+x^2}$, $(0, 2)$



58. $\frac{dy}{dx} = \frac{2}{\sqrt{25-x^2}}$, $(5, \pi)$



Slope Field **In Exercises 59–62, use a graphing utility to graph the slope field for the differential equation and graph the particular solution satisfying the specified initial condition.**

59. $\frac{dy}{dx} = \frac{10}{x\sqrt{x^2-1}}$, $y(3) = 0$

60. $\frac{dy}{dx} = \frac{1}{12+x^2}$, $y(4) = 2$

61. $\frac{dy}{dx} = \frac{2y}{\sqrt{16-x^2}}$, $y(0) = 2$

62. $\frac{dy}{dx} = \frac{\sqrt{y}}{1+x^2}$, $y(0) = 4$

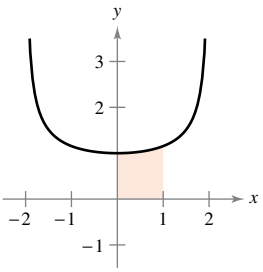
Differential Equation **In Exercises 63 and 64, find the particular solution of the differential equation that satisfies the initial condition.**

63. $\frac{dy}{dx} = \frac{1}{\sqrt{4-x^2}}$, $y(0) = \pi$

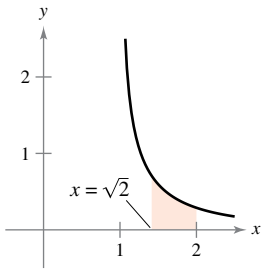
64. $\frac{dy}{dx} = \frac{1}{4+x^2}$, $y(2) = \pi$

Area **In Exercises 65–68, find the area of the given region. Use a graphing utility to verify your result.**

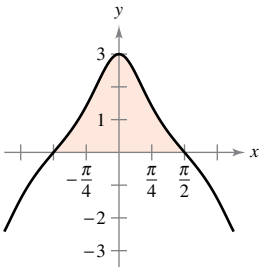
65. $y = \frac{2}{\sqrt{4-x^2}}$



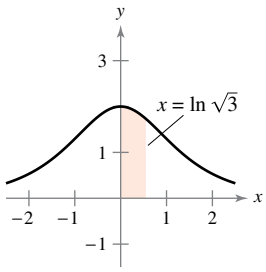
66. $y = \frac{1}{x\sqrt{x^2-1}}$



67. $y = \frac{3\cos x}{1+\sin^2 x}$



68. $y = \frac{4e^x}{1+e^{2x}}$



69. Area

(a) Sketch the region whose area is represented by

$$\int_0^1 \arcsin x\,dx.$$

(b) Use the integration capabilities of a graphing utility to approximate the area.

(c) Find the exact area analytically.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

70. Approximating Pi

(a) Show that

$$\int_0^1 \frac{4}{1+x^2}\,dx = \pi.$$

(b) Approximate the number π by using the integration capabilities of a graphing utility.

71. Investigation Consider the function

$$F(x) = \frac{1}{2}\int_x^{x+2} \frac{2}{t^2+1}\,dt.$$

(a) Write a short paragraph giving a geometric interpretation of the function $F(x)$ relative to the function

$$f(x) = \frac{2}{x^2+1}.$$

Use what you have written to guess the value of x that will make F maximum.

(b) Perform the specified integration to find an alternative form of $F(x)$. Use calculus to locate the value of x that will make F maximum and compare the result with your guess in part (a).

72. Comparing Integrals Consider the integral

$$\int \frac{1}{\sqrt{6x-x^2}}\,dx.$$

(a) Find the integral by completing the square of the radicand.

(b) Find the integral by making the substitution $u = \sqrt{x}$.

(c) The antiderivatives in parts (a) and (b) appear to be significantly different. Use a graphing utility to graph each antiderivative in the same viewing window and determine the relationship between them. Find the domain of each.

True or False? **In Exercises 73 and 74, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

73. $\displaystyle\int \frac{dx}{3x\sqrt{9x^2-16}} = \frac{1}{4}\operatorname{arcsec}\frac{3x}{4} + C$

74. $\displaystyle\int \frac{dx}{25+x^2} = \frac{1}{25}\arctan\frac{x}{25} + C$

Verifying an Integration Rule **In Exercises 75–77, verify the rule by differentiating. Let $a > 0$.**

75. $\displaystyle\int \frac{du}{\sqrt{a^2-u^2}} = \arcsin\frac{u}{a} + C$

76. $\displaystyle\int \frac{du}{a^2+u^2} = \frac{1}{a}\arctan\frac{u}{a} + C$

77. $\displaystyle\int \frac{du}{u\sqrt{u^2-a^2}} = \frac{1}{a}\operatorname{arcsec}\frac{|u|}{a} + C$

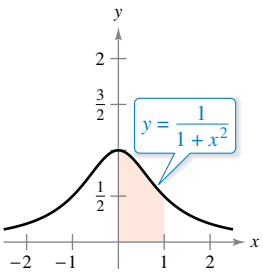
78. Proof Graph $y_1 = \dfrac{x}{1+x^2}$, $y_2 = \arctan x$, and $y_3 = x$ on $[0, 10]$. Prove that $\dfrac{x}{1+x^2} < \arctan x < x$ for $x > 0$.

79. Numerical Integration

(a) Write an integral that represents the area of the region in the figure.

(b) Use the Midpoint Rule with $n = 8$ to estimate the area of the region.

(c) Explain how you can use the results of parts (a) and (b) to estimate π.



80. Vertical Motion An object is projected upward from ground level with an initial velocity of 500 feet per second. In this exercise, the goal is to analyze the motion of the object during its upward flight.

(a) Find the velocity of the object as a function of time (neglect air resistance). Use a graphing utility to graph this function.

(b) Use the result of part (a) to find the position function and determine the maximum height attained by the object.

(c) When the air resistance is proportional to the square of the velocity, you obtain the equation

$$\frac{dv}{dt} = -(32 + kv^2)$$

where 32 feet per second per second is the acceleration due to gravity and k is a constant. Find the velocity as a function of time by solving the equation

$$\int \frac{dv}{32+kv^2} = -\int dt.$$

(d) Use a graphing utility to graph the velocity function $v(t)$ in part (c) for $k = 0.001$. Use the graph to approximate the time t_0 at which the object reaches its maximum height.

(e) Use the integration capabilities of a graphing utility to approximate the integral

$$\int_0^{t_0} v(t)\,dt$$

where $v(t)$ and t_0 are those found in part (d). This is the approximation of the maximum height of the object.

(f) Explain the difference between the results in parts (b) and (e).

5.9 Hyperbolic Functions

GO DIGITAL

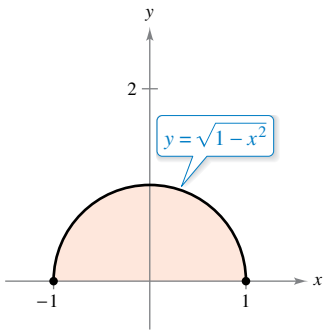
- Develop properties of hyperbolic functions.
- Differentiate and integrate hyperbolic functions.
- Develop properties of inverse hyperbolic functions.
- Differentiate and integrate functions involving inverse hyperbolic functions.

JOHANN HEINRICH LAMBERT (1728–1777)

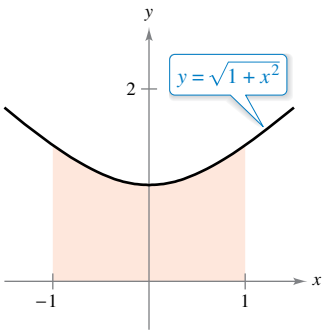
The first person to publish a comprehensive study on hyperbolic functions was Johann Heinrich Lambert, a Swiss-German mathematician and colleague of Euler. *See LarsonCalculus.com to read more of this biography.*

Hyperbolic Functions

In this section, you will look briefly at a special class of exponential functions called **hyperbolic functions.** The name *hyperbolic function* arose from comparison of the area of a semicircular region, as shown in Figure 5.29, with the area of a region under a hyperbola, as shown in Figure 5.30.



Circle: $x^2 + y^2 = 1$
Figure 5.29



Hyperbola: $-x^2 + y^2 = 1$
Figure 5.30

The integral for the semicircular region involves an inverse trigonometric (circular) function:

$$\int_{-1}^{1} \sqrt{1 - x^2}\, dx = \frac{1}{2}\left[x\sqrt{1 - x^2} + \arcsin x\right]_{-1}^{1} = \frac{\pi}{2} \approx 1.571.$$

The integral for the hyperbolic region involves an inverse hyperbolic function:

$$\int_{-1}^{1} \sqrt{1 + x^2}\, dx = \frac{1}{2}\left[x\sqrt{1 + x^2} + \sinh^{-1} x\right]_{-1}^{1} \approx 2.296.$$

This is only one of many ways in which the hyperbolic functions are similar to the trigonometric functions.

REMARK The notation $\sinh x$ is read as "the hyperbolic sine of x," $\cosh x$ as "the hyperbolic cosine of x," and so on.

Definitions of the Hyperbolic Functions

$$\sinh x = \frac{e^x - e^{-x}}{2} \qquad \operatorname{csch} x = \frac{1}{\sinh x}, \quad x \neq 0$$

$$\cosh x = \frac{e^x + e^{-x}}{2} \qquad \operatorname{sech} x = \frac{1}{\cosh x}$$

$$\tanh x = \frac{\sinh x}{\cosh x} \qquad \coth x = \frac{1}{\tanh x}, \quad x \neq 0$$

FOR FURTHER INFORMATION For more information on the development of hyperbolic functions, see the article "An Introduction to Hyperbolic Functions in Elementary Calculus" by Jerome Rosenthal in *Mathematics Teacher.* To view this article, go to *MathArticles.com.*

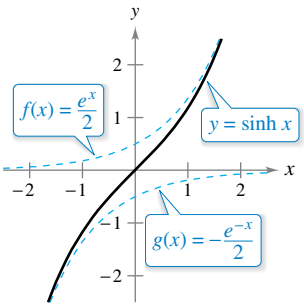
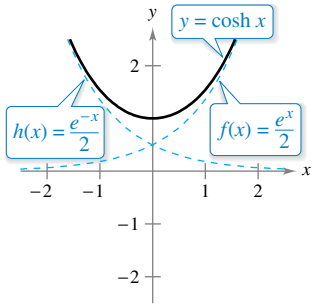
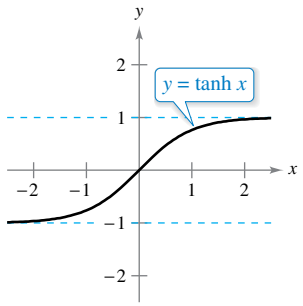
The graphs of the six hyperbolic functions and their domains and ranges are shown in Figure 5.31. Note that the graph of $\sinh x$ can be obtained by adding the corresponding y-coordinates of the exponential functions $f(x) = \frac{1}{2}e^x$ and $g(x) = -\frac{1}{2}e^{-x}$. Likewise, the graph of $\cosh x$ can be obtained by adding the corresponding y-coordinates of the exponential functions $f(x) = \frac{1}{2}e^x$ and $h(x) = \frac{1}{2}e^{-x}$.



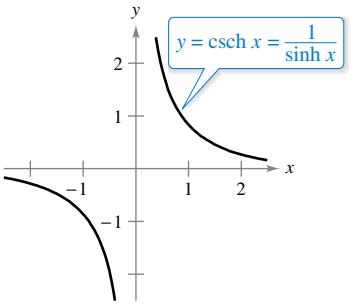
Domain: $(-\infty, \infty)$
Range: $(-\infty, \infty)$



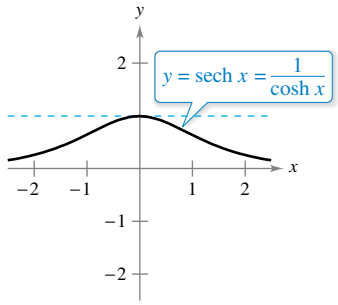
Domain: $(-\infty, \infty)$
Range: $[1, \infty)$



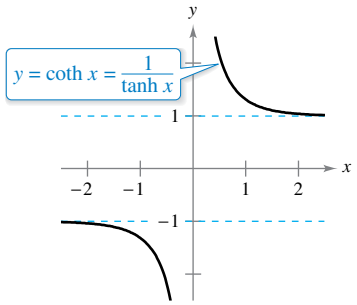
Domain: $(-\infty, \infty)$
Range: $(-1, 1)$



Domain: $(-\infty, 0) \cup (0, \infty)$
Range: $(-\infty, 0) \cup (0, \infty)$



Domain: $(-\infty, \infty)$
Range: $(0, 1]$



Domain: $(-\infty, 0) \cup (0, \infty)$
Range: $(-\infty, -1) \cup (1, \infty)$

Figure 5.31

Many of the trigonometric identities have corresponding *hyperbolic identities*. For instance,

$$\begin{aligned}\cosh^2 x - \sinh^2 x &= \left(\frac{e^x + e^{-x}}{2}\right)^2 - \left(\frac{e^x - e^{-x}}{2}\right)^2 \\ &= \frac{e^{2x} + 2 + e^{-2x}}{4} - \frac{e^{2x} - 2 + e^{-2x}}{4} \\ &= \frac{4}{4} \\ &= 1.\end{aligned}$$

Hyperbolic Identities

$$\cosh^2 x - \sinh^2 x = 1$$
$$\tanh^2 x + \operatorname{sech}^2 x = 1$$
$$\coth^2 x - \operatorname{csch}^2 x = 1$$

$$\sinh(x + y) = \sinh x \cosh y + \cosh x \sinh y$$
$$\sinh(x - y) = \sinh x \cosh y - \cosh x \sinh y$$
$$\cosh(x + y) = \cosh x \cosh y + \sinh x \sinh y$$
$$\cosh(x - y) = \cosh x \cosh y - \sinh x \sinh y$$

$$\sinh^2 x = \frac{-1 + \cosh 2x}{2}$$
$$\cosh^2 x = \frac{1 + \cosh 2x}{2}$$

$$\sinh 2x = 2 \sinh x \cosh x$$
$$\cosh 2x = \cosh^2 x + \sinh^2 x$$

Differentiation and Integration of Hyperbolic Functions

Because the hyperbolic functions are written in terms of e^x and e^{-x}, you can easily derive rules for their derivatives. The next theorem lists these derivatives with the corresponding integration rules.

THEOREM 5.20 Derivatives and Integrals of Hyperbolic Functions

Let u be a differentiable function of x.

$$\frac{d}{dx}[\sinh u] = (\cosh u)u' \qquad \int \cosh u\,du = \sinh u + C$$

$$\frac{d}{dx}[\cosh u] = (\sinh u)u' \qquad \int \sinh u\,du = \cosh u + C$$

$$\frac{d}{dx}[\tanh u] = (\operatorname{sech}^2 u)u' \qquad \int \operatorname{sech}^2 u\,du = \tanh u + C$$

$$\frac{d}{dx}[\coth u] = -(\operatorname{csch}^2 u)u' \qquad \int \operatorname{csch}^2 u\,du = -\coth u + C$$

$$\frac{d}{dx}[\operatorname{sech} u] = -(\operatorname{sech} u \tanh u)u' \qquad \int \operatorname{sech} u \tanh u\,du = -\operatorname{sech} u + C$$

$$\frac{d}{dx}[\operatorname{csch} u] = -(\operatorname{csch} u \coth u)u' \qquad \int \operatorname{csch} u \coth u\,du = -\operatorname{csch} u + C$$

Proof Here is a proof of two of the differentiation rules. (You are asked to prove some of the other differentiation rules in Exercises 99–101.)

$$\frac{d}{dx}[\sinh x] = \frac{d}{dx}\left[\frac{e^x - e^{-x}}{2}\right] \qquad \text{Definition of sinh } x$$

$$= \frac{e^x + e^{-x}}{2} \qquad \frac{d}{dx}[e^u] = e^u u'$$

$$= \cosh x \qquad \text{Definition of cosh } x$$

$$\frac{d}{dx}[\tanh x] = \frac{d}{dx}\left[\frac{\sinh x}{\cosh x}\right] \qquad \text{Definition of tanh } x$$

$$= \frac{(\cosh x)(\cosh x) - (\sinh x)(\sinh x)}{\cosh^2 x} \qquad \text{Quotient Rule}$$

$$= \frac{1}{\cosh^2 x} \qquad \cosh^2 x - \sinh^2 x = 1$$

$$= \operatorname{sech}^2 x \qquad \text{Hyperbolic identity}$$

The derivatives of sinh u and tanh u follow from the Chain Rule. ■

EXAMPLE 1 Differentiation of Hyperbolic Functions

a. $\frac{d}{dx}[\sinh(x^2 - 3)] = 2x\cosh(x^2 - 3)$

b. $\frac{d}{dx}[\ln(\cosh x)] = \frac{\sinh x}{\cosh x} = \tanh x$

c. $\frac{d}{dx}[x\sinh x - \cosh x] = x\cosh x + \sinh x - \sinh x = x\cosh x$

d. $\frac{d}{dx}[(x-1)\cosh x - \sinh x] = (x-1)\sinh x + \cosh x - \cosh x = (x-1)\sinh x$

■

REMARK In Example 1, in addition to applying Theorem 5.20, note the use of the Log, Product, and Difference Rules for differentiation to find the derivatives in parts (b)–(d).

$f''(0) < 0$, so $(0, -1)$ is a relative maximum. $f''(1) > 0$, so $(1, -\sinh 1)$ is a relative minimum.
Figure 5.32

EXAMPLE 2 Finding Relative Extrema

Find the relative extrema of $f(x) = (x - 1)\cosh x - \sinh x$.

Solution From the result of Example 1(d), you know that $f'(x) = (x - 1)\sinh x$. Next, set the first derivative of f equal to 0.

$$(x - 1)\sinh x = 0$$

So, the critical numbers are $x = 1$ and $x = 0$. By the Second Derivative Test, the point $(0, -1)$ yields a relative maximum and the point $(1, -\sinh 1)$ yields a relative minimum, as shown in Figure 5.32. Use a graphing utility to check this result. If your graphing utility does not have hyperbolic functions, use the definitions of $\cosh x$ and $\sinh x$ to rewrite f with exponential functions, as shown.

$$\begin{aligned} f(x) &= (x - 1)\left(\frac{1}{2}\right)(e^x + e^{-x}) - \frac{1}{2}(e^x - e^{-x}) \\ &= \frac{1}{2}(xe^x + xe^{-x} - e^x - e^{-x} - e^x + e^{-x}) \\ &= \frac{1}{2}(xe^x + xe^{-x} - 2e^x) \end{aligned}$$

When a uniform flexible cable, such as a power cable, is suspended from two points, it takes the shape of a *catenary*, as discussed in Example 3.

EXAMPLE 3 Hanging Power Cables

See LarsonCalculus.com for an interactive version of this type of example.

Power cables are suspended between two towers, forming the catenary shown in Figure 5.33. The equation for this catenary is

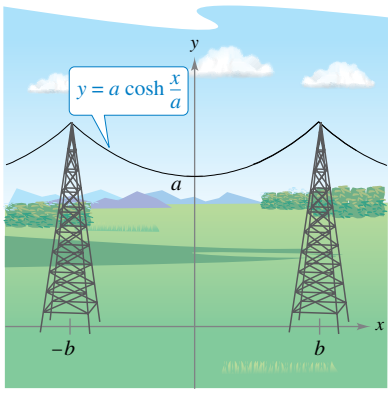
$$y = a\cosh\frac{x}{a}.$$

The distance between the two towers is $2b$. Find the slope of the catenary at the point where the cable meets the right-hand tower.

Solution Differentiating produces

$$y' = a\left(\frac{1}{a}\right)\sinh\frac{x}{a} = \sinh\frac{x}{a}. \qquad \text{Differentiate with respect to } x.$$

At the point $(b, a\cosh(b/a))$, the slope (from the left) is $m = \sinh(b/a)$.



Catenary
Figure 5.33

FOR FURTHER INFORMATION
In Example 3, the cable is a catenary between two supports at the same height. To learn about the shape of a cable hanging between supports of different heights, see the article "Reexamining the Catenary" by Paul Cella in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

EXAMPLE 4 Integrating a Hyperbolic Function

Find $\int \cosh 2x \sinh^2 2x\,dx$.

Solution

$$\begin{aligned} \int \cosh 2x \sinh^2 2x\,dx &= \frac{1}{2}\int (\sinh 2x)^2(2\cosh 2x)\,dx \qquad u = \sinh 2x \\ &= \frac{1}{2}\left[\frac{(\sinh 2x)^3}{3}\right] + C \\ &= \frac{\sinh^3 2x}{6} + C \end{aligned}$$

Inverse Hyperbolic Functions

Unlike trigonometric functions, hyperbolic functions are not periodic. In fact, by looking back at Figure 5.31, notice that four of the six hyperbolic functions are actually one-to-one (the hyperbolic sine, tangent, cosecant, and cotangent). So, you can apply Theorem 5.7 to conclude that these four functions have inverse functions. The other two (the hyperbolic cosine and secant) are one-to-one when their domains are restricted to the positive real numbers, and for this restricted domain they also have inverse functions. Because the hyperbolic functions are defined in terms of exponential functions, it is not surprising to find that the inverse hyperbolic functions can be written in terms of logarithmic functions, as shown in the next theorem.

THEOREM 5.21 Inverse Hyperbolic Functions

Function	Domain
$\sinh^{-1} x = \ln\left(x + \sqrt{x^2 + 1}\right)$	$(-\infty, \infty)$
$\cosh^{-1} x = \ln\left(x + \sqrt{x^2 - 1}\right)$	$[1, \infty)$
$\tanh^{-1} x = \frac{1}{2} \ln \frac{1 + x}{1 - x}$	$(-1, 1)$
$\coth^{-1} x = \frac{1}{2} \ln \frac{x + 1}{x - 1}$	$(-\infty, -1) \cup (1, \infty)$
$\operatorname{sech}^{-1} x = \ln \frac{1 + \sqrt{1 - x^2}}{x}$	$(0, 1]$
$\operatorname{csch}^{-1} x = \ln\left(\frac{1}{x} + \frac{\sqrt{1 + x^2}}{\lvert x \rvert}\right)$	$(-\infty, 0) \cup (0, \infty)$

Proof The proof of this theorem is a straightforward application of the properties of the exponential and logarithmic functions. For example, for

$$f(x) = \sinh x = \frac{e^x - e^{-x}}{2}$$ Definition of $\sinh x$

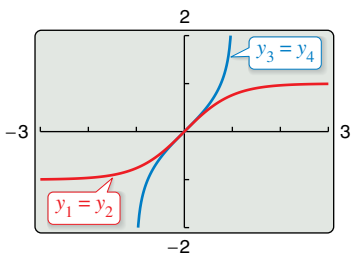
and

$$g(x) = \ln\left(x + \sqrt{x^2 + 1}\right)$$

you can show that

$$f(g(x)) = x \quad \text{and} \quad g(f(x)) = x$$

which implies that g is the inverse function of f. ∎



Graphs of the hyperbolic tangent function and the inverse hyperbolic tangent function

Figure 5.34

TECHNOLOGY You can use a graphing utility to support the results of Theorem 5.21. For instance, to investigate the definition of $\tanh^{-1} x$, graph the four functions below.

$y_1 = \tanh x$ Hyperbolic tangent

$y_2 = \frac{e^x - e^{-x}}{e^x + e^{-x}}$ Definition of hyperbolic tangent

$y_3 = \tanh^{-1} x$ Inverse hyperbolic tangent

$y_4 = \frac{1}{2} \ln \frac{1 + x}{1 - x}$ Definition of inverse hyperbolic tangent

The resulting display is shown in Figure 5.34. Using the *trace* or *table* feature to investigate each function, notice that $y_1 = y_2$ and $y_3 = y_4$. Also, notice that the graph of y_1 is the reflection of the graph of y_3 in the line $y = x$.

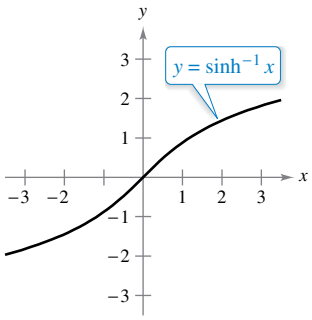
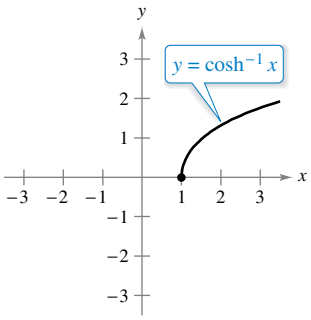
GO DIGITAL

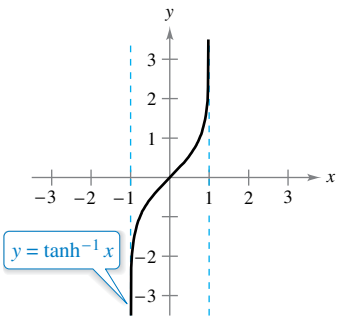
The graphs of the inverse hyperbolic functions are shown in Figure 5.35.



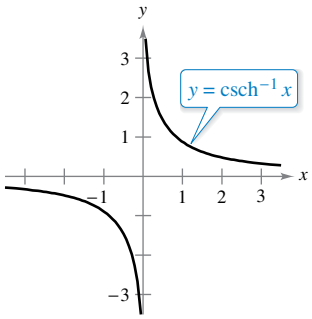
Domain: $(-\infty, \infty)$
Range: $(-\infty, \infty)$



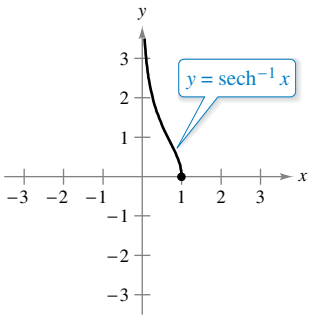
Domain: $[1, \infty)$
Range: $[0, \infty)$



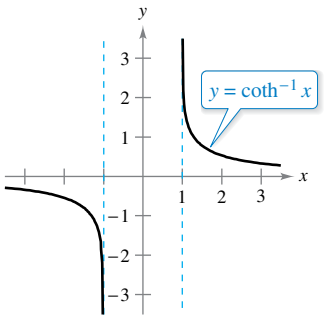
Domain: $(-1, 1)$
Range: $(-\infty, \infty)$



Domain: $(-\infty, 0) \cup (0, \infty)$
Range: $(-\infty, 0) \cup (0, \infty)$



Domain: $(0, 1]$
Range: $[0, \infty)$



Domain: $(-\infty, -1) \cup (1, \infty)$
Range: $(-\infty, 0) \cup (0, \infty)$

Figure 5.35

The inverse hyperbolic secant can be used to define a curve called a *tractrix* or *pursuit curve*, as discussed in Example 5.

EXAMPLE 5 A Tractrix

A person is holding a rope that is tied to a boat, as shown in Figure 5.36. As the person walks along the dock, the boat travels along a **tractrix,** given by the equation

$$y = a \operatorname{sech}^{-1} \frac{x}{a} - \sqrt{a^2 - x^2}$$

where a is the length of the rope. For $a = 20$ feet, find the distance the person must walk to bring the boat to a position 5 feet from the dock.

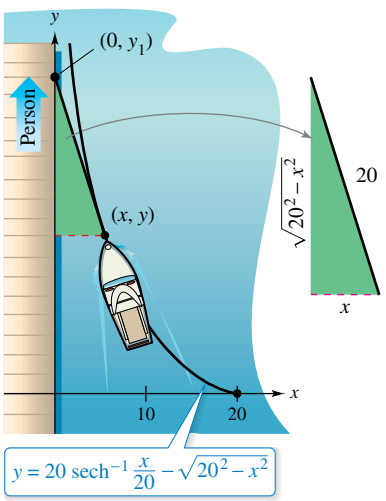
Solution In Figure 5.36, notice that the distance the person has walked is

$$\begin{aligned} y_1 &= y + \sqrt{20^2 - x^2} \\ &= \left(20 \operatorname{sech}^{-1} \frac{x}{20} - \sqrt{20^2 - x^2}\right) + \sqrt{20^2 - x^2} \\ &= 20 \operatorname{sech}^{-1} \frac{x}{20}. \end{aligned}$$

When $x = 5$, this distance is

$$y_1 = 20 \operatorname{sech}^{-1} \frac{5}{20} = 20 \ln \frac{1 + \sqrt{1 - (1/4)^2}}{1/4} = 20 \ln\left(4 + \sqrt{15}\right) \approx 41.27 \text{ feet.}$$

So, the person must walk about 41.27 feet to bring the boat to a position 5 feet from the dock. ■



A person must walk about 41.27 feet to bring the boat to a position 5 feet from the dock.

Inverse Hyperbolic Functions: Differentiation and Integration

The derivatives of the inverse hyperbolic functions, which resemble the derivatives of the inverse trigonometric functions, are listed in Theorem 5.22 with the corresponding integration formulas (in logarithmic form). You can verify each of these formulas by applying the logarithmic definitions of the inverse hyperbolic functions. (See Exercises 102–104.)

THEOREM 5.22 Differentiation and Integration Involving Inverse Hyperbolic Functions

Let u be a differentiable function of x.

$$\frac{d}{dx}[\sinh^{-1} u] = \frac{u'}{\sqrt{u^2 + 1}} \qquad \frac{d}{dx}[\cosh^{-1} u] = \frac{u'}{\sqrt{u^2 - 1}}$$

$$\frac{d}{dx}[\tanh^{-1} u] = \frac{u'}{1 - u^2} \qquad \frac{d}{dx}[\coth^{-1} u] = \frac{u'}{1 - u^2}$$

$$\frac{d}{dx}[\operatorname{sech}^{-1} u] = \frac{-u'}{u\sqrt{1 - u^2}} \qquad \frac{d}{dx}[\operatorname{csch}^{-1} u] = \frac{-u'}{|u|\sqrt{1 + u^2}}$$

$$\int \frac{du}{\sqrt{u^2 \pm a^2}} = \ln\left(u + \sqrt{u^2 \pm a^2}\right) + C$$

$$\int \frac{du}{a^2 - u^2} = \frac{1}{2a} \ln\left|\frac{a + u}{a - u}\right| + C$$

$$\int \frac{du}{u\sqrt{a^2 \pm u^2}} = -\frac{1}{a} \ln \frac{a + \sqrt{a^2 \pm u^2}}{|u|} + C$$

EXAMPLE 6 Differentiation of Inverse Hyperbolic Functions

a. $\dfrac{d}{dx}[\sinh^{-1}(2x)] = \dfrac{2}{\sqrt{(2x)^2 + 1}}$ $\quad \frac{d}{dx}[\sinh^{-1} u]$ with $u = 2x$

$= \dfrac{2}{\sqrt{4x^2 + 1}}$

b. $\dfrac{d}{dx}[\tanh^{-1}(x^3)] = \dfrac{3x^2}{1 - (x^3)^2}$ $\quad \frac{d}{dx}[\tanh^{-1} u]$ with $u = x^3$

$= \dfrac{3x^2}{1 - x^6}$

EXAMPLE 7 Integration Using Inverse Hyperbolic Functions

a. $\displaystyle\int \frac{dx}{x\sqrt{4 - 9x^2}} = \int \frac{3\,dx}{(3x)\sqrt{2^2 - (3x)^2}}$ $\quad \int \frac{du}{u\sqrt{a^2 - u^2}}$ with $a = 2$ and $u = 3x$

$\displaystyle= -\frac{1}{2} \ln \frac{2 + \sqrt{4 - 9x^2}}{|3x|} + C$ $\quad -\frac{1}{a} \ln \frac{a + \sqrt{a^2 - u^2}}{|u|} + C$

b. $\displaystyle\int \frac{dx}{5 - 4x^2} = \frac{1}{2}\int \frac{2\,dx}{(\sqrt{5})^2 - (2x)^2}$ $\quad \int \frac{du}{a^2 - u^2}$ with $a = \sqrt{5}$ and $u = 2x$

$\displaystyle= \frac{1}{2}\left(\frac{1}{2\sqrt{5}} \ln\left|\frac{\sqrt{5} + 2x}{\sqrt{5} - 2x}\right|\right) + C$ $\quad \frac{1}{2a} \ln\left|\frac{a + u}{a - u}\right| + C$

$\displaystyle= \frac{1}{4\sqrt{5}} \ln\left|\frac{\sqrt{5} + 2x}{\sqrt{5} - 2x}\right| + C$

5.9 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Describe how the name *hyperbolic function* arose.
2. Which hyperbolic functions have domains that are not all real numbers?
3. Give the hyperbolic identity that corresponds to the trigonometric identity
$$\sin^2 x = \frac{1 - \cos 2x}{2}.$$
4. Find the missing value.
$$\frac{d}{dx}[\operatorname{sech}^{-1}(3x)] = \frac{\square}{3x\sqrt{1 - 9x^2}}$$

Evaluating a Function **In Exercises 5–10, evaluate the function. If the value is not a rational number, round your answer to three decimal places.**

5. (a) $\sinh 3$ (b) $\tanh(-2)$
6. (a) $\cosh 0$ (b) $\operatorname{sech} 1$
7. (a) $\operatorname{csch}(\ln 2)$ (b) $\coth(\ln 5)$
8. (a) $\sinh^{-1} 0$ (b) $\tanh^{-1} 0$
9. (a) $\cosh^{-1} 2$ (b) $\operatorname{sech}^{-1} \frac{2}{3}$
10. (a) $\operatorname{csch}^{-1} 2$ (b) $\coth^{-1} 3$

Verifying an Identity **In Exercises 11–18, verify the identity.**

11. $\sinh x + \cosh x = e^x$
12. $\cosh x - \sinh x = e^{-x}$
13. $\tanh^2 x + \operatorname{sech}^2 x = 1$
14. $\coth^2 x - \operatorname{csch}^2 x = 1$
15. $\cosh^2 x = \dfrac{1 + \cosh 2x}{2}$
16. $\sinh^2 x = \dfrac{-1 + \cosh 2x}{2}$
17. $\sinh 2x = 2 \sinh x \cosh x$
18. $\sinh(x + y) = \sinh x \cosh y + \cosh x \sinh y$

Finding Values of Hyperbolic Functions **In Exercises 19 and 20, use the value of the given hyperbolic function to find the values of the other hyperbolic functions.**

19. $\sinh x = \dfrac{3}{2}$
20. $\tanh x = \dfrac{1}{2}$

Finding a Limit **In Exercises 21–24, find the limit.**

21. $\lim_{x \to \infty} \sinh x$
22. $\lim_{x \to -\infty} \tanh x$
23. $\lim_{x \to 0} \dfrac{\sinh x}{x}$
24. $\lim_{x \to 0^-} \coth x$

Finding a Derivative **In Exercises 25–34, find the derivative of the function.**

25. $f(x) = \sinh 9x$
26. $f(x) = \cosh(8x + 1)$
27. $y = \operatorname{sech} 5x^2$
28. $f(x) = \tanh(4x^2 + 3x)$
29. $f(x) = \ln(\sinh x)$
30. $y = \ln\left(\tanh \dfrac{x}{2}\right)$
31. $h(t) = \dfrac{t}{6} \sinh(-3t)$
32. $y = (x^2 + 1) \coth \dfrac{x}{3}$
33. $f(t) = \arctan(\sinh t)$
34. $g(x) = \operatorname{sech}^2 3x$

Finding an Equation of a Tangent Line **In Exercises 35–38, find an equation of the tangent line to the graph of the function at the given point.**

35. $y = \sinh(1 - x^2), \quad (1, 0)$
36. $y = x^{\cosh x}, \quad (1, 1)$
37. $y = (\cosh x - \sinh x)^2, \quad (0, 1)$
38. $y = e^{\sinh x}, \quad (0, 1)$

Finding Relative Extrema **In Exercises 39–42, find the relative extrema of the function. Use a graphing utility to confirm your result.**

39. $g(x) = x \operatorname{sech} x$
40. $h(x) = 2 \tanh x - x$
41. $f(x) = \sin x \sinh x - \cos x \cosh x, \quad -4 \le x \le 4$
42. $f(x) = x \sinh(x - 1) - \cosh(x - 1)$

Catenary **In Exercises 43 and 44, a model for a power cable suspended between two towers is given. (a) Graph the model. (b) Find the heights of the cable at the towers and at the midpoint between the towers. (c) Find the slope of the cable at the point where the cable meets the right-hand tower.**

43. $y = 10 + 15 \cosh \dfrac{x}{15}, \quad -15 \le x \le 15$
44. $y = 18 + 25 \cosh \dfrac{x}{25}, \quad -25 \le x \le 25$

Finding an Indefinite Integral **In Exercises 45–54, find the indefinite integral.**

45. $\displaystyle\int \cosh 4x \, dx$
46. $\displaystyle\int \operatorname{sech}^2 3x \, dx$
47. $\displaystyle\int \sinh(1 - 2x) \, dx$
48. $\displaystyle\int \frac{\cosh \sqrt{x}}{\sqrt{x}} \, dx$
49. $\displaystyle\int \cosh^2(x - 1) \sinh(x - 1) \, dx$
50. $\displaystyle\int \frac{\sinh x}{1 + \sinh^2 x} \, dx$
51. $\displaystyle\int \frac{\cosh x}{\sinh x} \, dx$
52. $\displaystyle\int \frac{\operatorname{csch}(1/x) \coth(1/x)}{x^2} \, dx$
53. $\displaystyle\int x \operatorname{csch}^2 \frac{x^2}{2} \, dx$
54. $\displaystyle\int \operatorname{sech}^3 x \tanh x \, dx$

Evaluating a Definite Integral **In Exercises 55–60, evaluate the definite integral.**

55. $\int_0^{\ln 2} \tanh x\,dx$

56. $\int_0^1 \cosh^2 x\,dx$

57. $\int_3^4 \operatorname{csch}^2(x-2)\,dx$

58. $\int_{1/2}^1 \operatorname{sech}^2(2x-1)\,dx$

59. $\int_{5/3}^2 \operatorname{csch}(3x-4)\coth(3x-4)\,dx$

60. $\int_0^{\ln 2} 2e^{-x}\cosh x\,dx$

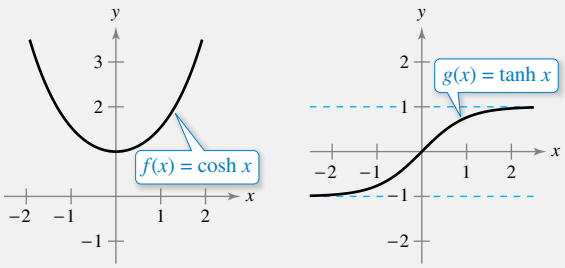
Exploring Concepts

61. Explain graphically why the equation $\cosh x = \sinh x$ has no solution.

62. Use the graphs on page 391 to determine whether each hyperbolic function is even, odd, or neither.

63. Verify the results of Exercise 62 algebraically.

64. HOW DO YOU SEE IT? Use the graphs of f and g shown in the figures to answer the following.



(a) Identify the open interval(s) on which the graphs of f and g are increasing or decreasing.

(b) Identify the open interval(s) on which the graphs of f and g are concave upward or concave downward.

Finding a Derivative **In Exercises 65–74, find the derivative of the function.**

65. $y = \cosh^{-1}(3x)$

66. $y = \operatorname{csch}^{-1}(1-x)$

67. $y = \tanh^{-1}\sqrt{x}$

68. $f(x) = \coth^{-1}(x^2)$

69. $y = \sinh^{-1}(\tan x)$

70. $y = \tanh^{-1}(\sin 2x)$

71. $y = \operatorname{sech}^{-1}(\sin x),\ 0 < x < \pi/2$

72. $y = \coth^{-1}(e^{2x})$

73. $y = 2x\sinh^{-1}(2x) - \sqrt{1+4x^2}$

74. $y = x\tanh^{-1}x + \ln\sqrt{1-x^2}$

Finding an Indefinite Integral **In Exercises 75–82, find the indefinite integral using the formulas from Theorem 5.22.**

75. $\int \frac{1}{3-9x^2}\,dx$

76. $\int \frac{1}{2x\sqrt{1-4x^2}}\,dx$

77. $\int \frac{1}{\sqrt{1+e^{2x}}}\,dx$

78. $\int \frac{x}{9-x^4}\,dx$

79. $\int \frac{1}{\sqrt{x}\sqrt{1+x}}\,dx$

80. $\int \frac{\sqrt{x}}{\sqrt{1+x^3}}\,dx$

81. $\int \frac{-1}{4x-x^2}\,dx$

82. $\int \frac{dx}{(x+2)\sqrt{x^2+4x+8}}$

Evaluating a Definite Integral **In Exercises 83–86, evaluate the definite integral using the formulas from Theorem 5.22.**

83. $\int_3^7 \frac{1}{\sqrt{x^2-4}}\,dx$

84. $\int_1^3 \frac{1}{x\sqrt{4+x^2}}\,dx$

85. $\int_{-1}^1 \frac{1}{16-9x^2}\,dx$

86. $\int_0^1 \frac{1}{\sqrt{25x^2+1}}\,dx$

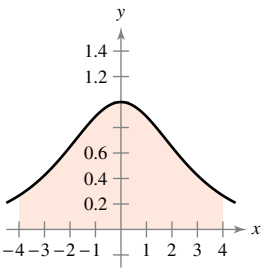
Differential Equation **In Exercises 87 and 88, find the general solution of the differential equation.**

87. $\frac{dy}{dx} = \frac{x^3-21x}{5+4x-x^2}$

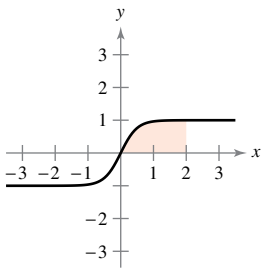
88. $\frac{dy}{dx} = \frac{1-2x}{4x-x^2}$

Area **In Exercises 89–92, find the area of the given region.**

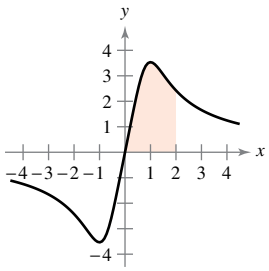
89. $y = \operatorname{sech}\frac{x}{2}$



90. $y = \tanh 2x$



91. $y = \frac{5x}{\sqrt{x^4+1}}$



92. $y = \frac{6}{x\sqrt{9-x^2}}$

93. Tractrix Consider the equation of a tractrix

$$y = a\,\text{sech}^{-1}\left(\frac{x}{a}\right) - \sqrt{a^2 - x^2}, \quad a > 0.$$

(a) Find dy/dx.

(b) Let L be the tangent line to the tractrix at the point P. When L intersects the y-axis at the point Q, show that the distance between P and Q is a.

94. Tractrix Show that the boat in Example 5 is always pointing toward the person.

95. Proof Prove that

$$\tanh^{-1} x = \frac{1}{2}\ln\left(\frac{1+x}{1-x}\right), \quad -1 < x < 1.$$

96. Proof Prove that $\sinh^{-1} t = \ln\left(t + \sqrt{t^2+1}\right)$.

97. Using a Right Triangle Show that

$$\arctan(\sinh x) = \arcsin(\tanh x).$$

98. Integration Let $x > 0$ and $b > 0$. Show that

$$\int_{-b}^{b} e^{xt}\,dt = \frac{2\sinh bx}{x}.$$

Proof **In Exercises 99–104, prove the differentiation formula.**

99. $\frac{d}{dx}[\cosh x] = \sinh x$ **100.** $\frac{d}{dx}[\coth x] = -\text{csch}^2 x$

101. $\frac{d}{dx}[\text{sech}\, x] = -\text{sech}\, x \tanh x$

102. $\frac{d}{dx}[\cosh^{-1} x] = \frac{1}{\sqrt{x^2-1}}$

103. $\frac{d}{dx}[\sinh^{-1} x] = \frac{1}{\sqrt{x^2+1}}$

104. $\frac{d}{dx}[\text{sech}^{-1} x] = \frac{-1}{x\sqrt{1-x^2}}$

105. Hyperbolic Identities Tell whether the identity is correct. If it is not correct, explain why or give an example to show that it is not correct. How does the identity compare to the corresponding trigonometric identity?

(a) $\cosh^2 x + \sinh^2 x = 1$

(b) $\cosh(x - y) = \cosh x \cosh y - \sinh x \sinh y$

PUTNAM EXAM CHALLENGE

106. From the vertex $(0, c)$ of the catenary $y = c\cosh(x/c)$ a line L is drawn perpendicular to the tangent to the catenary at point P. Prove that the length of L intercepted by the axes is equal to the ordinate y of the point P.

107. Prove or disprove: there is at least one straight line normal to the graph of $y = \cosh x$ at a point $(a, \cosh a)$ and also normal to the graph of $y = \sinh x$ at a point $(c, \sinh c)$.

[At a point on a graph, the normal line is the perpendicular to the tangent at that point. Also, $\cosh x = (e^x + e^{-x})/2$ and $\sinh x = (e^x - e^{-x})/2$.]

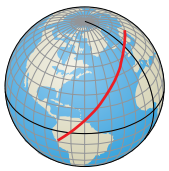
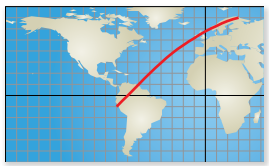
SECTION PROJECT

Mercator Map

When flying or sailing, pilots expect to be given a steady compass course to follow. On a standard flat map, this is difficult because a steady compass course results in a curved line, as shown below.

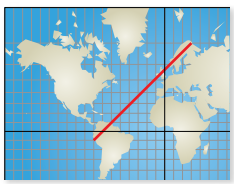


Globe: flight with constant 45° bearing



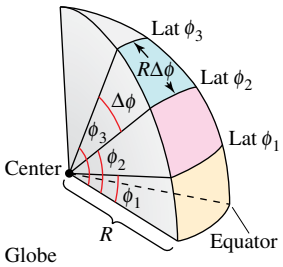
Standard flat map: flight with constant 45° bearing

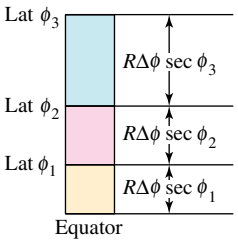
For curved lines to appear as straight lines on a flat map, Flemish geographer Gerardus Mercator (1512-1594) realized that latitude lines must be stretched horizontally by a scaling factor of sec ϕ, where ϕ is the angle (in radians) of the latitude line. The Mercator map has latitude lines that are not equidistant, as shown at the right.



Mercator map: flight with constant 45° bearing

To calculate these vertical lengths, imagine a globe with radius R and latitude lines marked at angles of every $\Delta\phi$ radians, with $\Delta\phi = \phi_i - \phi_{i-1}$, as shown in the figure on the left below. The arc length of consecutive latitude lines is $R\Delta\phi$. On the corresponding Mercator map, the vertical distance between the ith and $(i-1)$st latitude lines is $R\Delta\phi \sec\phi_i$, and the total vertical distance from the equator to the nth latitude line is approximately $\sum_{i=1}^{n} R\Delta\phi \sec\phi_i$, as shown in the figure on the right below.





Mercator maps are still used by websites to display the world.

(a) Explain how to calculate the total vertical distance on a Mercator map from the equator to the nth latitude line using calculus.

(b) Using a globe radius of $R = 6$ inches, find the total vertical distances on a Mercator map from the equator to the latitude lines whose angles are 30°, 45°, and 60°.

(c) Explain what happens when you attempt to find the total vertical distance on a Mercator map from the equator to the North Pole.

(d) The *Gudermannian function* $\text{gd}(y) = \int_0^y \frac{dt}{\cosh t}$ expresses the latitude $\phi(y) = \text{gd}(y)$ in terms of the vertical position y on a Mercator map. Show that $\text{gd}(y) = \arctan(\sinh y)$.

Review Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Exploring Concepts

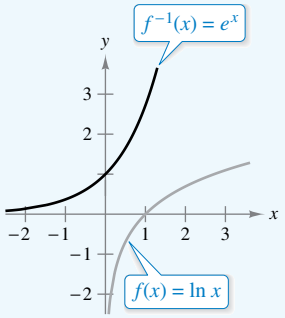
This chapter presented several key definitions. First, the natural logarithmic function was defined as an integral.

$$\ln x = \int_1^x \frac{1}{t}\,dt,\ x > 0$$

By the Second Fundamental Theorem of Calculus, this definition leads directly to the derivative of $\ln x$. Second, by defining e^x as the inverse of $\ln x$ (see figure), you developed several important properties, such as

$$\ln e^x = x \quad \text{and} \quad e^{\ln x} = x.$$

You used these definitions and properties to develop the derivatives and integration rules for e^x. You then developed differentiation and integration rules for inverse trigonometric functions and hyperbolic functions.



1. Use a graphing utility to evaluate

$$y_1 = \ln x \quad \text{and} \quad y_2 = e^x$$

for $x = 0.1$, 0.5, 1, 2, and 10. Plot the points on the same set of axes and describe the relationship between y_1 and y_2. How do the domains and ranges of y_1 and y_2 compare? How do the asymptotes of y_1 and y_2 compare?

2. Use L'Hôpital's Rule to evaluate the important limit from Theorem 1.9 in Section 1.3,

$$\lim_{\theta \to 0} \frac{\sin \theta}{\theta}.$$

3. (a) Sketch the region whose area is represented by

$$\int_0^1 \arccos x\,dx.$$

(b) Use the integration capabilities of a graphing utility to approximate the area.

(c) Find the exact area analytically.

4. State the integration formula you would use to perform the integration. Do not integrate.

(a) $\displaystyle\int \sqrt[3]{x}\,dx$ (b) $\displaystyle\int \frac{x}{(x^2+4)^3}\,dx$

(c) $\displaystyle\int \frac{x}{x^2+4}\,dx$ (d) $\displaystyle\int \frac{\sec^2 x}{\tan x}\,dx$

5. Find the derivative of each function. (Assume c is a constant.)

(a) $y = x^c$

(b) $y = c^x$

(c) $y = x^x$

(d) $y = c^c$

6. Evaluate the integral in terms of (a) natural logarithms and (b) inverse hyperbolic functions.

$$\int_{-1/2}^{1/2} \frac{dx}{1-x^2}$$

Sketching a Graph

In Exercises 7 and 8, sketch the graph of the function and state its domain.

7. $f(x) = \ln x - 3$ **8.** $f(x) = \ln(x+3)$

Using Properties of Logarithms

In Exercises 9 and 10, use the properties of logarithms to approximate the indicated logarithms, given that $\ln 4 \approx 1.3863$ and $\ln 5 \approx 1.6094$.

9. (a) $\ln 20$ (b) $\ln \frac{4}{5}$ (c) $\ln 625$ (d) $\ln \sqrt{5}$

10. (a) $\ln 0.0625$ (b) $\ln \frac{5}{4}$ (c) $\ln 16$ (d) $\ln \sqrt[3]{80}$

Expanding a Logarithmic Expression

In Exercises 11 and 12, use the properties of logarithms to expand the logarithmic expression.

11. $\ln \sqrt[5]{\dfrac{4x^2-1}{4x^2+1}}$

12. $\ln[(x^2+1)(x-1)]$

Condensing a Logarithmic Expression

In Exercises 13 and 14, write the expression as the logarithm of a single quantity.

13. $\ln 3 + \frac{1}{3}\ln(4-x^2) - \ln x$

14. $3[\ln x - 2\ln(x^2+1)] + 2\ln 5$

Finding a Derivative

In Exercises 15–22, find the derivative of the function.

15. $g(x) = \ln\sqrt{2x}$ **16.** $f(x) = \ln(3x^2+2x)$

17. $f(x) = x\sqrt{\ln x}$ **18.** $f(x) = [\ln(2x)]^3$

19. $y = \ln\sqrt{\dfrac{x^2+4}{x^2-4}}$ **20.** $y = \ln\dfrac{4x}{x-6}$

21. $y = \dfrac{1}{\ln(1-7x)}$

22. $y = \dfrac{\ln 5x}{1-x}$

Finding an Equation of a Tangent Line **In Exercises 23 and 24, find an equation of the tangent line to the graph of the function at the given point.**

23. $y = \ln(2 + x) + \dfrac{2}{2 + x}, \quad (-1, 2)$

24. $y = 2x^2 + \ln x^2, \quad (1, 2)$

Logarithmic Differentiation **In Exercises 25 and 26, use logarithmic differentiation to find dy/dx.**

25. $y = x^2\sqrt{x - 1}, \quad x > 1$

26. $y = \dfrac{x + 2}{\sqrt{3x - 2}}, \quad x > \dfrac{2}{3}$

Finding an Indefinite Integral **In Exercises 27–32, find the indefinite integral.**

27. $\displaystyle\int \frac{1}{7x - 2}\,dx$

28. $\displaystyle\int \frac{x^2}{x^3 + 1}\,dx$

29. $\displaystyle\int \frac{\sin x}{1 + \cos x}\,dx$

30. $\displaystyle\int \frac{\ln \sqrt{x}}{x}\,dx$

31. $\displaystyle\int \frac{x^2 - 6x + 1}{x^2 + 1}\,dx$

32. $\displaystyle\int \frac{dx}{\sqrt{x}\left(2\sqrt{x} + 5\right)}$

Evaluating a Definite Integral **In Exercises 33–36, evaluate the definite integral.**

33. $\displaystyle\int_1^4 \frac{2x + 1}{2x}\,dx$

34. $\displaystyle\int_1^e \frac{\ln x}{x}\,dx$

35. $\displaystyle\int_0^{\pi/3} \sec\theta\,d\theta$

36. $\displaystyle\int_0^{\pi} \tan\frac{\theta}{3}\,d\theta$

Area **In Exercises 37 and 38, find the area of the region bounded by the graphs of the equations. Use a graphing utility to verify your result.**

37. $y = \dfrac{6x^2}{x^3 - 2}, \ x = 3, \ x = 5, \ y = 0$

38. $y = x + \csc\dfrac{\pi x}{12}, \ x = 2, \ x = 6, \ y = 0$

Finding an Inverse Function **In Exercises 39–44, (a) find the inverse function of f, (b) graph f and f^{-1} on the same set of coordinate axes, (c) verify that $f^{-1}(f(x)) = x$ and $f(f^{-1}(x)) = x$, and (d) state the domains and ranges of f and f^{-1}.**

39. $f(x) = \frac{1}{2}x - 3$

40. $f(x) = 5x - 7$

41. $f(x) = \sqrt{x + 1}$

42. $f(x) = x^3 + 2$

43. $f(x) = \sqrt[3]{x + 1}$

44. $f(x) = x^2 - 5, \quad x \geq 0$

Evaluating the Derivative of an Inverse Function **In Exercises 45–48, verify that f has an inverse function. Then use the function f and the given function value $f(x) = a$ to find $(f^{-1})'(a)$. (*Hint:* Use Theorem 5.9.)**

45. $f(x) = x^3 + 2, \quad f\left(-\sqrt[3]{3}\right) = -1$

46. $f(x) = x\sqrt{x - 3}, \quad f(4) = 4$

47. $f(x) = \tan x, \quad -\dfrac{\pi}{4} \leq x \leq \dfrac{\pi}{4}, \quad f\left(\dfrac{\pi}{6}\right) = \dfrac{\sqrt{3}}{3}$

48. $f(x) = \cos x, \quad 0 \leq x \leq \pi, \quad f\left(\dfrac{\pi}{2}\right) = 0$

Solving an Exponential or Logarithmic Equation **In Exercises 49–52, solve for x accurate to three decimal places.**

49. $e^{3x} = 30$

50. $-4 + 3e^{-2x} = 6$

51. $\ln\sqrt{x + 1} = 2$

52. $\ln x + \ln(x - 3) = 0$

Finding a Derivative **In Exercises 53–58, find the derivative of the function.**

53. $g(t) = t^2e^t$

54. $g(x) = \ln\dfrac{e^x}{1 + e^x}$

55. $y = \sqrt{e^{2x} + e^{-2x}}$

56. $h(z) = e^{-z^2/2}$

57. $g(x) = \dfrac{x^3}{e^{2x}}$

58. $y = 3e^{-3/t}$

Finding an Equation of a Tangent Line **In Exercises 59 and 60, find an equation of the tangent line to the graph of the function at the given point.**

59. $f(x) = e^{6x}, \quad (0, 1)$

60. $h(x) = -xe^{2-x}, \quad (2, -2)$

Relative Extrema and Points of Inflection **In Exercises 61 and 62, find the relative extrema and points of inflection (if any exist) of the function. Use a graphing utility to graph the function and confirm your results.**

61. $f(x) = (x + 1)e^{-x}$

62. $g(x) = \dfrac{1}{\sqrt{2\pi}}e^{-(x-5)^2/2}$

Finding an Indefinite Integral **In Exercises 63–66, find the indefinite integral.**

63. $\displaystyle\int xe^{1-x^2}\,dx$

64. $\displaystyle\int x^2e^{x^3+1}\,dx$

65. $\displaystyle\int \frac{e^{4x} - e^{2x} + 1}{e^x}\,dx$

66. $\displaystyle\int \frac{e^{2x} - e^{-2x}}{e^{2x} + e^{-2x}}\,dx$

Evaluating a Definite Integral **In Exercises 67–70, evaluate the definite integral.**

67. $\displaystyle\int_0^1 xe^{-3x^2}\,dx$

68. $\displaystyle\int_{1/2}^2 \frac{e^{1/x}}{x^2}\,dx$

69. $\displaystyle\int_1^3 \frac{e^x}{e^x - 1}\,dx$

70. $\displaystyle\int_{1/4}^5 \frac{e^{4x} + 1}{4x + e^{4x}}\,dx$

71. Area Find the area of the region bounded by the graphs of

$y = 2e^{-x}$, $y = 0$, $x = 0$, and $x = 2$.

72. Depreciation The value V of an item t years after it is purchased is

$V = 9000e^{-0.6t}, \quad 0 \le t \le 5.$

(a) Use a graphing utility to graph the function.

(b) Find the rates of change of V with respect to t when $t = 1$ and $t = 4$.

(c) Use a graphing utility to graph the tangent lines to the function when $t = 1$ and $t = 4$.

Sketching a Graph **In Exercises 73 and 74, sketch the graph of the function.**

73. $y = 3^{x/2}$

74. $y = \left(\frac{1}{4}\right)^x$

Solving an Equation **In Exercises 75–80, solve the equation accurate to three decimal places.**

75. $4^{1-x} = 52$

76. $2(3^{x+2}) = 17$

77. $\left(1 + \frac{0.03}{12}\right)^{12t} = 3$

78. $\left(1 + \frac{0.06}{365}\right)^{365t} = 2$

79. $\log_6(x + 1) = 2$

80. $\log_5 x^2 = 4.1$

Finding a Derivative **In Exercises 81–88, find the derivative of the function.**

81. $f(x) = 3^{x-1}$

82. $f(x) = 5^{3x}$

83. $g(t) = \frac{2^{3t}}{t^2}$

84. $f(x) = x(4^{-3x})$

85. $g(x) = \log_3 \sqrt{1 - x}$

86. $h(x) = \log_5 \frac{x}{x - 1}$

87. $y = x^{2x+1}$

88. $y = (3x + 5)^x$

Finding an Indefinite Integral **In Exercises 89 and 90, find the indefinite integral.**

89. $\int (x + 1)5^{(x+1)^2}\,dx$

90. $\int \frac{2^{-1/t}}{t^2}\,dt$

Evaluating a Definite Integral **In Exercises 91 and 92, evaluate the definite integral.**

91. $\int_1^2 6^x\,dx$

92. $\int_{-4}^0 9^{x/2}\,dx$

93. Compound Interest

(a) A deposit of \$550 is made in a savings account that pays an annual interest rate of 1% compounded monthly. What is the balance after 11 years?

(b) How large a deposit, at 5% interest compounded continuously, must be made to obtain a balance of \$10,000 in 15 years?

(c) A deposit earns interest at a rate of r percent compounded continuously and doubles in value in 10 years. Find r.

94. Climb Rate The time t (in minutes) for a small plane to climb to an altitude of h feet is

$t = 50 \log_{10} \frac{18{,}000}{18{,}000 - h}$

where 18,000 feet is as high as the plane can fly.

(a) Determine the domain of the function appropriate for the context of the problem.

(b) Use a graphing utility to graph the function and identify any asymptotes.

(c) Find the time when the altitude is increasing at the greatest rate.

Evaluating a Limit **In Exercises 95–102, use L'Hôpital's Rule to evaluate the limit.**

95. $\lim_{x \to 1} \frac{(\ln x)^2}{x - 1}$

96. $\lim_{x \to 0} \frac{\sin \pi x}{\sin 5\pi x}$

97. $\lim_{x \to \infty} \frac{e^{2x}}{x^2}$

98. $\lim_{x \to \infty} xe^{-x^2}$

99. $\lim_{x \to \infty} (\ln x)^{2/x}$

100. $\lim_{x \to 1^+} (x - 1)^{\ln x}$

101. $\lim_{n \to \infty} 1000\left(1 + \frac{0.09}{n}\right)^n$

102. $\lim_{x \to \infty} \left(1 + \frac{4}{x}\right)^x$

Evaluating an Expression **In Exercises 103 and 104, evaluate each expression without using a calculator. (*Hint:* Make a sketch of a right triangle.)**

103. (a) $\sin\left(\arcsin \frac{1}{2}\right)$

(b) $\cos\left(\arcsin \frac{1}{2}\right)$

104. (a) $\tan(\operatorname{arccot} 2)$

(b) $\cos\left(\operatorname{arcsec} \sqrt{5}\right)$

Finding a Derivative **In Exercises 105–110, find the derivative of the function.**

105. $y = \operatorname{arccsc} 2x^2$

106. $y = \frac{1}{2} \arctan e^{2x}$

107. $y = x \operatorname{arcsec} x$

108. $y = \sqrt{x^2 - 4} - 2 \operatorname{arcsec} \frac{x}{2}, \quad 2 < x < 4$

109. $y = x(\arcsin x)^2 - 2x + 2\sqrt{1 - x^2} \arcsin x$

110. $y = \tan(\arcsin x)$

Finding an Indefinite Integral **In Exercises 111–116, find the indefinite integral.**

111. $\int \frac{1}{e^{2x} + e^{-2x}}\,dx$

112. $\int \frac{1}{3 + 25x^2}\,dx$

113. $\int \frac{x}{\sqrt{1 - x^4}}\,dx$

114. $\int \frac{1}{x\sqrt{9x^2 - 49}}\,dx$

115. $\int \frac{\arctan(x/2)}{4 + x^2}\,dx$

116. $\int \frac{\arcsin 2x}{\sqrt{1 - 4x^2}}\,dx$

Evaluating a Definite Integral **In Exercises 117–120, evaluate the definite integral.**

117. $\displaystyle\int_0^{1/7} \frac{dx}{\sqrt{1-49x^2}}$

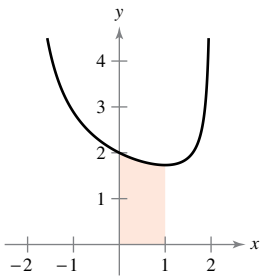
118. $\displaystyle\int_0^1 \frac{2x^2}{\sqrt{4-x^6}}\,dx$

119. $\displaystyle\int_{-1}^{2} \frac{10e^{2x}}{25+e^{4x}}\,dx$

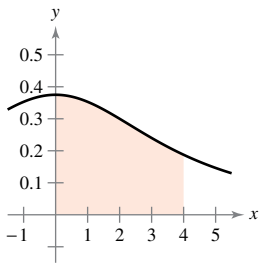
120. $\displaystyle\int_{\pi/3}^{\pi/2} \frac{\cos x}{(\sin x)\sqrt{\sin^2 x-(1/4)}}\,dx$

Area **In Exercises 121 and 122, find the area of the given region.**

121. $y = \dfrac{4-x}{\sqrt{4-x^2}}$



122. $y = \dfrac{6}{16+x^2}$



Finding a Derivative **In Exercises 123–128, find the derivative of the function.**

123. $y = \operatorname{sech}(4x-1)$

124. $y = 2x - \cosh\sqrt{x}$

125. $y = \coth 8x^2$

126. $y = \ln(\coth x)$

127. $y = \sinh^{-1}(4x)$

128. $y = x\tanh^{-1}(2x)$

Finding an Indefinite Integral **In Exercises 129–134, find the indefinite integral.**

129. $\displaystyle\int x^2\operatorname{sech}^2 x^3\,dx$

130. $\displaystyle\int \sinh 6x\,dx$

131. $\displaystyle\int \frac{\operatorname{sech}^2 x}{\tanh x}\,dx$

132. $\displaystyle\int \operatorname{csch}^4 3x\coth 3x\,dx$

133. $\displaystyle\int \frac{1}{9-4x^2}\,dx$

134. $\displaystyle\int \frac{x}{\sqrt{x^4-1}}\,dx$

Evaluating a Definite Integral **In Exercises 135–138, evaluate the definite integral.**

135. $\displaystyle\int_1^2 \operatorname{sech} 2x\tanh 2x\,dx$

136. $\displaystyle\int_0^1 \sinh^2 x\,dx$

137. $\displaystyle\int_0^1 \frac{3}{\sqrt{9x^2+16}}\,dx$

138. $\displaystyle\int_{-1}^{0} \frac{2}{49-4x^2}\,dx$

Building on Concepts

139. Consider the function

$$f(x) = \sin(\ln x).$$

(a) Determine the domain of f.

(b) Find two values of x satisfying $f(x) = 1$.

(c) Find two values of x satisfying $f(x) = -1$.

(d) What is the range of f?

(e) Find $f'(x)$ and use calculus to find the maximum value of f on the interval $[1, 10]$.

(f) Use a graphing utility to graph f in the viewing window where $0 \le x \le 5$ and $-2 \le y \le 2$. Estimate $\lim_{x\to 0^+} f(x)$, if it exists.

(g) Determine $\lim_{x\to 0^+} f(x)$ analytically, if it exists.

140. (a) Use a graphing utility to compare the graph of the function $y = e^x$ with the graph of each function below.

(i) $y_1 = 1 + \dfrac{x}{1!}$

(ii) $y_2 = 1 + \dfrac{x}{1!} + \dfrac{x^2}{2!}$

(iii) $y_3 = 1 + \dfrac{x}{1!} + \dfrac{x^2}{2!} + \dfrac{x^3}{3!}$

(b) Identify the pattern of successive polynomials in part (a), extend the pattern one more term, and compare the graph of the resulting polynomial function with the graph of $y = e^x$.

(c) What do you think this pattern implies?

141. Consider the function

$$f(x) = \frac{\ln x}{x}.$$

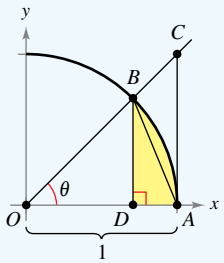
(a) Use a graphing utility to graph f and show that f is strictly decreasing on (e, ∞).

(b) Show that if $e \le A < B$, then $A^B > B^A$.

(c) Use part (b) to show that $e^\pi > \pi^e$.

142. In Section 1.3, a geometric argument (see figure) was used to prove that

$$\lim_{\theta\to 0} \frac{\sin\theta}{\theta}.$$



(a) Write the area of $\triangle ABD$ in terms of θ.

(b) Write the area of the shaded region in terms of θ.

(c) Write the ratio R of the area of $\triangle ABD$ to that of the shaded region.

(d) Find $\lim_{\theta\to 0} R$.

P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

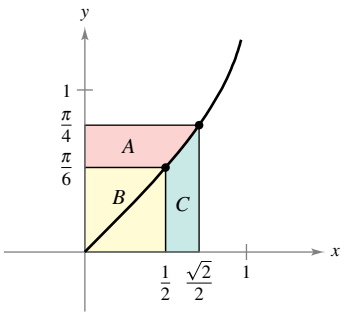
GO DIGITAL

1. Approximation To approximate e^x, you can use a function of the form

$$f(x) = \frac{a + bx}{1 + cx}.$$

(This function is known as a **Padé approximation.**) The values of $f(0)$, $f'(0)$, and $f''(0)$ are equal to the corresponding values of e^x. Show that these values are equal to 1 and find the values of a, b, and c such that $f(0) = f'(0) = f''(0) = 1$. Then use a graphing utility to compare the graphs of f and e^x.

2. Area Consider the three regions A, B, and C determined by the graph of $f(x) = \arcsin x$, as shown in the figure.



(a) Calculate the areas of regions A and B.

(b) Use your answers in part (a) to evaluate the integral

$$\int_{1/2}^{\sqrt{2}/2} \arcsin x \, dx.$$

(c) Use the methods in part (a) to evaluate the integral

$$\int_{1}^{3} \ln x \, dx.$$

(d) Use the methods in part (a) to evaluate the integral

$$\int_{1}^{\sqrt{3}} \arctan x \, dx.$$

3. Finding a Value Find the value of the positive constant c such that

$$\lim_{x\to\infty} \left(\frac{x + c}{x - c}\right)^x = 9.$$

4. Finding Limits Use a graphing utility to estimate each limit. Then calculate each limit using L'Hôpital's Rule. What can you conclude about the form $0 \cdot \infty$?

(a) $\lim_{x\to 0^+} \left(\cot x + \frac{1}{x}\right)$

(b) $\lim_{x\to 0^+} \left(\cot x - \frac{1}{x}\right)$

(c) $\lim_{x\to 0^+} \left[\left(\cot x + \frac{1}{x}\right)\left(\cot x - \frac{1}{x}\right)\right]$

5. Distance Let L be the tangent line to the graph of the function $y = \ln x$ at the point (a, b), where c is the y-intercept of the tangent line, as shown in the figure. Show that the distance between b and c is always equal to 1.

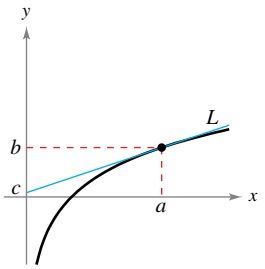


Figure for 5

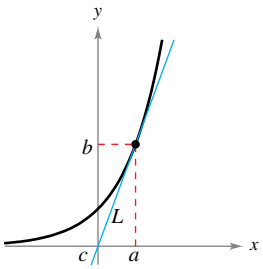

Figure for 6

6. Distance Let L be the tangent line to the graph of the function $y = e^x$ at the point (a, b), where c is the y-intercept of the tangent line, as shown in the figure. Show that the distance between a and c is always equal to 1.

7. Area Use integration by substitution to find the area under the curve

$$y = \frac{1}{\sin^2 x + 4\cos^2 x}$$

between $x = 0$ and $x = \frac{\pi}{4}$.

8. Areas and Angles

(a) Let $P(\cos t, \sin t)$ be a point on the unit circle $x^2 + y^2 = 1$ in the first quadrant (see figure). Show that t is equal to twice the area of the shaded circular sector AOP.

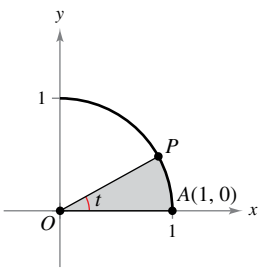

Figure for part (a)

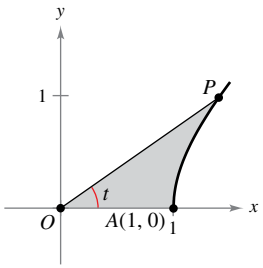

Figure for part (b)

(b) Let $P(\cosh t, \sinh t)$ be a point on the unit hyperbola $x^2 - y^2 = 1$ in the first quadrant (see figure). Show that t is equal to twice the area of the shaded region AOP. Begin by showing that the area of the shaded region AOP is given by the formula

$$A(t) = \frac{1}{2}\cosh t \sinh t - \int_{1}^{\cosh t} \sqrt{x^2 - 1}\, dx.$$

9. Intersection Graph the exponential function $y = a^x$ for $a = 0.5$, 1.2, and 2.0. Which of these curves intersects the line $y = x$? Determine all positive numbers a for which the curve $y = a^x$ intersects the line $y = x$.

6.1 Slope Fields and Euler's Method

GO DIGITAL

- Use initial conditions to find particular solutions of differential equations.
- Use slope fields to approximate solutions of differential equations.
- Use Euler's Method to approximate solutions of differential equations.

Big Ideas of Calculus

A differential equation is an equation involving a function and one or more of its derivatives. In many applications, the function represents a physical quantity, the derivatives represent the rates of changes, and the differential equation defines the relationship between the quantities. You will solve differential equations using three approaches—numerical, graphical, and analytic. Applications involving differential equations include velocities of falling objects, learning curves, chemical reactions, and population models.

General and Particular Solutions

In this text, you will learn that physical phenomena can be described by differential equations. Recall that a **differential equation** in x and y is an equation that involves x, y, and derivatives of y. For example,

$$2xy' - 3y = 0 \qquad \text{Differential equation}$$

is a differential equation. In Section 6.2, you will learn that problems involving radioactive decay, population growth, and Newton's Law of Cooling can be formulated in terms of differential equations.

A function $y = f(x)$ is called a **solution** of a differential equation if the equation is satisfied when y and its derivatives are replaced by $f(x)$ and its derivatives. For example, differentiation and substitution would show that $y = e^{-2x}$ is a solution of the differential equation $y' + 2y = 0$. It can be shown that every solution of this differential equation is of the form

$$y = Ce^{-2x} \qquad \text{General solution of } y' + 2y = 0$$

where C is any real number. This solution is called the **general solution.** Some differential equations have **singular solutions** that cannot be written as special cases of the general solution. Such solutions, however, are not considered in this text. The **order** of a differential equation is determined by the highest-order derivative in the equation. For instance, $y' = 4y$ is a first-order differential equation.

In Section 4.1, Example 9, you saw that the second-order differential equation $s''(t) = -32$ has the general solution

$$s(t) = -16t^2 + C_1t + C_2 \qquad \text{General solution of } s''(t) = -32$$

which contains two arbitrary constants. It can be shown that a differential equation of order n has a general solution with n arbitrary constants.

EXAMPLE 1 Determining Solutions

Determine whether each function is a solution of the differential equation $y'' - y = 0$.

a. $y = \sin x$ **b.** $y = 4e^{-x}$ **c.** $y = Ce^{x}$

Solution

a. Because $y = \sin x$, $y' = \cos x$, and $y'' = -\sin x$, it follows that

$$y'' - y = -\sin x - \sin x = -2\sin x \neq 0.$$

So, $y = \sin x$ is *not* a solution.

b. Because $y = 4e^{-x}$, $y' = -4e^{-x}$, and $y'' = 4e^{-x}$, it follows that

$$y'' - y = 4e^{-x} - 4e^{-x} = 0.$$

So, $y = 4e^{-x}$ is a solution.

c. Because $y = Ce^{x}$, $y' = Ce^{x}$, and $y'' = Ce^{x}$, it follows that

$$y'' - y = Ce^{x} - Ce^{x} = 0.$$

So, $y = Ce^{x}$ is a solution for any value of C. ■

REMARK Using techniques you will learn in Section 16.2, the general solution of the differential equation $y'' - y = 0$ in Example 1 is

$$y = C_1e^{x} + C_2e^{-x}.$$

Verify that this function is a solution of the differential equation.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Several solution curves for $y' + 2y = 0$
Figure 6.1

Geometrically, the general solution of a first-order differential equation represents a family of curves known as **solution curves,** one for each value assigned to the arbitrary constant. For instance, every function of the form

$$y = Ce^{-2x}$$ General solution of $y' + 2y = 0$

is a solution of the differential equation

$$y' + 2y = 0.$$

Figure 6.1 shows four of the solution curves corresponding to different values of C.

As discussed in Section 4.1, **particular solutions** of a differential equation are obtained from **initial conditions** that give the values of the dependent variable or one of its derivatives for particular values of the independent variable. The term "initial condition" stems from the fact that, often in problems involving time, the value of the dependent variable or one of its derivatives is known at the *initial* time $t = 0$. For instance, the second-order differential equation

$$s''(t) = -32$$

having the general solution

$$s(t) = -16t^2 + C_1t + C_2$$ General solution of $s''(t) = -32$

might have the following initial conditions.

$$s(0) = 80, \quad s'(0) = 64$$ Initial conditions

In this case, the initial conditions yield the particular solution

$$s(t) = -16t^2 + 64t + 80.$$ Particular solution

EXAMPLE 2 Finding a Particular Solution

See LarsonCalculus.com for an interactive version of this type of example.

For the differential equation

$$xy' - 3y = 0$$

verify that $y = Cx^3$ is a solution. (Assume $x > 0$.) Then find the particular solution determined by the initial condition $y = 2$ when $x = 3$.

Solution You know that $y = Cx^3$ is a solution because $y' = 3Cx^2$ and

$$xy' - 3y = x(3Cx^2) - 3(Cx^3) = 0.$$

Furthermore, the initial condition $y = 2$ when $x = 3$ yields

$$y = Cx^3$$ General solution

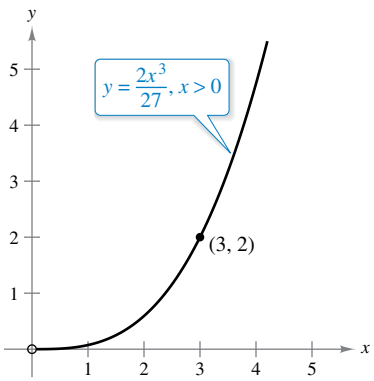
$$2 = C(3)^3$$ Substitute initial condition.

$$\frac{2}{27} = C$$ Solve for C.

and you can conclude that the particular solution is

$$y = \frac{2x^3}{27}, \quad x > 0$$ Particular solution

as shown in Figure 6.2. Try checking this solution by substituting for y and y' in the original differential equation. ■



For the initial condition $y = 2$ when $x = 3$, the particular solution of the differential equation $xy' - 3y = 0$, $x > 0$, is $y = (2x^3)/27$.
Figure 6.2

Note that to determine a particular solution, the number of initial conditions must match the number of constants in the general solution.

GO DIGITAL

Slope Fields

Solving a differential equation analytically can be difficult or even impossible. However, there is a graphical approach you can use to learn a lot about the solution of a differential equation. Consider a differential equation of the form

$$y' = F(x, y) \qquad \text{Differential equation}$$

where $F(x, y)$ is some expression in x and y. At each point (x, y) in the xy-plane where F is defined, the differential equation determines the slope $y' = F(x, y)$ of the solution at that point. If you draw short line segments with slope $F(x, y)$ at selected points (x, y) in the domain of F, then these line segments form a **slope field,** or a *direction field*, for the differential equation $y' = F(x, y)$. Each line segment has the same slope as the solution curve through that point. A slope field shows the general shape of all the solutions and can be helpful in getting a visual perspective of the directions of the solutions of a differential equation.

EXAMPLE 3 Sketching a Slope Field

Sketch a slope field for the differential equation $y' = x - y$ for the points $(-1, 1)$, $(0, 1)$, and $(1, 1)$.

Solution The slope of the solution curve at any point (x, y) is

$$F(x, y) = x - y. \qquad \text{Slope at } (x, y)$$

So, the slope at each point can be found as shown.

Slope at $(-1, 1)$: $y' = -1 - 1 = -2$
Slope at $(0, 1)$: $y' = 0 - 1 = -1$
Slope at $(1, 1)$: $y' = 1 - 1 = 0$

Draw short line segments at the three points with their respective slopes, as shown in Figure 6.3.

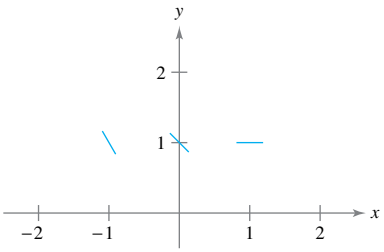

Figure 6.3

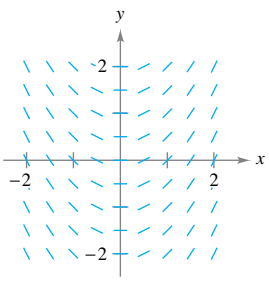
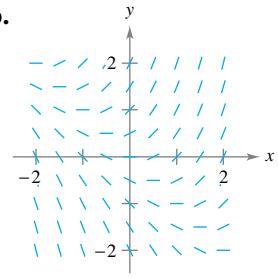
EXAMPLE 4 Identifying Slope Fields for Differential Equations

Match each slope field with its differential equation.

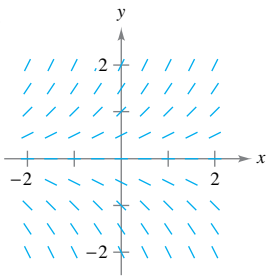
a.



b.



c.



i. $y' = x + y$ **ii.** $y' = x$ **iii.** $y' = y$

Solution

a. The slope at any point along the y-axis is 0. The only equation that satisfies this condition is $y' = x$. So, the graph matches equation (ii).

b. The slope at the point $(1, -1)$ is 0. The only equation that satisfies this condition is $y' = x + y$. So, the graph matches equation (i).

c. The slope at any point along the x-axis is 0. The only equation that satisfies this condition is $y' = y$. So, the graph matches equation (iii). ■

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s).
Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

A solution curve of a differential equation $y' = F(x, y)$ is simply a curve in the xy-plane whose tangent line at each point (x, y) has slope equal to $F(x, y)$. This is illustrated in Example 5.

EXAMPLE 5 Sketching a Solution Using a Slope Field

Sketch a slope field for the differential equation

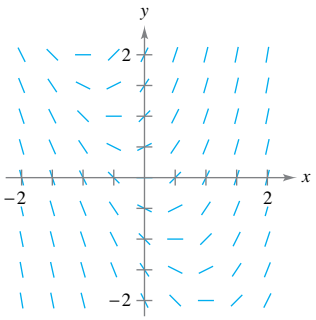
$$y' = 2x + y.$$

Use the slope field to sketch the solution that passes through the point $(1, 1)$.

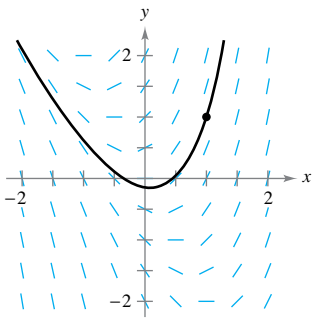
Solution Make a table showing the slopes at several points. The table shown is a small sample. The slopes at many other points should be calculated to get a representative slope field.

x	-2	-2	-1	-1	0	0	1	1	2	2
y	-1	1	-1	1	-1	1	-1	1	-1	1
$y' = 2x + y$	-5	-3	-3	-1	-1	1	1	3	3	5

Next, draw line segments at the points with their respective slopes, as shown in Figure 6.4.



Slope field for $y' = 2x + y$
Figure 6.4



Particular solution for $y' = 2x + y$ passing through $(1, 1)$
Figure 6.5

After the slope field is drawn, start at the initial point $(1, 1)$ and move to the right in the direction of the line segment. Continue to draw the solution curve so that it moves parallel to the nearby line segments. Do the same to the left of $(1, 1)$. The resulting solution is shown in Figure 6.5.

In Example 5, note that the slope field shows that y' increases to infinity as x increases.

TECHNOLOGY Sketching a slope field without a graphing utility is tedious. In practice, slope fields are usually drawn using a graphing utility. If you have access to a graphing utility that can graph slope fields, try graphing the slope field for the differential equation in Example 5. One example of a slope field drawn by a graphing utility is shown at the right.

Euler's Method

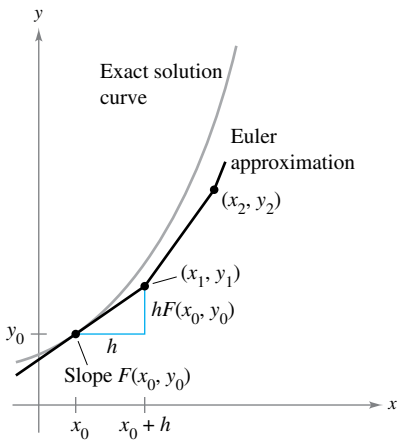

Figure 6.6

Euler's Method is a numerical approach to approximating the particular solution of the differential equation

$$y' = F(x, y)$$

that passes through the point (x_0, y_0). From the given information, you know that the graph of the solution passes through the point (x_0, y_0) and has a slope of $F(x_0, y_0)$ at this point. This gives you a "starting point" for approximating the solution.

From this starting point, you can proceed in the direction indicated by the slope. Using a small step h, move along the tangent line until you arrive at the point (x_1, y_1), where

$$x_1 = x_0 + h \quad \text{and} \quad y_1 = y_0 + hF(x_0, y_0)$$

as shown in Figure 6.6. Then, using (x_1, y_1) as a new starting point, repeat the process to obtain a second point (x_2, y_2). The values of x_i and y_i are shown below.

$$\begin{aligned} x_1 &= x_0 + h & y_1 &= y_0 + hF(x_0, y_0) \\ x_2 &= x_1 + h & y_2 &= y_1 + hF(x_1, y_1) \\ &\vdots & &\vdots \\ x_n &= x_{n-1} + h & y_n &= y_{n-1} + hF(x_{n-1}, y_{n-1}) \end{aligned}$$

When using this method, note that you can obtain better approximations of the exact solution by choosing smaller and smaller step sizes.

EXAMPLE 6 Approximating a Solution Using Euler's Method

Use Euler's Method to approximate the particular solution of the differential equation

$$y' = x - y$$

passing through the point $(0, 1)$. Use a step of $h = 0.1$.

Solution Using $h = 0.1$, $x_0 = 0$, $y_0 = 1$, and $F(x, y) = x - y$, you have

$$x_0 = 0, \quad x_1 = 0.1, \quad x_2 = 0.2, \quad x_3 = 0.3$$

and the first three approximations are

$$\begin{aligned} y_1 &= y_0 + hF(x_0, y_0) = 1 + (0.1)(0 - 1) = 0.9 \\ y_2 &= y_1 + hF(x_1, y_1) = 0.9 + (0.1)(0.1 - 0.9) = 0.82 \\ y_3 &= y_2 + hF(x_2, y_2) = 0.82 + (0.1)(0.2 - 0.82) = 0.758. \end{aligned}$$

The first ten approximations are shown in the table. You can plot these values to see a graph of the approximate solution, as shown in Figure 6.7.

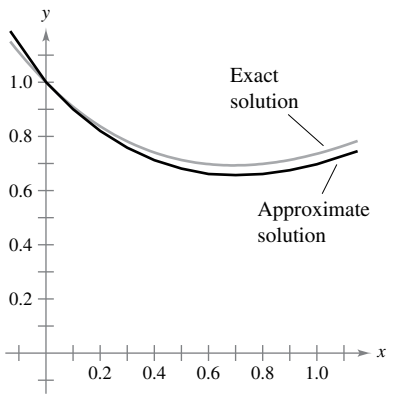

Figure 6.7

n	0	1	2	3	4	5	6	7	8	9	10
x_n	0	0.1	0.2	0.3	0.4	0.5	0.6	0.7	0.8	0.9	1
y_n	1	0.9	0.82	0.758	0.712	0.681	0.663	0.657	0.661	0.675	0.697

In Example 6, the exact solution of the differential equation $y' = x - y$ is

$$y = x - 1 + 2e^{-x}.$$

Figure 6.7 compares this exact solution with the approximate solution obtained in Example 6.

6.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Describe how to determine whether a function $y = f(x)$ is a solution of a differential equation.
2. Explain what the general solution of a first-order differential equation represents geometrically.
3. Explain what the line segments on a slope field represent.
4. When is it appropriate to use Euler's Method?

Verifying a Solution **In Exercises 5–10, verify that the function is a solution of the differential equation.**

Function	Differential Equation
5. $y = Ce^{5x}$	$y' = 5y$
6. $y = e^{-2x}$	$3y' + 5y = -e^{-2x}$
7. $y = C_1 \sin x - C_2 \cos x$	$y'' + y = 0$
8. $y = C_1e^{-x} \cos x + C_2e^{-x} \sin x$	$y'' + 2y' + 2y = 0$
9. $y = (-\cos x) \ln\lvert\sec x + \tan x\rvert$	$y'' + y = \tan x$
10. $y = \frac{2}{5}(e^{-4x} + e^{x})$	$y'' + 4y' = 2e^{x}$

Verifying a Particular Solution **In Exercises 11–14, verify that the function is a particular solution of the differential equation.**

Function	Differential Equation and Initial Condition
11. $y = \sin x \cos x - \cos^2 x$	$2y + y' = 2 \sin 2x - 1$, $y\left(\frac{\pi}{4}\right) = 0$
12. $y = 6x - 4 \sin x + 1$	$y' = 6 - 4 \cos x$, $y(0) = 1$
13. $y = 4e^{-6x^2}$	$y' = -12xy$, $y(0) = 4$
14. $y = e^{-\cos x}$	$y' = y \sin x$, $y\left(\frac{\pi}{2}\right) = 1$

Determining a Solution **In Exercises 15–22, determine whether the function is a solution of the differential equation $y^{(4)} - 16y = 0$.**

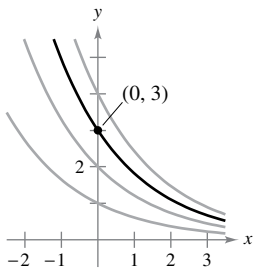
15. $y = 3 \cos 2x$
16. $y = 3 \sin 2x$
17. $y = 3 \cos x$
18. $y = 2 \sin x$
19. $y = e^{-2x}$
20. $y = 5 \ln x$
21. $y = \ln x + e^{2x} + Cx^4$
22. $y = 3e^{2x} - 4 \sin 2x$

Determining a Solution **In Exercises 23–30, determine whether the function is a solution of the differential equation $xy' - 2y = x^3e^x$, $x > 0$.**

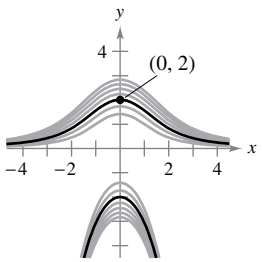
23. $y = x^2 + e^{x}$
24. $y = x^3 - e^{-x}$
25. $y = x^2e^{x}$
26. $y = x^2(2 + e^{x})$
27. $y = e^{x} - \sin x$
28. $y = x^2e^{x} + \sin x + \cos x$
29. $y = 2e^{x} \ln x$
30. $y = x^2e^{x} - 5x^2$

Finding a Particular Solution **In Exercises 31–34, some of the curves corresponding to different values of C in the general solution of the differential equation are shown in the graph. Find the particular solution that passes through the point shown on the graph.**

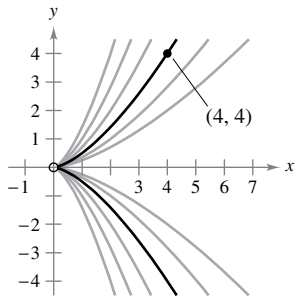
31. $y = Ce^{-x/2}$, $2y' + y = 0$



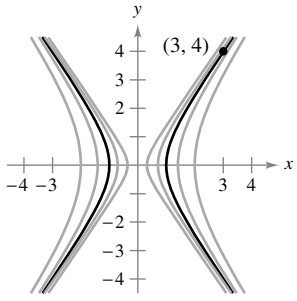
32. $y(x^2 + y) = C$, $2xy + (x^2 + 2y)y' = 0$



33. $y^2 = Cx^3$, $2xy' - 3y = 0, \quad x > 0$



34. $2x^2 - y^2 = C$, $yy' - 2x = 0$



Graphing Particular Solutions Using Technology **In Exercises 35 and 36, the general solution of the differential equation is given. Use a graphing utility to graph the particular solutions for the given values of C.**

35. $4yy' - x = 0$, $4y^2 - x^2 = C$, $C = 0, C = \pm 1, C = \pm 4$
36. $yy' + x = 0$, $x^2 + y^2 = C$, $C = 0, C = 1, C = 4$

Finding a Particular Solution **In Exercises 37–42, verify that the general solution satisfies the differential equation. Then find the particular solution that satisfies the initial condition(s).**

37. $y = Ce^{-6x}$

$y' + 6y = 0$

$y = 3$ when $x = 0$

38. $3x^2 + 2y^2 = C$

$3x + 2yy' = 0$

$y = 3$ when $x = 1$

39. $y = C_1 \sin 3x + C_2 \cos 3x$

$y'' + 9y = 0$

$y = 2$ when $x = \frac{\pi}{6}$

$y' = 1$ when $x = \frac{\pi}{6}$

40. $y = C_1 + C_2 \ln x$

$xy'' + y' = 0, x > 0$

$y = 0$ when $x = 2$

$y' = \frac{1}{2}$ when $x = 2$

41. $y = C_1x + C_2x^3$

$x^2y'' - 3xy' + 3y = 0, x > 0$

$y = 0$ when $x = 2$

$y' = 4$ when $x = 2$

42. $y = e^{2x/3}(C_1 + C_2x)$

$9y'' - 12y' + 4y = 0$

$y = 4$ when $x = 0$

$y = 0$ when $x = 3$

Finding a General Solution **In Exercises 43–52, use integration to find a general solution of the differential equation.**

43. $\frac{dy}{dx} = 12x^2$

44. $\frac{dy}{dx} = 3x^8 - 2x$

45. $\frac{dy}{dx} = \frac{x}{1 + x^2}$

46. $\frac{dy}{dx} = \frac{e^x}{4 + e^x}$

47. $\frac{dy}{dx} = \sin 2x$

48. $\frac{dy}{dx} = \tan^2 x$

49. $\frac{dy}{dx} = x\sqrt{x - 6}$

50. $\frac{dy}{dx} = 2x\sqrt{4x^2 + 1}$

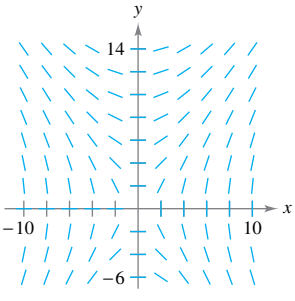
51. $\frac{dy}{dx} = xe^{x^2}$

52. $\frac{dy}{dx} = 5(\sin x)e^{\cos x}$

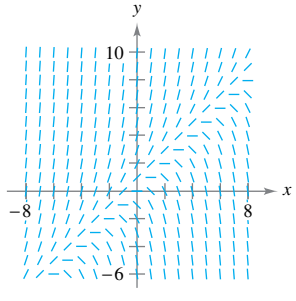
Slope Field **In Exercises 53–56, a differential equation and its slope field are given. Complete the table by determining the slopes (if possible) in the slope field at the given points.**

x	-4	-2	0	2	4	8
y	2	0	4	4	6	8
dy/dx						

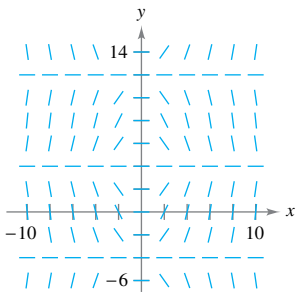
53. $\frac{dy}{dx} = \frac{2x}{y}$



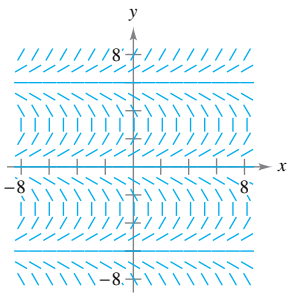
54. $\frac{dy}{dx} = y - x$



55. $\frac{dy}{dx} = x \cos \frac{\pi y}{8}$

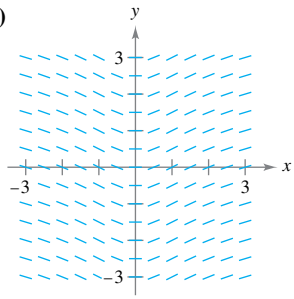


56. $\frac{dy}{dx} = \tan \frac{\pi y}{6}$

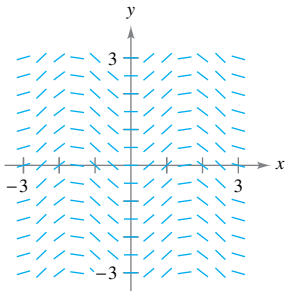


Matching **In Exercises 57–60, match the differential equation with its slope field. [The slope fields are labeled (a), (b), (c), and (d).]**

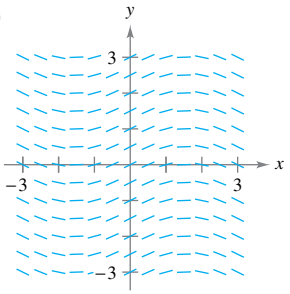
(a)



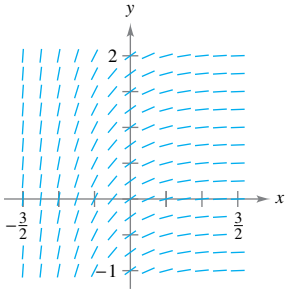
(b)



(c)



(d)



57. $\frac{dy}{dx} = \sin 2x$

58. $\frac{dy}{dx} = \frac{1}{2} \cos x$

59. $\frac{dy}{dx} = e^{-2x}$

60. $\frac{dy}{dx} = \frac{x}{x^2 + 1}$

Slope Field **In Exercises 61–64, (a) sketch the slope field for the differential equation, (b) use the slope field to sketch the solution that passes through the given point, and (c) discuss the graph of the solution as $x \to \infty$ and $x \to -\infty$. Use a graphing utility to verify your results. To print a blank coordinate plane, go to *MathGraphs.com*.**

61. $y' = 3 - x, \quad (4, 2)$

62. $y' = \frac{1}{3}x^2 - \frac{1}{2}x, \quad (1, 1)$

63. $y' = y - 4x, \quad (2, 2)$

64. $y' = y + xy, \quad (0, -4)$

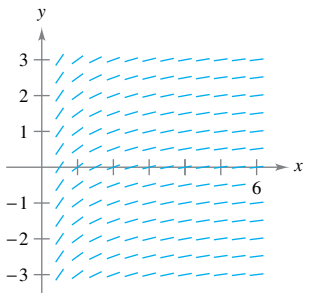
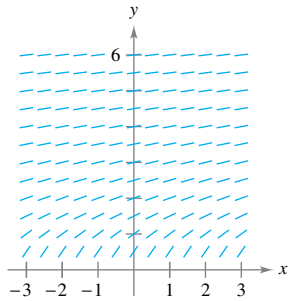
65. Slope Field Use the slope field for the differential equation $y' = 1/x$, where $x > 0$, to sketch the graph of the solution that satisfies each given initial condition. Then make a conjecture about the behavior of a particular solution of $y' = 1/x$ as $x \to \infty$. To print an enlarged copy of the graph, go to *MathGraphs.com.*



(a) $(1, 0)$

(b) $(2, -1)$

66. Slope Field Use the slope field for the differential equation $y' = 1/y$, where $y > 0$, to sketch the graph of the solution that satisfies each given initial condition. Then make a conjecture about the behavior of a particular solution of $y' = 1/y$ as $x \to \infty$. To print an enlarged copy of the graph, go to *MathGraphs.com.*



(a) $(0, 1)$

(b) $(1, 1)$

Slope Field **In Exercises 67–72, use a computer algebra system to (a) graph the slope field for the differential equation and (b) graph the solution satisfying the specified initial condition.**

67. $\dfrac{dy}{dx} = 0.25y, \quad y(0) = 4$

68. $\dfrac{dy}{dx} = 4 - y, \quad y(0) = 6$

69. $\dfrac{dy}{dx} = 0.02y(10 - y), \quad y(0) = 2$

70. $\dfrac{dy}{dx} = 0.2x(2 - y), \quad y(0) = 9$

71. $\dfrac{dy}{dx} = 0.4y(3 - x), \quad y(0) = 1$

72. $\dfrac{dy}{dx} = \dfrac{1}{2}e^{-x/8} \sin \dfrac{\pi y}{4}, \quad y(0) = 2$

Euler's Method **In Exercises 73–78, use Euler's Method to make a table of values for the approximate solution of the differential equation with the specified initial value. Use n steps of size h.**

73. $y' = x + y, \quad y(0) = 2, \quad n = 10, \quad h = 0.1$

74. $y' = x + y, \quad y(0) = 2, \quad n = 20, \quad h = 0.05$

75. $y' = 3x - 2y, \quad y(0) = 3, \quad n = 10, \quad h = 0.05$

76. $y' = 0.5x(3 - y), \quad y(0) = 1, \quad n = 5, \quad h = 0.4$

77. $y' = e^{xy}, \quad y(0) = 1, \quad n = 10, \quad h = 0.1$

78. $y' = \cos x + \sin y, \quad y(0) = 5, \quad n = 10, \quad h = 0.1$

Euler's Method **In Exercises 79–81, complete the table using the exact solution of the differential equation and two approximations obtained using Euler's Method to approximate the particular solution of the differential equation. Use $h = 0.2$ and $h = 0.1$, and compute each approximation to four decimal places.**

x	0	0.2	0.4	0.6	0.8	1
$y(x)$ (exact)						
$y(x)$ ($h = 0.2$)						
$y(x)$ ($h = 0.1$)						

	Differential Equation	Initial Condition	Exact Solution
79.	$\dfrac{dy}{dx} = y$	$(0, 3)$	$y = 3e^x$
80.	$\dfrac{dy}{dx} = \dfrac{2x}{y}$	$(0, 2)$	$y = \sqrt{2x^2 + 4}$
81.	$\dfrac{dy}{dx} = y + \cos x$	$(0, 0)$	$y = \dfrac{1}{2}(\sin x - \cos x + e^x)$

82. Euler's Method Compare the values of the approximations in Exercises 79–81 with the values given by the exact solution. How does the error change as h increases?

83. Temperature At time $t = 0$ minutes, the temperature of an object is 140°F. The temperature of the object is changing at the rate given by the differential equation

$$\frac{dy}{dt} = -\frac{1}{2}(y - 72).$$

(a) Use a graphing utility and Euler's Method to approximate the particular solutions of this differential equation at $t = 1$, 2, and 3. Use a step size of $h = 0.1$. (A graphing utility program for Euler's Method is available at *LarsonCalculus.com.*)

(b) Compare your results with the exact solution

$$y = 72 + 68e^{-t/2}.$$

(c) Repeat parts (a) and (b) using a step size of $h = 0.05$. Compare the results.

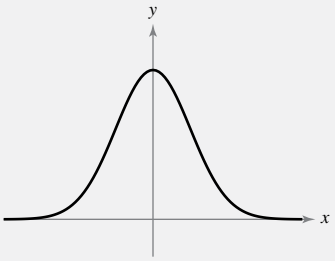
84. HOW DO YOU SEE IT? The graph shows a solution of one of the following differential equations. Which differential equation was used? Explain your reasoning.

(a) $y' = xy$

(b) $y' = \dfrac{4x}{y}$

(c) $y' = -4xy$

(d) $y' = 4 - xy$



Exploring Concepts

85. Explain when Euler's Method produces an exact particular solution of a differential equation.

86. It is known that $y = Ce^{kx}$ is a solution of the differential equation $y' = 0.07y$. Is it possible to determine C or k from the information given? Explain.

True or False? **In Exercises 87 and 88, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

87. If $y = f(x)$ is a solution of a first-order differential equation, then $y = f(x) + C$ is also a solution.

88. A slope field shows one particular solution of a differential equation.

89. Errors and Euler's Method The exact solution of the differential equation $y' = -2y$, where $y(0) = 4$, is

$y = 4e^{-2x}$.

(a) Use a graphing utility to complete the table, where y is the exact value of the solution, y_1 is the approximate solution using Euler's Method with $h = 0.1$, y_2 is the approximate solution using Euler's Method with $h = 0.2$, e_1 is the absolute error $|y - y_1|$, e_2 is the absolute error $|y - y_2|$, and r is the ratio e_1/e_2.

x	0	0.2	0.4	0.6	0.8	1
y						
y_1						
y_2						
e_1						
e_2						
r						

(b) What can you conclude about the ratio r as h changes?

(c) Predict the absolute error when $h = 0.05$.

90. Chebyshev Polynomials The **Chebyshev Polynomials** are defined recursively by

$T_0(x) = 1$, $T_1(x) = x$, and $T_{n+1}(x) = 2xT_n - T_{n-1}$,

$n = 1, 2, 3, \ldots$.

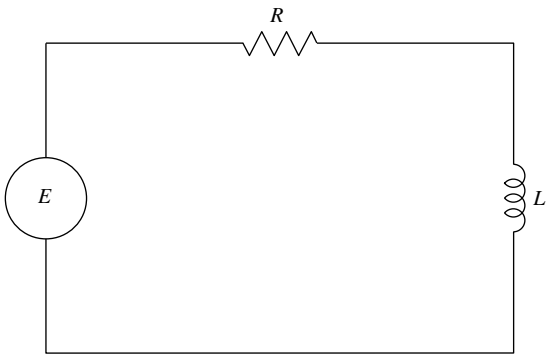
(a) Calculate $T_2(x)$, $T_3(x)$, and $T_4(x)$.

(b) It can be shown that $T_n(x)$ is a solution of the Chebyshev differential equation

$(1 - x^2)y'' - xy' + n^2y = 0, n = 0, 1, 2, \ldots$.

Show that $T_0(x)$, $T_1(x)$, and $T_2(x)$ are solutions of the Chebyshev differential equation.

91. Electric Circuit The diagram shows a simple electric circuit consisting of a power source, a resistor, and an inductor.



A model of the current I, in amperes (A), at time t is given by the first-order differential equation

$$L\frac{dI}{dt} + RI = E(t)$$

where $E(t)$ is the voltage (V) produced by the power source, R is the resistance, in ohms (Ω), and L is the inductance, in henrys (H). Suppose the electric circuit consists of a 24-V power source, a 12-Ω resistor, and a 4-H inductor.

(a) Sketch a slope field for the differential equation.

(b) What is the limiting value of the current? Explain.

92. Slope Field A slope field shows that the slope at the point $(1, 1)$ is 6. Does this slope field represent the family of solutions for the differential equation $y' = 4x + 2y$? Explain.

93. Think About It It is known that $y = A \sin \omega t$ is a solution of the differential equation $y'' + 16y = 0$. Find the value(s) of ω.

PUTNAM EXAM CHALLENGE

94. Let f be a twice-differentiable real-valued function satisfying $f(x) + f''(x) = -xg(x)f'(x)$, where $g(x) \geq 0$ for all real x. Prove that $|f(x)|$ is bounded.

95. Prove that if the family of integral curves of the differential equation

$$\frac{dy}{dx} + p(x)y = q(x), \quad p(x) \cdot q(x) \neq 0$$

is cut by the line $x = k$, the tangents at the points of intersection are concurrent.

6.2 Growth and Decay

GO DIGITAL

- Use separation of variables to solve a simple differential equation.
- Use exponential functions to model growth and decay in applied problems.

Differential Equations

In Section 6.1, you learned to analyze the solutions of differential equations visually using slope fields and to approximate solutions numerically using Euler's Method. Analytically, you have learned to solve only two types of differential equations—those of the forms $y' = f(x)$ and $y'' = f(x)$. In this section, you will learn how to solve a more general type of differential equation. The strategy is to rewrite the equation so that each variable occurs on only one side of the equation. This strategy is called *separation of variables*. (You will study this strategy in detail in Section 6.3.)

EXAMPLE 1 **Solving a Differential Equation**

$$y' = \frac{2x}{y}$$ Original equation

$$yy' = 2x$$ Multiply each side by y.

$$\int yy'\,dx = \int 2x\,dx$$ Integrate each side with respect to x.

$$\int y\,dy = \int 2x\,dx$$ $dy = y'\,dx$

$$\frac{1}{2}y^2 = x^2 + C_1$$ Apply Power Rule.

$$y^2 - 2x^2 = C$$ Rewrite, letting $C = 2C_1$.

So, the general solution is $y^2 - 2x^2 = C$. ■

REMARK You can use implicit differentiation to check the solution to Example 1.

When you integrate each side of the equation in Example 1, you do not need to add a constant of integration to each side. When you do, you still obtain the same result.

$$\int y\,dy = \int 2x\,dx$$

$$\frac{1}{2}y^2 + C_2 = x^2 + C_3$$

$$\frac{1}{2}y^2 = x^2 + (C_3 - C_2)$$

$$\frac{1}{2}y^2 = x^2 + C_1$$ Rewrite, letting $C_1 = C_3 - C_2$.

Some people prefer to use Leibniz notation and differentials when applying separation of variables. The solution to Example 1 is shown below using this notation.

$$\frac{dy}{dx} = \frac{2x}{y}$$

$$y\,dy = 2x\,dx$$

$$\int y\,dy = \int 2x\,dx$$

$$\frac{1}{2}y^2 = x^2 + C_1$$

$$y^2 - 2x^2 = C$$

Exploration

In Example 1, the general solution of the differential equation is

$$y^2 - 2x^2 = C.$$

Use a graphing utility to sketch the particular solutions for $C = \pm 2$, $C = \pm 1$, and $C = 0$. Describe the solutions graphically. Is the following statement true of each solution?

The slope of the graph at the point (x, y) is equal to twice the ratio of x and y.

Explain your reasoning. Are all curves for which this statement is true represented by the general solution?

GO DIGITAL

Growth and Decay Models

In many applications, the rate of change of a variable y is proportional to the value of y. When y is a function of time t, the proportion can be written as shown.

Rate of change of y is proportional to y.

$$\frac{dy}{dt} = ky$$

The general solution of this differential equation is given in the next theorem.

THEOREM 6.1 Exponential Growth and Decay

If y is a differentiable function of t such that $y > 0$ and $dy/dt = ky$ for some constant k, then

$$y = Ce^{kt}$$

where C is the **initial value** of y, and k is the **proportionality constant.** **Exponential growth** occurs when $k > 0$, and **exponential decay** occurs when $k < 0$.

Proof

$$\frac{dy}{dt} = ky \qquad \text{Write original equation.}$$

$$\frac{dy}{y} = k\,dt \qquad \text{Separate variables.}$$

$$\int \frac{dy}{y} = \int k\,dt \qquad \text{Integrate each side.}$$

$$\ln y = kt + C_1 \qquad \text{Find antiderivative of each side.}$$

$$y = e^{kt + C_1} \qquad \text{Exponentiate each side.}$$

$$y = e^{kt}e^{C_1} \qquad \text{Property of exponents}$$

$$y = Ce^{kt} \qquad \text{Let } C = e^{C_1}.$$

So, all solutions of $y' = ky$ are of the form $y = Ce^{kt}$. Remember that you can differentiate the function $y = Ce^{kt}$ with respect to t to verify that $y' = ky$.

REMARK Notice that you do not need to write $\ln|y|$ because $y > 0$.

EXAMPLE 2 Using an Exponential Growth Model

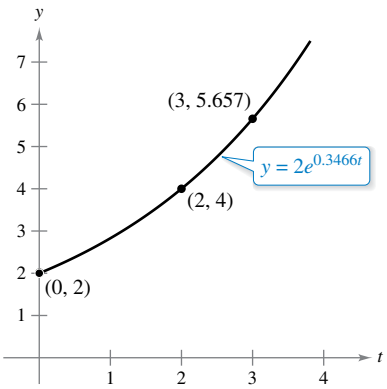
The rate of change of y is proportional to y. When $t = 0$, $y = 2$, and when $t = 2$, $y = 4$. What is the value of y when $t = 3$?

Solution Because $y' = ky$, you know that y and t are related by the equation $y = Ce^{kt}$. You can find the values of the constants C and k by applying the initial conditions.

$$2 = Ce^0 \Rightarrow C = 2 \qquad \text{When } t = 0,\ y = 2.$$

$$4 = 2e^{2k} \Rightarrow k = \frac{1}{2}\ln 2 \approx 0.3466 \qquad \text{When } t = 2,\ y = 4.$$

So, the model is $y = 2e^{0.3466t}$. When $t = 3$, the value of y is $2e^{0.3466(3)} \approx 5.657$. See Figure 6.8.



If the rate of change of y is proportional to y, then y follows an exponential model.

Figure 6.8

Using logarithmic properties, the value of k in Example 2 can also be written as $\ln\sqrt{2}$. So, the model becomes $y = 2e^{(\ln\sqrt{2})t}$, which can be rewritten as $y = 2(\sqrt{2})^t$.

TECHNOLOGY Most graphing utilities have curve-fitting capabilities that can be used to find models that represent data. Use the *exponential regression* feature of a graphing utility and the information in Example 2 to find a model for the data. How does your model compare with the given model?

Radioactive decay is measured in terms of *half-life*—the number of years required for half of the atoms in a sample of radioactive material to decay. The rate of decay is proportional to the amount present. The half-lives of some common radioactive isotopes are listed below.

Uranium (^{238}U)	4,470,000,000 years
Plutonium (^{239}Pu)	24,100 years
Carbon (^{14}C)	5715 years
Radium (^{226}Ra)	1599 years
Einsteinium (^{254}Es)	276 days
Radon (^{222}Rn)	3.82 days
Nobelium (^{257}No)	25 seconds

EXAMPLE 3 Radioactive Decay

Ten grams of the plutonium isotope ^{239}Pu were released in a nuclear accident. How long will it take for the 10 grams to decay to 1 gram?

Solution Let y represent the mass (in grams) of the plutonium. Because the rate of decay is proportional to y, you know that $y = Ce^{kt}$, where t is the time in years. To find the values of the constants C and k, apply the initial conditions. Using the fact that $y = 10$ when $t = 0$, you can write

$$10 = Ce^{k(0)} \quad \Rightarrow \quad 10 = Ce^0$$

which implies that $C = 10$. Next, using the fact that the half-life of ^{239}Pu is 24,100 years, you have $y = 10/2 = 5$ when $t = 24{,}100$. So, you can write

$$5 = 10e^{k(24{,}100)} \qquad \text{Substitute.}$$

$$\frac{1}{2} = e^{24{,}100k} \qquad \text{Divide each side by 10.}$$

$$\ln\frac{1}{2} = \ln e^{24{,}100k} \qquad \text{Take natural log of each side.}$$

$$\ln\frac{1}{2} = 24{,}100k \qquad \text{Apply inverse property.}$$

$$\frac{1}{24{,}100}\ln\frac{1}{2} = k \qquad \text{Divide each side by 24,100.}$$

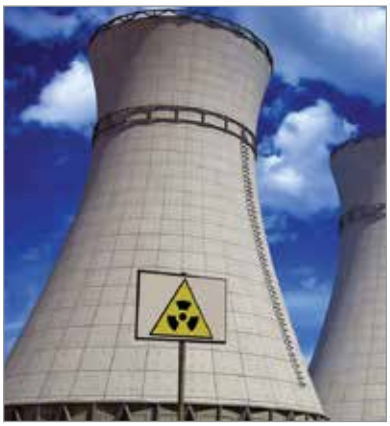
$$-0.000028761 \approx k. \qquad \text{Use a calculator.}$$

So, the model is

$$y = 10e^{-0.000028761t}. \qquad \text{Half-life model}$$

To find the time it would take for 10 grams to decay to 1 gram, solve for t in the equation $1 = 10e^{-0.000028761t}$. The solution is approximately 80,059 years. ■

From Example 3, notice that in an exponential growth or decay problem, it is easy to solve for C when you are given the value of y at $t = 0$. The next example demonstrates a procedure for solving for C and k when you do not know the value of y at $t = 0$.



In a conventional nuclear reactor, 1 kilogram of ^{239}Pu can generate enough electricity to power about 900 homes for a year. *(Source: World Nuclear Association, U.S. Energy Information Administration)*

iurii/Shutterstock.com

REMARK The exponential decay model in Example 3 can also be written as

$$y = 10\left(\frac{1}{2}\right)^{t/24{,}100}.$$

This model is much easier to derive, but for some applications it is not as convenient to use.

EXAMPLE 4 Population Growth

See LarsonCalculus.com for an interactive version of this type of example.

An experimental population of fruit flies increases according to the law of exponential growth. There were 100 flies after the second day of the experiment and 300 flies after the fourth day. Approximately how many flies were in the original population?

Solution Let $y = Ce^{kt}$ be the number of flies at time t, where t is measured in days. Note that y is continuous, whereas the number of flies is discrete. Because $y = 100$ when $t = 2$ and $y = 300$ when $t = 4$, you can write

$$100 = Ce^{2k} \quad \text{and} \quad 300 = Ce^{4k}.$$

From the first equation, you know that

$$C = 100e^{-2k}.$$

Substituting this value into the second equation produces the following.

$300 = 100e^{-2k}e^{4k}$	Substitute.
$300 = 100e^{2k}$	Property of exponents
$3 = e^{2k}$	Divide each side by 100.
$\ln 3 = \ln e^{2k}$	Take natural log of each side.
$\ln 3 = 2k$	Apply inverse property.
$\frac{1}{2}\ln 3 = k$	Divide each side by 2.
$0.5493 \approx k$	Use a calculator.

So, the exponential growth model is $y = Ce^{0.5493t}$. To solve for C, reapply the condition $y = 100$ when $t = 2$ and obtain

$$100 = Ce^{0.5493(2)}$$
$$\frac{100}{e^{1.0986}} = C$$
$$33 \approx C.$$

So, the original population (when $t = 0$) consisted of approximately $y = C = 33$ flies, as shown in Figure 6.9.

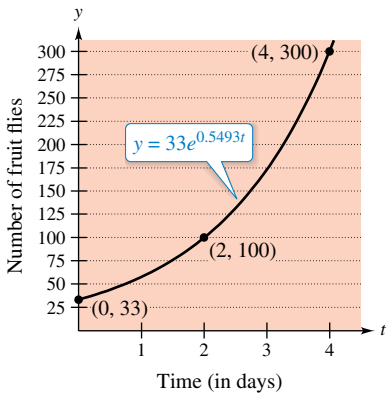

Figure 6.9

EXAMPLE 5 Declining Sales

Four months after it stops advertising, a manufacturing company notices that its sales have dropped from 100,000 units per month to 80,000 units per month. The sales follow an exponential pattern of decline. What will the sales be after another 2 months?

Solution Use the exponential decay model $y = Ce^{kt}$, where t is measured in months. From the initial condition ($t = 0$), you know that $C = 100{,}000$. Moreover, because $y = 80{,}000$ when $t = 4$, you have

$80{,}000 = 100{,}000e^{4k}$	Substitute.
$0.8 = e^{4k}$	Divide each side by 100,000.
$\ln(0.8) = \ln e^{4k}$	Take natural log of each side.
$\ln(0.8) = 4k$	Apply inverse property.
$-0.0558 \approx k.$	Divide each side by 4. The use a calculator.

So, after 2 more months ($t = 6$), you can expect the monthly sales to be

$$y = 100{,}000e^{-0.0558(6)}$$
$$\approx 71{,}500 \text{ units.}$$ See Figure 6.10.

GO DIGITAL

In Examples 2 through 5, you did not actually have to solve the differential equation $dy/dt = ky$. (This was done once in the proof of Theorem 6.1.) The next example demonstrates a problem whose solution involves the separation of variables technique. The example concerns **Newton's Law of Cooling,** which states that the rate of change of the temperature of an object is proportional to the difference between the object's temperature and the temperature of the surrounding medium.

EXAMPLE 6 Newton's Law of Cooling

Let y represent the temperature (in °F) of an object in a room whose temperature is kept at a constant 60°F. The object cools from 100°F to 90°F in 10 minutes. How much longer will it take for the temperature of the object to decrease to 80°F?

Solution From Newton's Law of Cooling, you know that the rate of change of y is proportional to the difference between y and 60. This can be written as

$$\frac{dy}{dt} = k(y - 60), \quad 80 \le y \le 100.$$

To solve this differential equation, use separation of variables, as shown.

$$\frac{dy}{dt} = k(y - 60) \qquad \text{Differential equation}$$

$$\left(\frac{1}{y - 60}\right) dy = k\,dt \qquad \text{Separate variables.}$$

$$\int \frac{1}{y - 60}\,dy = \int k\,dt \qquad \text{Integrate each side.}$$

$$\ln|y - 60| = kt + C_1 \qquad \text{Find antiderivative of each side.}$$

Because $y > 60$, $|y - 60| = y - 60$, and you can omit the absolute value signs. Using exponential notation and letting $C = e^{C_1}$, you have

$$y - 60 = e^{kt + C_1} \quad \Rightarrow \quad y = 60 + Ce^{kt}.$$

Using $y = 100$ when $t = 0$, you obtain

$$100 = 60 + Ce^{k(0)} \quad \Rightarrow \quad 100 = 60 + C \quad \Rightarrow \quad 40 = C.$$

Because $y = 90$ when $t = 10$, the value of k is

$$90 = 60 + 40e^{k(10)} \qquad \text{Substitute.}$$

$$30 = 40e^{10k} \qquad \text{Subtract 60 from each side.}$$

$$\ln\frac{3}{4} = \ln e^{10k} \qquad \text{Divide each side by 40. Then take natural log of each side.}$$

$$\frac{1}{10}\ln\frac{3}{4} = k. \qquad \text{Apply inverse property and divide each side by 10.}$$

So, $k \approx -0.02877$ and the model is $y = 60 + 40e^{-0.02877t}$. When $y = 80$, you obtain

$$80 = 60 + 40e^{-0.02877t} \qquad \text{Substitute.}$$

$$20 = 40e^{-0.02877t} \qquad \text{Subtract 60 from each side.}$$

$$\ln\frac{1}{2} = \ln e^{-0.02877t} \qquad \text{Divide each side by 40. Then take natural log of each side.}$$

$$\ln\frac{1}{2} = -0.02877t \qquad \text{Apply inverse property.}$$

$$24.09 \approx t. \qquad \text{Divide each side by } -0.02877 \text{ and simplify.}$$

So, it will require about 14.09 *more* minutes for the object to cool to a temperature of 80°F. See Figure 6.11. ■

6.2 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Describe what the values of C and k represent in the exponential growth and decay model $y = Ce^{kt}$.
2. For $y = Ce^{kt}$, explain why exponential growth occurs when $k > 0$ and exponential decay occurs when $k < 0$.

Solving a Differential Equation **In Exercises 3–12, find the general solution of the differential equation.**

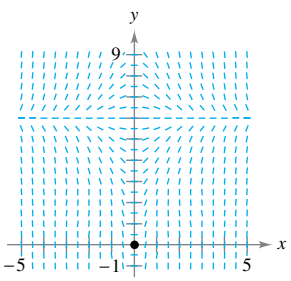
3. $\frac{dy}{dx} = x + 3$
4. $\frac{dy}{dx} = 5 - 8x$
5. $\frac{dy}{dx} = y + 3$
6. $\frac{dy}{dx} = 6 - y$
7. $y' = \frac{5x}{y}$
8. $y' = -\frac{\sqrt{x}}{4y}$
9. $y' = \sqrt{x}\,y$
10. $y' = x(1 + y)$
11. $(1 + x^2)y' - 2xy = 0$
12. $xy + y' = 100x$

Writing and Solving a Differential Equation **In Exercises 13–16, write and find the general solution of the differential equation that models the verbal statement.**

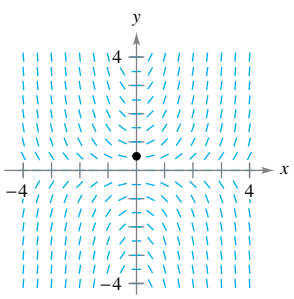
13. The rate of change of Q with respect to t is inversely proportional to the square of t.
14. The rate of change of P with respect to t is proportional to $25 - t$.
15. The rate of change of N with respect to s is proportional to $500 - s$.
16. The rate of change of y with respect to x varies jointly as x and $L - y$.

Slope Field **In Exercises 17 and 18, a differential equation, a point, and a slope field are given. (a) Sketch two approximate solutions of the differential equation on the slope field, one of which passes through the given point. (To print an enlarged copy of the graph, go to *MathGraphs.com*.) (b) Use integration and the given point to find the particular solution of the differential equation and use a graphing utility to graph the solution. Compare the result with the sketch in part (a) that passes through the given point.**

17. $\frac{dy}{dx} = x(6 - y)$, $(0, 0)$



18. $\frac{dy}{dx} = xy$, $\left(0, \frac{1}{2}\right)$



Finding a Particular Solution **In Exercises 19–22, find the function $y = f(t)$ passing through the point $(0, 10)$ with the given differential equation. Use a graphing utility to graph the solution.**

19. $\frac{dy}{dt} = \frac{1}{2}t$
20. $\frac{dy}{dt} = -9\sqrt{t}$
21. $\frac{dy}{dt} = -\frac{1}{2}y$
22. $\frac{dy}{dt} = \frac{3}{4}y$

Writing and Solving a Differential Equation **In Exercises 23–26, write and find the general solution of the differential equation that models the verbal statement. Evaluate the solution at the specified value of the independent variable.**

23. The rate of change of N is proportional to N. When $t = 0$, $N = 250$, and when $t = 1$, $N = 400$. What is the value of N when $t = 4$?
24. The rate of change of y is proportional to y. When $x = 0$, $y = 6$, and when $x = 4$, $y = 15$. What is the value of y when $x = 8$?
25. The rate of change of V is proportional to V. When $t = 0$, $V = 20{,}000$, and when $t = 4$, $V = 12{,}500$. What is the value of V when $t = 6$?
26. The rate of change of P is proportional to P. When $t = 0$, $P = 5000$, and when $t = 1$, $P = 4750$. What is the value of P when $t = 5$?

Finding an Exponential Function **In Exercises 27–30, find the exponential function $y = Ce^{kt}$ that passes through the two given points.**

27.

Exploring Concepts

In Exercises 31 and 32, determine the quadrants in which the solution of the differential equation is an increasing function. Explain. (Do not solve the differential equation.)

31. $\frac{dy}{dx} = \frac{1}{2}xy$ **32.** $\frac{dy}{dx} = \frac{1}{2}x^2y$

Radioactive Decay **In Exercises 33–40, complete the table for the radioactive isotope.**

	Isotope	Half-life (in years)	Initial Quantity	Amount After 1000 Years	Amount After 10,000 Years
33.	^{226}Ra	1599	20 g		
34.	^{226}Ra	1599		1.5 g	
35.	^{226}Ra	1599			0.1 g
36.	^{14}C	5715			3 g
37.	^{14}C	5715	5 g		
38.	^{14}C	5715		1.6 g	
39.	^{239}Pu	24,100		2.1 g	
40.	^{239}Pu	24,100			0.4 g

41. Radioactive Decay Radioactive radium has a half-life of approximately 1599 years. What percent of a given amount remains after 100 years?

42. Carbon Dating Carbon-14 dating assumes that the carbon dioxide on Earth today has the same radioactive content as it did centuries ago. If this is true, the amount of ^{14}C absorbed by a tree that grew several centuries ago should be the same as the amount of ^{14}C absorbed by a tree growing today. A piece of ancient charcoal contains only 15% as much of the radioactive carbon as a piece of modern charcoal. How long ago was the tree burned to make the ancient charcoal? (The half-life of ^{14}C is 5715 years.)

Compound Interest **In Exercises 43–48, complete the table for a savings account in which interest is compounded continuously.**

	Initial Investment	Annual Rate	Time to Double	Amount After 10 Years
43.	$1000	12%		
44.	$28,000	2.5%		
45.	$150		15 yr	
46.	$31,000		8 yr	
47.	$900			$1845.25
48.	$6000			$6840

Compound Interest **In Exercises 49–52, find the principal P that must be invested at rate r, compounded monthly, so that $1,000,000 will be available for retirement in t years.**

49. $r = 7\frac{1}{2}\%, \quad t = 20$ **50.** $r = 6\%, \quad t = 40$

51. $r = 8\%, \quad t = 35$ **52.** $r = 9\%, \quad t = 25$

Compound Interest **In Exercises 53 and 54, find the time necessary for $1000 to double when it is invested at rate r and compounded (a) annually, (b) monthly, (c) daily, and (d) continuously.**

53. $r = 7\%$ **54.** $r = 5.5\%$

Population **In Exercises 55–58, the population (in millions) of a country in 2019 and the expected continuous annual rate of change k of the population are given. (*Source: U.S. Census Bureau, International Data Base*)**

(a) Find the exponential growth model

$$P = Ce^{kt}$$

for the population by letting $t = 9$ correspond to 2019.

(b) Use the model to predict the population of the country in 2040.

(c) Discuss the relationship between the sign of k and the change in population for the country.

	Country	2019 Population	k
55.	Latvia	1.9	−0.011
56.	Canada	37.4	0.008
57.	Paraguay	7.1	0.012
58.	Ukraine	44.0	0.0

59. Modeling Data One hundred bacteria are started in a culture, and the number N of bacteria is counted each hour for 5 hours. The results are shown in the table, where t is the time in hours.

t	0	1	2	3	4	5
N	100	126	151	198	243	297

(a) Use the regression capabilities of a graphing utility to find an exponential model for the data.

(b) Use the model to estimate the time required for the population to quadruple in size.

60. Bacteria Growth The number of bacteria in a culture is increasing according to the law of exponential growth. There are 125 bacteria in the culture after 2 hours and 350 bacteria after 4 hours.

(a) Find the initial population.

(b) Write an exponential growth model for the bacteria population. Let t represent the time in hours.

(c) Use the model to determine the number of bacteria after 8 hours.

(d) After how many hours will the bacteria count be 25,000?

61. Insect Population

(a) Suppose an insect population increases by a constant number each month. Explain why the number of insects can be represented by a linear function.

(b) Suppose an insect population increases by a constant percentage each month. Explain why the number of insects can be represented by an exponential function.

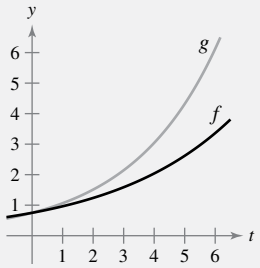
62. HOW DO YOU SEE IT? The functions f and g are both of the form $y = Ce^{kt}$.



(a) Do the functions f and g represent exponential growth or exponential decay? Explain.

(b) Assume both functions have the same value of C. Which function has a greater value of k? Explain.

63. Modeling Data The table shows the cost of tuition and fees M (in 2020 dollars) at public four-year universities for selected years. (*Source: The College Board*)

Year	1985	1990	1995	2000
Cost, M	3170	3800	4770	5260

Year	2005	2010	2015	2020
Cost, M	7280	9070	10,240	10,560

(a) Use a graphing utility to find an exponential model M_1 for the data. Let $t = 5$ represent 1985.

(b) Use a graphing utility to find a linear model M_2 for the data. Let $t = 5$ represent 1985.

(c) Which model fits the data better? Explain.

(d) Use the exponential model to predict when the cost of tuition and fees will be \$15,000. Does the result seem reasonable? Explain.

64. Forestry

The value of a tract of timber is

$$V(t) = 100{,}000e^{0.8\sqrt{t}}$$

where t is the time in years, with $t = 0$ corresponding to 2020. If money earns interest continuously at 10%, then the present value of the timber at any time t is

$$A(t) = V(t)e^{-0.10t}.$$

Find the year in which the timber should be harvested to maximize the present value function.

65. Sound Intensity The level of sound β (in decibels) with an intensity of I is

$$\beta(I) = 10 \log_{10} \frac{I}{I_0}$$

where I_0 is an intensity of 10^{-16} watt per square centimeter, corresponding roughly to the faintest sound that can be heard. Determine $\beta(I)$ for the following.

(a) $I = 10^{-14}$ watt per square centimeter (whisper)

(b) $I = 10^{-9}$ watt per square centimeter (busy street corner)

(c) $I = 10^{-4}$ watt per square centimeter (threshold of pain)

66. Noise Level With the installation of noise suppression materials, the noise level in an auditorium was reduced from 93 to 80 decibels. Use the function in Exercise 65 to find the percent decrease in the intensity level of the noise as a result of the installation of these materials.

67. Newton's Law of Cooling When an object is removed from a furnace and placed in an environment with a constant temperature of 80°F, its core temperature is 1500°F. One hour after it is removed, the core temperature is 1120°F.

(a) Write an equation for the core temperature y of the object t hours after it is removed from the furnace.

(b) What is the core temperature of the object 6 hours after it is removed from the furnace?

68. Newton's Law of Cooling A container of hot liquid is placed in a freezer that is kept at a constant temperature of 20°F. The initial temperature of the liquid is 160°F. After 5 minutes, the liquid's temperature is 60°F.

(a) Write an equation for the temperature y of the liquid t minutes after it is placed in the freezer.

(b) How much longer will it take for the temperature of the liquid to decrease to 25°F?

True or False? In Exercises 69 and 70, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.

69. Half of the atoms in a sample of radioactive radium decay in 799.5 years.

70. If prices are rising at a rate of 0.5% per month, then they are rising at a rate of 6% per year.

71. Earthquake Intensity On the Richter scale, the magnitude R of an earthquake of intensity I is

$$R = \frac{\ln I - \ln I_0}{\ln 10}$$

where I_0 is the minimum intensity used for comparison. Assume that $I_0 = 1$.

(a) Find the intensity of the 1906 San Francisco earthquake ($R = 8.3$).

(b) Find the factor by which the intensity is increased if the Richter scale measurement is doubled.

(c) Find dR/dI.

6.3 Separation of Variables and the Logistic Equation

GO DIGITAL

- **Recognize and solve differential equations that can be solved by separation of variables.**
- **Use differential equations to model and solve applied problems.**
- **Solve and analyze logistic differential equations.**

Separation of Variables

Consider a differential equation that can be written in the form

$$M(x) + N(y)\frac{dy}{dx} = 0$$

where M is a continuous function of x alone and N is a continuous function of y alone. As you learned in Section 6.2, for this type of equation, all x-terms can be collected with dx and all y-terms with dy, and a solution can be obtained by integration. Such equations are said to be **separable,** and the solution procedure is called **separation of variables.** Below are some examples of differential equations that are separable.

Original Differential Equation	Rewritten with Variables Separated
$x^2 + 3y\frac{dy}{dx} = 0$	$3y\,dy = -x^2\,dx$
$(\sin x)y' = \cos x$	$dy = \cot x\,dx$
$\frac{xy'}{e^y + 1} = 2$	$\frac{1}{e^y + 1}dy = \frac{2}{x}dx$

EXAMPLE 1 Separation of Variables

See LarsonCalculus.com for an interactive version of this type of example.

Find the general solution of $(x^2 + 4)\frac{dy}{dx} = xy$.

Solution To begin, note that $y = 0$ is a solution. To find other solutions, assume that $y \neq 0$ and separate variables as shown.

$$(x^2 + 4)\,dy = xy\,dx \qquad \text{Differential form}$$

$$\frac{dy}{y} = \frac{x}{x^2 + 4}dx \qquad \text{Separate variables.}$$

Now, integrate to obtain

$$\int \frac{dy}{y} = \int \frac{x}{x^2 + 4}dx \qquad \text{Integrate each side.}$$

$$\ln|y| = \frac{1}{2}\ln(x^2 + 4) + C_1 \qquad \text{Find antiderivative of each side.}$$

$$\ln|y| = \ln\sqrt{x^2 + 4} + C_1 \qquad \text{Logarithmic property}$$

$$|y| = e^{\ln\sqrt{x^2+4}+C_1} \qquad \text{Exponentiate each side.}$$

$$|y| = e^{C_1}e^{\ln\sqrt{x^2+4}} \qquad \text{Property of exponents}$$

$$|y| = e^{C_1}\sqrt{x^2 + 4} \qquad \text{Apply inverse property.}$$

$$y = \pm e^{C_1}\sqrt{x^2 + 4}. \qquad \text{Definition of absolute value}$$

Because $y = 0$ is also a solution, you can write the general solution as

$$y = C\sqrt{x^2 + 4}. \qquad \text{General solution}$$

REMARK In Example 1, you can check the solution

$$y = C\sqrt{x^2 + 4}$$

by differentiating and substituting into the original equation.

$$(x^2 + 4)\frac{dy}{dx} = xy$$

$$(x^2 + 4)\frac{Cx}{\sqrt{x^2 + 4}} \stackrel{?}{=} x\left(C\sqrt{x^2 + 4}\right)$$

$$Cx\sqrt{x^2 + 4} = Cx\sqrt{x^2 + 4}$$

So, the solution checks.

GO DIGITAL

In some cases, it is not feasible to write the general solution in the explicit form $y = f(x)$. The next example illustrates such a solution.

EXAMPLE 2 Finding a Particular Solution

Find the particular solution of $xy\,dx + e^{-x^2}(y^2 - 1)\,dy = 0$ that satisfies the initial condition $y(0) = 1$.

Solution Note that $y = 0$ is a solution of the differential equation—but this solution does not satisfy the initial condition. So, assume that $y \neq 0$. To separate variables, you must rid the first term of y and the second term of e^{-x^2}. So, you should multiply by e^{x^2}/y and obtain the following.

$$xy\,dx + e^{-x^2}(y^2 - 1)\,dy = 0 \qquad \text{Write original equation.}$$

$$e^{-x^2}(y^2 - 1)\,dy = -xy\,dx \qquad \text{Subtract } xy\,dx \text{ from each side.}$$

$$\left(y - \frac{1}{y}\right)dy = -xe^{x^2}\,dx \qquad \text{Separate variables.}$$

$$\int \left(y - \frac{1}{y}\right)dy = \int -xe^{x^2}\,dx \qquad \text{Integrate each side.}$$

$$\frac{y^2}{2} - \ln|y| = -\frac{1}{2}e^{x^2} + C \qquad \text{Find antiderivative of each side.}$$

From the initial condition $y(0) = 1$, you have

$$\frac{1^2}{2} - \ln|1| = -\frac{1}{2}e^{0^2} + C \quad \Rightarrow \quad \frac{1}{2} - 0 = -\frac{1}{2} + C$$

which implies that $C = 1$. So, the particular solution has the implicit form

$$\frac{y^2}{2} - \ln|y| = -\frac{1}{2}e^{x^2} + 1 \quad \text{or} \quad y^2 - \ln y^2 + e^{x^2} = 2.$$

Check this by differentiating implicitly and rewriting to get the original equation.

EXAMPLE 3 Finding a Particular Solution Curve

Find the equation of the curve that passes through the point $(1, 3)$ and has a slope of y/x^2 at any point (x, y).

Solution Because the slope of the curve is y/x^2, you have

$$\frac{dy}{dx} = \frac{y}{x^2}$$

with the initial condition $y(1) = 3$. Because the initial condition occurs in Quadrant I, assume $x > 0$. Then, separating variables and integrating produce

$$\int \frac{dy}{y} = \int \frac{dx}{x^2}, \quad y \neq 0, x > 0 \qquad \text{Separate variables and integrate each side.}$$

$$\ln|y| = -\frac{1}{x} + C_1 \qquad \text{Find antiderivative of each side.}$$

$$y = e^{-(1/x)+C_1} \qquad \text{Exponentiate each side.}$$

$$y = Ce^{-1/x}. \qquad \text{Rewrite, letting } C = e^{C_1}.$$

Because $y = 3$ when $x = 1$, it follows that $3 = Ce^{-1}$ and $C = 3e$. So, the equation of the specified curve is

$$y = (3e)e^{-1/x} \quad \Rightarrow \quad y = 3e^{(x-1)/x}, \quad x > 0.$$

GO DIGITAL

Applications

EXAMPLE 4 Wildlife Population

The rate of change of the number of coyotes $N(t)$ in a population is directly proportional to $650 - N(t)$, where t is the time in years. When $t = 0$, the population is 300, and when $t = 2$, the population has increased to 500. Find the population when $t = 3$.

Solution Because the rate of change of the population is proportional to $650 - N(t)$, or $650 - N$, you can write the differential equation

$$\frac{dN}{dt} = k(650 - N).$$

You can solve this equation using separation of variables.

$$dN = k(650 - N)\,dt \qquad \text{Differential form}$$

$$\frac{dN}{650 - N} = k\,dt \qquad \text{Separate variables.}$$

$$-\ln|650 - N| = kt + C_1 \qquad \text{Integrate each side.}$$

$$\ln|650 - N| = -kt - C_1 \qquad \text{Multiply each side by } -1.$$

$$650 - N = e^{-kt - C_1} \qquad \text{Exponentiate each side. (Assume } N < 650.\text{)}$$

$$650 - N = e^{-C_1}e^{-kt} \qquad \text{Property of exponents}$$

$$N = 650 - Ce^{-kt} \qquad \text{General solution}$$

Using $N = 300$ when $t = 0$, you can conclude that $C = 350$, which produces

$$N = 650 - 350e^{-kt}.$$

Then, using $N = 500$ when $t = 2$, it follows that

$$500 = 650 - 350e^{-2k} \quad \Rightarrow \quad e^{-2k} = \frac{3}{7} \quad \Rightarrow \quad k \approx 0.4236.$$

So, the model for the coyote population is

$$N = 650 - 350e^{-0.4236t}. \qquad \text{Model for population}$$

When $t = 3$, you can approximate the population to be

$$N = 650 - 350e^{-0.4236(3)}$$
$$\approx 552 \text{ coyotes.}$$

The model for the population is shown in Figure 6.13. Note that $N = 650$ is the horizontal asymptote of the graph and is the *carrying capacity* of the model. You will learn more about carrying capacity later in this section.

FOR FURTHER INFORMATION
For an example (from engineering) of a differential equation that is separable, see the article "Designing a Rose Cutter" by J. S. Hartzler in *The College Mathematics Journal*. To view this article, go to *MathArticles.com*.

GO DIGITAL

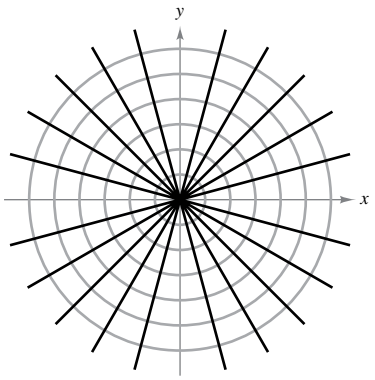
A common problem in electrostatics, thermodynamics, and hydrodynamics involves finding a family of curves, each of which is *orthogonal* to all members of a given family of curves. For example, Figure 6.14 shows a family of circles

$$x^2 + y^2 = C \qquad \text{Family of circles}$$

each of which intersects the lines in the family

$$y = Kx \qquad \text{Family of lines}$$

at right angles. Two such families of curves are said to be **mutually orthogonal,** and each curve in one of the families is called an **orthogonal trajectory** of the other family. In electrostatics, lines of force are orthogonal to the *equipotential curves*. In thermodynamics, the flow of heat across a plane surface is orthogonal to the *isothermal curves*. In hydrodynamics, the flow (stream) lines are orthogonal trajectories of the *velocity potential curves*.



Each line $y = Kx$ is an orthogonal trajectory of the family of circles.
Figure 6.14

EXAMPLE 5 Finding Orthogonal Trajectories

Describe the orthogonal trajectories for the family of curves given by

$$y = \frac{C}{x}$$

for $C \neq 0$. Sketch several members of each family.

Solution First, solve the given equation for C and write $xy = C$. Then, by differentiating implicitly with respect to x, you obtain the differential equation

$$x\frac{dy}{dx} + y = 0 \qquad \text{Differential equation}$$

$$x\frac{dy}{dx} = -y$$

$$\frac{dy}{dx} = -\frac{y}{x}. \qquad \text{Slope of given family}$$

Because dy/dx represents the slope of the given family of curves at (x, y), it follows that the orthogonal family has the negative reciprocal slope x/y. So,

$$\frac{dy}{dx} = \frac{x}{y}. \qquad \text{Slope of orthogonal family}$$

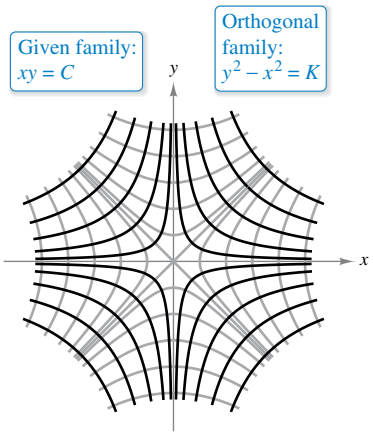
Now you can find the orthogonal family by separating variables and integrating.

$$\int y\,dy = \int x\,dx \qquad \text{Separate variables and integrate each side.}$$

$$\frac{y^2}{2} = \frac{x^2}{2} + C_1 \qquad \text{Find antiderivative of each side.}$$

$$y^2 - x^2 = K \qquad \text{Rewrite, letting } K = 2C_1.$$

So, the orthogonal trajectories for the family of curves given by $y = C/x$ is the family of curves given by $y^2 - x^2 = K$. When $K \neq 0$, the orthogonal trajectories are hyperbolas with centers at the origin, and the transverse axes are vertical for $K > 0$ and horizontal for $K < 0$. When $K = 0$, the orthogonal trajectories are the lines $y = \pm x$. Several trajectories are shown in Figure 6.15.



Orthogonal trajectories

Note that as $t \to \infty$, $y \to L$.
Figure 6.16

Logistic Differential Equation

In Section 6.2, the exponential growth model was derived from the fact that the rate of change of a variable y is proportional to the value of y. You observed that the differential equation $dy/dt = ky$ has the general solution $y = Ce^{kt}$. Exponential growth is unlimited, but when describing a population, there often exists some upper limit L past which growth cannot occur. This upper limit L is called the **carrying capacity,** which is the maximum population $y(t)$ that can be sustained or supported as time t increases. A model that is often used to describe this type of growth is the **logistic differential equation**

$$\frac{dy}{dt} = ky\left(1 - \frac{y}{L}\right) \qquad \text{Logistic differential equation}$$

where k and L are positive constants. A population that satisfies this equation does not grow without bound but approaches the carrying capacity L as t increases.

In the logistic differential equation, if y is between 0 and the carrying capacity L, then $dy/dt > 0$, and the population increases. If y is greater than L, then $dy/dt < 0$, and the population decreases. The graph of the function y is called the *logistic curve*, as shown in Figure 6.16.

EXAMPLE 6 Deriving the General Solution

Solve the logistic differential equation

$$\frac{dy}{dt} = ky\left(1 - \frac{y}{L}\right).$$

Solution Begin by separating variables.

$$\frac{dy}{dt} = ky\left(1 - \frac{y}{L}\right) \qquad \text{Write differential equation.}$$

$$\frac{1}{y(1 - y/L)}\,dy = k\,dt \qquad \text{Separate variables.}$$

$$\int \frac{1}{y(1 - y/L)}\,dy = \int k\,dt \qquad \text{Integrate each side.}$$

$$\int \left(\frac{1}{y} + \frac{1}{L - y}\right)dy = \int k\,dt \qquad \text{Rewrite left side using partial fractions.}$$

$$\ln|y| - \ln|L - y| = kt + C \qquad \text{Find antiderivative of each side.}$$

$$\ln\left|\frac{L - y}{y}\right| = -kt - C \qquad \text{Multiply each side by } -1 \text{ and simplify.}$$

$$\left|\frac{L - y}{y}\right| = e^{-kt - C} \qquad \text{Exponentiate each side.}$$

$$\left|\frac{L - y}{y}\right| = e^{-C}e^{-kt} \qquad \text{Property of exponents}$$

$$\frac{L - y}{y} = be^{-kt} \qquad \text{Let } \pm e^{-C} = b.$$

Solving this equation for y produces $y = \dfrac{L}{1 + be^{-kt}}$. ■

From Example 6, you can conclude that all solutions of the logistic differential equation are of the general form

$$y = \frac{L}{1 + be^{-kt}}.$$

REMARK A review of the method of partial fractions is given in Section 8.5.

Exploration

Use a graphing utility to investigate the effects of the values of L, b, and k on the graph of

$$y = \frac{L}{1 + be^{-kt}}.$$

Include some examples to support your results.

EXAMPLE 7 Solving a Logistic Differential Equation

A state game commission releases 40 elk into a game refuge. After 5 years, the elk population is 104. The commission believes that the environment can support no more than 4000 elk. The growth rate of the elk population p is

$$\frac{dp}{dt} = kp\left(1 - \frac{p}{4000}\right), \quad 40 \le p \le 4000$$

where t is the number of years.

a. Write a model for the elk population in terms of t.

b. Graph the slope field for the differential equation and the solution that passes through the point $(0, 40)$.

c. Use the model to estimate the elk population after 15 years.

d. Find the limit of the model as $t \to \infty$.

Solution

a. You know that $L = 4000$. So, the solution of the equation is of the form

$$p = \frac{4000}{1 + be^{-kt}}.$$

Because $p(0) = 40$, you can solve for b as follows.

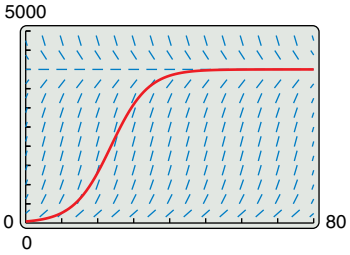
$$40 = \frac{4000}{1 + be^{-k(0)}} \quad \Rightarrow \quad 40 = \frac{4000}{1 + b} \quad \Rightarrow \quad b = 99$$

Then, because $p = 104$ when $t = 5$, you can solve for k.

$$104 = \frac{4000}{1 + 99e^{-k(5)}} \quad \Rightarrow \quad k \approx 0.194$$

So, a model for the elk population is

$$p = \frac{4000}{1 + 99e^{-0.194t}}.$$



Slope field for

$$\frac{dp}{dt} = 0.194p\left(1 - \frac{p}{4000}\right)$$

and the solution passing through $(0, 40)$

Figure 6.17

b. Using a graphing utility, you can graph the slope field for

$$\frac{dp}{dt} = 0.194p\left(1 - \frac{p}{4000}\right)$$

and the solution that passes through $(0, 40)$, as shown in Figure 6.17.

c. To estimate the elk population after 15 years, substitute 15 for t in the model.

$$p = \frac{4000}{1 + 99e^{-0.194(15)}} \qquad \text{Substitute 15 for } t.$$

$$= \frac{4000}{1 + 99e^{-2.91}} \qquad \text{Simplify.}$$

$$\approx 626$$

d. As t increases without bound, the denominator of

$$\frac{4000}{1 + 99e^{-0.194t}}$$

gets closer and closer to 1. So,

$$\lim_{t \to \infty} \frac{4000}{1 + 99e^{-0.194t}} = 4000.$$

6.3 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Determine whether each differential equation is separable.
   (a) $y = 2x^5y' - y'$ (b) $y'/x = x^2y + 1$
2. Explain what it means for two families of curves to be mutually orthogonal.
3. Describe carrying capacity.
4. Describe a real-life application that can be modeled by the logistic differential equation.

Finding a General Solution **In Exercises 5–18, find the general solution of the differential equation.**

5. $\frac{dy}{dx} = \frac{x}{y}$
6. $\frac{dy}{dx} = \frac{3x^2}{y^2}$
7. $\frac{dy}{dx} = \frac{x-1}{y^3}$
8. $\frac{dy}{dx} = \frac{6-x^2}{2y^3}$
9. $\frac{dr}{ds} = \frac{4}{9}r$
10. $\frac{dr}{ds} = \frac{9}{4}s$
11. $(2+x)y' = 3y$
12. $xy' = y$
13. $y^2y' = \sin 9x$
14. $yy' = -8\cos(\pi x)$
15. $\sqrt{1-4x^2}\,y' = x$
16. $\sqrt{x^3-5}\,y' = x^2$
17. $y\ln x - xy' = 0, \quad x > 0$
18. $12yy' - 7e^x = 0$

Finding a Particular Solution **In Exercises 19–28, find the particular solution of the differential equation that satisfies the initial condition.**

Differential Equation	Initial Condition
19. $yy' - 2e^x = 0$	$y(0) = 6$
20. $\sqrt{x} + \sqrt{y}\,y' = 0$	$y(1) = 9$
21. $y(x+1) + y' = 0$	$y(-2) = 1$
22. $2xy' - \ln x^2 = 0, \quad x > 0$	$y(1) = 2$
23. $y(1+x^2)y' - x(1+y^2) = 0$	$y(0) = \sqrt{3}$
24. $y\sqrt{1-x^2}\,y' - x\sqrt{1-y^2} = 0$	$y(\frac{1}{2}) = \frac{1}{2}$
25. $\frac{du}{dv} = uv\sin v^2$	$u(0) = e^2$
26. $\frac{dr}{ds} = e^{r-2s}$	$r(0) = 0$
27. $dP - kP\,dt = 0$	$P(0) = P_0$
28. $dT + k(T-70)\,dt = 0$	$T(0) = 140$

Finding a Particular Solution Curve **In Exercises 29–32, find an equation of the curve that passes through the point and has the given slope.**

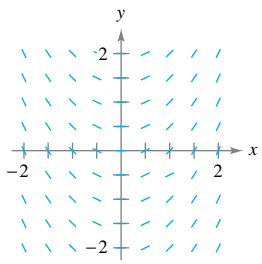
29. $(0, 2), \quad y' = \frac{x}{4y}$
30. $(1, 1), \quad y' = -\frac{9x}{16y}$
31. $(3, 1), \quad y' = -\frac{y}{5x}$
32. $(8, 2), \quad y' = \frac{2y}{3x}$

Finding Functions **In Exercises 33 and 34, find all functions f having the indicated property.**

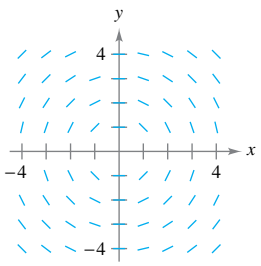
33. The tangent to the graph of f at the point (x, y) intersects the x-axis at $(x+2, 0)$.
34. All tangents to the graph of f pass through the origin.

Slope Field **In Exercises 35 and 36, sketch a few solutions of the differential equation on the slope field and then find the general solution analytically. To print an enlarged copy of the graph, go to *MathGraphs.com*.**

35. $\frac{dy}{dx} = x$

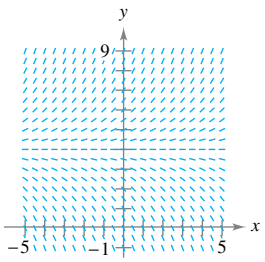


36. $\frac{dy}{dx} = -\frac{x}{y}$

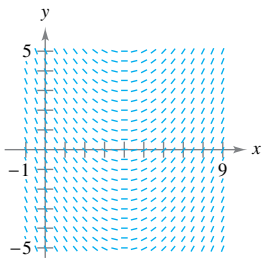


Slope Field **In Exercises 37–40, (a) write a differential equation for the statement, (b) match the differential equation with a possible slope field, and (c) verify your result by using a graphing utility to graph a slope field for the differential equation. [The slope fields are labeled (i), (ii), (iii), and (iv).]**

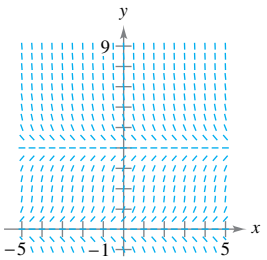
(i)



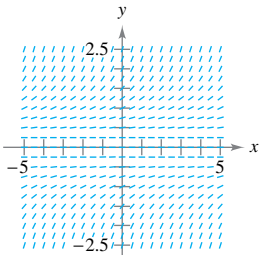
(ii)



(iii)



(iv)



37. The rate of change of y with respect to x is proportional to the difference between y and 4.
38. The rate of change of y with respect to x is proportional to the difference between x and 4.
39. The rate of change of y with respect to x is proportional to the product of y and the difference between y and 4.
40. The rate of change of y with respect to x is proportional to y^2.

Euler's Method **In Exercises 41–44, (a) use Euler's Method with a step size of $h = 0.1$ to approximate the particular solution of the initial value problem at the given x-value, (b) find the exact solution of the differential equation analytically, and (c) compare the solutions at the given x-value.**

	Differential Equation	Initial Condition	x-value
41.	$\frac{dy}{dx} = -6xy$	$(0, 5)$	$x = 1$
42.	$\frac{dy}{dx} + 6xy^2 = 0$	$(0, 3)$	$x = 1$
43.	$\frac{dy}{dx} = \frac{2x + 12}{3y^2 - 4}$	$(1, 2)$	$x = 2$
44.	$\frac{dy}{dx} = 2x(1 + y^2)$	$(1, 0)$	$x = 1.5$

45. Radioactive Decay The rate of decomposition of radioactive radium is proportional to the amount present at any time. The half-life of radioactive radium is 1599 years. What percent of a present amount will remain after 50 years?

46. Chemical Reaction In a chemical reaction, a certain compound changes into another compound at a rate proportional to the unchanged amount. There is 40 grams of the original compound initially and 35 grams after 1 hour. When will 75 percent of the compound be changed?

47. Weight Gain A calf that weighs 60 pounds at birth gains weight at the rate

$$\frac{dw}{dt} = k(1200 - w)$$

where w is the weight in pounds and t is the time in years.

(a) Find the general solution of the differential equation.

(b) Use a graphing utility to graph the particular solutions for $k = 0.8$, 0.9, and 1.

(c) The animal is sold when its weight reaches 800 pounds. Find the time of sale for each of the models in part (b).

(d) What is the maximum weight of the animal for each of the models in part (b)?

48. Weight Gain A goat that weighs 7 pounds at birth gains weight at the rate

$$\frac{dw}{dt} = k(250 - w)$$

where w is the weight in pounds and t is the time in years. Repeat Exercise 47 assuming that the goat is sold when its weight reaches 175 pounds.

Finding Orthogonal Trajectories **In Exercises 49–54, find the orthogonal trajectories for the family of curves. Use a graphing utility to graph several members of each family.**

49. $3x^2 - y^2 = C$

50. $x^2 - 2y^2 = C$

51. $x^2 = Cy$

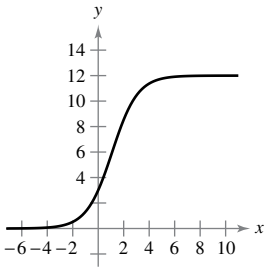
52. $y^2 = 2Cx$

53. $y^2 = Cx^3$

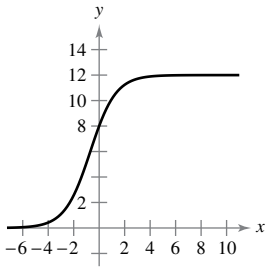
54. $y = Ce^x$

Matching **In Exercises 55–58, match the logistic equation with its graph. [The graphs are labeled (a), (b), (c), and (d).]**

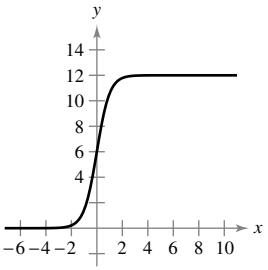
(a)



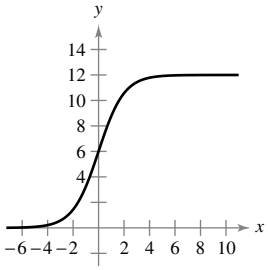
(b)



(c)



(d)



55. $y = \frac{12}{1 + e^{-x}}$

56. $y = \frac{12}{1 + 3e^{-x}}$

57. $y = \frac{12}{1 + \frac{1}{2}e^{-x}}$

58. $y = \frac{12}{1 + e^{-2x}}$

Using a Logistic Equation **In Exercises 59 and 60, the logistic equation models the growth of a population. Use the equation to (a) find the value of k, (b) find the carrying capacity, (c) find the initial population, (d) determine when the population will reach 50% of its carrying capacity, and (e) write a logistic differential equation that has the solution $P(t)$.**

59. $P(t) = \frac{2100}{1 + 29e^{-0.75t}}$

60. $P(t) = \frac{5000}{1 + 39e^{-0.2t}}$

Using a Logistic Differential Equation **In Exercises 61 and 62, the logistic differential equation models the growth rate of a population. Use the equation to (a) find the value of k, (b) find the carrying capacity, (c) graph a slope field using a computer algebra system, and (d) determine the value of P at which the population growth rate is the greatest.**

61. $\frac{dP}{dt} = 3P\left(1 - \frac{P}{100}\right)$

62. $\frac{dP}{dt} = 0.1P - 0.0004P^2$

Solving a Logistic Differential Equation **In Exercises 63–66, find the logistic equation that passes through the given point.**

63. $\frac{dy}{dt} = y\left(1 - \frac{y}{36}\right)$, $(0, 4)$

64. $\frac{dy}{dt} = 4.2y\left(1 - \frac{y}{21}\right)$, $(0, 9)$

65. $\frac{dy}{dt} = \frac{4y}{5} - \frac{y^2}{150}$, $(0, 8)$

66. $\frac{dy}{dt} = \frac{3y}{20} - \frac{y^2}{1600}$, $(0, 15)$

67. Endangered Species A conservation organization releases 25 Florida panthers into a game preserve. After 2 years, there are 39 panthers in the preserve. The Florida preserve has a carrying capacity of 200 panthers.

(a) Write a logistic equation that models the population of panthers in the preserve.

(b) Find the population after 5 years.

(c) When will the population reach 100?

(d) Write a logistic differential equation that models the growth rate of the panther population. Then repeat part (b) using Euler's Method with a step size of $h = 1$. Compare the approximation with the exact answer.

(e) At what time is the panther population growing most rapidly? Explain.

68. Bacteria Growth At time $t = 0$, a bacterial culture weighs 1 gram. Two hours later, the culture weighs 4 grams. The maximum weight of the culture is 20 grams.

(a) Write a logistic equation that models the weight of the bacterial culture.

(b) Find the culture's weight after 5 hours.

(c) When will the culture's weight reach 18 grams?

(d) Write a logistic differential equation that models the growth rate of the culture's weight. Then repeat part (b) using Euler's Method with a step size of $h = 1$. Compare the approximation with the exact answer.

(e) At what time is the culture's weight increasing most rapidly? Explain.

Exploring Concepts

69. Determine whether an equation of the form

$$\frac{dy}{dx} = f(x)g(y) - f(x)h(y), \quad g(y) \neq h(y)$$

is separable. Explain.

70. Describe the slope field for a logistic differential equation. Explain your reasoning.

71. Finding a Derivative Show that if

$$y = \frac{1}{1 + be^{-kt}}$$

then

$$\frac{dy}{dt} = ky(1 - y).$$

72. Point of Inflection For any logistic equation, show that the point of inflection occurs at

$$y = \frac{L}{2}$$

when the solution starts below the carrying capacity L.

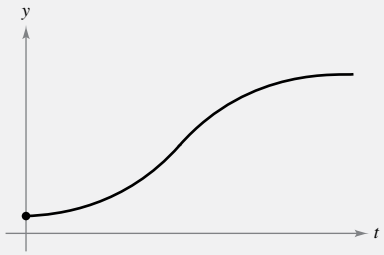
73. Sailing

Ignoring resistance, a sailboat starting from rest accelerates (dv/dt) at a rate proportional to the difference between the velocities of the wind and the boat.

(a) The wind is blowing at 20 knots, and after a half-hour, the boat is moving at 10 knots. Write the velocity v as a function of time t.

(b) Use the result of part (a) to write the distance traveled by the boat as a function of time.

74. HOW DO YOU SEE IT? The growth of a population is modeled by a logistic equation, as shown in the graph below. What happens to the rate of growth as the population increases? What do you think causes this to occur in real-life situations, such as animal or human populations?



True or False? In Exercises 75–77, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.

75. The function $y = 0$ is always a solution of a differential equation that can be solved by separation of variables.

76. The differential equation $y' = xy - 2y + x - 2$ is separable.

77. The families

$$x^2 + y^2 = 2Cy \quad \text{and} \quad x^2 + y^2 = 2Kx$$

are mutually orthogonal.

PUTNAM EXAM CHALLENGE

78. A not uncommon calculus mistake is to believe that the product rule for derivatives says that $(fg)' = f'g'$. If

$$f(x) = e^{x^2}$$

determine, with proof, whether there exists an open interval (a, b) and a nonzero function g defined on (a, b) such that this wrong product rule is true for x in (a, b).

This problem was composed by the Committee on the Putnam Prize Competition.

6.4 First-Order Linear Differential Equations

GO DIGITAL

Solve a first-order linear differential equation, and use linear differential equations to solve applied problems.

ANNA JOHNSON PELL WHEELER (1883–1966)

Anna Johnson Pell Wheeler was awarded a master's degree in 1904 from the University of Iowa for her thesis *The Extension of Galois Theory to Linear Differential Equations*. Influenced by David Hilbert, she worked on integral equations while studying infinite linear spaces.

See LarsonCalculus.com to read more of this biography.

First-Order Linear Differential Equations

In this section, you will learn how to solve a very important class of first-order differential equations—first-order linear differential equations.

Definition of First-Order Linear Differential Equation

A **first-order linear differential equation** is an equation of the form

$$\frac{dy}{dx} + P(x)y = Q(x)$$

where P and Q are continuous functions of x. This first-order linear differential equation is said to be in **standard form.**

To solve a linear differential equation, write it in standard form to identify the functions $P(x)$ and $Q(x)$. Then integrate $P(x)$ and form the expression

$$u(x) = e^{\int P(x)\,dx}$$ Integrating factor

which is called an **integrating factor.** The general solution of the equation is

$$y = \frac{1}{u(x)}\int Q(x)u(x)\,dx.$$ General solution

It is instructive to see why the integrating factor helps solve a linear differential equation of the form $y' + P(x)y = Q(x)$. When each side of the equation is multiplied by the integrating factor $u(x) = e^{\int P(x)\,dx}$, the left side becomes the derivative of a product.

$$y'e^{\int P(x)\,dx} + P(x)ye^{\int P(x)\,dx} = Q(x)e^{\int P(x)\,dx}$$
$$\left[ye^{\int P(x)\,dx}\right]' = Q(x)e^{\int P(x)\,dx}$$

Integrating each side of this second equation and dividing by $u(x)$ produces the general solution.

EXAMPLE 1 Solving a Linear Differential Equation

Find the general solution of $y' + y = e^x$.

Solution For this equation, $P(x) = 1$ and $Q(x) = e^x$. So, the integrating factor is

$$u(x) = e^{\int P(x)\,dx} = e^{\int dx} = e^x.$$ Integrating factor

This implies that the general solution is

$$y = \frac{1}{u(x)}\int Q(x)u(x)\,dx$$ Form of general solution
$$= \frac{1}{e^x}\int e^x(e^x)\,dx$$ Substitute.
$$= e^{-x}\left(\frac{1}{2}e^{2x} + C\right)$$ Integrate.
$$= \frac{1}{2}e^x + Ce^{-x}.$$ General solution

REMARK Check the answer to Example 1 by showing that the general solution satisfies the differential equation $y' + y = e^x$.

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

REMARK Rather than memorizing the formula in Theorem 6.2, just remember that multiplication by the integrating factor $e^{\int P(x)\,dx}$ converts the left side of the differential equation into the derivative of the product $ye^{\int P(x)\,dx}$.

THEOREM 6.2 Solution of a First-Order Linear Differential Equation

An integrating factor for the first-order linear differential equation

$$y' + P(x)y = Q(x)$$

is $u(x) = e^{\int P(x)\,dx}$. The solution of the differential equation is

$$ye^{\int P(x)\,dx} = \int Q(x)e^{\int P(x)\,dx}\,dx + C.$$

EXAMPLE 2 Solving a First-Order Linear Differential Equation

See LarsonCalculus.com for an interactive version of this type of example.

Find the general solution of $xy' - 2y = x^2$, where $x > 0$.

Solution First, divide by x to write the equation in the form $y' + P(x)y = Q(x)$.

$$y' + \left(-\frac{2}{x}\right)y = x, \quad x > 0 \qquad \text{Standard form}$$

So, $P(x) = -2/x$, and you have

$$\int P(x)\,dx = -\int \frac{2}{x}\,dx = -\ln x^2$$

which implies that the integrating factor is

$$e^{\int P(x)\,dx} = e^{-\ln x^2} = \frac{1}{e^{\ln x^2}} = \frac{1}{x^2}. \qquad \text{Integrating factor}$$

So, multiplying each side of the standard form by $1/x^2$ yields

$$\frac{y'}{x^2} - \frac{2y}{x^3} = \frac{1}{x} \qquad \text{Multiply each side of the standard form by } \frac{1}{x^2}.$$

$$\frac{d}{dx}\left[\frac{y}{x^2}\right] = \frac{1}{x} \qquad \text{Use Product Rule to rewrite left side.}$$

$$\frac{y}{x^2} = \int \frac{1}{x}\,dx \qquad \text{Integrate each side.}$$

$$\frac{y}{x^2} = \ln x + C$$

$$y = x^2(\ln x + C). \qquad \text{General solution}$$

Several solution curves (for $C = -2, -1, 0, 1, 2, 3,$ and 4) are shown in Figure 6.18.

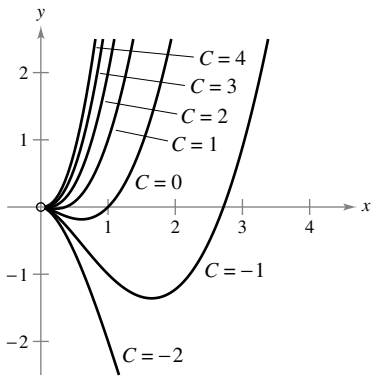

Figure 6.18

In most falling-body problems discussed so far in the text, air resistance has been neglected. The next example includes this factor. In the example, the air resistance on the falling object is assumed to be proportional to its velocity v. If g is the acceleration due to gravity, the downward force F on a falling object of mass m is given by $-mg - kv$. If a is the acceleration of the object, then by Newton's Second Law of Motion,

$$F = ma = m\frac{dv}{dt} \qquad \text{Newton's Second Law of Motion}$$

which yields the following differential equation.

$$m\frac{dv}{dt} = -mg - kv \quad \Rightarrow \quad \frac{dv}{dt} + \frac{kv}{m} = -g$$

GO DIGITAL

EXAMPLE 3 A Falling Object with Air Resistance

An object of mass m is dropped from a hovering helicopter. The air resistance is proportional to the velocity of the object. Find the velocity of the object as a function of time t.

Solution The velocity v satisfies the equation

$$\frac{dv}{dt} + \frac{kv}{m} = -g.$$

g = acceleration due to gravity, k = constant of proportionality

Letting $b = k/m$, you can *separate variables* to obtain

$$dv = -(g + bv)\,dt \qquad \text{Separate variables.}$$

$$\int \frac{dv}{g + bv} = -\int dt \qquad \text{Integrate each side.}$$

$$\frac{1}{b}\ln|g + bv| = -t + C_1 \qquad \text{Find antiderivative of each side.}$$

$$\ln|g + bv| = -bt + bC_1$$

$$g + bv = Ce^{-bt}. \qquad C = e^{bC_1}$$

Because the object was dropped, $v = 0$ when $t = 0$; so $g = C$, and it follows that

$$bv = -g + ge^{-bt} \quad \Rightarrow \quad v = \frac{-g(1 - e^{-bt})}{b} = -\frac{mg}{k}(1 - e^{-kt/m}).$$

REMARK Notice in Example 3 that the velocity approaches a limit of $-mg/k$ as a result of the air resistance. For falling-body problems in which air resistance is neglected, the velocity increases without bound.

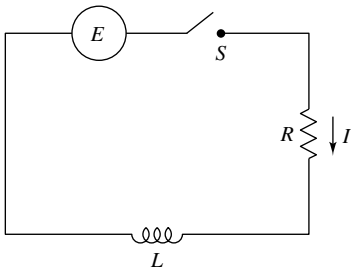

Figure 6.19

A simple electric circuit consists of an electric current I (in amperes), a resistance R (in ohms), an inductance L (in henrys), and a constant electromotive force E (in volts), as shown in Figure 6.19. According to Kirchhoff's Second Law, if the switch S is closed when $t = 0$, then the applied electromotive force (voltage) is equal to the sum of the voltage drops in the rest of the circuit. This, in turn, means that the current I satisfies the differential equation

$$L\frac{dI}{dt} + RI = E.$$

EXAMPLE 4 An Electric Circuit Problem

Find the current I as a function of time t (in seconds), given that I satisfies the differential equation $L(dI/dt) + RI = \sin 2t$, where R and L are nonzero constants.

Solution In standard form, the given linear equation is

$$\frac{dI}{dt} + \frac{R}{L}I = \frac{1}{L}\sin 2t.$$

Let $P(t) = R/L$, so that $e^{\int P(t)\,dt} = e^{(R/L)t}$, and by Theorem 6.2,

$$Ie^{(R/L)t} = \frac{1}{L}\int e^{(R/L)t}\sin 2t\,dt$$

$$= \frac{1}{4L^2 + R^2}e^{(R/L)t}(R\sin 2t - 2L\cos 2t) + C.$$

So, the general solution is

$$I = e^{-(R/L)t}\left[\frac{1}{4L^2 + R^2}e^{(R/L)t}(R\sin 2t - 2L\cos 2t) + C\right]$$

$$= \frac{1}{4L^2 + R^2}(R\sin 2t - 2L\cos 2t) + Ce^{-(R/L)t}.$$

REMARK The integral in Example 4 was found using a graphing utility. In Chapter 8, you will learn how to integrate functions of this type using integration by parts.

GO DIGITAL

One type of problem that can be described in terms of a differential equation involves chemical mixtures, as illustrated in the next example.

EXAMPLE 5 A Mixture Problem

A tank contains 50 gallons of a solution composed of 90% water and 10% alcohol. A second solution containing 50% water and 50% alcohol is added to the tank at a rate of 4 gallons per minute. As the second solution is being added, the tank is being drained at a rate of 5 gallons per minute, as shown in Figure 6.20. The solution in the tank is stirred constantly. How much alcohol is in the tank after 10 minutes?

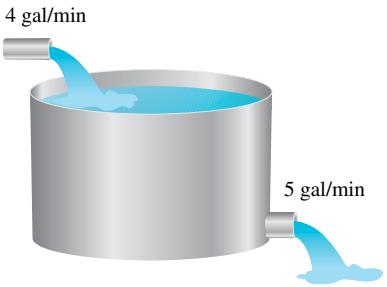

Figure 6.20

Solution Let y be the number of gallons of alcohol in the tank at any time t. You know that $y = 5$ when $t = 0$. Because the number of gallons of solution in the tank at any time is $50 - t$, and the tank loses 5 gallons of solution per minute, it must lose

$$\left(\frac{5}{50 - t}\right)y$$

gallons of alcohol per minute. Furthermore, because the tank is gaining 2 gallons of alcohol per minute, the rate of change of alcohol in the tank is

$$\frac{dy}{dt} = 2 - \left(\frac{5}{50 - t}\right)y \quad \Rightarrow \quad \frac{dy}{dt} + \left(\frac{5}{50 - t}\right)y = 2.$$

To solve this linear differential equation, let

$$P(t) = \frac{5}{50 - t}$$

and obtain

$$\int P(t)\,dt = \int \frac{5}{50 - t}\,dt = -5\ln|50 - t|.$$

Because $t < 50$, you can drop the absolute value signs and conclude that

$$e^{\int P(t)\,dt} = e^{-5\ln(50 - t)} = \frac{1}{(50 - t)^5}. \qquad \text{Integrating factor}$$

So, the general solution is

$$\frac{y}{(50 - t)^5} = \int \frac{2}{(50 - t)^5}\,dt$$

$$\frac{y}{(50 - t)^5} = \frac{1}{2(50 - t)^4} + C$$

$$y = \frac{50 - t}{2} + C(50 - t)^5. \qquad \text{General solution}$$

Because $y = 5$ when $t = 0$, you have

$$5 = \frac{50}{2} + C(50)^5 \quad \Rightarrow \quad -\frac{20}{50^5} = C$$

which means that the particular solution is

$$y = \frac{50 - t}{2} - 20\left(\frac{50 - t}{50}\right)^5. \qquad \text{Particular solution}$$

Finally, when $t = 10$, the amount of alcohol in the tank is

$$y = \frac{50 - 10}{2} - 20\left(\frac{50 - 10}{50}\right)^5 \approx 13.45 \text{ gal}$$

which represents a solution containing 33.6% alcohol.

EVANGELISTA TORRICELLI (1608–1647)

Torricelli was an Italian mathematician and physicist. He is probably most famous for being the first person to create a sustained vacuum and inventing the barometer. His work in geometry aided in the eventual development of integral calculus. He also developed a theorem used in fluid dynamics called Torricelli's Law. (See page 442, Exercises 3–5.)

6.4 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain what the term "first-order" refers to in a first-order linear differential equation.
2. Describe how to solve a first-order linear differential equation.

Determining Whether a Differential Equation Is Linear **In Exercises 3–6, determine whether the differential equation is linear. Explain your reasoning.**

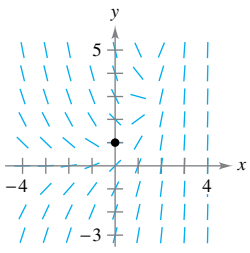
3. $x^3y' + xy = e^x + 1$
4. $2xy - y' \ln x = y$
5. $y' - y \sin x = xy^2$
6. $\dfrac{2 - y'}{y} = 5x$

Solving a First-Order Linear Differential Equation **In Exercises 7–14, find the general solution of the first-order linear differential equation for $x > 0$.**

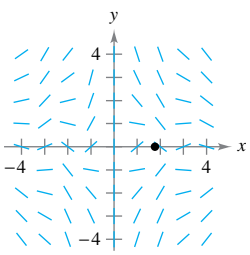
7. $\dfrac{dy}{dx} + \left(\dfrac{1}{x}\right)y = 6x + 2$
8. $\dfrac{dy}{dx} + \left(\dfrac{2}{x}\right)y = 3x - 5$
9. $y' + 2xy = 10x$
10. $y' + 3x^2y = 6x^2$
11. $(y + 1)\cos x\,dx - dy = 0$
12. $(y - 1)\sin x\,dx - dy = 0$
13. $y' + 3y = e^{3x}$
14. $xy' + y = x^2 \ln x$

Slope Field **In Exercises 15 and 16, (a) sketch an approximate solution of the differential equation satisfying the given initial condition on the slope field, (b) find the particular solution that satisfies the given initial condition, and (c) use a graphing utility to graph the particular solution. Compare the graph with the sketch in part (a). To print an enlarged copy of the graph, go to *MathGraphs.com*.**

15. $\dfrac{dy}{dx} = e^x - y$, $(0, 1)$



16. $y' + \left(\dfrac{1}{x}\right)y = \sin x^2$, $\left(\sqrt{\pi}, 0\right)$



Finding a Particular Solution **In Exercises 17–24, find the particular solution of the first-order linear differential equation for $x > 0$ that satisfies the initial condition.**

Differential Equation	Initial Condition
17. $y' + y = 6e^x$	$y(0) = 3$
18. $x^3y' + 2y = e^{1/x^2}$	$y(1) = e$
19. $y' + y \tan x = \sec x + \cos x$	$y(0) = 1$
20. $y' + y \sec x = \sec x$	$y(0) = 4$
21. $y' + \left(\dfrac{1}{x}\right)y = 0$	$y(2) = 2$
22. $y' + (2x - 1)y = 0$	$y(1) = 2$
23. $x\,dy = (x + y + 2)\,dx$	$y(1) = 10$
24. $2xy' - y = x^3 - x$	$y(4) = 2$

25. **Population Growth** When predicting population growth, demographers must consider birth and death rates as well as the net change caused by the difference between the rates of immigration and emigration. Let P be the population at time t and let N be the net increase per unit time resulting from the difference between immigration and emigration. So, the rate of growth of the population is given by

$$\frac{dP}{dt} = kP + N$$

where N is constant. Solve this differential equation to find P as a function of time, when at time $t = 0$ the size of the population is P_0.

26. **Investment Growth** A large corporation starts at time $t = 0$ to invest part of its receipts continuously at a rate of P dollars per year in a fund for future corporate expansion. Assume that the fund earns r percent interest per year compounded continuously. So, the rate of growth of the amount A in the fund is given by $dA/dt = rA + P$, where $A = 0$ when $t = 0$. Solve this differential equation for A as a function of t.

Investment Growth **In Exercises 27 and 28, use the result of Exercise 26.**

27. Find A for the following.
    (a) $P = \$275{,}000$, $r = 8\%$, $t = 10$ years
    (b) $P = \$550{,}000$, $r = 5.9\%$, $t = 25$ years
28. Find t if the corporation needs $1,000,000 and it can invest $125,000 per year in a fund earning 8% interest compounded continuously.

29. **Learning Curve** The management at a certain factory has found that the maximum number of units a worker can produce in a day is 75. The rate of increase in the number of units N produced with respect to time t in days by a new employee is proportional to $75 - N$.
    (a) Determine the differential equation describing the rate of change of performance with respect to time.
    (b) Solve the differential equation from part (a).
    (c) Find the particular solution for a new employee who produced 20 units on the first day at the factory and 35 units on the twentieth day.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

30. Intravenous Feeding

Glucose is added intravenously to the bloodstream at the rate of q units per minute, and the body removes glucose from the bloodstream at a rate proportional to the amount present. Assume that $Q(t)$ is the amount of glucose in the bloodstream at time t.

(a) Determine the differential equation describing the rate of change of glucose in the bloodstream with respect to time.

(b) Solve the differential equation from part (a), letting $Q = Q_0$ when $t = 0$.

(c) Find the limit of $Q(t)$ as $t \to \infty$.

Falling Object **In Exercises 31 and 32, consider an object with a mass of 4 kilograms dropped from a height of 1500 meters, where the air resistance is proportional to the velocity.**

31. Write the velocity of the object as a function of time t when the velocity after 5 seconds is approximately -31 meters per second. What is the limiting value of the velocity function?

32. Use the result of Exercise 31 to write the position of the object as a function of time t. Approximate the velocity of the object when it reaches ground level.

Electric Circuits **In Exercises 33 and 34, use the differential equation for electric circuits given by**

$$L\frac{dI}{dt} + RI + E.$$

In this equation, I is the current, R is the resistance, L is the inductance, and E is the electromotive force (voltage).

33. Solve the differential equation for the current given a constant voltage E_0.

34. Use the result of Exercise 33 to find the equation for the current when $I(0) = 0$, $E_0 = 120$ volts, $R = 600$ ohms, and $L = 4$ henrys. When does the current reach 90% of its limiting value?

Mixture **In Exercises 35–38, consider a tank that at time $t = 0$ contains v_0 gallons of a solution of which, by weight, q_0 pounds is soluble concentrate. Another solution containing q_1 pounds of the concentrate per gallon is running into the tank at the rate of r_1 gallons per minute. The solution in the tank is kept well stirred and is withdrawn at the rate of r_2 gallons per minute.**

35. Let Q be the amount of concentrate (in pounds) in the solution at any time t. Show that

$$\frac{dQ}{dt} + \frac{r_2 Q}{v_0 + (r_1 - r_2)t} = q_1 r_1.$$

36. Let Q be the amount of concentrate (in pounds) in the solution at any time t. Write the differential equation for the rate of change of Q with respect to t when $r_1 = r_2 = r$.

37. A 200-gallon tank is full of a solution containing 25 pounds of concentrate. Starting at time $t = 0$, distilled water is admitted to the tank at a rate of 10 gallons per minute, and the well-stirred solution is withdrawn at the same rate.

(a) Find the amount of concentrate Q (in pounds) in the solution as a function of t.

(b) Find the time at which the amount of concentrate in the tank reaches 15 pounds.

(c) Find the amount of concentrate (in pounds) in the solution as $t \to \infty$.

38. A 200-gallon tank is half full of distilled water. Starting at time $t = 0$, a solution containing 0.5 pound of concentrate per gallon is admitted to the tank at a rate of 5 gallons per minute, and the well-stirred mixture is withdrawn at a rate of 3 gallons per minute.

(a) At what time will the tank be full?

(b) At the time the tank is full, how many pounds of concentrate will it contain?

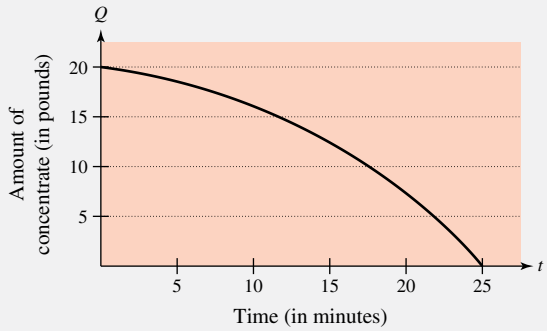
(c) Repeat parts (a) and (b), assuming that the solution entering the tank contains 1 pound of concentrate per gallon.

39. Using an Integrating Factor The expression $u(x)$ is an integrating factor for $y' + P(x)y = Q(x)$. Which of the following is equal to $u'(x)$? Verify your answer.

(a) $P(x)u(x)$ (b) $P'(x)u(x)$

(c) $Q(x)u(x)$ (d) $Q'(x)u(x)$

40. HOW DO YOU SEE IT? The graph shows the amount of concentrate Q (in pounds) in a solution in a tank at time t (in minutes) as a solution with concentrate enters the tank, is well stirred, and is withdrawn from the tank.



(a) How much concentrate is in the tank at time $t = 0$?

(b) Which is greater, the rate of solution into the tank or the rate of solution withdrawn from the tank? Explain.

(c) At what time is there no concentrate in the tank? Explain what this means.

Exploring Concepts

41. Describe two ways to find the general solution of

$$\frac{dy}{dx} + 3xy = x.$$

Verify that each method gives the same result.

42. Explain why you can omit the constant of integration when finding an integrating factor.

Matching **In Exercises 43–46, match the differential equation with its solution.**

Differential Equation	Solution
43. $y' - 2x = 0$	(a) $y = Ce^{x^2}$
44. $y' - 2y = 0$	(b) $y = -\frac{1}{2} + Ce^{x^2}$
45. $y' - 2xy = 0$	(c) $y = x^2 + C$
46. $y' - 2xy = x$	(d) $y = Ce^{2x}$

Slope Field **In Exercises 47 and 48, (a) use a graphing utility to graph the slope field for the differential equation, (b) find the particular solutions of the differential equation passing through the given points, and (c) use a graphing utility to graph the particular solutions on the slope field in part (a).**

Differential Equation	Points
47. $\frac{dy}{dx} - \frac{1}{x}y = x^2, \quad x > 0$	$(-2, 4), (2, 8)$
48. $\frac{dy}{dx} + 4x^3y = x^3$	$\left(0, \frac{7}{2}\right), \left(0, -\frac{1}{2}\right)$

Solving a First-Order Differential Equation **In Exercises 49–56, find the general solution of the first-order differential equation for $x > 0$ by any appropriate method.**

49. $\frac{dy}{dx} = \frac{e^{2x+y}}{e^{x-y}}$

50. $y' \cos x^2 + \frac{y \cos x^2}{x} = \sec x^2$

51. $y \cos x - \cos x + \frac{dy}{dx} = 0$

52. $y' = 2x\sqrt{1 - y^2}$

53. $(2y - e^x)\,dx + x\,dy = 0$

54. $(x + y)\,dx - x\,dy = 0$

55. $3(y - 4x^2)\,dx + x\,dy = 0$

56. $x\,dx + (y + e^y)(x^2 + 1)\,dy = 0$

Solving a Bernoulli Differential Equation **In Exercises 57–64, solve the Bernoulli differential equation. The *Bernoulli equation* is a well-known nonlinear equation of the form**

$$y' + P(x)y = Q(x)y^n$$

that can be reduced to a linear form by a substitution. The general solution of a Bernoulli equation is

$$y^{1-n}e^{\int(1-n)P(x)\,dx} = \int (1-n)Q(x)e^{\int(1-n)P(x)\,dx}\,dx + C.$$

57. $y' + 3x^2y = x^2y^3$

58. $y' + xy = xy^{-1}$

59. $y' + \left(\frac{1}{x}\right)y = xy^2, \quad x > 0$

60. $y' + \left(\frac{1}{x}\right)y = x\sqrt{y}, \quad x > 0$

61. $xy' + y = xy^3, \quad x > 0$

62. $y' - y = y^3$

63. $y' - y = e^x\sqrt[3]{y}$

64. $yy' - 2y^2 = e^x$

True or False? **In Exercises 65 and 66, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

65. $y' + x\sqrt{y} = x^2$ is a first-order linear differential equation.

66. $y' + xy = e^xy$ is a first-order linear differential equation.

SECTION PROJECT

Weight Loss

A person's weight depends on both the number of calories consumed and the energy used. Moreover, the amount of energy used depends on a person's weight—the average amount of energy used by a person is 17.5 calories per pound per day. So, the more weight a person loses, the less energy a person uses (assuming that the person maintains a constant level of activity). An equation that can be used to model weight loss is

$$\frac{dw}{dt} = \frac{C}{3500} - \frac{17.5}{3500}w$$

where w is the person's weight (in pounds), t is the time in days, and C is the constant daily calorie consumption.

(a) Find the general solution of the differential equation.

(b) Consider a person who weighs 180 pounds and begins a diet of 2500 calories per day. How long will it take the person to lose 10 pounds? How long will it take the person to lose 35 pounds?

(c) Use a graphing utility to graph the particular solution from part (b). What is the "limiting" weight of the person?

(d) Repeat parts (b) and (c) for a person who weighs 200 pounds when the diet is started.

FOR FURTHER INFORMATION For more information on modeling weight loss, see the article "A Linear Diet Model" by Arthur C. Segal in *The College Mathematics Journal.*

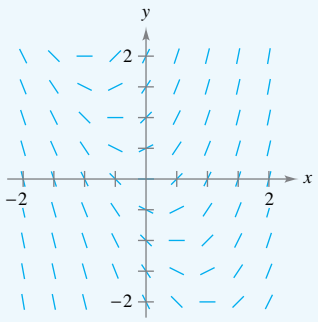
GO DIGITAL

Exploring Concepts

In this chapter, you studied differential equations, one of the most important areas of applied mathematics. Solving differential equations analytically can be difficult, so you studied how to solve differential equations using numerical and graphical approaches as well. (Note how this three-pronged approach to problem solving is used in Exercise 5.)

1. **Numerical approach** Euler's Method, an approximation technique for initial value problems
2. **Graphical approach** Slope fields (see figure)
3. **Analytic approach** Separation of variables; integrating factor and first-order linear differential equation in standard form

Using these approaches, you solved a variety of applications involving differential equations, including growth and decay models and logistic models.



Slope field for $y' = 2x + y$

1. Determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.

(a) In exponential growth, the rate of growth is constant.

(b) In linear growth, the rate of growth is constant.

(c) A differential equation can have more than one solution.

2. When determining a particular solution, how do you determine how many initial conditions are required?

3. Explain how you can find a particular solution of the differential equation $y'' + 4y' + 6y = 30$ by observation.

4. Explain how to use separation of variables to solve a differential equation.

5. Consider the differential equation $y' = -x/y$ that satisfies the initial condition $y(3) = 4$.

(a) Use Euler's Method with $h = 0.1$ to approximate the solutions at $x = 3.1$ and $x = 3.2$.

(b) Sketch a slope field for the differential equation. Then sketch the solution that passes through the point $(3, 4)$.

(c) Solve the differential equation.

(d) Explain how you can check your answer to part (c).

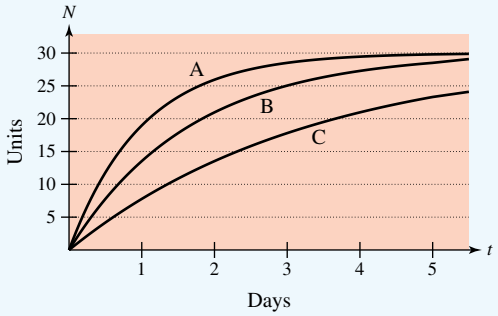
6. The differential equation

$$\frac{dN}{dt} = k(30 - N)$$

represents the rate of change of the number of units produced per day by a new employee, where N is the number of units and t is the time in days. The general solution of this differential equation is

$$N = 30 - 30e^{-kt}.$$

The figure shows the particular solutions for $k = 0.3$, 0.6, and 1. Match the value of k with each solution. (The solutions are labeled A, B, and C.) Explain your reasoning.



7. Determining a Solution Determine whether the function $y = x^3$ is a solution of the differential equation $2xy' + 4y = 10x^3$.

8. Determining a Solution Determine whether the function $y = 2 \sin 2x$ is a solution of the differential equation $y''' - 8y = 0$.

Finding a General Solution **In Exercises 9–14, use integration to find a general solution of the differential equation.**

9. $\dfrac{dy}{dx} = 4x^2 + 7$

10. $\dfrac{dy}{dx} = \dfrac{6 - x}{3x}, \quad x > 0$

11. $\dfrac{dy}{dx} = \cos 2x$

12. $\dfrac{dy}{dx} = 8 \csc x \cot x$

13. $\dfrac{dy}{dx} = e^{2-x}$

14. $\dfrac{dy}{dx} = 2e^{3x}$

Slope Field **In Exercises 15 and 16, (a) sketch the slope field for the differential equation, and (b) use the slope field to sketch the solution that passes through the given point. Use a graphing utility to verify your results. To print a blank coordinate plane, go to *MathGraphs.com*.**

15. $y' = 2x^2 - x, \quad (0, 2)$

16. $y' = y + 4x, \quad (-1, 1)$

Euler's Method **In Exercises 17 and 18, use Euler's Method to make a table of values for the approximate solution of the differential equation with the specified initial value. Use n steps of size h.**

17. $y' = x - y, \quad y(0) = 4, \quad n = 10, \quad h = 0.05$

18. $y' = 5x - 2y, \quad y(0) = 2, \quad n = 10, \quad h = 0.1$

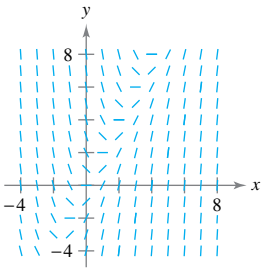
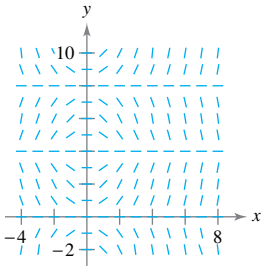
Slope Field **In Exercises 19 and 20, a differential equation and its slope field are given. Complete the table by determining the slopes (if possible) in the slope field at the given points.**

x	-4	-2	0	2	4	8
y	2	0	4	4	6	8
dy/dx						

19. $\dfrac{dy}{dx} = 2x - y$



20. $\dfrac{dy}{dx} = x \sin \dfrac{\pi y}{4}$



Solving a Differential Equation **In Exercises 21–28, find the general solution of the differential equation.**

21. $\dfrac{dy}{dx} = 6x - x^3$

22. $\dfrac{dy}{dx} = 3y + 5$

23. $\dfrac{dy}{dx} = (y - 1)^2$

24. $\dfrac{dy}{dx} = \dfrac{x}{x^2 + 2}$

25. $(2 + x)y' - xy = 0$

26. $xy' - (x + 1)y = 0$

27. $\sqrt{x + 1}\,y' - y = 0$

28. $y' + \sqrt{x}y = 9\sqrt{x}$

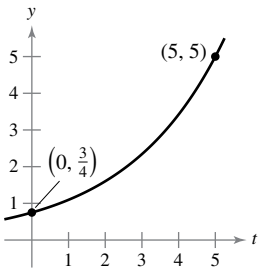
Writing and Solving a Differential Equation **In Exercises 29 and 30, write and find the general solution of the differential equation that models the verbal statement.**

29. The rate of change of y with respect to t is inversely proportional to the cube of t.

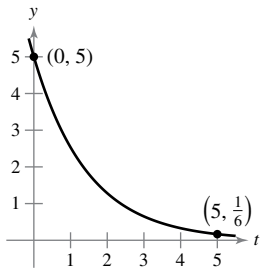
30. The rate of change of y with respect to t is proportional to $50 - t$.

Finding an Exponential Function **In Exercises 31–34, find the exponential function $y = Ce^{kt}$ that passes through the two given points.**

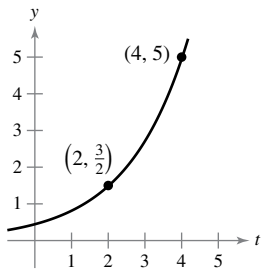
31.



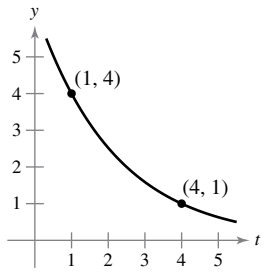
32.



33.



34.



35. Air Pressure Under ideal conditions, air pressure decreases continuously with the height above sea level at a rate proportional to the pressure at that height. The barometer reads 30 inches at sea level and 15 inches at 18,000 feet. Find the barometric pressure at 35,000 feet.

36. Radioactive Decay Radioactive radium has a half-life of approximately 1599 years. The initial quantity is 15 grams. How much remains after 750 years?

37. Population Growth A population grows exponentially at the rate of 1.85%. How long will it take the population to double?

38. Compound Interest Find the balance in an account when \$400 is deposited for 11 years at an interest rate of 2% compounded continuously.

39. Sales The sales S (in thousands of units) of a new product after it has been on the market for t years is given by

$$S = Ce^{k/t}.$$

(a) Find S as a function of t when 5000 units have been sold after 1 year and the saturation point for the market is 30,000 units (that is, $\lim_{t\to\infty} S = 30$).

(b) How many units will have been sold after 5 years?

40. Sales The sales S (in thousands of units) of a new product after it has been on the market for t years is given by

$$S = 25(1 - e^{kt}).$$

(a) Find S as a function of t when 4000 units have been sold after 1 year.

(b) How many units will saturate this market?

Finding a General Solution Using Separation of Variables **In Exercises 41–44, find the general solution of the differential equation.**

41. $\dfrac{dy}{dx} = \dfrac{5x}{y}$

42. $\dfrac{dy}{dx} = \dfrac{x^3}{2y^2}$

43. $y'e^{y-3x} = e^{x+2y}$

44. $y' - e^y \sin x = 0$

Finding a Particular Solution Using Separation of Variables **In Exercises 45–48, find the particular solution of the differential equation that satisfies the initial condition.**

Differential Equation	Initial Condition
45. $y^3y' - 3x = 0$	$y(2) = 2$
46. $yy' - 5e^{2x} = 0$	$y(0) = -3$
47. $y^3(x^4 + 1)y' - x^3(y^4 + 1) = 0$	$y(0) = 1$
48. $y' + \sin x \cos x = 0$	$y(\pi) = -2$

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Finding a Particular Solution Curve **In Exercises 49 and 50, find an equation of the curve that passes through the point and has the given slope.**

49. $(1, 3), \quad y' = \dfrac{2x}{y}$

50. $(1, -2), \quad y' = \dfrac{y}{8x}$

Finding Orthogonal Trajectories **In Exercises 51 and 52, find the orthogonal trajectories for the family of curves. Use a graphing utility to graph several members of each family.**

51. $5x^2 - 4y^2 = C$

52. $x^3 = Cy$

Using a Logistic Equation **In Exercises 53 and 54, the logistic equation models the growth of a population. Use the equation to (a) find the value of k, (b) find the carrying capacity, (c) find the initial population, (d) determine when the population will reach 50% of its carrying capacity, and (e) write a logistic differential equation that has the solution $P(t)$.**

53. $P(t) = \dfrac{5250}{1 + 34e^{-0.55t}}$

54. $P(t) = \dfrac{4800}{1 + 14e^{-0.15t}}$

Solving a Logistic Differential Equation **In Exercises 55 and 56, find the logistic equation that passes through the given point.**

55. $\dfrac{dy}{dt} = y\left(1 - \dfrac{y}{80}\right), \quad (0, 8)$

56. $\dfrac{dy}{dt} = 1.76y\left(1 - \dfrac{y}{8}\right), \quad (0, 3)$

57. Wildlife Population The rate of change of the number of raccoons $N(t)$ in a population is directly proportional to $380 - N(t)$, where t is the time in years. When $t = 0$, the population is 110, and when $t = 4$, the population has increased to 150. Find the population when $t = 8$.

58. Environment A conservation department releases 1200 brook trout into a lake. It is estimated that the carrying capacity of the lake for the species is 20,400. After the first year, there are 2000 brook trout in the lake.

(a) Write a logistic equation that models the number of brook trout in the lake.

(b) Find the number of brook trout in the lake after 8 years.

(c) When will the number of brook trout reach 10,000?

(d) Write a logistic differential equation that models the growth rate of the brook trout population. Then repeat part (b) using Euler's method with a step size of $h = 1$. Compare the approximation with the exact answer.

(e) At what time is the brook trout population growing most rapidly? Explain.

Solving a First-Order Linear Differential Equation **In Exercises 59–64, find the general solution of the first-order linear differential equation.**

59. $y' - y = 10$

60. $e^x y' + 4e^x y = 1$

61. $4y' = e^{x/4} + y$

62. $\dfrac{dy}{dx} - \dfrac{5y}{x^2} = \dfrac{1}{x^2}, \quad x > 0$

63. $(x - 2)y' + y = 1, \quad x > 2$

64. $(x + 3)y' + 2y = 2(x + 3)^2, \quad x > -3$

Finding a Particular Solution **In Exercises 65–68, find the particular solution of the first-order linear differential equation that satisfies the initial condition.**

Differential Equation	Initial Condition
65. $y' + 5y = e^{5x}$	$y(0) = 3$
66. $y' - \left(\dfrac{3}{x}\right)y = 2x^3$	$y(1) = 1$
67. $(3y + 5)\cos x\, dx = dy$	$y(\pi) = 0$
68. $y' - 8x^3 y = e^{2x^4}$	$y(0) = 2$

Building on Concepts

69. Although it is true for some functions f and g, a common mistake in calculus is to believe that the Product Rule for derivatives is $(fg)' = f'g'$.

(a) Given $g(x) = x$, find f such that $(fg)' = f'g'$.

(b) Given an arbitrary function g, find a function f such that $(fg)' = f'g'$.

(c) Describe what happens when $g(x) = e^x$.

70. In a disease outbreak, carriers are individuals who can transmit a disease but who exhibit no apparent symptoms. Let y represent the proportion of carriers in a population at any time t. Suppose that carriers are quarantined at a rate r. Then the change in the proportion of carriers can be modeled by

$$\frac{dy}{dt} = -ry.$$

Find the general solution of the differential equation given that 40% of the population are carriers at the beginning of an outbreak.

71. A function $f(x, y)$ is **homogeneous of degree n** if

$$f(tx, ty) = t^n f(x, y)$$

for all t, where n is an integer. Determine whether each function is homogeneous, and if it is, determine its degree.

(a) $f(x, y) = x^3 + 4xy^2 + y^3$ (b) $f(x, y) = e^{x/y}$

(c) $f(x, y) = 2 \ln xy$ (d) $f(x, y) = \tan(x + y)$

72. A **homogeneous differential equation** is an equation of the form $M(x, y)\, dx + N(x, y)\, dy = 0$, where M and N are homogeneous functions of the same degree. To solve an equation of this form by the method of separation of variables, use the substitutions $y = vx$ and $dy = x\, dv + v\, dx$, where v is a differentiable function of x. Solve each homogeneous differential equation in terms of x and y.

(a) $(x + y)\, dx - 2x\, dy = 0$

(b) $(x^3 + y^3)\, dx - xy^2\, dy = 0$

(c) $(x - y)\, dx - (x + y)\, dy = 0$

P.S. Problem Solving

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

1. Doomsday Equation The differential equation

$$\frac{dy}{dt} = ky^{1+\varepsilon}$$

where k and ε are positive constants, is called the **doomsday equation.**

(a) Solve the doomsday equation

$$\frac{dy}{dt} = y^{1.01}$$

given that $y(0) = 1$. Find the time T at which

$$\lim_{t \to T^-} y(t) = \infty.$$

(b) Solve the doomsday equation

$$\frac{dy}{dt} = ky^{1+\varepsilon}$$

given that $y(0) = y_0$. Explain why this equation is called the doomsday equation.

2. Rewriting the Logistic Equation Show that the logistic equation

$$y = \frac{L}{1 + be^{-kt}}$$

can be written as

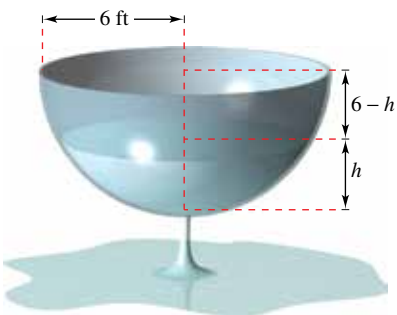
$$y = \frac{1}{2}L\left[1 + \tanh\left(\frac{1}{2}k\left(t - \frac{\ln b}{k}\right)\right)\right].$$

What can you conclude about the graph of the logistic equation?

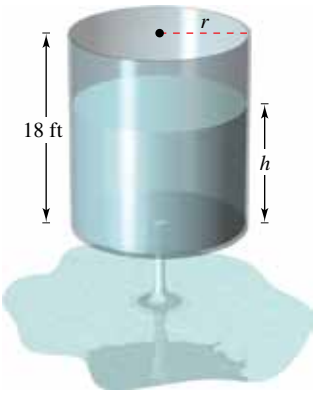
3. Torricelli's Law **Torricelli's Law** states that water will flow from an opening at the bottom of a tank with the same speed that it would attain falling from the surface of the water to the opening. One of the forms of Torricelli's Law is

$$A(h)\frac{dh}{dt} = -k\sqrt{2gh}$$

where h is the height of the water in the tank, k is the area of the opening at the bottom of the tank, $A(h)$ is the horizontal cross-sectional area at height h, and g is the acceleration due to gravity ($g \approx 32$ feet per second per second). A hemispherical water tank has a radius of 6 feet. When the tank is full, a circular valve with a radius of 1 inch is opened at the bottom (see figure). How long will it take for the tank to drain completely?



4. Torricelli's Law The cylindrical water tank shown in the figure has a height of 18 feet. When the tank is full, a circular valve is opened at the bottom of the tank. After 30 minutes, the depth of the water is 12 feet.



(a) Using Torricelli's Law, how long will it take for the tank to drain completely?

(b) What is the depth of the water in the tank after 1 hour?

5. Torricelli's Law Suppose the tank in Exercise 4 has a height of 20 feet and a radius of 8 feet, and the valve is circular with a radius of 2 inches. The tank is full when the valve is opened. How long will it take for the tank to drain completely?

6. Gompertz Equation Another model that can be used to represent population growth is the **Gompertz equation,** which is the solution of the differential equation

$$\frac{dy}{dt} = ky \ln \frac{L}{y}$$

where k is a constant and L is the carrying capacity.

(a) Find the general solution of the differential equation.

(b) Use a graphing utility to graph the slope field for the differential equation when $k = 0.05$ and $L = 1000$.

(c) Describe the behavior of the graph in part (b) as $t \to \infty$.

(d) Use a graphing utility to graph the equation you found in part (a) for $L = 5000$, $y(0) = 500$, and $k = 0.02$. Determine the concavity of the graph and how it compares with the general solution of the logistic differential equation.

7. Biomass Biomass is a measure of the amount of living matter in an ecosystem. Suppose the biomass $s(t)$ in a given ecosystem increases at a rate of about 3.5 tons per year and decreases by about 1.9% per year. This situation can be modeled by the differential equation

$$\frac{ds}{dt} = 3.5 - 0.019s.$$

(a) Find the general solution of the differential equation.

(b) Use a graphing utility to graph the slope field for the differential equation. What do you notice?

(c) Explain what happens to the biomass as $t \to \infty$.

7.1 Area of a Region Between Two Curves

GO DIGITAL

- Find the area of a region between two curves using integration.
- Find the area of a region between intersecting curves using integration.
- Describe integration as an accumulation process.

Area of a Region Between Two Curves

With a few modifications, you can extend the application of definite integrals from the area of a region *under* a curve to the area of a region *between* two curves. Consider two functions f and g that are continuous on the interval $[a, b]$. Also, the graphs of both f and g lie above the x-axis, and the graph of g lies below the graph of f, as shown in Figure 7.1. You can geometrically interpret the area of the region between the graphs as the area of the region under the graph of g subtracted from the area of the region under the graph of f, as shown in Figure 7.2.

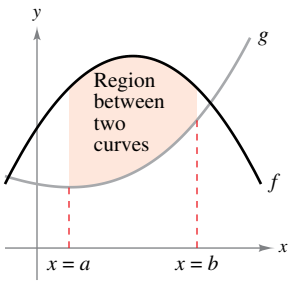

Figure 7.1

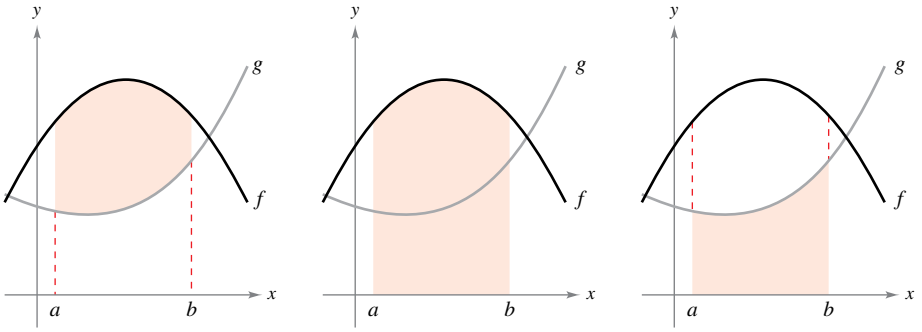

Area of region between f and g	=	Area of region under f	−	Area of region under g
$\int_a^b [f(x) - g(x)]\,dx$	=	$\int_a^b f(x)\,dx$	−	$\int_a^b g(x)\,dx$

Figure 7.2

To verify the reasonableness of the result shown in Figure 7.2, you can partition the interval $[a, b]$ into n subintervals, each of width Δx. Then, as shown in Figure 7.3, sketch a **representative rectangle** of width Δx and height $f(x_i) - g(x_i)$, where x_i is in the ith subinterval. The area of this representative rectangle is

$$\Delta A_i = (\text{height})(\text{width}) = [f(x_i) - g(x_i)]\Delta x.$$

By adding the areas of the n rectangles and taking the limit as $\|\Delta\| \to 0$ $(n \to \infty)$, you obtain

$$\lim_{n\to\infty} \sum_{i=1}^{n} [f(x_i) - g(x_i)]\Delta x.$$

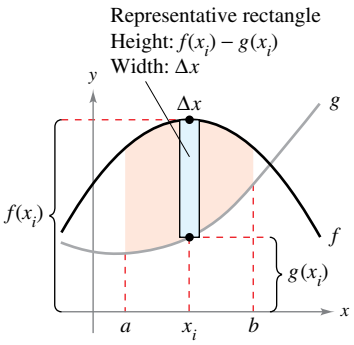

Figure 7.3

Because f and g are continuous on $[a, b]$, $f - g$ is also continuous on $[a, b]$ and the limit exists. So, the area of the region is

$$\begin{aligned} \text{Area} &= \lim_{n\to\infty} \sum_{i=1}^{n} [f(x_i) - g(x_i)]\Delta x \\ &= \int_a^b [f(x) - g(x)]\,dx. \end{aligned}$$

Area between f and g

Big Ideas of Calculus

In this chapter, you will study some applications of the integral. These applications include

- finding the area of a region between two curves,
- finding the volume of a solid, and
- the work done by a force.

In many of these applications, you begin with a known formula. Then you will investigate how the limit of a sum yields a new formula that involves integration.

REMARK Recall from Section 4.3 that $\|\Delta\|$ is the norm of the partition. In a regular partition, the statements $\|\Delta\| \to 0$ and $n \to \infty$ are equivalent.

Area of a Region Between Two Curves

If f and g are continuous functions on $[a, b]$ and $g(x) \le f(x)$ for all x in $[a, b]$, then the area of the region bounded by the graphs of f and g and the vertical lines $x = a$ and $x = b$ is

$$A = \int_a^b [f(x) - g(x)]\,dx.$$

In Figure 7.1, the graphs of f and g are shown above the x-axis. This, however, is not necessary. The same integrand $[f(x) - g(x)]$ can be used as long as f and g are continuous and $g(x) \le f(x)$ for all x in the interval $[a, b]$. This is summarized graphically in Figure 7.4. Notice in Figure 7.4 that the height of a representative rectangle is $f(x) - g(x)$ regardless of the relative position of the x-axis.

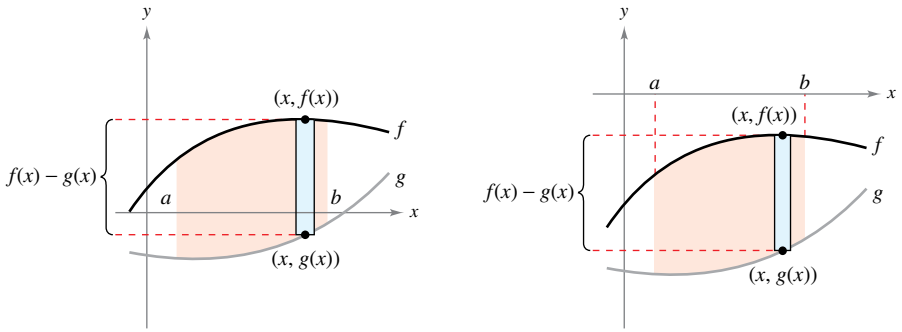

Figure 7.4

Representative rectangles are used throughout this chapter in various applications of integration. A vertical rectangle (of width Δx) implies integration with respect to x, whereas a horizontal rectangle (of width Δy) implies integration with respect to y.

EXAMPLE 1 Finding the Area of a Region Between Two Curves

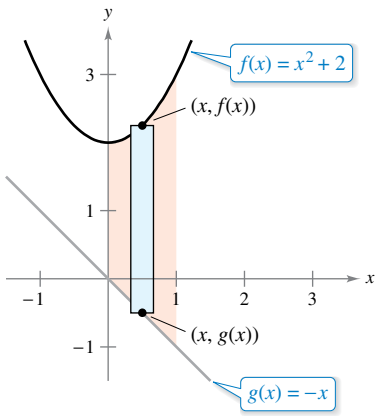
Find the area of the region bounded by the graphs of $y = x^2 + 2$, $y = -x$, $x = 0$, and $x = 1$.

Solution Begin by sketching the graphs of both functions, as shown in Figure 7.5. From the figure, note that $-x \le x^2 + 2$ for all x in $[0, 1]$. So, let $f(x) = x^2 + 2$ and $g(x) = -x$. The area of the representative rectangle is

$$\Delta A = [f(x) - g(x)]\Delta x = [(x^2 + 2) - (-x)]\Delta x$$

and the area of the region is

$$\begin{aligned} A &= \int_a^b [f(x) - g(x)]\,dx && \text{Area between } f \text{ and } g \\ &= \int_0^1 [(x^2 + 2) - (-x)]\,dx && \text{Substitute for } f \text{ and } g. \\ &= \left[\frac{x^3}{3} + \frac{x^2}{2} + 2x\right]_0^1 && \text{Integrate.} \\ &= \frac{1}{3} + \frac{1}{2} + 2 && \text{Apply Fundamental Theorem of Calculus.} \\ &= \frac{17}{6}. && \text{Simplify.} \end{aligned}$$



Region bounded by the graph of f, the graph of g, $x = 0$, and $x = 1$

GO DIGITAL

Area of a Region Between Intersecting Curves

In Example 1, the graphs of $f(x) = x^2 + 2$ and $g(x) = -x$ do not intersect, and the values of a and b are given explicitly. A more common problem involves the area of a region bounded by two *intersecting* graphs, where the values of a and b must be calculated.

EXAMPLE 2 A Region Lying Between Two Intersecting Graphs

Find the area of the region bounded by the graphs of $f(x) = 2 - x^2$ and $g(x) = x$.

Solution In Figure 7.6, notice that the graphs of f and g have two points of intersection. To find the x-coordinates of these points, set $f(x)$ and $g(x)$ equal to each other and solve for x.

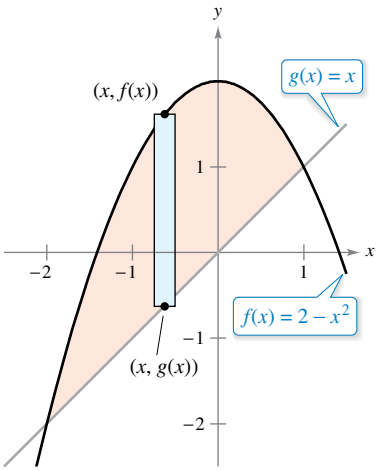
$$\begin{aligned} 2 - x^2 &= x && \text{Set } f(x) \text{ equal to } g(x). \\ -x^2 - x + 2 &= 0 && \text{Write in general form.} \\ -(x + 2)(x - 1) &= 0 && \text{Factor.} \\ x &= -2 \text{ or } 1 && \text{Solve for } x. \end{aligned}$$

So, $a = -2$ and $b = 1$. Because $g(x) \le f(x)$ for all x in the interval $[-2, 1]$, the representative rectangle has an area of

$$\Delta A = [f(x) - g(x)]\Delta x = [(2 - x^2) - x]\Delta x$$

and the area of the region is

$$\begin{aligned} A &= \int_{-2}^{1} [(2 - x^2) - x]\,dx && \text{Area between } f \text{ and } g \\ &= \left[-\frac{x^3}{3} - \frac{x^2}{2} + 2x \right]_{-2}^{1} && \text{Integrate.} \\ &= \frac{9}{2}. \end{aligned}$$



Region bounded by the graph of f and the graph of g
Figure 7.6

EXAMPLE 3 A Region Lying Between Two Intersecting Graphs

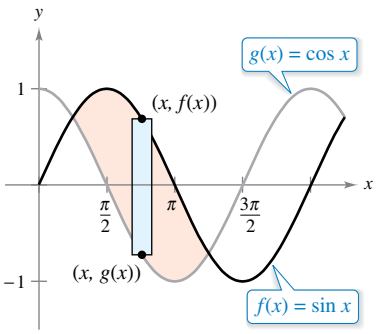
The sine and cosine curves intersect infinitely many times, bounding regions of equal areas, as shown in Figure 7.7. Find the area of one of these regions.

Solution Consider the interval corresponding to the shaded region in Figure 7.7. For all x in this interval, $\cos x \le \sin x$. So, let $g(x) = \cos x$ and $f(x) = \sin x$. To find the two points of intersection on this interval, set $f(x)$ and $g(x)$ equal to each other and solve for x.

$$\begin{aligned} \sin x &= \cos x && \text{Set } f(x) \text{ equal to } g(x). \\ \frac{\sin x}{\cos x} &= 1 && \text{Divide each side by } \cos x. \\ \tan x &= 1 && \text{Trigonometric identity} \\ x &= \frac{\pi}{4} \text{ or } \frac{5\pi}{4}, \quad 0 \le x \le 2\pi && \text{Solve for } x. \end{aligned}$$

So, $a = \pi/4$ and $b = 5\pi/4$. Because $\cos x \le \sin x$ for all x in the interval $[\pi/4, 5\pi/4]$, the area of the region is

$$\begin{aligned} A &= \int_{\pi/4}^{5\pi/4} [\sin x - \cos x]\,dx && \text{Area between } f \text{ and } g \\ &= \left[-\cos x - \sin x \right]_{\pi/4}^{5\pi/4} && \text{Integrate.} \\ &= 2\sqrt{2}. \end{aligned}$$



One of the regions bounded by the graphs of the sine and cosine functions

GO DIGITAL

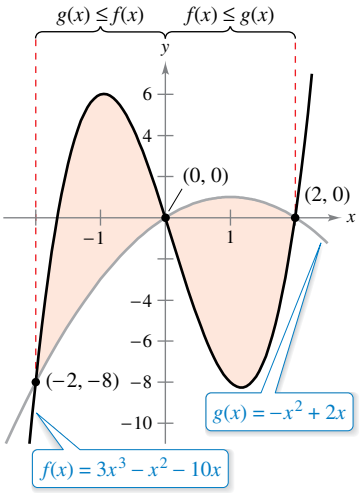
To find the area of the region between two curves that intersect at *more* than two points, first determine all points of intersection. Then check to see which curve is above the other in each interval determined by these points, as shown in Example 4.

EXAMPLE 4 Curves That Intersect at More than Two Points

See LarsonCalculus.com for an interactive version of this type of example.

Find the area of the region between the graphs of

$$f(x) = 3x^3 - x^2 - 10x \quad \text{and} \quad g(x) = -x^2 + 2x.$$



On $[-2, 0]$, $g(x) \leq f(x)$, and on $[0, 2]$, $f(x) \leq g(x)$.
Figure 7.8

Solution Begin by setting $f(x)$ and $g(x)$ equal to each other and solving for x. This yields the x-values at all points of intersection of the two graphs.

$$\begin{aligned} 3x^3 - x^2 - 10x &= -x^2 + 2x && \text{Set } f(x) \text{ equal to } g(x). \\ 3x^3 - 12x &= 0 && \text{Write in general form.} \\ 3x(x-2)(x+2) &= 0 && \text{Factor.} \\ x &= -2, 0, 2 && \text{Solve for } x. \end{aligned}$$

So, the two graphs intersect when $x = -2$, 0, and 2. In Figure 7.8, notice that $g(x) \leq f(x)$ on the interval $[-2, 0]$. The two graphs switch at the origin, however, and $f(x) \leq g(x)$ on the interval $[0, 2]$. So, you need two integrals—one for the interval $[-2, 0]$ and one for the interval $[0, 2]$.

$$\begin{aligned} A &= \overbrace{\int_{-2}^{0} [f(x) - g(x)]\,dx}^{\text{Area on } [-2,0]} + \overbrace{\int_{0}^{2} [g(x) - f(x)]\,dx}^{\text{Area on } [0,2]} \\ &= \int_{-2}^{0} (3x^3 - 12x)\,dx + \int_{0}^{2} (-3x^3 + 12x)\,dx && \text{Substitute for } f \text{ and } g \text{ and simplify.} \\ &= \left[\frac{3x^4}{4} - 6x^2\right]_{-2}^{0} + \left[\frac{-3x^4}{4} + 6x^2\right]_{0}^{2} && \text{Integrate.} \\ &= -(12 - 24) + (-12 + 24) \\ &= 24 \end{aligned}$$

REMARK In Example 4, notice that you obtain an incorrect result when you integrate from -2 to 2. Such integration produces

$$\int_{-2}^{2} [f(x) - g(x)]\,dx = \int_{-2}^{2} (3x^3 - 12x)\,dx = 0.$$

When the graph of a function of y is a boundary of a region, it is often convenient to use representative rectangles that are *horizontal* and find the area by integrating with respect to y. In general, to determine the area between two curves, you can use

$$A = \int_{x_1}^{x_2} \underbrace{[(\text{top curve}) - (\text{bottom curve})]}_{\text{in variable } x}\,dx \qquad \text{Vertical rectangles}$$

or

$$A = \int_{y_1}^{y_2} \underbrace{[(\text{right curve}) - (\text{left curve})]}_{\text{in variable } y}\,dy \qquad \text{Horizontal rectangles}$$

where (x_1, y_1) and (x_2, y_2) are either adjacent points of intersection of the two curves involved or points on the specified boundary lines.

EXAMPLE 5 Horizontal Representative Rectangles

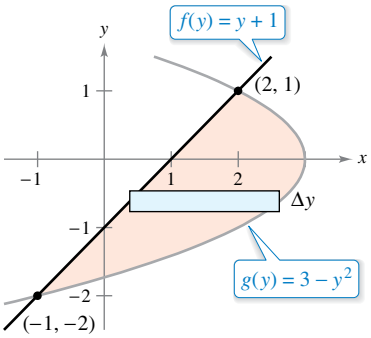
Find the area of the region bounded by the graphs of $x = 3 - y^2$ and $x = y + 1$.

Solution Begin by sketching the graphs of both functions, as shown in Figure 7.9. From the figure, note that the two curves intersect when $y = -2$ and $y = 1$. Because $y + 1 \leq 3 - y^2$ for all y in $[-2, 1]$, let $g(y) = 3 - y^2$ and $f(y) = y + 1$. The area of the representative rectangle is

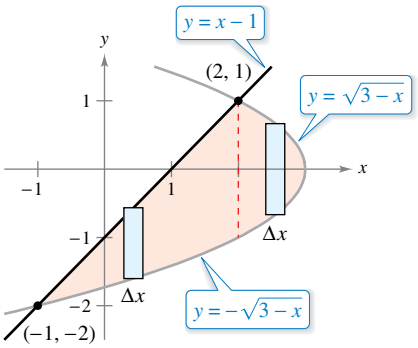
$$\Delta A = \overbrace{[g(y)}^{\text{Right curve}} - \overbrace{f(y)]}^{\text{Left curve}}\Delta y = [(3 - y^2) - (y + 1)]\Delta y.$$

So, the area is

$$\begin{aligned} A &= \int_{-2}^{1} [(3 - y^2) - (y + 1)]\, dy && \text{Area between } g \text{ and } f \\ &= \int_{-2}^{1} (-y^2 - y + 2)\, dy && \text{Simplify.} \\ &= \left[\frac{-y^3}{3} - \frac{y^2}{2} + 2y\right]_{-2}^{1} && \text{Integrate.} \\ &= \left(-\frac{1}{3} - \frac{1}{2} + 2\right) - \left(\frac{8}{3} - 2 - 4\right) \\ &= \frac{9}{2}. \end{aligned}$$



Horizontal rectangles (integration with respect to y)
Figure 7.9



Vertical rectangles (integration with respect to x)
Figure 7.10

In Example 5, notice that by integrating with respect to y, you need only one integral. To integrate with respect to x, you would need two integrals because the upper boundary changes at $x = 2$, as shown in Figure 7.10.

$$\begin{aligned} A &= \int_{-1}^{2} \left[(x - 1) + \sqrt{3 - x}\right] dx + \int_{2}^{3} \left(\sqrt{3 - x} + \sqrt{3 - x}\right) dx \\ &= \int_{-1}^{2} [x - 1 + (3 - x)^{1/2}]\, dx + 2\int_{2}^{3} (3 - x)^{1/2}\, dx \\ &= \left[\frac{x^2}{2} - x - \frac{(3 - x)^{3/2}}{3/2}\right]_{-1}^{2} - 2\left[\frac{(3 - x)^{3/2}}{3/2}\right]_{2}^{3} \\ &= \left(2 - 2 - \frac{2}{3}\right) - \left(\frac{1}{2} + 1 - \frac{16}{3}\right) - 2(0) + 2\left(\frac{2}{3}\right) \\ &= \frac{9}{2} \end{aligned}$$

Integration as an Accumulation Process

In this section, the integration formula for the area between two curves was developed by using a rectangle as the *representative element.* For each new application of integration in the remaining sections of this chapter, an appropriate representative element will be constructed using known precalculus formulas. Each integration formula will then be obtained by summing or accumulating these representative elements.

Known precalculus formula ⇨ Representative element ⇨ New integration formula

For example, the area formula in this section was developed as follows.

$A = (\text{height})(\text{width})$ ⇨ $\Delta A = [f(x) - g(x)]\Delta x$ ⇨ $A = \int_a^b [f(x) - g(x)]\,dx$

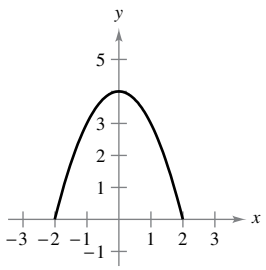
EXAMPLE 6 **Integration as an Accumulation Process**

Find the area of the region bounded by the graph of $y = 4 - x^2$ and the x-axis. Describe the integration as an accumulation process.

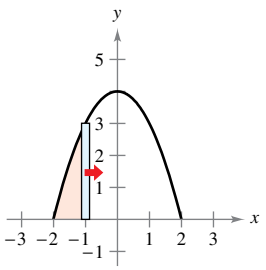
Solution The area of the region is

$$A = \int_{-2}^{2} (4 - x^2)\,dx.$$

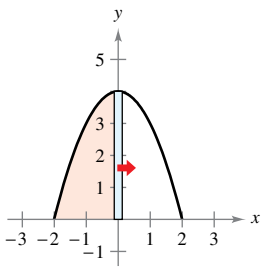
You can think of the integration as an accumulation of the areas of the rectangles formed as the representative rectangle slides from $x = -2$ to $x = 2$, as shown in Figure 7.11.



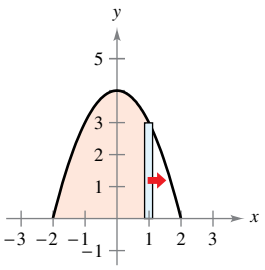
$$A = \int_{-2}^{-2} (4 - x^2)\,dx = 0$$



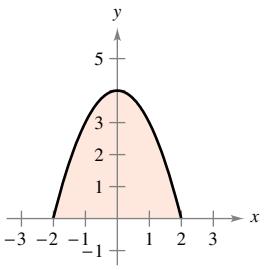
$$A = \int_{-2}^{-1} (4 - x^2)\,dx = \frac{5}{3}$$



$$A = \int_{-2}^{0} (4 - x^2)\,dx = \frac{16}{3}$$



$$A = \int_{-2}^{1} (4 - x^2)\,dx = 9$$



$$A = \int_{-2}^{2} (4 - x^2)\,dx = \frac{32}{3}$$

7.1 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

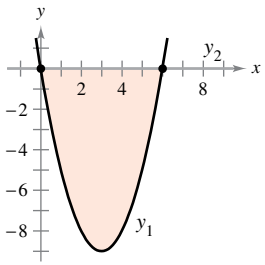
GO DIGITAL

Concept Check

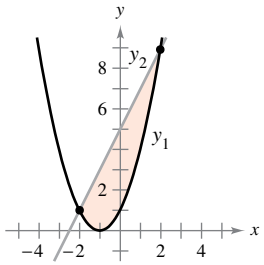
1. Give the geometric interpretation of the area of the region between two curves.
2. Describe how to find the area of the region bounded by the graphs of $f(x)$ and $g(x)$ and the vertical lines $x = a$ and $x = b$, where f and g do not intersect on $[a, b]$.
3. Explain why it is important to determine all points of intersection of two curves when finding the area of the region between the curves.
4. Sketch a region for which integration with respect to y is easier than integration with respect to x.

Writing a Definite Integral **In Exercises 5–10, write a definite integral that represents the area of the region. (Do not evaluate the integral.)**

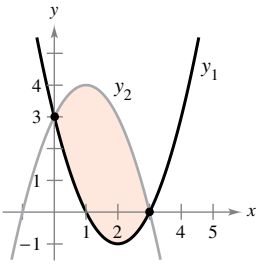
5. $y_1 = x^2 - 6x$, $y_2 = 0$



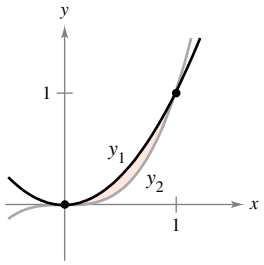
6. $y_1 = x^2 + 2x + 1$, $y_2 = 2x + 5$



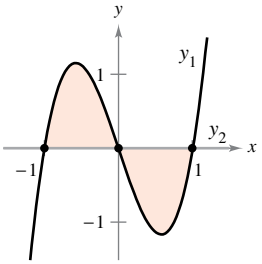
7. $y_1 = x^2 - 4x + 3$, $y_2 = -x^2 + 2x + 3$



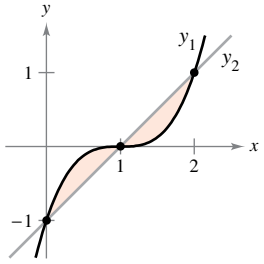
8. $y_1 = x^2$, $y_2 = x^3$



9. $y_1 = 3(x^3 - x)$, $y_2 = 0$



10. $y_1 = (x - 1)^3$, $y_2 = x - 1$



Finding a Region **In Exercises 11–14, the integrand of the definite integral is a difference of two functions. Sketch the graph of each function and shade the region whose area is represented by the integral.**

11. $\int_0^4 \left[(x + 1) - \frac{x}{2}\right] dx$

12. $\int_2^3 \left[\left(\frac{x^3}{3} - x\right) - \frac{x}{3}\right] dx$

13. $\int_{-2}^1 [(2 - y) - y^2] \, dy$

14. $\int_0^4 \left(2\sqrt{y} - y\right) dy$

Finding the Area of a Region **In Exercises 15–28, sketch the region bounded by the graphs of the equations and find the area of the region.**

15. $y = x^2 - 1, \quad y = -x + 2, \quad x = 0, \quad x = 1$

16. $y = -x^3 + 2, \quad y = x - 3, \quad x = -1, \quad x = 1$

17. $f(x) = x^2 + 2x, \quad g(x) = x + 2$

18. $y = -x^2 + 3x + 1, \quad y = -x + 1$

19. $f(x) = \frac{1}{9x^2}, \quad y = 1, \quad x = 1, \quad x = 2$

20. $f(x) = -\frac{4}{x^3}, \quad y = 0, \quad x = -3, \quad x = -1$

21. $f(x) = x^5 + 2, \quad g(x) = x + 2$

22. $f(x) = \sqrt[3]{x - 1}, \quad g(x) = x - 1$

23. $f(y) = y^2, \quad g(y) = y + 2$

24. $f(y) = y(2 - y), \quad g(y) = -y$

25. $f(y) = y^2 + 1, \quad g(y) = 0, \quad y = -1, \quad y = 2$

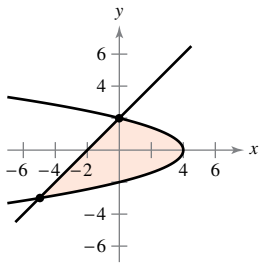
26. $f(y) = \frac{y}{\sqrt{16 - y^2}}, \quad g(y) = 0, \quad y = 3$

27. $f(x) = \frac{10}{x}, \quad x = 0, \quad y = 2, \quad y = 10$

28. $g(x) = \frac{4}{2 - x}, \quad y = 4, \quad x = 0$

Comparing Methods **In Exercises 29 and 30, find the area of the region by integrating (a) with respect to x and (b) with respect to y. (c) Compare your results. Which method is simpler? In general, will this method always be simpler than the other one? Why or why not?**

29. $x = 4 - y^2$, $x = y - 2$



30. $y = x^2$, $y = 6 - x$

Finding the Area of a Region **In Exercises 31–36, (a) use a graphing utility to graph the region bounded by the graphs of the functions, (b) find the area of the region analytically, and (c) use the integration capabilities of the graphing utility to verify your results.**

31. $f(x) = x(x^2 - 3x + 3), \quad g(x) = x^2$

32. $y = x^4 - 2x^2, \quad y = 2x^2$

33. $f(x) = x^4 - 4x^2, \quad g(x) = x^2 - 4$

34. $f(x) = x^4 - 9x^2, \quad g(x) = x^3 - 9x$

35. $f(x) = \dfrac{1}{1 + x^2}, \quad g(x) = \dfrac{1}{2}x^2$

36. $f(x) = \dfrac{6x}{x^2 + 1}, \quad y = 0, \quad 0 \le x \le 3$

Finding the Area of a Region **In Exercises 37–42, sketch the region bounded by the graphs of the equations and find the area of the region.**

37. $f(x) = \cos x, \quad g(x) = 2 - \cos x, \quad 0 \le x \le 2\pi$

38. $f(x) = \sin x, \quad g(x) = \cos 2x, \quad -\dfrac{\pi}{2} \le x \le \dfrac{\pi}{6}$

39. $f(x) = 2 \sin x, \quad g(x) = \tan x, \quad -\dfrac{\pi}{3} \le x \le \dfrac{\pi}{3}$

40. $f(x) = \sec \dfrac{\pi x}{4} \tan \dfrac{\pi x}{4}, \quad g(x) = \left(\sqrt{2} - 4\right)x + 4, \quad x = 0$

41. $f(x) = xe^{-x^2}, \quad y = 0, \quad 0 \le x \le 1$

42. $f(x) = -2^x, \quad g(x) = 1 - 3x$

Finding the Area of a Region **In Exercises 43–46, (a) use a graphing utility to graph the region bounded by the graphs of the equations, (b) find the area of the region analytically, and (c) use the integration capabilities of the graphing utility to verify your results.**

43. $f(x) = 2 \sin x + \sin 2x, \quad y = 0, \quad 0 \le x \le \pi$

44. $f(x) = 2 \sin x + \cos 2x, \quad y = 0, \quad 0 < x \le \pi$

45. $f(x) = \dfrac{1}{x^2}e^{1/x}, \quad y = 0, \quad 1 \le x \le 3$

46. $g(x) = \dfrac{4 \ln x}{x}, \quad y = 0, \quad x = 5$

Finding the Area of a Region **In Exercises 47–50, (a) use a graphing utility to graph the region bounded by the graphs of the equations, (b) explain why the area of the region is difficult to find analytically, and (c) use the integration capabilities of the graphing utility to approximate the area of the region to four decimal places.**

47. $y = \sqrt{\dfrac{x^3}{4 - x}}, \quad y = 0, \quad x = 3$

48. $y = \sqrt{x}\, e^x, \quad y = 0, \quad x = 0, \quad x = 1$

49. $y = x^2, \quad y = 4 \cos x$

50. $y = x^2, \quad y = \sqrt{3 + x}$

51. Finding the Area of a Region Find the area of the given region bounded by the graphs of y_1, y_2, and y_3, as shown in the figure.

$y_1 = x^2 + 2, \quad y_2 = 4 - x^2, \quad y_3 = 2 - x$

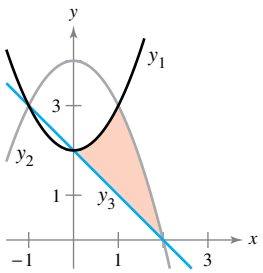

Figure for 51

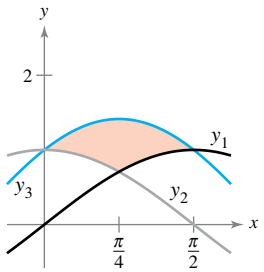

Figure for 52

52. Finding the Area of a Region Find the area of the given region bounded by the graphs of y_1, y_2, and y_3, as shown in the figure.

$y_1 = \sin x, \quad y_2 = \cos x, \quad y_3 = \sin x + \cos x$

Integration as an Accumulation Process **In Exercises 53–56, find the accumulation function F. Then evaluate F at each value of the independent variable and graphically show the area given by each value of the independent variable.**

53. $F(x) = \displaystyle\int_0^x \left(\frac{1}{2}t + 1\right) dt$ (a) $F(0)$ (b) $F(2)$ (c) $F(6)$

54. $F(x) = \displaystyle\int_0^x \left(\frac{1}{2}t^2 + 2\right) dt$ (a) $F(0)$ (b) $F(4)$ (c) $F(6)$

55. $F(\alpha) = \displaystyle\int_{-1}^{\alpha} \cos \frac{\pi\theta}{2}\, d\theta$ (a) $F(-1)$ (b) $F(0)$ (c) $F\left(\frac{1}{2}\right)$

56. $F(y) = \displaystyle\int_{-1}^{y} 4e^{x/2}\, dx$ (a) $F(-1)$ (b) $F(0)$ (c) $F(4)$

Finding the Area of a Figure **In Exercises 57–60, use integration to find the area of the figure having the given vertices.**

57. $(-1, -1), (1, 1), (2, -1)$

58. $(0, 0), (6, 0), (4, 3)$

59. $(0, 2), (4, 2), (0, -2), (-4, -2)$

60. $(0, 0), (1, 2), (3, -2), (1, -3)$

Using a Tangent Line **In Exercises 61–64, write and evaluate the definite integral that represents the area of the region bounded by the graph of the function and the tangent line to the graph at the given point.**

61. $f(x) = 2x^3 - 1, \quad (1, 1)$

62. $f(x) = x - x^3, \quad (-1, 0)$

63. $f(x) = \dfrac{1}{x^2 + 1}, \quad \left(1, \dfrac{1}{2}\right)$

64. $y = \dfrac{2}{1 + 4x^2}, \quad \left(\dfrac{1}{2}, 1\right)$

Exploring Concepts

65. The graphs of $y = 1 - x^2$ and $y = x^4 - 2x^2 + 1$ intersect at three points. However, the area between the curves *can* be found by a single integral. Explain why this is so, and write an integral that represents this area. (Do not integrate.)

66. The area of the region bounded by the graphs of $y = x^3$ and $y = x$ *cannot* be found by the single integral $\int_{-1}^{1} (x^3 - x)\,dx$. Explain why this is so. Use symmetry to write a single integral that does represent the area. (Do not integrate.)

67. Two cars with velocities $v_1(t)$ and $v_2(t)$ (in meters per second) are tested on a straight track. Consider the following integrals.

$$\int_0^5 [v_1(t) - v_2(t)]\,dt = 10 \qquad \int_0^{10} [v_1(t) - v_2(t)]\,dt = 30$$

$$\int_{20}^{30} [v_1(t) - v_2(t)]\,dt = -5$$

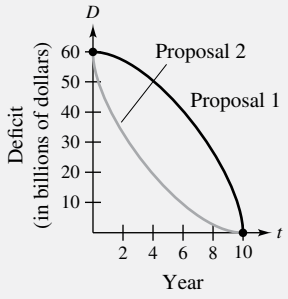
(a) Write a verbal interpretation of each integral.

(b) Determine whether it is possible to find the distance between the two cars when $t = 5$ seconds. Explain.

(c) Assume both cars start at the same time and place. Which car is ahead when $t = 10$ seconds? How far ahead is the car?

(d) Suppose Car 1 has velocity v_1 and is ahead of Car 2 by 13 meters when $t = 20$ seconds. How far ahead or behind is Car 1 when $t = 30$ seconds?

68. **HOW DO YOU SEE IT?** A state legislature is debating two proposals for eliminating the annual budget deficits after 10 years. The figure shows the rate of decrease of the deficits for each proposal.



(a) What does the area between the two curves represent?

(b) From the viewpoint of minimizing the cumulative state deficit, which is the better proposal? Explain.

Dividing a Region **In Exercises 69 and 70, find b such that the line $y = b$ divides the region bounded by the graphs of the equations into two regions of equal area.**

69. $y = 9 - x^2, \quad y = 0$

70. $y = 9 - |x|, \quad y = 0$

Dividing a Region **In Exercises 71 and 72, find a such that the line $x = a$ divides the region bounded by the graphs of the equations into two regions of equal area.**

71. $y = x, \quad y = 4, \quad x = 0$

72. $y^2 = 4 - x, \quad x = 0$

Limits and Integrals **In Exercises 73 and 74, evaluate the limit and sketch the graph of the region whose area is represented by the limit.**

73. $\lim_{\|\Delta\| \to 0} \sum_{i=1}^{n} (x_i - x_i^2)\Delta x$, where $x_i = \frac{i}{n}$ and $\Delta x = \frac{1}{n}$

74. $\lim_{\|\Delta\| \to 0} \sum_{i=1}^{n} (4 - x_i^2)\Delta x$, where $x_i = -2 + \frac{4i}{n}$ and $\Delta x = \frac{4}{n}$

Revenue **In Exercises 75 and 76, two models R_1 and R_2 are given for revenue (in millions of dollars) for a corporation. Both models are estimates of revenues from 2030 through 2035, with $t = 0$ corresponding to 2030. Which model projects the greater revenue? How much more total revenue does that model project over the six-year period?**

75. $R_1 = 7.21 + 0.58t$

$R_2 = 7.21 + 0.45t$

76. $R_1 = 7.21 + 0.26t + 0.02t^2$

$R_2 = 7.21 + 0.1t + 0.01t^2$

77. **Lorenz Curve** Economists use *Lorenz curves* to illustrate the distribution of income in a country. A Lorenz curve, $y = f(x)$, represents the actual income distribution in the country. In this model, x represents percents of families in the country from the poorest to the wealthiest and y represents percents of total income. The model $y = x$ represents a country in which each family has the same income. The area between these two models, where $0 \le x \le 100$, indicates a country's "income inequality." The table lists percents of income y for selected percents of families x in a country.

x	10	20	30	40	50
y	3.35	6.07	9.17	13.39	19.45

x	60	70	80	90
y	28.03	39.77	55.28	75.12

(a) Use a graphing utility to find a quadratic model for the Lorenz curve.

(b) Plot the data and graph the model.

(c) Graph the model $y = x$. How does this model compare with the model in part (a)?

(d) Use the integration capabilities of a graphing utility to approximate the "income inequality."

78. **Profit** The chief financial officer of a company reports that profits for the past fiscal year were \$15.9 million. The officer predicts that profits for the next 5 years will grow at a continuous annual rate somewhere between $3\frac{1}{2}\%$ and 5%. Estimate the cumulative difference in total profit over the 5 years based on the predicted range of growth rates.

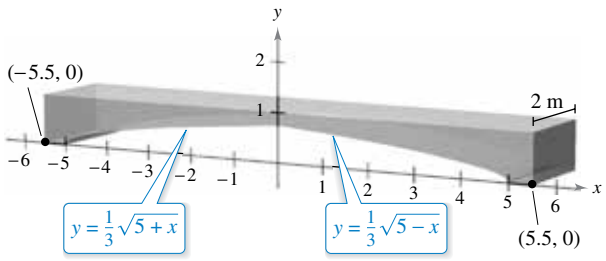
79. Building Design

Concrete sections for a new building have the dimensions (in meters) and shape shown in the figure.

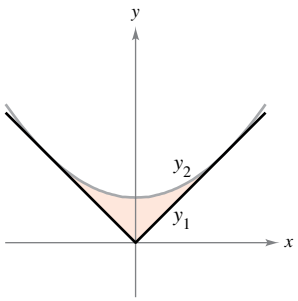


(a) Find the area of the face of the section superimposed on the rectangular coordinate system.

(b) Find the volume of concrete in one of the sections by multiplying the area in part (a) by 2 meters.

(c) One cubic meter of concrete weighs 5000 pounds. Find the weight of the section.

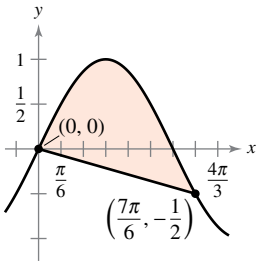
80. Mechanical Design The surface of a machine part is the region between the graphs of $y_1 = |x|$ and $y_2 = 0.08x^2 + k$ (see figure).



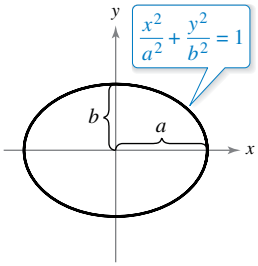
(a) Find k such that the parabola is tangent to the graph of y_1.

(b) Find the area of the surface of the machine part.

81. Area Find the area between the graph of $y = \sin x$ and the line segment joining the points $(0, 0)$ and $\left(\frac{7\pi}{6}, -\frac{1}{2}\right)$, as shown in the figure.



82. Area Let $a > 0$ and $b > 0$. Show that the area of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ is πab (see figure).



True or False? **In Exercises 83–86, determine whether the statement is true or false. If it is false, explain why or give an example that shows it is false.**

83. If the area of the region bounded by the graphs of f and g is 1, then the area of the region bounded by the graphs of $h(x) = f(x) + C$ and $k(x) = g(x) + C$ is also 1.

84. If

$$\int_a^b [f(x) - g(x)]\,dx = A$$

then

$$\int_a^b [g(x) - f(x)]\,dx = -A.$$

85. If the graphs of f and g intersect midway between $x = a$ and $x = b$, then

$$\int_a^b [f(x) - g(x)]\,dx = 0.$$

86. The line

$$y = \left(1 - \sqrt[3]{0.5}\right)x$$

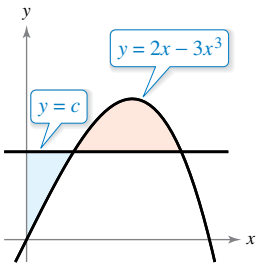
divides the region under the curve

$$f(x) = x(1 - x)$$

on $[0, 1]$ into two regions of equal area.

PUTNAM EXAM CHALLENGE

87. The horizontal line $y = c$ intersects the curve $y = 2x - 3x^3$ in the first quadrant as shown in the figure. Find c so that the areas of the two shaded regions are equal.



This problem was composed by the Committee on the Putnam Prize Competition.

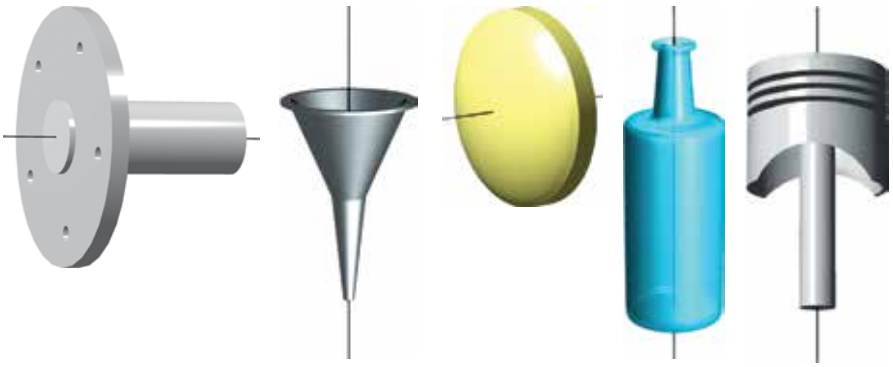
7.2 Volume: The Disk Method

GO DIGITAL

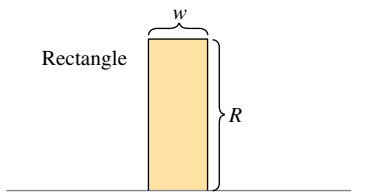
- **Find the volume of a solid of revolution using the disk method.**
- **Find the volume of a solid of revolution using the washer method.**
- **Find the volume of a solid with known cross sections.**

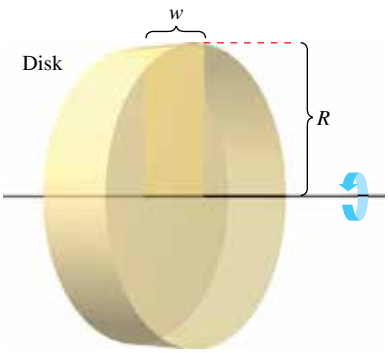
The Disk Method

You have already learned that area is only one of the *many* applications of the definite integral. Another important application is its use in finding the volume of a three-dimensional solid. In this section, you will study a particular type of three-dimensional solid—one whose cross sections are similar. Solids of revolution are used commonly in engineering and manufacturing. Some examples are axles, funnels, pills, bottles, and pistons, as shown in Figure 7.12.



Solids of revolution
Figure 7.12





Volume of a disk: $\pi R^2 w$
Figure 7.13

When a region in the plane is revolved about a line, the resulting solid is a **solid of revolution,** and the line is called the **axis of revolution.** The simplest such solid is a right circular cylinder or **disk,** which is formed by revolving a rectangle about an axis adjacent to one side of the rectangle, as shown in Figure 7.13. The volume of such a disk is

$$\begin{aligned}\text{Volume of disk} &= (\text{area of disk})(\text{width of disk}) \\ &= \pi R^2 w\end{aligned}$$

where R is the radius of the disk and w is the width.

To use the volume of a disk to find the volume of a general solid of revolution, consider a solid of revolution formed by revolving the plane region in Figure 7.14 (see next page) about the indicated axis. To determine the volume of this solid, consider a representative rectangle in the plane region. When this rectangle is revolved about the axis of revolution, it generates a representative disk whose volume is

$$\Delta V = \pi R^2 \Delta x.$$

Approximating the volume of the solid by n such disks of width Δx and radius $R(x_i)$ produces

$$\begin{aligned}\text{Volume of solid} &\approx \sum_{i=1}^{n} \pi[R(x_i)]^2 \Delta x \\ &= \pi \sum_{i=1}^{n} [R(x_i)]^2 \Delta x.\end{aligned}$$

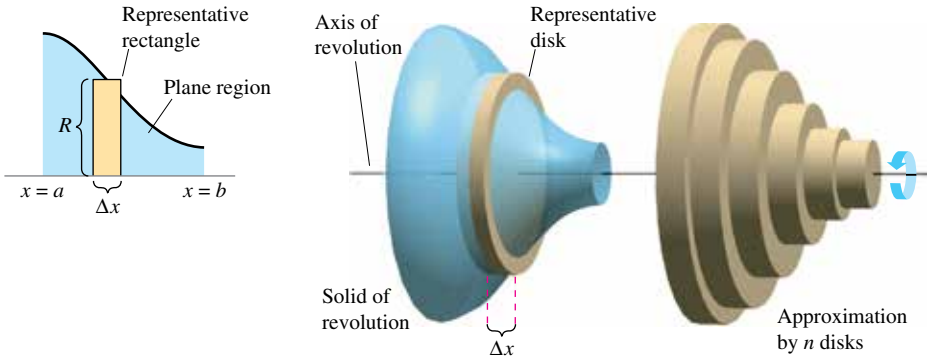
Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.



Disk method
Figure 7.14

This approximation appears to become better and better as $\|\Delta\| \to 0$ $(n \to \infty)$. So, you can define the volume of the solid as

$$\text{Volume of solid} = \lim_{\|\Delta\|\to 0} \pi \sum_{i=1}^{n} [R(x_i)]^2 \, \Delta x = \pi \int_a^b [R(x)]^2 \, dx.$$

Schematically, the disk method looks like this.

Known Precalculus Formula		**Representative Element**		**New Integration Formula**
Volume of disk $V = \pi R^2 w$	⇨	$\Delta V = \pi[R(x_i)]^2 \Delta x$	⇨	Solid of revolution $V = \pi \int_a^b [R(x)]^2 \, dx$

A similar formula can be derived when the axis of revolution is vertical.

The Disk Method

To find the volume of a solid of revolution with the **disk method,** use one of the formulas below. (See Figure 7.15.)

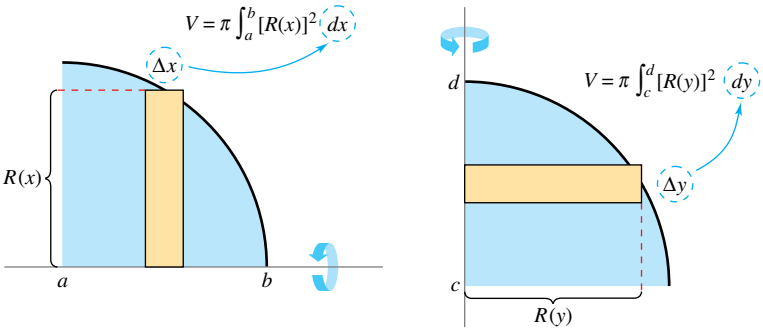
Horizontal Axis of Revolution

$$\text{Volume} = V = \pi \int_a^b [R(x)]^2 \, dx$$

Vertical Axis of Revolution

$$\text{Volume} = V = \pi \int_c^d [R(y)]^2 \, dy$$

REMARK In Figure 7.15, note that you can determine the variable of integration by placing a representative rectangle in the plane region "perpendicular" to the axis of revolution. When the width of the rectangle is Δx, integrate with respect to x, and when the width of the rectangle is Δy, integrate with respect to y.



Horizontal axis of revolution
Vertical axis of revolution

GO DIGITAL

The simplest application of the disk method involves a plane region bounded by the graph of f and the x-axis. When the axis of revolution is the x-axis, the radius $R(x)$ is simply $f(x)$.

EXAMPLE 1 Using the Disk Method

Find the volume of the solid formed by revolving the region bounded by the graph of $f(x) = \sqrt{\sin x}$ and the x-axis $(0 \le x \le \pi)$ about the x-axis, as shown in Figure 7.16.

Solution From the representative rectangle in the upper graph in Figure 7.16, you can see that the radius of this solid is $R(x) = f(x) = \sqrt{\sin x}$. The volume of the solid of revolution is

$$
\begin{aligned}
V &= \pi \int_a^b [R(x)]^2 \, dx && \text{Apply disk method.} \\
&= \pi \int_0^\pi \left(\sqrt{\sin x}\right)^2 dx && \text{Substitute } \sqrt{\sin x} \text{ for } R(x). \\
&= \pi \int_0^\pi \sin x \, dx && \text{Simplify.} \\
&= \pi \Big[-\cos x \Big]_0^\pi && \text{Integrate.} \\
&= \pi(1 + 1) && \text{Apply Fundamental Theorem of Calculus.} \\
&= 2\pi. && \text{Simplify.}
\end{aligned}
$$

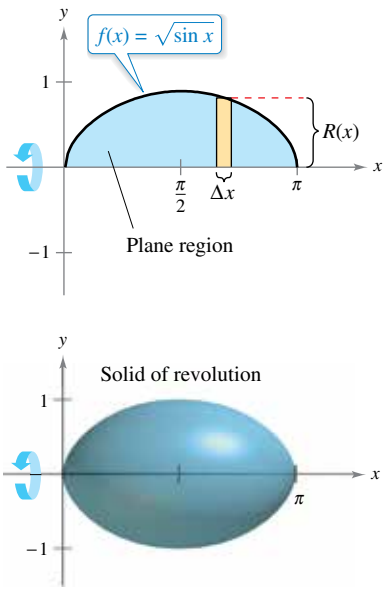

Figure 7.16

Note in Example 1 that the problem was solved *without* referring to the three-dimensional sketch in Figure 7.16. In general, to set up an integral to find the volume of a solid of revolution, a sketch of the plane region is more useful than a sketch of the solid because the radius is more readily visualized in the plane region.

EXAMPLE 2 Using a Line That Is Not a Coordinate Axis

Find the volume of the solid formed by revolving the region bounded by the graphs of $f(x) = 2 - x^2$ and $g(x) = 1$ about the line $y = 1$, as shown in Figure 7.17.

Solution By equating $f(x)$ and $g(x)$, you can determine that the two graphs intersect when $x = \pm 1$. To find the radius, subtract $g(x)$ from $f(x)$.

$$
\begin{aligned}
R(x) &= f(x) - g(x) \\
&= (2 - x^2) - 1 \\
&= 1 - x^2
\end{aligned}
$$

To find the volume, integrate between -1 and 1.

$$
\begin{aligned}
V &= \pi \int_a^b [R(x)]^2 \, dx && \text{Apply disk method.} \\
&= \pi \int_{-1}^1 (1 - x^2)^2 \, dx && \text{Substitute } 1 - x^2 \text{ for } R(x). \\
&= \pi \int_{-1}^1 (1 - 2x^2 + x^4) \, dx && \text{Simplify.} \\
&= \pi \left[x - \frac{2x^3}{3} + \frac{x^5}{5} \right]_{-1}^1 && \text{Integrate.} \\
&= \frac{16\pi}{15}
\end{aligned}
$$

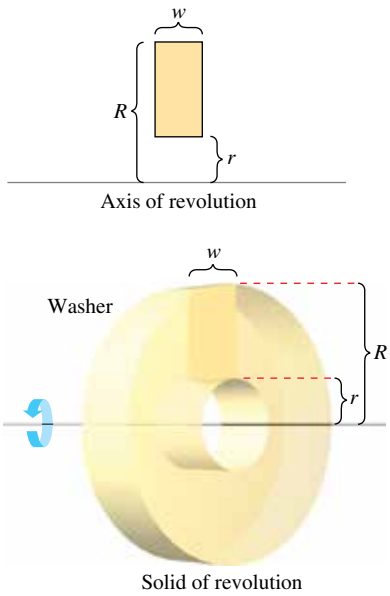

Figure 7.18

GO DIGITAL

The Washer Method

The disk method can be extended to cover solids of revolution with holes by replacing the representative disk with a representative **washer.** The washer is formed by revolving a rectangle about an axis, as shown in Figure 7.18. If r and R are the inner and outer radii of the washer, respectively, and w is the width of the washer, then the volume is

$$\text{Volume of washer} = \pi(R^2 - r^2)w.$$

To use this concept to find the volume of a solid of revolution, consider a region bounded by an **outer radius** $R(x)$ and an **inner radius** $r(x)$, as shown in Figure 7.19. If the region is revolved about its axis of revolution, then the volume of the resulting solid is

$$V = \pi \int_a^b \left([R(x)]^2 - [r(x)]^2\right) dx. \qquad \text{Washer method}$$

Note that the integral involving the inner radius represents the volume of the hole and is *subtracted* from the integral involving the outer radius.

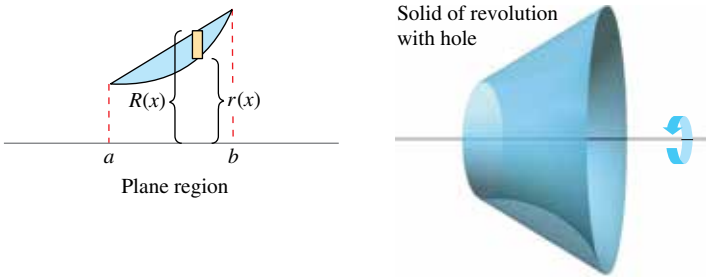

Figure 7.19

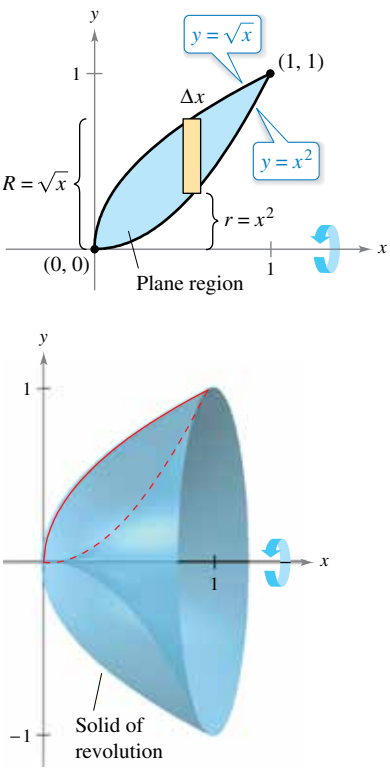

Solid of revolution

Figure 7.20

EXAMPLE 3 Using the Washer Method

Find the volume of the solid formed by revolving the region bounded by the graphs of

$$y = \sqrt{x} \quad \text{and} \quad y = x^2$$

about the x-axis, as shown in Figure 7.20.

Solution The upper graph in Figure 7.20 shows that the two curves intersect when $x = 0$ and $x = 1$. Also, notice that the outer and inner radii are

$$R(x) = \sqrt{x} \quad \text{and} \quad r(x) = x^2$$

respectively. Integrating between 0 and 1 produces

$$V = \pi \int_a^b \left([R(x)]^2 - [r(x)]^2\right) dx \qquad \text{Apply washer method.}$$

$$= \pi \int_0^1 \left[\left(\sqrt{x}\right)^2 - (x^2)^2\right] dx \qquad \text{Substitute } \sqrt{x} \text{ for } R(x) \text{ and } x^2 \text{ for } r(x).$$

$$= \pi \int_0^1 (x - x^4)\, dx \qquad \text{Simplify.}$$

$$= \pi \left[\frac{x^2}{2} - \frac{x^5}{5}\right]_0^1 \qquad \text{Integrate.}$$

$$= \frac{3\pi}{10}.$$

GO DIGITAL

In each example so far, the axis of revolution has been *horizontal* and you have integrated with respect to x. In the next example, the axis of revolution is *vertical* and you integrate with respect to y. In this example, you need two separate integrals to compute the volume.

EXAMPLE 4 Integrating with Respect to y: Two-Integral Case

Find the volume of the solid formed by revolving the region bounded by the graphs of

$$y = x^2 + 1, \quad y = 0, \quad x = 0, \quad \text{and} \quad x = 1$$

about the y-axis, as shown in Figure 7.21.

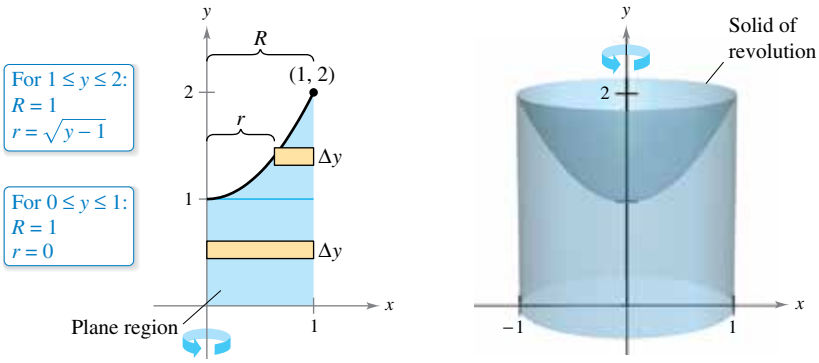

Figure 7.21

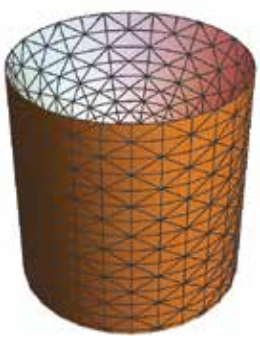
Solution For the region shown in Figure 7.21, the outer radius is simply $R = 1$. There is, however, no convenient formula that represents the inner radius. When $0 \le y \le 1$, $r = 0$, but when $1 \le y \le 2$, r is determined by the equation $y = x^2 + 1$, which implies that $r = \sqrt{y - 1}$.

$$r(y) = \begin{cases} 0, & 0 \le y \le 1 \\ \sqrt{y - 1}, & 1 \le y \le 2 \end{cases}$$

Using this definition of the inner radius, you can use two integrals to find the volume.

$$\begin{aligned} V &= \pi \int_0^1 (1^2 - 0^2)\, dy + \pi \int_1^2 \left[1^2 - \left(\sqrt{y - 1}\right)^2\right] dy && \text{Apply washer method.} \\ &= \pi \int_0^1 1\, dy + \pi \int_1^2 (2 - y)\, dy && \text{Simplify.} \\ &= \pi \Big[y\Big]_0^1 + \pi \Big[2y - \frac{y^2}{2}\Big]_1^2 && \text{Integrate.} \\ &= \pi + \pi\left(4 - 2 - 2 + \frac{1}{2}\right) \\ &= \frac{3\pi}{2} \end{aligned}$$

Note that the first integral $\pi \int_0^1 1\, dy$ represents the volume of a right circular cylinder of radius 1 and height 1. This portion of the volume could have been determined without using calculus. ■



Generated by Mathematica

Figure 7.22

TECHNOLOGY Some graphing utilities can generate a solid of revolution. If you have access to such a utility, use it to graph some of the solids of revolution described in this section. For instance, the solid in Example 4 might appear like that shown in Figure 7.22.

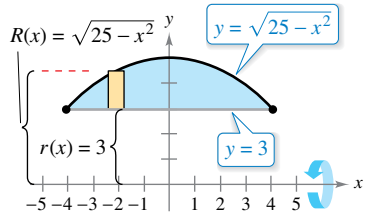
Solid of revolution

(a)



Plane region

(b)

Figure 7.23

EXAMPLE 5 Manufacturing

See LarsonCalculus.com for an interactive version of this type of example.

A manufacturer drills a hole through the center of a metal sphere of radius 5 inches, as shown in Figure 7.23(a). The hole has a radius of 3 inches. What is the volume of the resulting metal ring?

Solution The ring is generated by a segment of the circle whose equation is $x^2 + y^2 = 25$, as shown in Figure 7.23(b). Because the radius of the hole is 3 inches, let $y = 3$ and solve the equation $x^2 + y^2 = 25$ to determine that the limits of integration are $x = \pm 4$. So, the inner and outer radii are $r(x) = 3$ and $R(x) = \sqrt{25 - x^2}$, and the volume is

$$V = \pi \int_a^b \left([R(x)]^2 - [r(x)]^2 \right) dx \qquad \text{Apply washer method.}$$

$$= \pi \int_{-4}^{4} \left[\left(\sqrt{25 - x^2} \right)^2 - (3)^2 \right] dx \qquad \text{Substitute } \sqrt{25 - x^2} \text{ for } R(x) \text{ and 3 for } r(x).$$

$$= \pi \int_{-4}^{4} (16 - x^2)\, dx \qquad \text{Simplify.}$$

$$= \pi \left[16x - \frac{x^3}{3} \right]_{-4}^{4} \qquad \text{Integrate.}$$

$$= \frac{256\pi}{3} \text{ cubic inches.} \qquad \text{Volume of metal ring}$$

Solids with Known Cross Sections

With the disk method, you can find the volume of a solid having a circular cross section whose area is $A = \pi R^2$. This method can be generalized to solids of any shape, as long as you know a formula for the area of an arbitrary cross section. Some common cross sections are squares, rectangles, triangles, semicircles, and trapezoids.

BONAVENTURA CAVALIERI (1598–1647)

Cavalieri made many contributions to trigonometry, geometry, optics, and astronomy. He discovered that if two solids have equal altitudes and all cross sections parallel to their bases and at equal distances from their bases have equal areas, then the solids have the same volume. (See Exercise 72.)

See LarsonCalculus.com to read more of this biography.

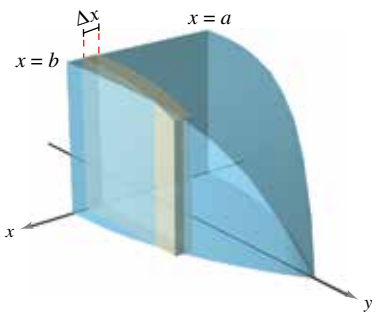
Volumes of Solids with Known Cross Sections

1. For cross sections of area $A(x)$ taken perpendicular to the x-axis,

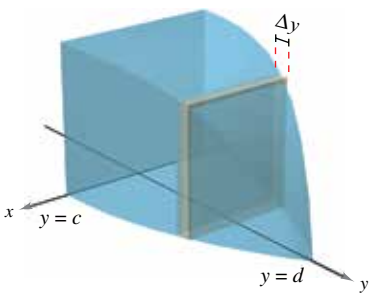
$$\text{Volume} = \int_a^b A(x)\, dx. \qquad \text{See Figure 7.24(a).}$$

2. For cross sections of area $A(y)$ taken perpendicular to the y-axis,

$$\text{Volume} = \int_c^d A(y)\, dy. \qquad \text{See Figure 7.24(b).}$$



(a) Cross sections perpendicular to x-axis



(b) Cross sections perpendicular to y-axis

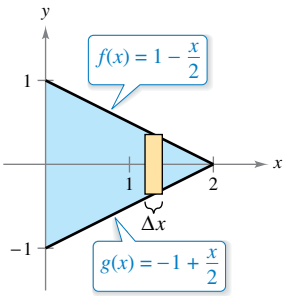
Cross sections are equilateral triangles.



Triangular base in xy-plane

Figure 7.25

EXAMPLE 6 Triangular Cross Sections

Find the volume of the solid shown in Figure 7.25. The base of the solid is the region bounded by the lines

$$f(x) = 1 - \frac{x}{2}, \quad g(x) = -1 + \frac{x}{2}, \quad \text{and} \quad x = 0.$$

The cross sections perpendicular to the x-axis are equilateral triangles.

Solution The base and area of each triangular cross section are as follows.

$$\text{Base} = \left(1 - \frac{x}{2}\right) - \left(-1 + \frac{x}{2}\right) = 2 - x \qquad \text{Length of base}$$

$$\text{Area} = \frac{\sqrt{3}}{4}(\text{base})^2 \qquad \text{Area of equilateral triangle}$$

$$A(x) = \frac{\sqrt{3}}{4}(2 - x)^2 \qquad \text{Area of cross section}$$

Because x ranges from 0 to 2, the volume of the solid is

$$V = \int_a^b A(x)\,dx = \int_0^2 \frac{\sqrt{3}}{4}(2 - x)^2\,dx = -\frac{\sqrt{3}}{4}\left[\frac{(2 - x)^3}{3}\right]_0^2 = \frac{2\sqrt{3}}{3}.$$

EXAMPLE 7 An Application to Geometry

Prove that the volume of a pyramid with a square base is

$$V = \frac{1}{3}hB$$

where h is the height of the pyramid and B is the area of the base.

Solution As shown in Figure 7.26, you can intersect the pyramid with a plane parallel to the base at height y to form a square cross section whose sides are of length b'. Using similar triangles, you can show that

$$\frac{b'}{b} = \frac{h - y}{h} \quad \text{or} \quad b' = \frac{b}{h}(h - y)$$

where b is the length of the sides of the base of the pyramid. So,

$$A(y) = (b')^2 = \frac{b^2}{h^2}(h - y)^2.$$

Integrating between 0 and h produces

$$V = \int_0^h A(y)\,dy \qquad \text{Cross sections perpendicular to } y\text{-axis}$$

$$= \int_0^h \frac{b^2}{h^2}(h - y)^2\,dy \qquad \text{Substitute.}$$

$$= \frac{b^2}{h^2}\int_0^h (h - y)^2\,dy \qquad \text{Constant Multiple Rule}$$

$$= -\left(\frac{b^2}{h^2}\right)\left[\frac{(h - y)^3}{3}\right]_0^h \qquad \text{Integrate.}$$

$$= \frac{b^2}{h^2}\left(\frac{h^3}{3}\right)$$

$$= \frac{1}{3}hB. \qquad B = b^2$$

7.2 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

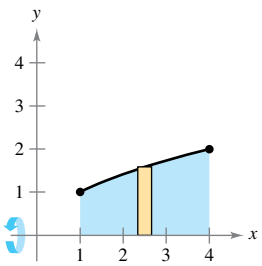
GO DIGITAL

Concept Check

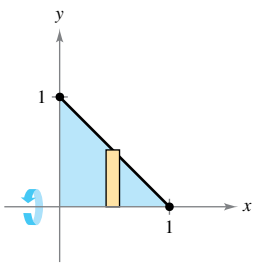
1. Explain how to use the disk method to find the volume of a solid of revolution.
2. Explain the relationship between the disk method and the washer method.
3. Describe when it is necessary to use more than one integral to find the volume of a solid of revolution.
4. Explain how to find the volume of a solid with a known cross section.

Finding the Volume of a Solid In Exercises 5–8, write and evaluate the definite integral that represents the volume of the solid formed by revolving the region about the x-axis.

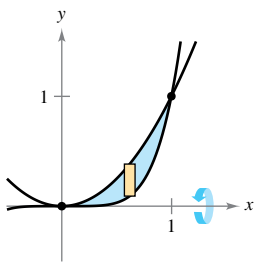
5. $y = \sqrt{x}$



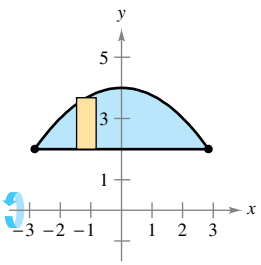
6. $y = -x + 1$



7. $y = x^2, \quad y = x^5$

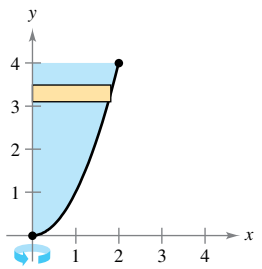


8. $y = 2, \quad y = 4 - \frac{x^2}{4}$

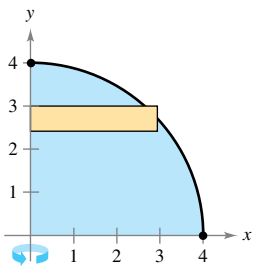


Finding the Volume of a Solid In Exercises 9–12, write and evaluate the definite integral that represents the volume of the solid formed by revolving the region about the y-axis.

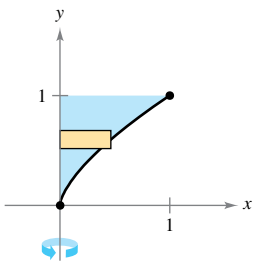
9. $y = x^2$



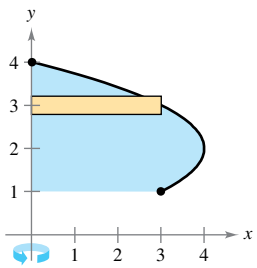
10. $y = \sqrt{16 - x^2}$



11. $y = x^{2/3}$



12. $x = -y^2 + 4y$



Finding the Volume of a Solid In Exercises 13–16, find the volumes of the solids generated by revolving the region bounded by the graphs of the equations about the given lines.

13. $y = \sqrt{x}, \quad y = 0, \quad x = 3$

(a) x-axis (b) y-axis

(c) $x = 3$ (d) $x = 6$

14. $y = 2x^2, \quad y = 0, \quad x = 2$

(a) y-axis

(b) x-axis

(c) $y = 8$

(d) $x = 2$

15. $y = x^2, \quad y = 4x - x^2$

(a) x-axis

(b) $y = 6$

16. $y = 4 + 2x - x^2, \quad y = 4 - x$

(a) x-axis

(b) $y = 1$

Finding the Volume of a Solid In Exercises 17–20, find the volume of the solid generated by revolving the region bounded by the graphs of the equations about the line $y = 4$.

17. $y = x, \quad y = 3, \quad x = 0$

18. $y = \frac{1}{2}x^3, \quad y = 4, \quad x = 0$

19. $y = \dfrac{2}{1 + x}, \quad y = 0, \quad x = 0, \quad x = 4$

20. $y = \sqrt{1 - x}, \quad x = 0, \quad y = 0$

Finding the Volume of a Solid In Exercises 21–24, find the volume of the solid generated by revolving the region bounded by the graphs of the equations about the line $x = 5$.

21. $y = x, \quad y = 0, \quad y = 4, \quad x = 5$

22. $y = 2 - \dfrac{x}{2}, \quad y = 0, \quad y = 1, \quad x = 0$

23. $x = y^2, \quad x = 4$

24. $xy = 3, \quad y = 1, \quad y = 4, \quad x = 5$

Finding the Volume of a Solid **In Exercises 25–32, find the volume of the solid generated by revolving the region bounded by the graphs of the equations about the x-axis.**

25. $y = \dfrac{1}{\sqrt{3x + 5}}, \quad y = 0, \quad x = 0, \quad x = 2$

26. $y = x\sqrt{4 - x^2}, \quad y = 0$

27. $y = \dfrac{6}{x}, \quad y = 0, \quad x = 1, \quad x = 3$

28. $y = \dfrac{2}{x + 1}, \quad y = 0, \quad x = 0, \quad x = 6$

29. $y = e^{-3x}, \quad y = 0, \quad x = 0, \quad x = 2$

30. $y = e^{x/4}, \quad y = 0, \quad x = 0, \quad x = 6$

31. $y = x^2 + 1, \quad y = -x^2 + 2x + 5, \quad x = 0, \quad x = 3$

32. $y = \sqrt{x}, \quad y = -\frac{1}{2}x + 4, \quad x = 0, \quad x = 8$

Finding the Volume of a Solid **In Exercises 33–36, find the volume of the solid generated by revolving the region bounded by the graphs of the equations about the y-axis.**

33. $y = 3(2 - x), \quad y = 0, \quad x = 0$

34. $y = \sqrt{3x - 2}, \quad x = 0, \quad y = 0, \quad y = 1$

35. $y = 9 - x^2, \quad y = 0, \quad x = 2, \quad x = 3$

36. $y = \dfrac{x^3}{8}, \quad y = 0, \quad x = 4$

Finding the Volume of a Solid **In Exercises 37–40, find the volume of the solid generated by revolving the region bounded by the graphs of the equations about the x-axis. Verify your results using the integration capabilities of a graphing utility.**

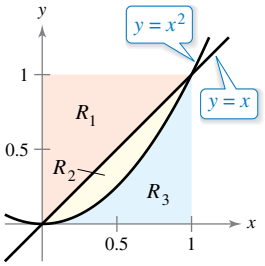
37. $y = \sin x, \quad y = 0, \quad x = 0, \quad x = \pi$

38. $y = \cos 2x, \quad y = 0, \quad x = 0, \quad x = \dfrac{\pi}{4}$

39. $y = e^{x-1}, \quad y = 0, \quad x = 1, \quad x = 2$

40. $y = e^{x/2} + e^{-x/2}, \quad y = 0, \quad x = -1, \quad x = 2$

Finding the Volume of a Solid **In Exercises 41–48, find the volume of the solid generated by revolving the specified region about the given line.**



41. R_1 about $y = 0$

42. R_1 about $x = 1$

43. R_1 about $x = 0$

44. R_2 about $y = 1$

45. R_2 about $y = 0$

46. R_3 about $x = 1$

47. R_3 about $x = 0$

48. R_3 about $y = 1$

Finding the Volume of a Solid Using Technology **In Exercises 49–52, use the integration capabilities of a graphing utility to approximate the volume of the solid generated by revolving the region bounded by the graphs of the equations about the x-axis.**

49. $y = e^{-x^2}, \quad y = 0, \quad x = 0, \quad x = 2$

50. $y = \ln x, \quad y = 0, \quad x = 1, \quad x = 3$

51. $y = 2 \arctan(0.2x), \quad y = 0, \quad x = 0, \quad x = 5$

52. $y = \sqrt{2x}, \quad y = x^2$

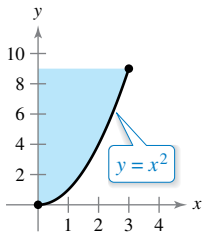
Exploring Concepts

53. Each integral represents the volume of a solid. Describe each solid.

(a) $\pi \displaystyle\int_0^{\pi/2} \sin^2 x \, dx$ (b) $\pi \displaystyle\int_2^4 y^4 \, dy$

54. A region bounded by the parabola $y = 4x - x^2$ and the x-axis is revolved about the x-axis. A second region bounded by the parabola $y = 4 - x^2$ and the x-axis is revolved about the x-axis. Without integrating, how do the volumes of the two solids compare? Explain.

55. Comparing Volumes The region in the figure is revolved about the indicated axes and line. Order the volumes of the resulting solids from least to greatest. Explain your reasoning.

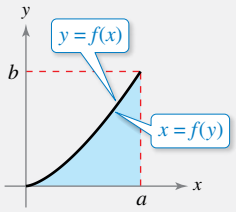


(a) x-axis

(b) y-axis

(c) $x = 3$

56. HOW DO YOU SEE IT? Use the graph to match the integral for the volume with the axis of rotation.



(a) $V = \pi \displaystyle\int_0^b (a^2 - [f(y)]^2) \, dy$ (i) x-axis

(b) $V = \pi \displaystyle\int_0^a (b^2 - [b - f(x)]^2) \, dx$ (ii) y-axis

(c) $V = \pi \displaystyle\int_0^a [f(x)]^2 \, dx$ (iii) $x = a$

(d) $V = \pi \displaystyle\int_0^b [a - f(y)]^2 \, dy$ (iv) $y = b$

Dividing a Solid **In Exercises 57 and 58, consider the solid formed by revolving the region bounded by $y = \sqrt{x}$, $y = 0$, $x = 1$, and $x = 3$ about the x-axis.**

57. Find the value of x in the interval $[1, 3]$ that divides the solid into two parts of equal volume.

58. Find the values of x in the interval $[1, 3]$ that divide the solid into three parts of equal volume.

59. Manufacturing A manufacturer drills a hole through the center of a metal sphere of radius R. The hole has a radius r. Find the volume of the resulting ring.

60. Manufacturing For the metal sphere in Exercise 59, let $R = 6$. What value of r will produce a ring whose volume is exactly half the volume of the sphere?

61. Volume of a Cone Use the disk method to verify that the volume of a right circular cone is $\frac{1}{3}\pi r^2 h$, where r is the radius of the base and h is the height.

62. Volume of a Sphere Use the disk method to verify that the volume of a sphere is $\frac{4}{3}\pi r^3$, where r is the radius.

63. Using a Cone A cone of height H with a base of radius r is cut by a plane parallel to and h units above the base, where $h < H$. Find the volume of the solid (frustum of a cone) below the plane.

64. Using a Sphere A sphere of radius r is cut by a plane h units above the equator, where $h < r$. Find the volume of the solid (spherical segment) above the plane.

65. Volume of a Fuel Tank A tank on the wing of a jet aircraft is formed by revolving the region bounded by the graph of $y = \frac{1}{4}x^2\sqrt{2 - x}$ and the x-axis $(0 \le x \le 2)$ about the x-axis, where x and y are measured in meters. Use a graphing utility to graph the function. Find the volume of the tank analytically.

66. Volume of a Container A container can be modeled by revolving the graph of

$$y = \begin{cases} \sqrt{0.1x^3 - 2.2x^2 + 10.9x + 22.2}, & 0 \le x \le 11.5 \\ 2.95, & 11.5 < x \le 15 \end{cases}$$

about the x-axis, where x and y are measured in centimeters. Use a graphing utility to graph the function. Find the volume of the container analytically.

67. Finding Volumes of Solids Find the volumes of the solids (see figures) generated if the upper half of the ellipse $9x^2 + 25y^2 = 225$ is revolved about (a) the x-axis to form a prolate spheroid (shaped like a football) and (b) the y-axis to form an oblate spheroid (shaped like half of a candy).

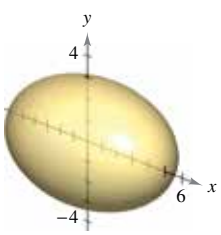

Figure for 67(a)

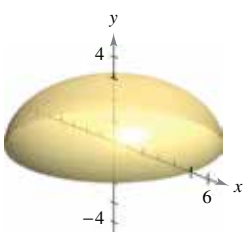

Figure for 67(b)

68. 3D Printing

A 3D printer is used to create a plastic drinking glass. The equations given to the printer for the inside of the glass are

$$x = \left(\frac{y}{4}\right)^{1/32} \quad \text{and} \quad y = 5$$

where x and y are measured in inches. What is the total volume that the drinking glass can hold when the region bounded by the graphs of the equations is revolved about the y-axis?

69. Minimum Volume The function $y = 4 - (x^2/4)$ on the interval $[0, 4]$ is revolved about the line $y = b$ (see figure).

(a) Find the volume of the resulting solid as a function of b.

(b) Use a graphing utility to graph the function in part (a), and use the graph to approximate the value of b that minimizes the volume of the solid.

(c) Use calculus to find the value of b that minimizes the volume of the solid, and compare the result with the answer to part (b).

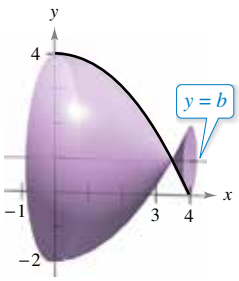

Figure for 69

Figure for 70

70. Modeling Data A draftsman is asked to determine the amount of material required to produce a machine part (see figure). The diameters d of the part at equally spaced points x are listed in the table. The measurements are listed in centimeters.

x	0	1	2	3	4	5
d	4.2	3.8	4.2	4.7	5.2	5.7

x	6	7	8	9	10
d	5.8	5.4	4.9	4.4	4.6

(a) Use the regression capabilities of a graphing utility to find a fourth-degree polynomial through the points representing the radius of the machine part. Plot the data and graph the model.

(b) Use the integration capabilities of a graphing utility to approximate the volume of the machine part.

71. Think About It Match each integral with the solid whose volume it represents, and give the dimensions of each solid.

(a) Right circular cylinder (b) Ellipsoid

(c) Sphere (d) Right circular cone (e) Torus

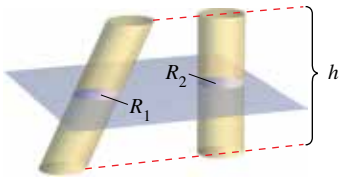
(i) $\pi \int_0^h \left(\frac{rx}{h}\right)^2 dx$ (ii) $\pi \int_0^h r^2\, dx$

(iii) $\pi \int_{-r}^{r} \left(\sqrt{r^2 - x^2}\right)^2 dx$

(iv) $\pi \int_{-b}^{b} \left(a\sqrt{1 - \frac{x^2}{b^2}}\right)^2 dx$

(v) $\pi \int_{-r}^{r} \left[\left(R + \sqrt{r^2 - x^2}\right)^2 - \left(R - \sqrt{r^2 - x^2}\right)^2\right] dx$

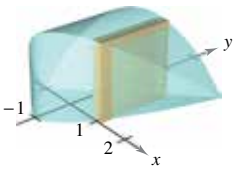
72. Cavalieri's Theorem Prove that if two solids have equal altitudes and all cross sections parallel to their bases and at equal distances from their bases have equal areas, then the solids have the same volume (see figure).

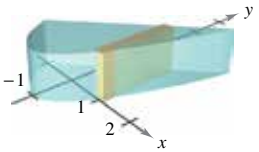


Area of R_1 = area of R_2

73. Using Cross Sections Find the volumes of the solids whose bases are bounded by the graphs of $y = x + 1$ and $y = x^2 - 1$, with the indicated cross sections taken perpendicular to the x-axis.

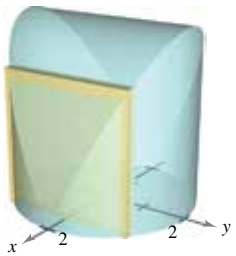
(a) Squares (b) Rectangles of height 1

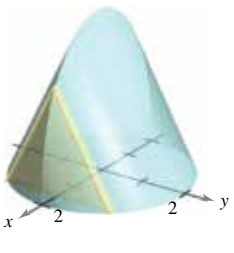




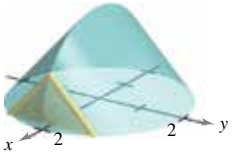
74. Using Cross Sections Find the volumes of the solids whose bases are bounded by the circle $x^2 + y^2 = 4$, with the indicated cross sections taken perpendicular to the x-axis.

(a) Squares (b) Equilateral triangles

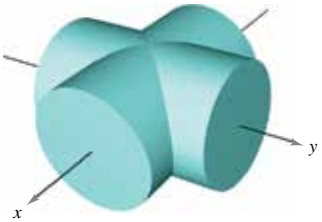




(c) Semicircles (d) Isosceles right triangles



75. Using Cross Sections Find the volume of the solid of intersection (the solid common to both) of the two right circular cylinders of radius r whose axes meet at right angles (see figure).



Two intersecting cylinders

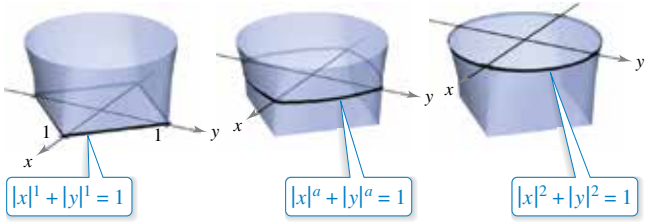
Solid of intersection

FOR FURTHER INFORMATION For more information on this problem, see the article "Estimating the Volumes of Solid Figures with Curved Surfaces" by Donald Cohen in *Mathematics Teacher*. To view this article, go to *MathArticles.com*.

76. Using Cross Sections The solid shown in the figure has cross sections bounded by the graph of $|x|^a + |y|^a = 1$, where $1 \le a \le 2$.

(a) Describe the cross section when $a = 1$ and $a = 2$.

(b) Describe a procedure for approximating the volume of the solid.



77. Volume of a Wedge Two planes cut a right circular cylinder to form a wedge. One plane is perpendicular to the axis of the cylinder and the second makes an angle of θ degrees with the first (see figure).

(a) Find the volume of the wedge if $\theta = 45°$.

(b) Find the volume of the wedge for an arbitrary angle θ. Assuming that the cylinder has sufficient length, how does the volume of the wedge change as θ increases from 0° to 90°?

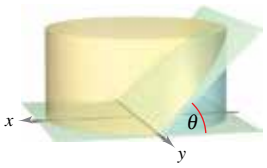


Figure for 77

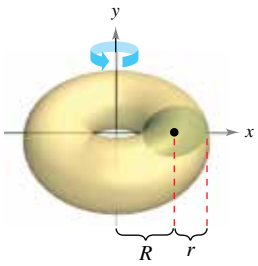

Figure for 78

78. Volume of a Torus

(a) Show that the volume of the torus shown in the figure is given by the integral $8\pi R \int_0^r \sqrt{r^2 - y^2}\, dy$, where $R > r > 0$.

(b) Find the volume of the torus.

7.3 Volume: The Shell Method

GO DIGITAL

- **Find the volume of a solid of revolution using the shell method.**
- **Compare the uses of the disk method and the shell method.**

The Shell Method

In this section, you will study an alternative method for finding the volume of a solid of revolution. This method is called the **shell method** because it uses cylindrical shells. A comparison of the advantages of the disk and shell methods is given later in this section.

To begin, consider a representative rectangle as shown in Figure 7.27, where w is the width of the rectangle, h is the height of the rectangle, and p is the distance between the axis of revolution and the *center* of the rectangle. When this rectangle is revolved about its axis of revolution, it forms a cylindrical shell (or tube) of thickness w. To find the volume of this shell, consider two cylinders. The radius of the larger cylinder corresponds to the outer radius of the shell, and the radius of the smaller cylinder corresponds to the inner radius of the shell. Because p is the average radius of the shell, you know the outer radius is

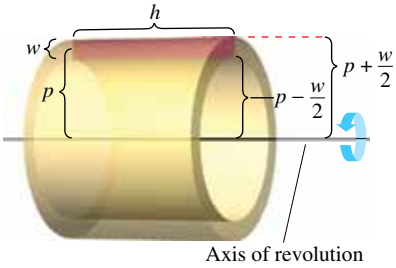

Figure 7.27

$$p + \frac{w}{2}$$ Outer radius

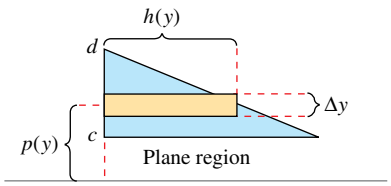
and the inner radius is

$$p - \frac{w}{2}.$$ Inner radius

So, the volume of the shell is

$$\begin{aligned}\text{Volume of shell} &= (\text{volume of cylinder}) - (\text{volume of hole})\\ &= \pi\left(p + \frac{w}{2}\right)^2 h - \pi\left(p - \frac{w}{2}\right)^2 h\\ &= 2\pi phw\\ &= 2\pi(\text{average radius})(\text{height})(\text{thickness}).\end{aligned}$$

You can use this formula to find the volume of a solid of revolution. For instance, the plane region in Figure 7.28 is revolved about a line to form the indicated solid. Consider a horizontal rectangle of width Δy. As the plane region is revolved about a line parallel to the x-axis, the rectangle generates a representative shell whose volume is



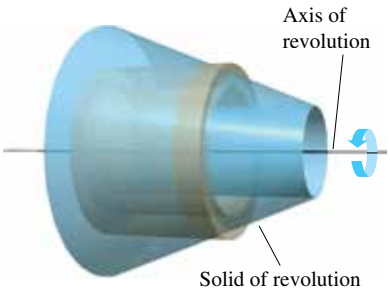


Figure 7.28

$$\Delta V = 2\pi[p(y)h(y)]\Delta y.$$

You can approximate the volume of the solid by n such shells of thickness Δy, height $h(y_i)$, and average radius $p(y_i)$.

$$\text{Volume of solid} \approx \sum_{i=1}^{n} 2\pi[p(y_i)h(y_i)]\Delta y = 2\pi\sum_{i=1}^{n}[p(y_i)h(y_i)]\Delta y$$

This approximation appears to become better and better as $\|\Delta\| \to 0$ $(n \to \infty)$. So, the volume of the solid is

$$\begin{aligned}\text{Volume of solid} &= \lim_{\|\Delta\|\to 0} 2\pi\sum_{i=1}^{n}[p(y_i)h(y_i)]\Delta y\\ &= 2\pi\int_c^d [p(y)h(y)]\,dy.\end{aligned}$$

GO DIGITAL

The Shell Method

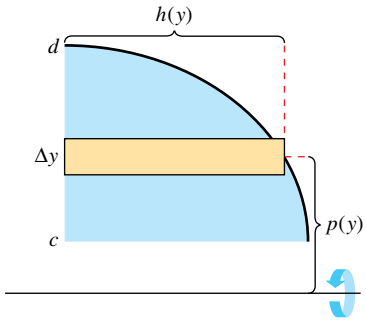
To find the volume of a solid of revolution with the **shell method,** use one of the formulas below. (See Figure 7.29.)

Horizontal Axis of Revolution

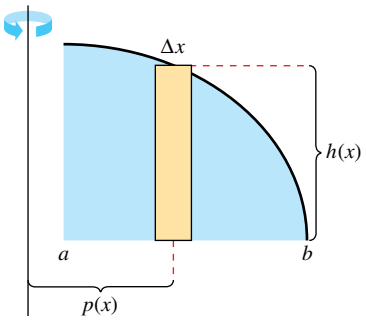
$$\text{Volume} = V = 2\pi \int_c^d p(y)h(y)\,dy$$

Vertical Axis of Revolution

$$\text{Volume} = V = 2\pi \int_a^b p(x)h(x)\,dx$$



Horizontal axis of revolution



Vertical axis of revolution

Figure 7.29

REMARK Be sure you understand that with the shell method, the representative rectangle is *parallel* to the axis of revolution.

EXAMPLE 1 Using the Shell Method to Find Volume

Find the volume of the solid formed by revolving the region bounded by

$$y = x - x^3$$

and the x-axis $(0 \le x \le 1)$ about the y-axis.

Solution Because the axis of revolution is vertical, use a vertical representative rectangle, as shown in Figure 7.30. The width Δx indicates that x is the variable of integration. The distance from the center of the rectangle to the axis of revolution is $p(x) = x$, and the height of the rectangle is

$$h(x) = x - x^3.$$

Because x ranges from 0 to 1, apply the shell method to find the volume of the solid.

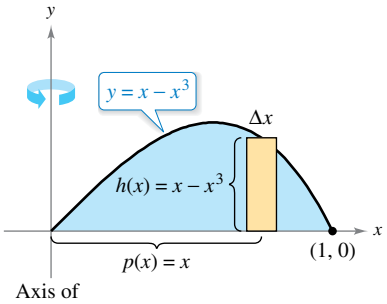


Figure 7.30

$$V = 2\pi \int_a^b p(x)h(x)\,dx \qquad \text{Apply shell method.}$$

$$= 2\pi \int_0^1 x(x - x^3)\,dx \qquad \text{Substitute } x \text{ for } p(x) \text{ and } x - x^3 \text{ for } h(x).$$

$$= 2\pi \int_0^1 (-x^4 + x^2)\,dx \qquad \text{Simplify.}$$

$$= 2\pi \left[-\frac{x^5}{5} + \frac{x^3}{3} \right]_0^1 \qquad \text{Integrate.}$$

$$= 2\pi \left(-\frac{1}{5} + \frac{1}{3} \right) \qquad \text{Apply Fundamental Theorem of Calculus.}$$

$$= \frac{4\pi}{15} \qquad \text{Simplify.}$$

■

Exploration

Suppose you were asked to use the disk method to find the volume in Example 1. What would the representative rectangle look like? Is the disk method a good way to find the volume? Why or why not?

GO DIGITAL

EXAMPLE 2 Using the Shell Method to Find Volume

Find the volume of the solid formed by revolving the region bounded by the graph of

$$x = e^{-y^2}$$

and the y-axis $(0 \le y \le 1)$ about the x-axis.

Solution Because the axis of revolution is horizontal, use a horizontal representative rectangle, as shown in Figure 7.31. The width Δy indicates that y is the variable of integration. The distance from the center of the rectangle to the axis of revolution is $p(y) = y$, and the height of the rectangle is $h(y) = e^{-y^2}$. Because y ranges from 0 to 1, the volume of the solid is

$$V = 2\pi \int_c^d p(y)h(y)\,dy \qquad \text{Apply shell method.}$$

$$= 2\pi \int_0^1 ye^{-y^2}\,dy \qquad \text{Substitute } y \text{ for } p(y) \text{ and } e^{-y^2} \text{ for } h(y).$$

$$= -\pi\left[e^{-y^2}\right]_0^1 \qquad \text{Integrate.}$$

$$= \pi\left(1 - \frac{1}{e}\right) \qquad \text{Apply Fundamental Theorem of Calculus.}$$

$$\approx 1.986. \qquad \text{Use a calculator.}$$

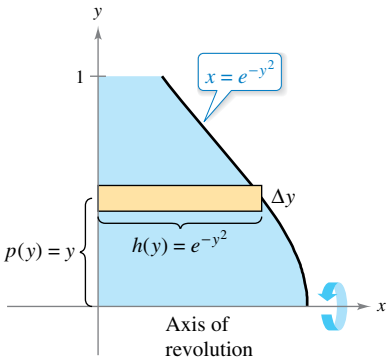

Figure 7.31

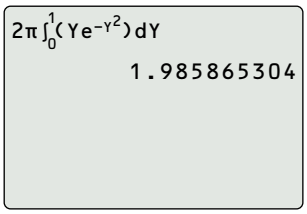
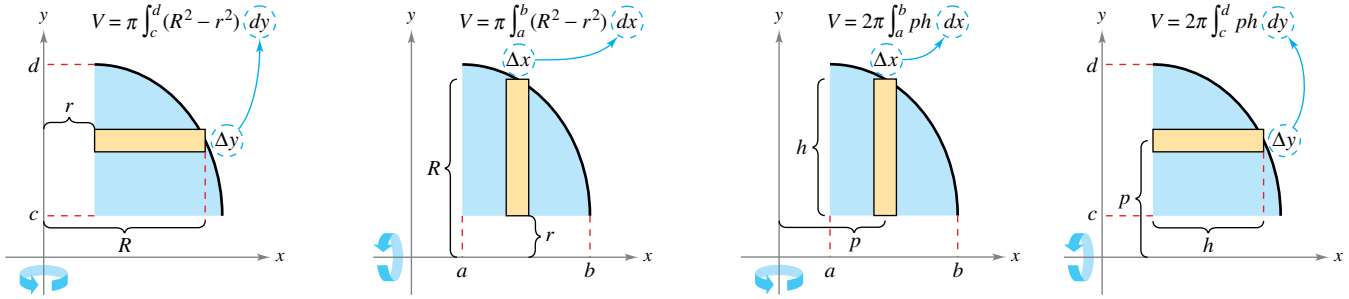
Check this result using a graphing utility, as shown below.



Comparison of Disk and Shell Methods

The disk and shell methods can be distinguished as follows. For the disk method, the representative rectangle is always *perpendicular* to the axis of revolution, whereas for the shell method, the representative rectangle is always *parallel* to the axis of revolution, as shown in Figure 7.32.



$V = \pi \int_c^d (R^2 - r^2)\,dy$
$V = \pi \int_a^b (R^2 - r^2)\,dx$
$V = 2\pi \int_a^b ph\,dx$
$V = 2\pi \int_c^d ph\,dy$
Vertical axis of revolution
Horizontal axis of revolution
Vertical axis of revolution
Horizontal axis of revolution
Disk method: Representative rectangle is perpendicular to the axis of revolution.
Shell method: Representative rectangle is parallel to the axis of revolution.

GO DIGITAL

Often, one method is more convenient to use than the other. The next example illustrates a case in which the shell method is preferable.

EXAMPLE 3 Comparing Methods

See LarsonCalculus.com for an interactive version of this type of example.

Find the volume of the solid formed by revolving the region bounded by the graphs of $y = x^2 + 1$, $y = 0$, $x = 0$, and $x = 1$ about the y-axis.

Solution In Example 4 in Section 7.2, you saw that the washer method requires two integrals to determine the volume of this solid. See Figure 7.33(a).

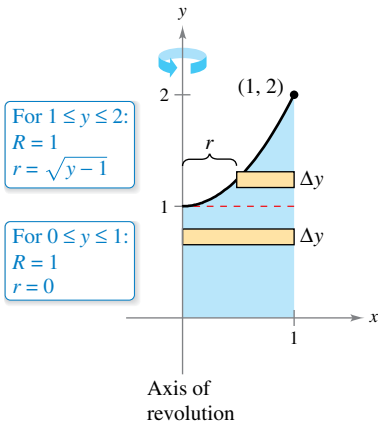
$$V = \pi \int_0^1 (1^2 - 0^2)\, dy + \pi \int_1^2 \left[1^2 - \left(\sqrt{y-1}\right)^2\right] dy \qquad \text{Apply washer method.}$$

$$= \pi \int_0^1 1\, dy + \pi \int_1^2 (2 - y)\, dy \qquad \text{Simplify.}$$

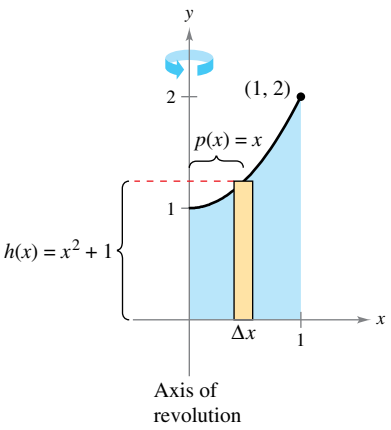
$$= \pi \left[y \right]_0^1 + \pi \left[2y - \frac{y^2}{2} \right]_1^2 \qquad \text{Integrate.}$$

$$= \pi + \pi\left(4 - 2 - 2 + \frac{1}{2}\right)$$

$$= \frac{3\pi}{2}$$



(a) Washer method



(b) Shell method

Figure 7.33

Notice in Figure 7.33(b) that the shell method requires only one integral to find the volume. The distance from the center of the rectangle to the axis of revolution is $p(x) = x$, the height of the rectangle is $h(x) = x^2 + 1$, and x ranges from 0 to 1.

$$V = 2\pi \int_a^b p(x)h(x)\, dx \qquad \text{Apply shell method.}$$

$$= 2\pi \int_0^1 x(x^2 + 1)\, dx \qquad \text{Substitute.}$$

$$= 2\pi \int_0^1 (x^3 + x)\, dx \qquad \text{Simplify.}$$

$$= 2\pi \left[\frac{x^4}{4} + \frac{x^2}{2} \right]_0^1 \qquad \text{Integrate.}$$

$$= 2\pi\left(\frac{3}{4}\right)$$

$$= \frac{3\pi}{2}$$

Consider the solid formed by revolving the region in Example 3 about the vertical line $x = 1$. Would the resulting solid of revolution have a greater volume or a smaller volume than the solid in Example 3? Without integrating, you should be able to reason that the resulting solid would have a smaller volume because "more" of the revolved region would be closer to the axis of revolution. To confirm this, try solving the integral

$$V = 2\pi \int_0^1 (1 - x)(x^2 + 1)\, dx \qquad p(x) = 1 - x$$

which gives the volume of the solid.

FOR FURTHER INFORMATION To learn more about the disk and shell methods, see the article "The Disk and Shell Method" by Charles A. Cable in *The American Mathematical Monthly*. To view this article, go to *MathArticles.com*.

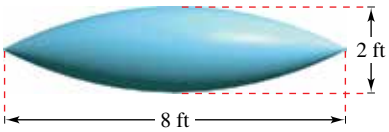

Figure 7.34

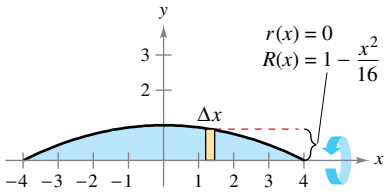

Disk method

Figure 7.35

GO DIGITAL

EXAMPLE 4 Volume of a Pontoon

A pontoon is to be made in the shape shown in Figure 7.34. The pontoon is designed by revolving the graph of

$$y = 1 - \frac{x^2}{16}, \quad -4 \le x \le 4$$

about the x-axis, where x and y are measured in feet. Find the volume of the pontoon.

Solution Refer to Figure 7.35 and use the disk method as shown.

$$V = \pi \int_{-4}^{4} \left(1 - \frac{x^2}{16}\right)^2 dx \qquad \text{Apply disk method.}$$

$$= \pi \int_{-4}^{4} \left(1 - \frac{x^2}{8} + \frac{x^4}{256}\right) dx \qquad \text{Simplify.}$$

$$= \pi \left[x - \frac{x^3}{24} + \frac{x^5}{1280}\right]_{-4}^{4} \qquad \text{Integrate.}$$

$$= \frac{64\pi}{15}$$

$$\approx 13.4 \text{ cubic feet}$$

To use the shell method in Example 4, you would have to solve for x in terms of y in the equation

$$y = 1 - \frac{x^2}{16}$$

and then evaluate an integral that requires a u-substitution.

Sometimes, solving for x is very difficult (or even impossible). In such cases, you must use a vertical rectangle (of width Δx), making x the variable of integration. The position (horizontal or vertical) of the axis of revolution then determines the method to be used. This is shown in Example 5.

EXAMPLE 5 Shell Method Necessary

Find the volume of the solid formed by revolving the region bounded by the graphs of $y = x^3 + x + 1$, $y = 1$, and $x = 1$ about the line $x = 2$, as shown in Figure 7.36.

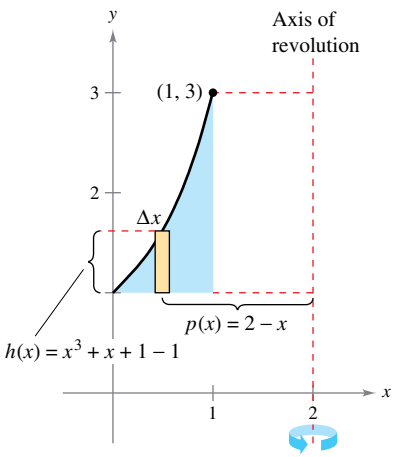

Figure 7.36

Solution In the equation $y = x^3 + x + 1$, you cannot easily solve for x in terms of y. (See the discussion at the end of Section 3.8.) So, the variable of integration must be x, and you should choose a vertical representative rectangle. Because the rectangle is parallel to the axis of revolution, use the shell method.

$$V = 2\pi \int_a^b p(x)h(x)\,dx \qquad \text{Apply shell method.}$$

$$= 2\pi \int_0^1 (2 - x)(x^3 + x + 1 - 1)\,dx \qquad \text{Substitute. (See Figure 7.36.)}$$

$$= 2\pi \int_0^1 (-x^4 + 2x^3 - x^2 + 2x)\,dx \qquad \text{Simplify.}$$

$$= 2\pi \left[-\frac{x^5}{5} + \frac{x^4}{2} - \frac{x^3}{3} + x^2\right]_0^1 \qquad \text{Integrate.}$$

$$= 2\pi \left(-\frac{1}{5} + \frac{1}{2} - \frac{1}{3} + 1\right)$$

$$= \frac{29\pi}{15}$$

7.3 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

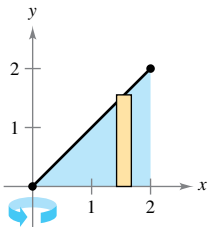
GO DIGITAL

Concept Check

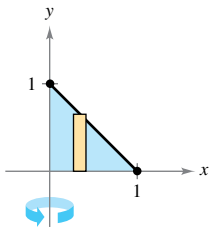
1. Explain how to use the shell method to find the volume of a solid of revolution.
2. Compare the representative rectangles for the disk and shell methods.

Finding the Volume of a Solid **In Exercises 3–12, use the shell method to write and evaluate the definite integral that represents the volume of the solid generated by revolving the plane region about the *y*-axis.**

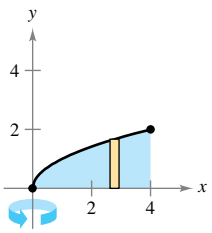
3. $y = x$



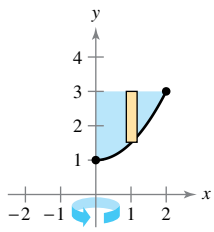
4. $y = 1 - x$



5. $y = \sqrt{x}$



6. $y = \frac{1}{2}x^2 + 1$



7. $y = \frac{1}{4}x^2, \quad y = 0, \quad x = 4$

8. $y = \frac{1}{2}x^3, \quad y = 0, \quad x = 3$

9. $y = x^2, \quad y = 4x - x^2$

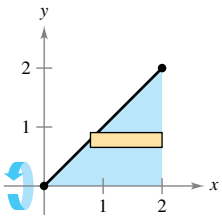
10. $y = x^3, \quad y = 8, \quad x = 0$

11. $y = \sqrt{2x - 5}, \quad y = 0, \quad x = 4$

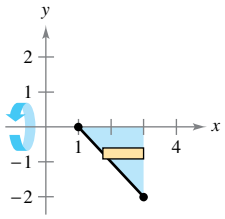
12. $y = x^{3/2}, \quad y = 8, \quad x = 0$

Finding the Volume of a Solid **In Exercises 13–22, use the shell method to write and evaluate the definite integral that represents the volume of the solid generated by revolving the plane region about the *x*-axis.**

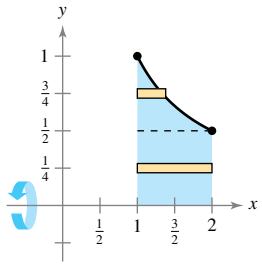
13. $y = x$



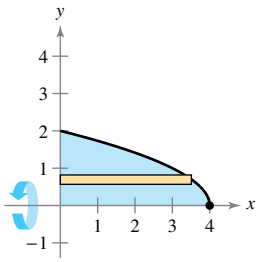
14. $y = 1 - x$



15. $y = \frac{1}{x}$



16. $x + y^2 = 4$



17. $y = x^3, \quad x = 0, \quad y = 8$

18. $y = 4x^2, \quad x = 0, \quad y = 4$

19. $x + y = 4, \quad y = x, \quad y = 0$

20. $y = 3 - x, \quad y = 0, \quad x = 6$

21. $y = 1 - \sqrt{x}, \quad y = x + 1, \quad y = 0$

22. $y = \sqrt{x + 2}, \quad y = x, \quad y = 0$

Finding the Volume of a Solid **In Exercises 23–26, use the shell method to find the volume of the solid generated by revolving the region bounded by the graphs of the equations about the given line.**

23. $y = 2x - x^2, \quad y = 0,$ about the line $x = 4$

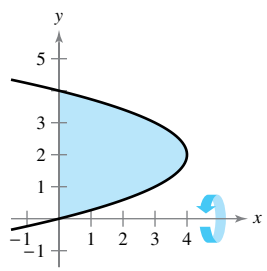
24. $y = \sqrt{x}, \quad y = 0, \quad x = 4,$ about the line $x = 6$

25. $y = 3x - x^2, \quad y = x^2,$ about the line $x = 2$

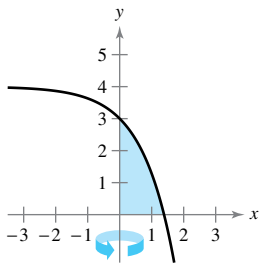
26. $y = \frac{1}{3}x^3, \quad y = 6x - x^2,$ about the line $x = 3$

Choosing a Method **In Exercises 27 and 28, decide whether it is more convenient to use the disk method or the shell method to find the volume of the solid of revolution. Explain your reasoning. (Do not find the volume.)**

27. $(y - 2)^2 = 4 - x$



28. $y = 4 - e^x$



Choosing a Method **In Exercises 29–32, use the disk method *or* the shell method to find the volumes of the solids generated by revolving the region bounded by the graphs of the equations about the given lines.**

29. $y = x^3, \quad y = 0, \quad x = 2$

(a) *x*-axis (b) *y*-axis (c) $x = 4$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

30. $y = \dfrac{10}{x^2}, \quad y = 0, \quad x = 1, \quad x = 5$

(a) x-axis (b) y-axis (c) $y = 10$

31. $x^{1/2} + y^{1/2} = a^{1/2}, \quad x = 0, \quad y = 0$

(a) x-axis (b) y-axis (c) $x = a$

32. $x^{2/3} + y^{2/3} = a^{2/3}, \quad a > 0$ (hypocycloid)

(a) x-axis (b) y-axis

Finding the Volume of a Solid Using Technology **In Exercises 33–36, (a) use a graphing utility to graph the region bounded by the graphs of the equations, and (b) use the integration capabilities of the graphing utility to approximate the volume of the solid generated by revolving the region about the y-axis.**

33. $x^{4/3} + y^{4/3} = 1, \quad x = 0, \quad y = 0,$ first quadrant

34. $y = \sqrt{1 - x^3}, \quad y = 0, \quad x = 0$

35. $y = \sqrt[3]{(x - 2)^2(x - 6)^2}, \quad y = 0, \quad x = 2, \quad x = 6$

36. $y = \dfrac{2}{1 + e^{1/x}}, \quad y = 0, \quad x = 1, \quad x = 3$

Exploring Concepts

37. Consider the plane region bounded by the graphs of $y = k$, $y = 0$, $x = 0$, and $x = b$, where $k > 0$ and $b > 0$. Find the heights and radii of the cylinders generated when this region is revolved about (a) the x-axis and (b) the y-axis.

38. A solid is generated by revolving the region bounded by $y = 9 - x^2$ and $x = 0$ about the y-axis. Explain why you can use the shell method with limits of integration $x = 0$ and $x = 3$ to find the volume of the solid.

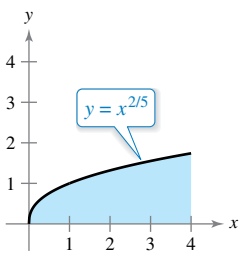
In Exercises 39 and 40, give a geometric argument that explains why the integrals have equal values.

39. $\pi \displaystyle\int_1^5 (x - 1)\,dx = 2\pi \int_0^2 y[5 - (y^2 + 1)]\,dy$

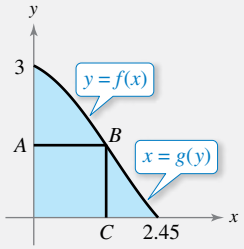
40. $\pi \displaystyle\int_0^2 [16 - (2y)^2]\,dy = 2\pi \int_0^4 x\left(\frac{x}{2}\right)dx$

41. Comparing Volumes The region in the figure is revolved about the indicated axes and line. Order the volumes of the resulting solids from least to greatest. Explain your reasoning.

(a) x-axis (b) y-axis (c) $x = 4$



42. HOW DO YOU SEE IT? Use the graph to answer the following.



(a) Describe the figure generated by revolving segment AB about the y-axis.

(b) Describe the figure generated by revolving segment BC about the y-axis.

(c) Assume the curve in the figure can be described as $y = f(x)$ or $x = g(y)$. A solid is generated by revolving the region bounded by the curve, $y = 0$, and $x = 0$ about the y-axis. Set up integrals to find the volume of this solid using the disk method and the shell method. (Do not integrate.)

Analyzing an Integral **In Exercises 43–46, the integral represents the volume of a solid of revolution. Identify (a) the plane region that is revolved and (b) the axis of revolution.**

43. $2\pi \displaystyle\int_0^2 x^3\,dx$

44. $2\pi \displaystyle\int_0^1 (y - y^{3/2})\,dy$

45. $2\pi \displaystyle\int_0^6 (y + 2)\sqrt{6 - y}\,dy$

46. $2\pi \displaystyle\int_0^1 (4 - x)e^x\,dx$

47. Machine Part A solid is generated by revolving the region bounded by $y = \frac{1}{2}x^2$ and $y = 2$ about the y-axis. A hole, centered along the axis of revolution, is drilled through this solid so that one-fourth of the volume is removed. Find the diameter of the hole.

48. Machine Part A solid is generated by revolving the region bounded by $y = \sqrt{9 - x^2}$ and $y = 0$ about the y-axis. A hole, centered along the axis of revolution, is drilled through this solid so that one-third of the volume is removed. Find the diameter of the hole.

49. Volume of a Torus A torus is formed by revolving the region bounded by the circle $x^2 + y^2 = 1$ about the line $x = 2$ (see figure). Find the volume of this "doughnut-shaped" solid. (*Hint:* The integral $\int_{-1}^{1} \sqrt{1 - x^2}\,dx$ represents the area of a semicircle.)

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

50. Volume of a Torus Repeat Exercise 49 for a torus formed by revolving the region bounded by the circle $x^2 + y^2 = r^2$ about the line $x = R$, where $r < R$.

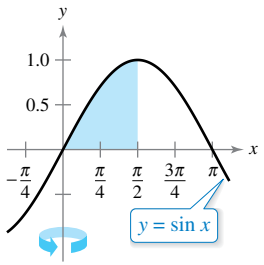
51. Finding Volumes of Solids

(a) Use differentiation to verify that

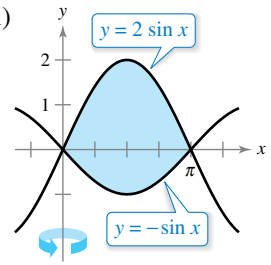
$$\int x \sin x \, dx = \sin x - x \cos x + C.$$

(b) Use the result of part (a) to find the volume of the solid generated by revolving each plane region about the y-axis.

(i)



(ii)



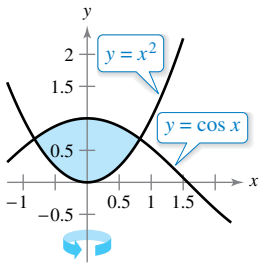
52. Finding Volumes of Solids

(a) Use differentiation to verify that

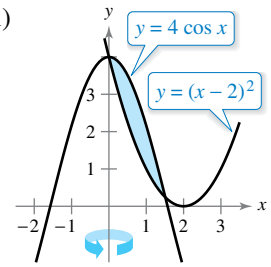
$$\int x \cos x \, dx = \cos x + x \sin x + C.$$

(b) Use the result of part (a) to find the volume of the solid generated by revolving each plane region about the y-axis. (*Hint:* Begin by approximating the points of intersection.)

(i)



(ii)



53. Volume of a Segment of a Sphere Let a sphere of radius r be cut by a plane, thereby forming a segment of height h. Show that the volume of this segment is

$$\frac{1}{3}\pi h^2(3r - h).$$

54. Volume of an Ellipsoid Consider the plane region bounded by the graph of the ellipse

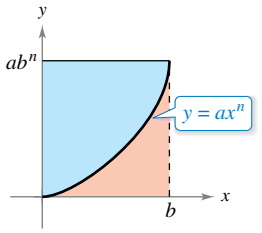
$$\left(\frac{x}{a}\right)^2 + \left(\frac{y}{b}\right)^2 = 1$$

where $a > 0$ and $b > 0$. Show that the volume of the ellipsoid formed when this region is revolved about the y-axis is

$$\frac{4}{3}\pi a^2 b.$$

What is the volume when the region is revolved about the x-axis?

55. Exploration Consider the region bounded by the graphs of $y = ax^n$, $y = ab^n$, and $x = 0$, as shown in the figure.



(a) Find the ratio $R_1(n)$ of the area of the region to the area of the circumscribed rectangle.

(b) Find $\lim_{n\to\infty} R_1(n)$ and compare the result with the area of the circumscribed rectangle.

(c) Find the volume of the solid of revolution formed by revolving the region about the y-axis. Find the ratio $R_2(n)$ of this volume to the volume of the circumscribed right circular cylinder.

(d) Find $\lim_{n\to\infty} R_2(n)$ and compare the result with the volume of the circumscribed cylinder.

(e) Use the results of parts (b) and (d) to make a conjecture about the shape of the graph of $y = ax^n$, $0 \le x \le b$, as $n \to \infty$.

56. Think About It Match each integral with the solid whose volume it represents and give the dimensions of each solid.

(a) Right circular cone (b) Torus (c) Sphere

(d) Right circular cylinder (e) Ellipsoid

(i) $2\pi \int_0^r hx \, dx$

(ii) $2\pi \int_0^r hx\left(1 - \frac{x}{r}\right) dx$

(iii) $2\pi \int_0^r 2x\sqrt{r^2 - x^2} \, dx$

(iv) $2\pi \int_0^b 2ax\sqrt{1 - \frac{x^2}{b^2}} \, dx$

(v) $2\pi \int_{-r}^r (R - x)\left(2\sqrt{r^2 - x^2}\right) dx$

57. Volume of a Storage Shed A storage shed has a circular base of diameter 80 feet. Starting at the center, the interior height is measured every 10 feet and recorded in the table (see figure). Find the volume of the shed.

x	Height
0	50
10	45
20	40
30	20
40	0

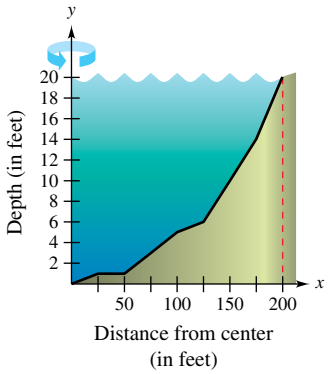
Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

58. Modeling Data A pond is approximately circular, with a diameter of 400 feet. Starting at the center, the depth of the water is measured every 25 feet and recorded in the table (see figure).

x	0	25	50
Depth	20	19	19

x	75	100	125
Depth	17	15	14

x	150	175	200
Depth	10	6	0



(a) Use the regression capabilities of a graphing utility to find a quadratic model for the depths recorded in the table. Use the graphing utility to plot the depths and graph the model.

(b) Use the integration capabilities of a graphing utility and the model in part (a) to approximate the volume of water in the pond.

(c) Use the result of part (b) to approximate the number of gallons of water in the pond. (*Hint:* 1 cubic foot of water is approximately 7.48 gallons.)

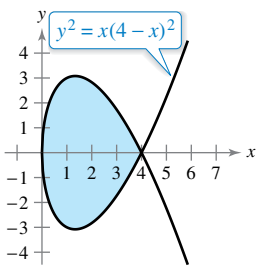
59. Equal Volumes Let V_1 and V_2 be the volumes of the solids that result when the plane region bounded by

$$y = \frac{1}{x}, \quad y = 0, \quad x = \frac{1}{4}, \quad \text{and} \quad x = c, \quad c > \frac{1}{4}$$

is revolved about the x-axis and the y-axis, respectively. Find the value of c for which $V_1 = V_2$.

60. Volume of a Segment of a Paraboloid The region bounded by $y = r^2 - x^2$, $y = 0$, and $x = 0$ is revolved about the y-axis to form a paraboloid. A hole, centered along the axis of revolution, is drilled through this solid. The hole has a radius k, $0 < k < r$. Find the volume of the resulting ring (a) by integrating with respect to x and (b) by integrating with respect to y.

61. Finding Volumes of Solids Consider the graph of $y^2 = x(4 - x)^2$, as shown in the figure. Find the volumes of the solids that are generated when the loop of this graph is revolved about (a) the x-axis, (b) the y-axis, and (c) the line $x = 4$.



SECTION PROJECT

Saturn

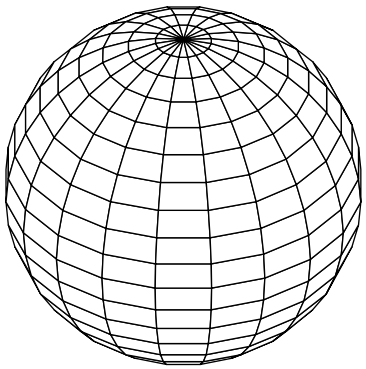
The Oblateness of Saturn Saturn is the most oblate of the planets in our solar system. Its equatorial radius is 60,268 kilometers and its polar radius is 54,364 kilometers. The color-enhanced photograph of Saturn was taken by Voyager 1. In the photograph, the oblateness of Saturn is clearly visible.

(a) Find the ratio of the volumes of the sphere and the oblate ellipsoid shown below.

(b) If a planet were spherical and had the same volume as Saturn, what would its radius be?

Computer model of "spherical Saturn," whose equatorial radius is equal to its polar radius. The equation of the cross section passing through the pole is

$x^2 + y^2 = 60{,}268^2$.



Computer model of "oblate Saturn," whose equatorial radius is greater than its polar radius. The equation of the cross section passing through the pole is

$$\frac{x^2}{60{,}268^2} + \frac{y^2}{54{,}364^2} = 1.$$

7.4 Arc Length and Surfaces of Revolution

GO DIGITAL

- **Find the arc length of a smooth curve.**
- **Find the area of a surface of revolution.**

Arc Length

In this section, definite integrals are used to find the arc lengths of curves and the areas of surfaces of revolution. In either case, an arc (a segment of a curve) is approximated by straight line segments whose lengths are given by the familiar Distance Formula

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}.$$ See Appendix C.2.

A **rectifiable** curve is one that has a finite arc length. You will learn that a sufficient condition for the graph of a function f to be rectifiable between $(a, f(a))$ and $(b, f(b))$ is that f' be continuous on $[a, b]$. Such a function is **continuously differentiable** on $[a, b]$, and its graph on the interval $[a, b]$ is a **smooth curve.**

Consider a function $y = f(x)$ that is continuously differentiable on the interval $[a, b]$. You can approximate the graph of f by n line segments whose endpoints are determined by the partition

$$a = x_0 < x_1 < x_2 < \cdots < x_n = b$$

as shown in Figure 7.37. By letting $\Delta x_i = x_i - x_{i-1}$ and $\Delta y_i = y_i - y_{i-1}$, the approximate length of the graph is

$$\begin{aligned} s &\approx \sum_{i=1}^{n} \sqrt{(x_i - x_{i-1})^2 + (y_i - y_{i-1})^2} \\ &= \sum_{i=1}^{n} \sqrt{(\Delta x_i)^2 + (\Delta y_i)^2} && \Delta x_i = x_i - x_{i-1} \text{ and } \Delta y_i = y_i - y_{i-1} \\ &= \sum_{i=1}^{n} \sqrt{(\Delta x_i)^2 + \left(\frac{\Delta y_i}{\Delta x_i}\right)^2 (\Delta x_i)^2} && \text{Multiply and divide } (\Delta y_i)^2 \text{ by } (\Delta x_i)^2. \\ &= \sum_{i=1}^{n} \sqrt{1 + \left(\frac{\Delta y_i}{\Delta x_i}\right)^2} (\Delta x_i). && \Delta x_i > 0 \end{aligned}$$

This approximation appears to become better and better as $\|\Delta\| \to 0$ $(n \to \infty)$. So, the length of the graph is

$$s = \lim_{\|\Delta\| \to 0} \sum_{i=1}^{n} \sqrt{1 + \left(\frac{\Delta y_i}{\Delta x_i}\right)^2} (\Delta x_i).$$

Because $f'(x)$ exists for each x in (x_{i-1}, x_i), the Mean Value Theorem guarantees the existence of c_i in (x_{i-1}, x_i) such that

$$\frac{f(x_i) - f(x_{i-1})}{x_i - x_{i-1}} = f'(c_i)$$

$$\frac{\Delta y_i}{\Delta x_i} = f'(c_i).$$

Because f' is continuous on $[a, b]$, it follows that $\sqrt{1 + [f'(x)]^2}$ is also continuous (and therefore integrable) on $[a, b]$, which implies that

$$\begin{aligned} s &= \lim_{\|\Delta\| \to 0} \sum_{i=1}^{n} \sqrt{1 + [f'(c_i)]^2}\, (\Delta x_i) \\ &= \int_a^b \sqrt{1 + [f'(x)]^2}\, dx \end{aligned}$$

where s is called the **arc length** of f between a and b.

CHRISTIAN HUYGENS (1629–1695)

The Dutch mathematician Christian Huygens, who invented the pendulum clock, and James Gregory (1638–1675), a Scottish mathematician, both made early contributions to the problem of finding the length of a rectifiable curve.

See LarsonCalculus.com to read more of this biography.

Definition of Arc Length

Let the function $y = f(x)$ represent a smooth curve on the interval $[a, b]$. The **arc length** of f between a and b is

$$s = \int_a^b \sqrt{1 + [f'(x)]^2}\, dx.$$ y is a function of x.

Similarly, for a smooth curve $x = g(y)$, the **arc length** of g between c and d is

$$s = \int_c^d \sqrt{1 + [g'(y)]^2}\, dy.$$ x is a function of y.

FOR FURTHER INFORMATION To learn how arc length can be used to define trigonometric functions, see the article "Trigonometry Requires Calculus, Not Vice Versa" by Yves Nievergelt in *UMAP Modules*.

Because the definition of arc length can be applied to a linear function, you can check that this new definition agrees with the Distance Formula for the length of a line segment. This is shown in Example 1.

EXAMPLE 1 The Length of a Line Segment

Find the arc length from (x_1, y_1) to (x_2, y_2) on the graph of

$$f(x) = mx + b.$$

Solution Because

$$f'(x) = m = \frac{y_2 - y_1}{x_2 - x_1}$$ First derivative

it follows that

$$s = \int_{x_1}^{x_2} \sqrt{1 + [f'(x)]^2}\, dx$$ Formula for arc length

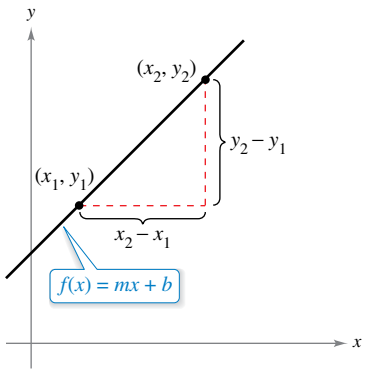
$$= \int_{x_1}^{x_2} \sqrt{1 + \left(\frac{y_2 - y_1}{x_2 - x_1}\right)^2}\, dx$$ $f'(x) = \frac{y_2 - y_1}{x_2 - x_1}$

$$= \sqrt{\frac{(x_2 - x_1)^2 + (y_2 - y_1)^2}{(x_2 - x_1)^2}}(x)\Bigg]_{x_1}^{x_2}$$ Integrate and simplify.

$$= \sqrt{\frac{(x_2 - x_1)^2 + (y_2 - y_1)^2}{(x_2 - x_1)^2}}(x_2 - x_1)$$ Apply Fundamental Theorem of Calculus.

$$= \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$ Simplify.

which is the formula for the distance between two points in the plane, as shown in Figure 7.38.



The formula for the arc length of the graph of f from (x_1, y_1) to (x_2, y_2) is the same as the standard Distance Formula.
Figure 7.38

TECHNOLOGY Definite integrals representing arc length often are very difficult to evaluate. In this section, a few examples are presented. In the next chapter, with more advanced integration techniques, you will be able to tackle more difficult arc length problems. In the meantime, remember that you can always use a numerical integration program to approximate an arc length. For instance, use the *numerical integration* feature of a graphing utility to approximate the arc lengths in Examples 2 and 3.

The arc length of the graph of y on $\left[\frac{1}{2}, 2\right]$

Figure 7.39

EXAMPLE 2 Finding Arc Length

Find the arc length of the graph of $y = x^3/6 + 1/(2x)$ on the interval $[1/2, 2]$, as shown in Figure 7.39.

Solution Using

$$\frac{dy}{dx} = \frac{3x^2}{6} - \frac{1}{2x^2} = \frac{1}{2}\left(x^2 - \frac{1}{x^2}\right)$$ First derivative

yields an arc length of

$$s = \int_a^b \sqrt{1 + \left(\frac{dy}{dx}\right)^2}\, dx$$ Formula for arc length

$$= \int_{1/2}^{2} \sqrt{1 + \left[\frac{1}{2}\left(x^2 - \frac{1}{x^2}\right)\right]^2}\, dx$$ $\frac{dy}{dx} = \frac{1}{2}\left(x^2 - \frac{1}{x^2}\right)$

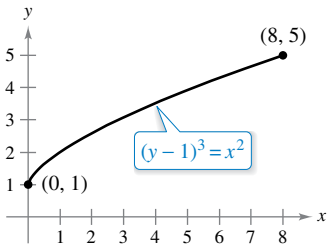
$$= \int_{1/2}^{2} \sqrt{\frac{1}{4}\left(x^4 + 2 + \frac{1}{x^4}\right)}\, dx$$

$$= \frac{1}{2}\int_{1/2}^{2} \left(x^2 + \frac{1}{x^2}\right) dx$$ Simplify.

$$= \frac{1}{2}\left[\frac{x^3}{3} - \frac{1}{x}\right]_{1/2}^{2}$$ Integrate.

$$= \frac{1}{2}\left(\frac{13}{6} + \frac{47}{24}\right)$$ Apply Fundamental Theorem of Calculus.

$$= \frac{33}{16}.$$ Simplify.



The arc length of the graph of y on $[0, 8]$

Figure 7.40

EXAMPLE 3 Finding Arc Length

Find the arc length of the graph of $(y - 1)^3 = x^2$ on the interval $[0, 8]$, as shown in Figure 7.40. Round your answer to three decimal places.

Solution Solving for y yields $y = x^{2/3} + 1$ and $dy/dx = 2/(3x^{1/3})$. Because dy/dx is undefined when $x = 0$, the arc length formula with respect to x cannot be used. Solving for x in terms of y yields $x = \pm(y - 1)^{3/2}$. Choosing the positive value of x produces

$$\frac{dx}{dy} = \frac{3}{2}(y - 1)^{1/2}.$$ First derivative

The x-interval $[0, 8]$ corresponds to the y-interval $[1, 5]$, and the arc length is

$$s = \int_c^d \sqrt{1 + \left(\frac{dx}{dy}\right)^2}\, dy$$ Formula for arc length

$$= \int_1^5 \sqrt{1 + \left[\frac{3}{2}(y - 1)^{1/2}\right]^2}\, dy$$ $\frac{dx}{dy} = \frac{3}{2}(y - 1)^{1/2}$

$$= \int_1^5 \sqrt{\frac{9}{4}y - \frac{5}{4}}\, dy$$

$$= \frac{1}{2}\int_1^5 \sqrt{9y - 5}\, dy$$ Simplify.

$$= \frac{1}{18}\left[\frac{(9y - 5)^{3/2}}{3/2}\right]_1^5$$ Integrate.

$$= \frac{1}{27}(40^{3/2} - 4^{3/2})$$ Apply Fundamental Theorem of Calculus.

$$\approx 9.073.$$ Use a calculator.

The arc length of the graph of y on $\left[0, \frac{\pi}{4}\right]$

Figure 7.41

EXAMPLE 4 Finding Arc Length

See LarsonCalculus.com for an interactive version of this type of example.

Find the arc length of the graph of

$$y = \ln(\cos x)$$

from $x = 0$ to $x = \pi/4$, as shown in Figure 7.41. Round your answer to three decimal places.

Solution Using

$$\frac{dy}{dx} = -\frac{\sin x}{\cos x} = -\tan x \qquad \text{First derivative}$$

yields an arc length of

$$\begin{aligned}
s &= \int_a^b \sqrt{1 + \left(\frac{dy}{dx}\right)^2}\, dx && \text{Formula for arc length} \\
&= \int_0^{\pi/4} \sqrt{1 + \tan^2 x}\, dx && \frac{dy}{dx} = -\tan x \\
&= \int_0^{\pi/4} \sqrt{\sec^2 x}\, dx && \text{Trigonometric identity} \\
&= \int_0^{\pi/4} \sec x\, dx && \text{Simplify.} \\
&= \Big[\ln|\sec x + \tan x|\Big]_0^{\pi/4} && \text{Integrate.} \\
&= \ln\left(\sqrt{2} + 1\right) - \ln 1 && \text{Apply Fundamental Theorem of Calculus.} \\
&\approx 0.881. && \text{Use a calculator.}
\end{aligned}$$

EXAMPLE 5 Length of a Cable

An electric cable is hung between two towers that are 200 feet apart, as shown in Figure 7.42. The cable takes the shape of a catenary whose equation is

$$y = 75(e^{x/150} + e^{-x/150}) = 150 \cosh \frac{x}{150}.$$

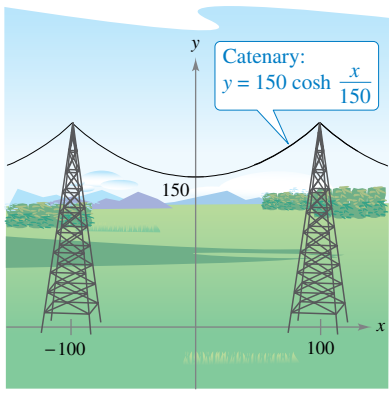

Figure 7.42

Find the arc length of the cable between the two towers to the nearest foot.

Solution Because $y' = \frac{1}{2}(e^{x/150} - e^{-x/150})$, you can square each side to obtain

$$(y')^2 = \frac{1}{4}(e^{x/75} - 2 + e^{-x/75}).$$

Then add 1 to each side and simplify to obtain

$$1 + (y')^2 = \frac{1}{4}(e^{x/75} + 2 + e^{-x/75}) = \left[\frac{1}{2}(e^{x/150} + e^{-x/150})\right]^2.$$

Therefore, the arc length of the cable is

$$\begin{aligned}
s &= \int_a^b \sqrt{1 + (y')^2}\, dx && \text{Formula for arc length} \\
&= \frac{1}{2}\int_{-100}^{100} (e^{x/150} + e^{-x/150})\, dx \\
&= 75\Big[e^{x/150} - e^{-x/150}\Big]_{-100}^{100} && \text{Integrate.} \\
&= 150(e^{2/3} - e^{-2/3}) && \text{Apply Fundamental Theorem of Calculus.} \\
&\approx 215 \text{ feet.} && \text{Use a calculator.}
\end{aligned}$$

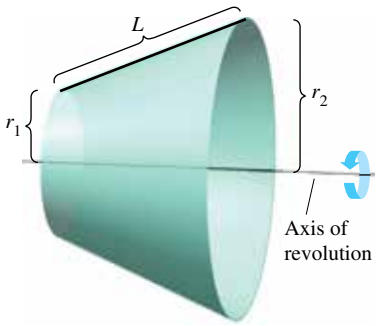
Area of a Surface of Revolution

In Sections 7.2 and 7.3, integration was used to calculate the volume of a solid of revolution. You will now learn a procedure for finding the area of a surface of revolution.

Definition of Surface of Revolution

When the graph of a continuous function is revolved about a line, the resulting surface is a **surface of revolution.**

The area of a surface of revolution is derived from the formula for the lateral surface area of the frustum of a right circular cone. Consider the line segment in the figure at the right, where L is the length of the line segment, r_1 is the radius at the left end of the line segment, and r_2 is the radius at the right end of the line segment. When the line segment is revolved about its axis of revolution, it forms a frustum of a right circular cone, with



$$S = 2\pi rL \qquad \text{Lateral surface area of frustum}$$

where

$$r = \frac{1}{2}(r_1 + r_2). \qquad \text{Average radius of frustum}$$

(In Exercise 56, you are asked to verify the formula for S.)

Consider a function f that has a continuous derivative on the interval $[a, b]$. The graph of f is revolved about the x-axis to form a surface of revolution, as shown in Figure 7.43. Let Δ be a partition of $[a, b]$, with subintervals of width Δx_i. Then the line segment of length

$$\Delta L_i = \sqrt{(\Delta x_i)^2 + (\Delta y_i)^2}$$

generates a frustum of a cone. Let r_i be the average radius of this frustum. By the Intermediate Value Theorem, a number d_i exists (in the ith subinterval) such that

$$r_i = f(d_i).$$

The lateral surface area ΔS_i of the frustum is

$$\begin{aligned}\Delta S_i &= 2\pi r_i \Delta L_i \\ &= 2\pi f(d_i)\sqrt{(\Delta x_i)^2 + (\Delta y_i)^2} \\ &= 2\pi f(d_i)\sqrt{1 + \left(\frac{\Delta y_i}{\Delta x_i}\right)^2}\Delta x_i.\end{aligned}$$

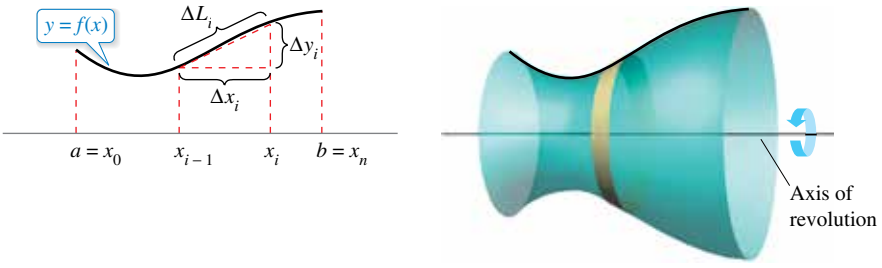


Figure 7.43

Copyright 2023 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

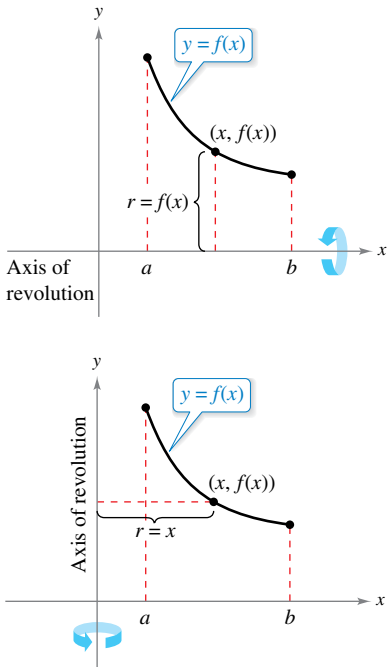

Figure 7.44

By the Mean Value Theorem, a number c_i exists in (x_{i-1}, x_i) such that

$$f'(c_i) = \frac{f(x_i) - f(x_{i-1})}{x_i - x_{i-1}} = \frac{\Delta y_i}{\Delta x_i}.$$

So, $\Delta S_i = 2\pi f(d_i)\sqrt{1 + [f'(c_i)]^2}\,\Delta x_i$, and the total surface area can be approximated by

$$S \approx 2\pi \sum_{i=1}^{n} f(d_i)\sqrt{1 + [f'(c_i)]^2}\,\Delta x_i.$$

It can be shown that the limit of the right side as $\|\Delta\| \to 0$ $(n \to \infty)$ is

$$S = 2\pi \int_a^b f(x)\sqrt{1 + [f'(x)]^2}\,dx. \qquad f \text{ is revolved about the } x\text{-axis.}$$

In a similar manner, if the graph of f is revolved about the y-axis, then S is

$$S = 2\pi \int_a^b x\sqrt{1 + [f'(x)]^2}\,dx. \qquad f \text{ is revolved about the } y\text{-axis.}$$

In these two formulas for S, you can regard the products $2\pi f(x)$ and $2\pi x$ as the circumferences of the circles traced by a point (x, y) on the graph of f as it is revolved about the x-axis and the y-axis (see Figure 7.44). In one case, the radius is $r = f(x)$, and in the other case, the radius is $r = x$. Moreover, by appropriately adjusting r, you can generalize the formula for surface area to cover *any* horizontal or vertical axis of revolution, as indicated in the next definition.

Definition of the Area of a Surface of Revolution

Let $y = f(x)$ have a continuous derivative on the interval $[a, b]$. The area S of the surface of revolution formed by revolving the graph of f about a horizontal or vertical axis is

$$S = 2\pi \int_a^b r(x)\sqrt{1 + [f'(x)]^2}\,dx \qquad y \text{ is a function of } x.$$

where $r(x)$ is the distance between the graph of f and the axis of revolution. If $x = g(y)$ on the interval $[c, d]$, then the surface area is

$$S = 2\pi \int_c^d r(y)\sqrt{1 + [g'(y)]^2}\,dy \qquad x \text{ is a function of } y.$$

where $r(y)$ is the distance between the graph of g and the axis of revolution.

The formulas in this definition are sometimes written as

$$S = 2\pi \int_a^b r(x)\,ds \qquad y \text{ is a function of } x.$$

and

$$S = 2\pi \int_c^d r(y)\,ds \qquad x \text{ is a function of } y.$$

where

$$ds = \sqrt{1 + [f'(x)]^2}\,dx \quad \text{and} \quad ds = \sqrt{1 + [g'(y)]^2}\,dy$$

respectively.

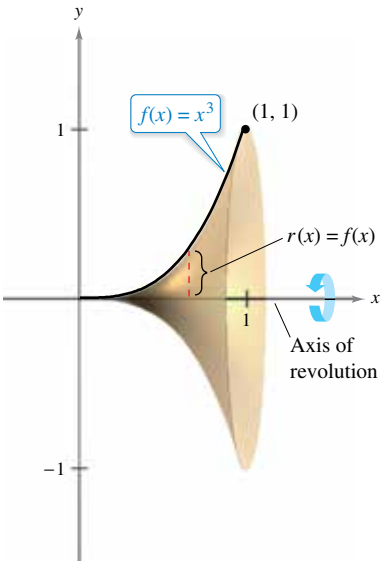

Figure 7.45

EXAMPLE 6 The Area of a Surface of Revolution

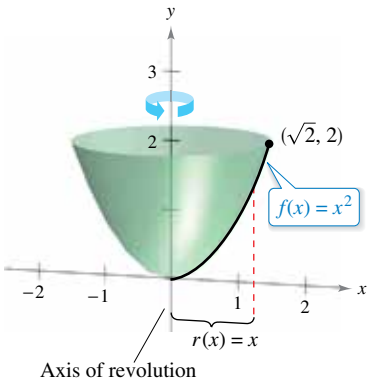
Find the area of the surface formed by revolving the graph of $f(x) = x^3$ on the interval $[0, 1]$ about the x-axis (see Figure 7.45). Round your answer to three decimal places.

Solution The distance between the x-axis and the graph of f is $r(x) = f(x)$, and because $f'(x) = 3x^2$, the surface area is

$$\begin{aligned}
S &= 2\pi \int_a^b r(x)\sqrt{1 + [f'(x)]^2}\,dx && \text{Formula for surface area} \\
&= 2\pi \int_0^1 x^3\sqrt{1 + (3x^2)^2}\,dx && f'(x) = 3x^2 \\
&= \frac{2\pi}{36}\int_0^1 (36x^3)(1 + 9x^4)^{1/2}\,dx && \text{Simplify.} \\
&= \frac{\pi}{18}\left[\frac{(1 + 9x^4)^{3/2}}{3/2}\right]_0^1 && \text{Integrate.} \\
&= \frac{\pi}{27}(10^{3/2} - 1) && \text{Apply Fundamental Theorem of Calculus.} \\
&\approx 3.563. && \text{Use a calculator.}
\end{aligned}$$

EXAMPLE 7 The Area of a Surface of Revolution

Find the area of the surface formed by revolving the graph of $f(x) = x^2$ on the interval $[0, \sqrt{2}]$ about the y-axis (see figure). Round your answer to three decimal places.



Solution In this case, the distance between the graph of f and the y-axis is $r(x) = x$. Using $f'(x) = 2x$ and the formula for surface area, you can determine that

$$\begin{aligned}
S &= 2\pi \int_a^b r(x)\sqrt{1 + [f'(x)]^2}\,dx && \text{Formula for surface area} \\
&= 2\pi \int_0^{\sqrt{2}} x\sqrt{1 + (2x)^2}\,dx && f'(x) = 2x \\
&= \frac{2\pi}{8}\int_0^{\sqrt{2}} (1 + 4x^2)^{1/2}(8x)\,dx && \text{Simplify.} \\
&= \frac{\pi}{4}\left[\frac{(1 + 4x^2)^{3/2}}{3/2}\right]_0^{\sqrt{2}} && \text{Integrate.} \\
&= \frac{\pi}{6}[(1 + 8)^{3/2} - 1] && \text{Apply Fundamental Theorem of Calculus.} \\
&= \frac{13\pi}{3} \\
&\approx 13.614. && \text{Use a calculator.}
\end{aligned}$$

7.4 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Describe the condition for a curve to be rectifiable between two points.
2. Explain how to find the arc length of a function that is a smooth curve on the interval $[a, b]$.
3. Name a function for which the integral below represents the arc length of the function on the interval $[0, 2]$.

$$\int_0^2 \sqrt{1 + (4x)^2}\, dx$$

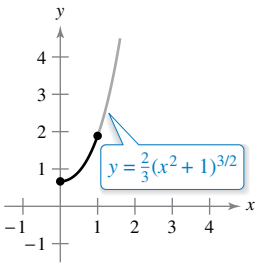
4. Describe a surface of revolution.

Finding Distance Using Two Methods **In Exercises 5 and 6, find the distance between the points using (a) the Distance Formula and (b) integration.**

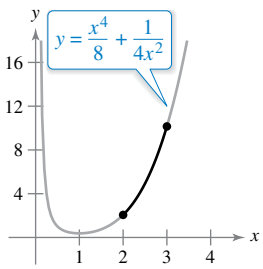
5. $(2, 1), (5, 3)$
6. $(-2, 2), (4, -6)$

Finding Arc Length **In Exercises 7–20, find the arc length of the graph of the function over the indicated interval.**

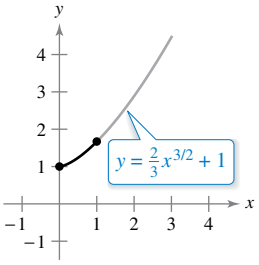
7. $y = \frac{2}{3}(x^2 + 1)^{3/2}$



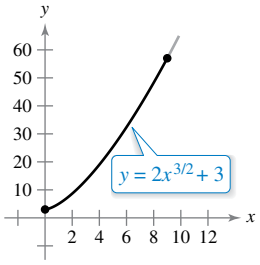
8. $y = \frac{x^4}{8} + \frac{1}{4x^2}, \quad [2, 3]$



9. $y = \frac{2}{3}x^{3/2} + 1$



10. $y = 2x^{3/2} + 3$



11. $y = \frac{3}{2}x^{2/3}, \quad [1, 8]$
12. $y = \frac{3}{2}x^{2/3} + 4, \quad [1, 27]$
13. $y = \frac{x^5}{10} + \frac{1}{6x^3}, \quad [2, 5]$
14. $y = \frac{x^7}{14} + \frac{1}{10x^5}, \quad [1, 2]$
15. $y = \ln(\sin x), \quad \left[\frac{\pi}{4}, \frac{3\pi}{4}\right]$
16. $y = \ln(\cos x), \quad \left[0, \frac{\pi}{3}\right]$
17. $y = \frac{1}{2}(e^x + e^{-x}), \quad [0, 2]$
18. $y = \ln\left(\frac{e^x + 1}{e^x - 1}\right), \quad [\ln 6, \ln 8]$
19. $x = \frac{1}{3}(y^2 + 2)^{3/2}, \quad 0 \le y \le 4$
20. $x = \frac{1}{3}\sqrt{y}(y - 3), \quad 1 \le y \le 4$

Finding Arc Length **In Exercises 21–30, (a) sketch the graph of the function, highlighting the part indicated by the given interval, (b) write a definite integral that represents the arc length of the curve over the indicated interval and observe that the integral cannot be evaluated with the techniques studied so far, and (c) use the integration capabilities of a graphing utility to approximate the arc length.**

21. $y = 4 - x^2, \quad [0, 2]$
22. $y = x^2 + x - 2, \quad [-2, 1]$
23. $y = \frac{1}{x}, \quad [1, 3]$
24. $y = \frac{1}{x + 1}, \quad [0, 1]$
25. $y = \sin x, \quad [0, \pi]$
26. $y = \cos x, \quad \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$
27. $y = 2 \arctan x, \quad [0, 1]$
28. $y = \ln x, \quad [1, 5]$
29. $x = e^{-y}, \quad 0 \le y \le 2$
30. $x = \sqrt{36 - y^2}, \quad 0 \le y \le 3$

Approximation **In Exercises 31 and 32, approximate the arc length of the graph of the function over the interval $[0, 4]$ in three ways. (a) Use the Distance Formula to find the distance between the endpoints of the arc. (b) Use the Distance Formula to find the lengths of the four line segments connecting the points on the arc when $x = 0$, $x = 1$, $x = 2$, $x = 3$, and $x = 4$. Find the sum of the four lengths. (c) Use the integration capabilities of a graphing utility to approximate the integral yielding the indicated arc length.**

31. $f(x) = x^3$
32. $f(x) = (x^2 - 4)^2$

33. **Length of a Cable** An electric cable is hung between two towers that are 40 meters apart (see figure). The cable takes the shape of a catenary whose equation is

$$y = 10(e^{x/20} + e^{-x/20}), \quad -20 \le x \le 20$$

where x and y are measured in meters. Find the arc length of the cable between the two towers.

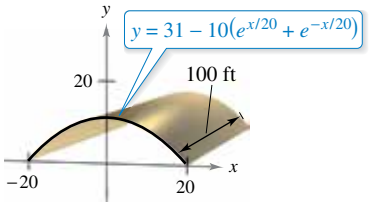
34. Roof Area A barn is 100 feet long and 40 feet wide (see figure). A cross section of the roof is the inverted catenary $y = 31 - 10(e^{x/20} + e^{-x/20})$. Find the number of square feet of roofing on the barn.



35. Length of Gateway Arch The Gateway Arch in St. Louis, Missouri, is modeled by the inverted catenary

$$y = 693.8597 - 68.7672 \cosh(0.0100333x)$$

where $-299.2239 \le x \le 299.2239$. Use the integration capabilities of a graphing utility to approximate the length of this curve (see figure).

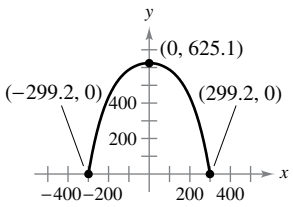


Figure for 35

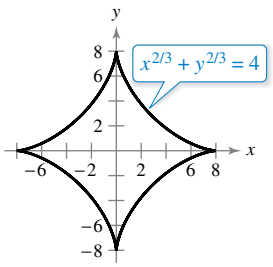

Figure for 36

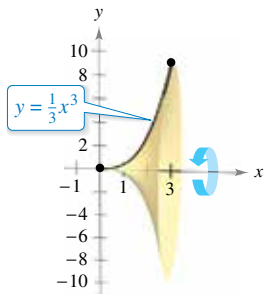
36. Astroid Find the total length of the graph of the astroid $x^{2/3} + y^{2/3} = 4$ (see figure).

37. Arc Length of a Sector of a Circle Find the arc length from $(0, 3)$ clockwise to $(2, \sqrt{5})$ along the circle $x^2 + y^2 = 9$.

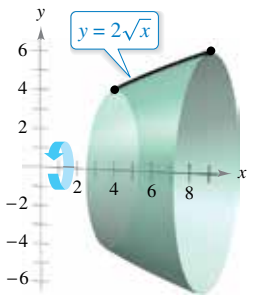
38. Arc Length of a Sector of a Circle Find the arc length from $(-3, 4)$ clockwise to $(4, 3)$ along the circle $x^2 + y^2 = 25$. Show that the result is one-fourth the circumference of the circle.

Finding the Area of a Surface of Revolution **In Exercises 39–44, write and evaluate the definite integral that represents the area of the surface generated by revolving the curve on the indicated interval about the *x*-axis.**

39. $y = \frac{1}{3}x^3$



40. $y = 2\sqrt{x}$



41. $y = \frac{x^3}{6} + \frac{1}{2x}, \quad 1 \le x \le 2$

42. $y = 3x, \quad 0 \le x \le 3$

43. $y = \sqrt{4 - x^2}, \quad -1 \le x \le 1$

44. $y = \sqrt{9 - x^2}, \quad -2 \le x \le 2$

Finding the Area of a Surface of Revolution **In Exercises 45–48, write and evaluate the definite integral that represents the area of the surface generated by revolving the curve on the indicated interval about the *y*-axis.**

45. $y = \sqrt[3]{x} + 2, \quad 1 \le x \le 8$

46. $y = 9 - x^2, \quad 0 \le x \le 3$

47. $y = 1 - \frac{x^2}{4}, \quad 0 \le x \le 2$

48. $y = \frac{x}{2} + 3, \quad 1 \le x \le 5$

Finding the Area of a Surface of Revolution Using Technology **In Exercises 49 and 50, use the integration capabilities of a graphing utility to approximate the area of the surface of revolution.**

Function	Interval	Axis of Revolution
49. $y = \sin x$	$[0, \pi]$	x-axis
50. $y = \ln x$	$[1, e]$	y-axis

Exploring Concepts

In Exercises 51 and 52, determine which value best approximates the length of the arc represented by the integral. Make your selection on the basis of a sketch of the arc, not by performing calculations.

51. $\displaystyle\int_0^2 \sqrt{1 + \left[\frac{d}{dx}\left(\frac{5}{x^2 + 1}\right)\right]^2}\, dx$

(a) 25 (b) 5 (c) 2 (d) -4 (e) 3

52. $\displaystyle\int_0^{\pi/4} \sqrt{1 + \left[\frac{d}{dx}(\tan x)\right]^2}\, dx$

(a) 3 (b) -2 (c) 4 (d) $\frac{4\pi}{3}$ (e) 1

53. Consider the function

$$f(x) = \frac{1}{4}e^x + e^{-x}.$$

Compare the definite integral of f on the interval $[a, b]$ with the arc length of f over the interval $[a, b]$.

54. HOW DO YOU SEE IT? The graphs of the functions f_1 and f_2 on the interval $[a, b]$ are shown in the figure. The graph of each function is revolved about the x-axis. Which surface of revolution has the greater surface area? Explain.

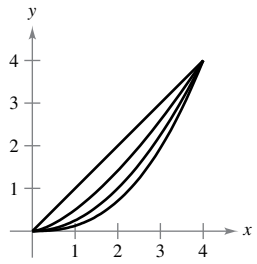
55. Think About It The figure shows the graphs of the functions $y_1 = x$, $y_2 = \frac{1}{2}x^{3/2}$, $y_3 = \frac{1}{4}x^2$, and $y_4 = \frac{1}{8}x^{5/2}$ on the interval $[0, 4]$. To print an enlarged copy of the graph, go to *MathGraphs.com.*



(a) Label the functions.

(b) Without calculating, list the functions in order of increasing arc length.

(c) Verify your answer in part (b) by using the integration capabilities of a graphing utility to approximate each arc length accurate to three decimal places.

56. Verifying a Formula

(a) Given a circular sector with radius L and central angle θ (see figure), show that the area of the sector is given by

$$S = \frac{1}{2}L^2\theta.$$

(b) By joining the straight-line edges of the sector in part (a), a right circular cone is formed (see figure) and the lateral surface area of the cone is the same as the area of the sector. Show that the area is $S = \pi rL$, where r is the radius of the base of the cone. (*Hint:* The arc length of the sector equals the circumference of the base of the cone.)

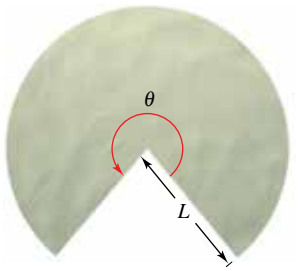


Figure for 56(a)

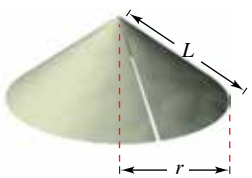

Figure for 56(b)

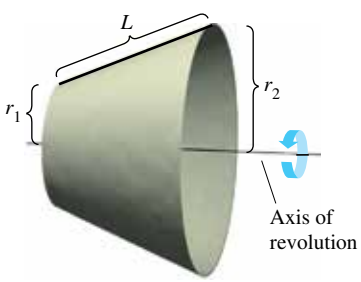
(c) Use the result of part (b) to verify that the formula for the lateral surface area of the frustum of a cone with slant height L and radii r_1 and r_2 (see figure) is $S = \pi(r_1 + r_2)L$. (*Note:* This formula was used to develop the integral for finding the surface area of a surface of revolution.)



57. Lateral Surface Area of a Cone A right circular cone is generated by revolving the region bounded by $y = 3x/4$, $y = 3$, and $x = 0$ about the y-axis. Find the lateral surface area of the cone.

58. Lateral Surface Area of a Cone A right circular cone is generated by revolving the region bounded by $y = hx/r$, $y = h$, and $x = 0$ about the y-axis. Verify that the lateral surface area of the cone is $S = \pi r\sqrt{r^2 + h^2}$.

59. Using a Sphere Find the area of the segment of a sphere formed by revolving the graph of $y = \sqrt{9 - x^2}$, $0 \le x \le 2$, about the y-axis.

60. Using a Sphere Find the area of the segment of a sphere formed by revolving the graph of $y = \sqrt{r^2 - x^2}$, $0 \le x \le a$, about the y-axis. Assume that $a < r$.

61. Modeling Data The circumference C (in inches) of a vase is measured at three-inch intervals starting at its base. The measurements are shown in the table, where y is the vertical distance in inches from the base.

y	0	3	6	9	12	15	18
C	50	65.5	70	66	58	51	48

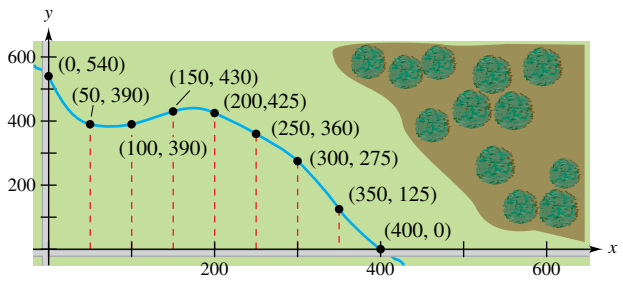
(a) Use the data to approximate the volume of the vase by summing the volumes of approximating disks.

(b) Use the data to approximate the outside surface area (excluding the base) of the vase by summing the outside surface areas of approximating frustums of right circular cones.

(c) Use the regression capabilities of a graphing utility to find a cubic model for the points (y, r), where $r = C/(2\pi)$. Use the graphing utility to plot the points and graph the model.

(d) Use the model in part (c) and the integration capabilities of a graphing utility to approximate the volume and outside surface area of the vase. Compare the results with your answers in parts (a) and (b).

62. Modeling Data Property bounded by two perpendicular roads and a stream is shown in the figure. All distances are measured in feet.



(a) Use the regression capabilities of a graphing utility to fit a fourth-degree polynomial to the path of the stream.

(b) Use the model in part (a) to approximate the area of the property in acres.

(c) Use the integration capabilities of a graphing utility to find the length of the stream that bounds the property.

63. Volume and Surface Area Let R be the region bounded by $y = 1/x$, the x-axis, $x = 1$, and $x = b$, where $b > 1$. Let D be the solid formed when R is revolved about the x-axis.

(a) Find the volume V of D.

(b) Write a definite integral that represents the surface area S of D.

(c) Show that V approaches a finite limit as $b \to \infty$.

(d) Show that $S \to \infty$ as $b \to \infty$.

64. Arc Length Show that

$$\int_{-1}^{1} \frac{1}{\sqrt{1 - x^2}}\,dx = \pi$$

without evaluating the antiderivative of

$$\frac{1}{\sqrt{1 - x^2}}.$$

Approximating Arc Length or Surface Area **In Exercises 65–68, (a) write the definite integral for finding the indicated arc length or surface area, (b) explain why the integral does not satisfy the definition of a definite integral, and (c) use the integration capabilities of a graphing utility to approximate the arc length or surface area. (You will learn how to evaluate this type of integral in Section 8.8.)**

65. Length of Pursuit A fleeing object leaves the origin and moves up the y-axis (see figure). At the same time, a pursuer leaves the point $(1, 0)$ and always moves toward the fleeing object. The pursuer's speed is twice that of the fleeing object. The equation of the path is modeled by

$$y = \frac{1}{3}(x^{3/2} - 3x^{1/2} + 2).$$

How far has the fleeing object traveled when it is caught? Show that the pursuer has traveled twice as far.

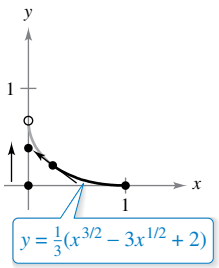

Figure for 65

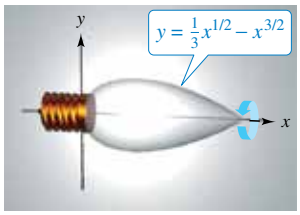

Figure for 66

66. Bulb Design An ornamental light bulb is designed by revolving the graph of

$$y = \frac{1}{3}x^{1/2} - x^{3/2}, \quad 0 \le x \le \frac{1}{3}$$

about the x-axis, where x and y are measured in feet (see figure). Find the surface area of the bulb and use the result to approximate the amount of glass needed to make the bulb. Assume that the thickness of the glass is 0.015 inch.

67. Astroid Find the area of the surface formed by revolving the portion in the first quadrant of the graph of $x^{2/3} + y^{2/3} = 4$, $0 \le y \le 8$, about the y-axis.

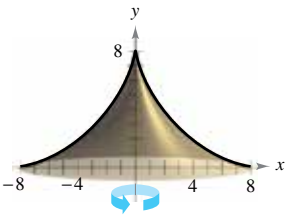

Figure for 67

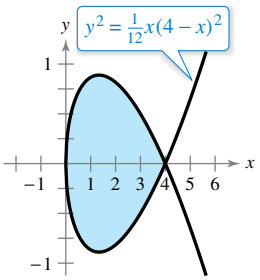

Figure for 68

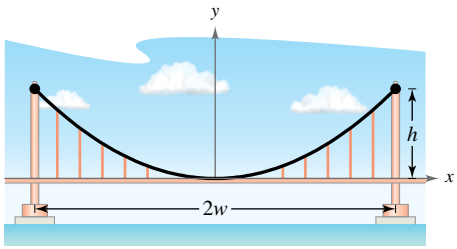
68. Using a Loop Consider the graph of

$$y^2 = \frac{1}{12}x(4 - x)^2$$

shown in the figure. Find the area of the surface formed when the loop of this graph is revolved about the x-axis.

69. Suspension Bridge A cable for a suspension bridge has the shape of a parabola with equation $y = kx^2$. Let h represent the height of the cable from its lowest point to its highest point and let $2w$ represent the total span of the bridge (see figure). Show that the length C of the cable is given by

$$C = 2\int_0^w \sqrt{1 + \left(\frac{4h^2}{w^2}\right)x^2}\,dx.$$



70. Suspension Bridge The Humber Bridge, located in the United Kingdom and opened in 1981, has a main span of about 1400 meters. Each of its towers has a height of about 155 meters. Use these dimensions, the integral in Exercise 69, and the integration capabilities of a graphing utility to approximate the length of a parabolic cable along the main span.

71. Arc Length and Area Let C be the curve given by $f(x) = \cosh x$ for $0 \le x \le t$, where $t > 0$. Show that the arc length of C is equal to the area bounded by C and the x-axis. Identify another curve on the interval $0 \le x \le t$ with this property.

PUTNAM EXAM CHALLENGE

72. Find the length of the curve $y^2 = x^3$ from the origin to the point where the tangent makes an angle of 45° with the x-axis.

This problem was composed by the Committee on the Putnam Prize Competition.

7.5 Work

GO DIGITAL

- Find the work done by a constant force.
- Find the work done by a variable force.

Work Done by a Constant Force

The concept of work is important to scientists and engineers for determining the energy needed to perform various jobs. For instance, it is useful to know the amount of work done when a crane lifts a steel girder, when a spring is compressed, when a rocket is propelled into the air, or when a truck pulls a load along a highway.

In general, **work** is done by a force when it moves an object. If the force applied to the object is *constant,* then the work done is a product of the force and the distance the object moves in the direction of the force.

Definition of Work Done by a Constant Force

If an object is moved a distance D in the direction of an applied constant force F, then the **work** W done by the force is defined as $W = FD$.

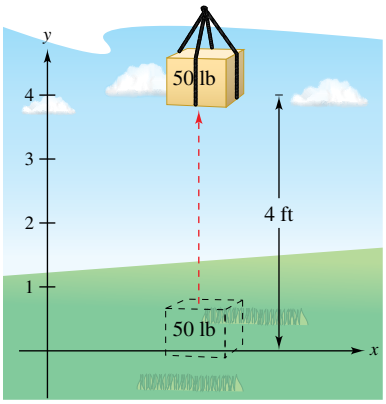
There are four fundamental types of forces—gravitational, electromagnetic, strong nuclear, and weak nuclear. A **force** can be thought of as a *push* or a *pull*; a force changes the state of rest or state of motion of a body. For gravitational forces on Earth, it is common to use units of measure corresponding to the weight of an object.

EXAMPLE 1 **Lifting an Object**

Determine the work done in lifting a 50-pound object 4 feet.

Solution The magnitude of the required force F is the weight of the object, as shown in Figure 7.46. So, the work done in lifting the object 4 feet is

$$W = FD = 50(4) = 200 \text{ foot-pounds.}$$



The work done in lifting a 50-pound object 4 feet is 200 foot-pounds.

Figure 7.46

In the U.S. measurement system, work is typically expressed in foot-pounds (ft-lb), inch-pounds, or foot-tons. In the International System of Units (SI), the basic unit of force is the **newton**—the force required to produce an acceleration of 1 meter per second per second on a mass of 1 kilogram. In this system, work is typically expressed in newton-meters, also called joules. In another system, the centimeter-gram-second (C-G-S) system, the basic unit of force is the **dyne**—the force required to produce an acceleration of 1 centimeter per second per second on a mass of 1 gram. In this system, work is typically expressed in dyne-centimeters, also called ergs, or in joules. The table below summarizes the units of measure that are commonly used to express the work done and lists several conversion factors.

System of Measurement	Measure of Work	Measure of Force	Measure of Distance
U.S.	foot-pound (ft-lb)	pound (lb)	foot (ft)
International	joule (J)	newton (N)	meter (m)
C-G-S	erg	dyne (dyn)	centimeter (cm)
Conversions: 1 ft-lb $\approx$ 1.35582 J $= 1.35582 \times 10^7$ ergs 1 J $= 10^7$ ergs $\approx$ 0.73756 ft-lb		1 N $= 10^5$ dyn $\approx$ 0.22481 lb 1 lb $\approx$ 4.44822 N

Work Done by a Variable Force

In Example 1, the force involved was *constant*. When a *variable* force is applied to an object, calculus is needed to determine the work done, because the amount of force changes as the object changes position. For instance, the force required to compress a spring increases as the spring is compressed.

Consider an object that is moved along a straight line from $x = a$ to $x = b$ by a continuously varying force $F(x)$. Let Δ be a partition that divides the interval $[a, b]$ into n subintervals determined by

$$a = x_0 < x_1 < x_2 < \cdots < x_n = b$$

and let $\Delta x_i = x_i - x_{i-1}$. For each i, choose c_i such that

$$x_{i-1} \le c_i \le x_i.$$

Then at c_i, the force is $F(c_i)$. Because F is continuous, you can approximate the work done in moving the object through the ith subinterval by the increment

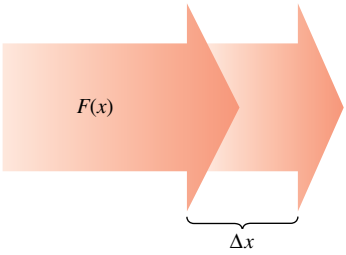
$$\Delta W_i = F(c_i)\Delta x_i$$

as shown in Figure 7.47. So, the total work done as the object moves from $x = a$ to $x = b$ is approximated by

$$W \approx \sum_{i=1}^{n} \Delta W_i = \sum_{i=1}^{n} F(c_i)\Delta x_i.$$

This approximation appears to become better and better as $\|\Delta\| \to 0$ $(n \to \infty)$. So, the work done is

$$W = \lim_{\|\Delta\|\to 0} \sum_{i=1}^{n} F(c_i)\Delta x_i = \int_a^b F(x)\,dx.$$



The amount of force changes as an object changes position (Δx).
Figure 7.47

Definition of Work Done by a Variable Force

If an object is moved along a straight line by a continuously varying force $F(x)$, then the **work** W done by the force as the object is moved from

$$x = a \quad \text{to} \quad x = b$$

is given by

$$W = \lim_{\|\Delta\|\to 0} \sum_{i=1}^{n} \Delta W_i = \int_a^b F(x)\,dx.$$

EMILIE DE BRETEUIL (1706–1749)

A major work by Breteuil was the translation of Newton's "Philosophiae Naturalis Principia Mathematica" into French. Her translation and commentary greatly contributed to the acceptance of Newtonian science in Europe.

See LarsonCalculus.com to read more of this biography.

The remaining examples in this section use some well-known physical laws. The discoveries of many of these laws occurred during the same period in which calculus was being developed. In fact, during the seventeenth and eighteenth centuries, there was little difference between physicists and mathematicians. One such physicist-mathematician was Emilie de Breteuil. Breteuil was instrumental in synthesizing the work of many other scientists, including Newton, Leibniz, Huygens, Kepler, and Descartes. Her physics text *Institutions* was widely used for many years.

GO DIGITAL

The three laws of physics listed below were developed by Robert Hooke (1635–1703), Isaac Newton (1642–1727), and Charles Coulomb (1736–1806).

1. **Hooke's Law:** The force F required to compress or stretch a spring (within its elastic limits) is proportional to the distance d that the spring is compressed or stretched from its original length. That is,

$$F = kd$$

where the constant of proportionality k (the spring constant) depends on the specific nature of the spring.

2. **Newton's Law of Universal Gravitation:** The force F of attraction between two particles of masses m_1 and m_2 is proportional to the product of the masses and inversely proportional to the square of the distance d between the two particles. That is,

$$F = G\frac{m_1 m_2}{d^2}.$$

When m_1 and m_2 are in kilograms and d in meters, F will be in newtons for a value of $G = 6.67 \times 10^{-11}$ cubic meter per kilogram-second squared, where G is the **gravitational constant.**

3. **Coulomb's Law:** The force F between two charges q_1 and q_2 in a vacuum is proportional to the product of the charges and inversely proportional to the square of the distance d between the two charges. That is,

$$F = k\frac{q_1 q_2}{d^2}.$$

When q_1 and q_2 are given in electrostatic units and d in centimeters, F will be in dynes for a value of $k = 1$.

EXAMPLE 2 Compressing a Spring

See LarsonCalculus.com for an interactive version of this type of example.

A force of 30 newtons compresses a spring 0.3 meter from its natural length of 1.5 meters. Find the work done in compressing the spring an additional 0.3 meter.

Solution By Hooke's Law, the force $F(x)$ required to compress the spring x units (from its natural length) is $F(x) = kx$. Because $F(0.3) = 30$, it follows that

$$F(0.3) = (k)(0.3) \quad \Rightarrow \quad 30 = 0.3k \quad \Rightarrow \quad 100 = k.$$

So, $F(x) = 100x$, as shown in Figure 7.48. To find the increment of work, assume that the force required to compress the spring over a small increment Δx is nearly constant. So, the increment of work is

$$\Delta W = (\text{force})(\text{distance increment}) = (100x)\Delta x.$$

Because the spring is compressed from $x = 0.3$ to $x = 0.6$ meter less than its natural length, the work required is

$$W = \int_a^b F(x)\,dx = \int_{0.3}^{0.6} 100x\,dx = 50x^2\Big]_{0.3}^{0.6} = 18 - 4.5 = 13.5 \text{ joules}.$$

Note that you do *not* integrate from $x = 0$ to $x = 0.6$ because you were asked to determine the work done in compressing the spring an *additional* 0.3 meter (not including the first 0.3 meter). ■

GO DIGITAL

EXAMPLE 3 Moving a Space Module into Orbit

A space module weighs 15 tons on the surface of Earth. How much work is done in propelling the module to a height of 800 miles above Earth, as shown in Figure 7.49? (Use 4000 miles as the radius of Earth. Do not consider the effect of air resistance or the weight of the propellant.)

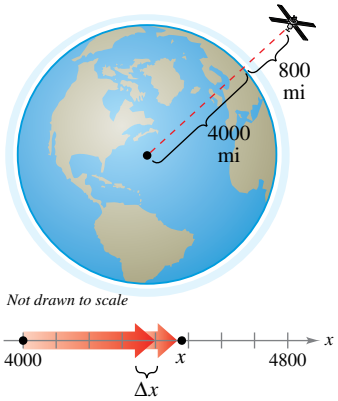

Figure 7.49

Solution Because the weight of a body varies inversely as the square of its distance from the center of Earth, the force $F(x)$ exerted by gravity is

$$F(x) = \frac{C}{x^2}$$

where C is the constant of proportionality. Because the module weighs 15 tons on the surface of Earth and the radius of Earth is approximately 4000 miles, you have

$$15 = \frac{C}{(4000)^2} \quad \Rightarrow \quad 240{,}000{,}000 = C.$$

So, the increment of work is

$$\Delta W = (\text{force})(\text{distance increment}) = \frac{240{,}000{,}000}{x^2}\,\Delta x.$$

Finally, because the module is propelled from $x = 4000$ to $x = 4800$ miles, the total work done is

$$\begin{aligned} W &= \int_a^b F(x)\,dx && \text{Formula for work} \\ &= \int_{4000}^{4800} \frac{240{,}000{,}000}{x^2}\,dx \\ &= \frac{-240{,}000{,}000}{x}\Bigg]_{4000}^{4800} && \text{Integrate.} \\ &= -50{,}000 + 60{,}000 \\ &= 10{,}000 \text{ mile-tons} \\ &= 1.056 \times 10^{11} \text{ foot-pounds.} && \text{1 mile} = \text{5280 feet; 1 ton} = \text{2000 pounds} \end{aligned}$$

In SI units, using a conversion factor of 1 foot-pound ≈ 1.35582 joules, the work done is

$$W \approx 1.432 \times 10^{11} \text{ joules.}$$

The solutions to Examples 2 and 3 conform to our development of work as the summation of increments in the form

$$\Delta W = (\text{force})(\text{distance increment}) = (F)(\Delta x).$$

Another way to formulate the increment of work is

$$\Delta W = (\text{force increment})(\text{distance}) = (\Delta F)(x).$$

This second interpretation of ΔW is useful in problems involving the movement of nonrigid substances such as fluids and chains.

GO DIGITAL

EXAMPLE 4 Emptying a Tank of Oil

A spherical tank of radius 8 feet is half full of oil that weighs 50 pounds per cubic foot. Find the work required to pump all of the oil out through a hole in the top of the tank.

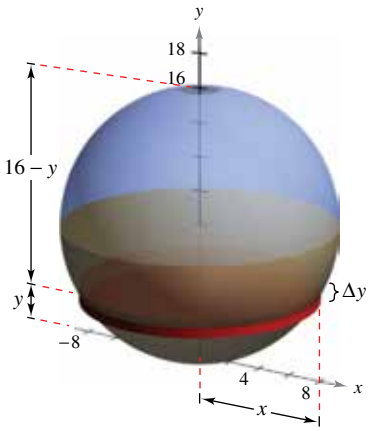

Figure 7.50

Solution Consider the oil to be subdivided into disks of thickness Δy and radius x, as shown in Figure 7.50. Because the increment of force for each disk is given by its weight, you have

$$\begin{aligned}\Delta F &= \text{weight} \\ &= \left(\frac{50 \text{ pounds}}{\text{cubic foot}}\right)(\text{volume}) \\ &= 50(\pi x^2 \Delta y) \text{ pounds.}\end{aligned}$$

For a circle of radius 8 and center at (0, 8), you have

$$\begin{aligned}x^2 + (y - 8)^2 &= 8^2 \\ x^2 &= 16y - y^2\end{aligned}$$

and you can write the force increment as

$$\begin{aligned}\Delta F &= 50(\pi x^2 \Delta y) \\ &= 50\pi(16y - y^2)\Delta y.\end{aligned}$$

In Figure 7.50, note that a disk y feet from the bottom of the tank must be moved a distance of $(16 - y)$ feet. So, the increment of work is

$$\begin{aligned}\Delta W &= (\Delta F)(16 - y) \\ &= [50\pi(16y - y^2)\Delta y](16 - y) \\ &= 50\pi(256y - 32y^2 + y^3)\Delta y.\end{aligned}$$

Because the tank is half full, y ranges from 0 to 8 feet, and the work required to empty the tank is

$$\begin{aligned}W &= \int_0^8 50\pi(256y - 32y^2 + y^3)\, dy \\ &= 50\pi\left[128y^2 - \frac{32}{3}y^3 + \frac{y^4}{4}\right]_0^8 \\ &= 50\pi\left(\frac{11{,}264}{3}\right) \\ &\approx 589{,}782 \text{ foot-pounds.}\end{aligned}$$

To estimate the reasonableness of the result in Example 4, consider that the weight of the oil in the tank is

$$\left(\frac{1}{2}\right)(\text{volume})(\text{density}) = \frac{1}{2}\left(\frac{4}{3}\pi 8^3\right)(50) \approx 53{,}616.5 \text{ pounds.}$$

Lifting the entire half-tank of oil 8 feet would involve work of

$$\begin{aligned}W &= FD \qquad \text{Formula for work done by a constant force} \\ &\approx (53{,}616.5)(8) \\ &= 428{,}932 \text{ foot-pounds.}\end{aligned}$$

Because the oil is actually lifted between 8 and 16 feet, it seems reasonable that the work done is about 589,782 foot-pounds.

Work required to raise one end of the chain

Figure 7.51

EXAMPLE 5 Lifting a Chain

A 20-foot chain weighing 5 pounds per foot is lying coiled on the ground. How much work is required to raise one end of the chain to a height of 20 feet so that it is fully extended, as shown in Figure 7.51?

Solution Imagine that the chain is divided into small sections, each of length Δy. Then the weight of each section is the increment of force

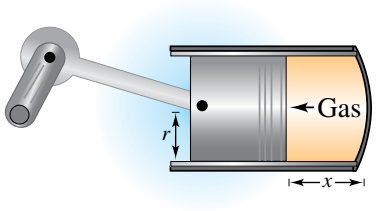
$$\Delta F = (\text{weight}) = \left(\frac{5 \text{ pounds}}{\text{foot}}\right)(\text{length}) = 5\,\Delta y.$$

Because a typical section (initially on the ground) is raised to a height of y, the increment of work is

$$\Delta W = (\text{force increment})(\text{distance}) = (5\,\Delta y)y = 5y\,\Delta y.$$

Because y ranges from 0 to 20 feet, the total work required to raise the chain is

$$W = \int_0^{20} 5y\,dy = \frac{5y^2}{2}\Big]_0^{20} = \frac{5(400)}{2} = 1000 \text{ foot-pounds.}$$



Work done by expanding gas

Figure 7.52

In the next example, you will consider a piston of radius r in a cylindrical casing, as shown in Figure 7.52. As the gas in the cylinder expands, the piston moves, and work is done. If p represents the pressure of the gas (in pounds per square foot) against the piston head and V represents the volume of the gas (in cubic feet), then the work increment involved in moving the piston Δx feet is

$$\Delta W = (\text{force})(\text{distance increment}) = F\,\Delta x = p(\pi r^2)\Delta x = p\,\Delta V.$$

So, as the volume of the gas expands from V_0 to V_1, the work done in moving the piston is

$$W = \int_{V_0}^{V_1} p\,dV.$$

Assuming the pressure of the gas to be inversely proportional to its volume, you have $p = k/V$ and the integral for work becomes

$$W = \int_{V_0}^{V_1} \frac{k}{V}\,dV.$$

EXAMPLE 6 Work Done by an Expanding Gas

A quantity of gas with an initial volume of 1 cubic foot and a pressure of 500 pounds per square foot expands to a volume of 2 cubic feet. Find the work done by the gas. (Assume that the pressure is inversely proportional to the volume.)

Solution Because $p = k/V$ and $p = 500$ when $V = 1$, you have $k = 500$. So, the work done by the gas is

$$\begin{aligned} W &= \int_{V_0}^{V_1} \frac{k}{V}\,dV \\ &= \int_1^2 \frac{500}{V}\,dV \\ &= 500 \ln|V|\Big]_1^2 \\ &\approx 346.6 \text{ foot-pounds.} \end{aligned}$$

7.5 Exercises

See CalcChat.com for tutorial help and worked-out solutions to odd-numbered exercises.

GO DIGITAL

Concept Check

1. Explain how you know when work is done by a force.
2. Describe the difference between finding the work done by a constant force and finding the work done by a variable force.
3. Explain what each variable in Hooke's Law represents.

   $F = kd$

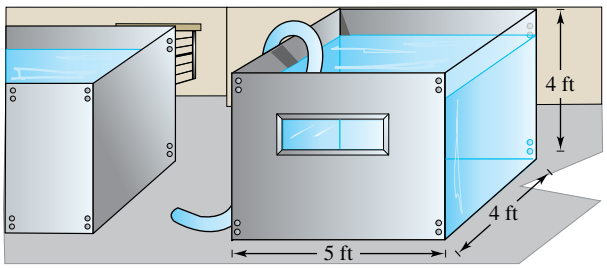
4. Explain two ways to write the increment of work.

Constant Force **In Exercises 5–8, determine the work done by the constant force.**

5. A 1200-pound steel beam is lifted 40 feet.
6. An electric hoist lifts a 3000-pound car 6 feet.
7. A force of 112 newtons is required to slide a cement block 8 meters in a construction project.
8. The locomotive of a freight train pulls its cars with a constant force of 7 tons for a distance of one-quarter mile.

Hooke's Law **In Exercises 9–14, use Hooke's Law to determine the work done by the variable force in the spring problem.**

9. A force of 5 pounds compresses a 15-inch spring a total of 3 inches. How much work is done in compressing the spring 7 inches?
10. A force of 250 newtons stretches a spring 30 centimeters. How much work is done in stretching the spring from 20 centimeters to 50 centimeters?
11. A force of 20 pounds stretches a spring 9 inches in an exercise machine. Find the work done in stretching the spring 1 foot from its natural position.
12. An overhead garage door has two springs, one on each side of the door. A force of 15 pounds is required to stretch each spring 1 foot. Because of the pulley system, the springs stretch only one-half the distance the door travels. The door moves a total of 8 feet, and the springs are at their natural length when the door is open. Find the work done by the pair of springs.
13. Eighteen foot-pounds of work is required to stretch a spring 4 inches from its natural length. Find the work required to stretch the spring an additional 3 inches.
14. Six joules of work is required to stretch a spring 0.5 meter from its natural length. Find the work required to stretch the spring an additional 0.25 meter.
15. **Propulsion** Neglecting air resistance and the weight of the propellant, determine the work done in propelling a five-ton satellite to a height of (a) 100 miles above Earth and (b) 300 miles above Earth.
16. **Propulsion** Use the information in Exercise 15 to write the work W of the propulsion system as a function of the height h of the satellite above Earth. Find the limit (if it exists) of W as h approaches infinity.
17. **Propulsion** Neglecting air resistance and the weight of the propellant, determine the work done in propelling a 10-ton satellite to a height of (a) 11,000 miles above Earth and (b) 22,000 miles above Earth.
18. **Propulsion** A lunar module weighs 12 tons on the surface of Earth. How much work is done in propelling the module from the surface of the moon to a height of 50 miles? Consider the radius of the moon to be 1100 miles and its force of gravity to be one-sixth that of Earth.
19. **Pumping Water** A rectangular tank with a base 4 feet by 5 feet and a height of 4 feet is full of water (see figure). The water weighs 62.4 pounds per cubic foot. How much work is done in pumping water out over the top edge in order to empty (a) half of the tank and (b) all of the tank?



20. **Think About It** Explain why the answer in part (b) of Exercise 19 is not twice the answer in part (a).
21. **Pumping Water** A cylindrical water tank 4 meters high with a radius of 2 meters is buried so that the top of the tank is 1 meter below ground level (see figure). How much work is done in pumping a full tank of water up to ground level? The water weighs 9800 newtons per cubic meter.
